

Report to Congress on the Recovery of Threatened and Endangered Species

Fiscal Years 2013-2014

From the Director

Photo Credit: Tami Heilemann/DOI

I am proud to present this report, which provides an update on the progress of federally protected species toward recovery between October 1, 2012 and September 30, 2014 (fiscal years 2013 and 2014).

During these two fiscal years, the Endangered Species Act (ESA) delivered some inspiring success stories, including the removal of three species from federal lists of endangered and threatened species after recovering to the point where federal protection was no longer necessary for their survival: the Magazine Mountain shagreen, Virginia northern flying squirrel, and island night lizard.

The stories behind the recovery of these species remind us all how the ESA can and should work—bringing partners together to recover imperiled species, as well as the land and water on which they depend for habitat. While full recovery and removal from federal protection is – of course – the ultimate goal, a more complete measure of ESA success includes the number of species lifted from the brink of extinction, are no longer declining, have stable populations, or have gained a solid foothold on the path

toward recovery. By these measures, the ESA is a runaway success.

In addition to species recovered and removed from federal protection during this time, three species – San Clemente Island Indian paintbrush, San Clemente Island lotus, and the wood stork – were reclassified from endangered to the less critical threatened status. Meanwhile, those engaged in the effort to restore the endangered Nihoa millerbird to Hawaii's Laysan Island reached a significant milestone when the recently established population more than doubled to reach 100 individuals. Nearly 6,000 miles away, the Puerto Rican parrot recovery team celebrated equally encouraging news that two parrots born in the wild fledged the nest for the first time in 100 years.

These various achievements demonstrate how critical and effective the ESA is in preventing extinction, improving the conservation prospects for vanishing plants and animals, and achieving recovery progress. While the ESA – time and time again – has managed to bring success when success seemed improbable, we must remember that recovering endangered and threatened species is complex and challenging work. Species' declines often occur over the course of decades or even centuries prior to their listing under the ESA. It takes time to reverse declining populations and pull species away from extinction risk, and increasing threats from climate change and habitat destruction and fragmentation make this work all the more challenging. The fact that, to date, 34 species have successfully recovered and no longer require federal protection in just over four decades is remarkable progress.

With this in mind, we are continuing to provide you with a compilation of our completed Five Year Status Reviews (5-year reviews) which provide the most recent assessment of species status and progress toward recovery.

The ESA has given us much to celebrate and to be proud of, but as this report illustrates there is more work to be done. As we move forward and face ever-evolving challenges we do so with the knowledge that collaboration is at the heart of all ESA success stories. Through these diverse collaborative partnerships, the ESA will continue to serve as the critical safety net for species that Congress intended when it passed the law into action just over 40 years ago.

Daniel M. Ashe, Director

Report to Congress on the Recovery of Threatened and Endangered Species

Fiscal Years 2013-2014

This biennial report provides an update on the progress toward recovery of all domestic threatened and endangered species protected under the Endangered Species Act (ESA) for which the U.S. Fish and Wildlife Service (Service) has lead responsibility. This report covers progress toward recovery during the period between October 1, 2012, and September 30, 2014. Data, summarized in the preceding table, are presented for each U.S. listed domestic species under the jurisdiction of the Service, and organized by major taxonomic groupings. At the close of this reporting period, the Service had lead responsibility for recovering 1,478 federally-listed threatened (307) and endangered (1,171) species. Data include:

- the species' inverted common name and scientific name, or just scientific name where no common name is available;
- the lead Service Region;
- the date the species was listed under the ESA;
- the date of the species' recovery plan;
- the stage of development of the recovery plan;
- the number of actions outlined in the recovery plan that have been implemented;
- the estimated costs for recovery, if available;
- the estimated time to recovery, if available;
- the species' listing classification as an endangered species or threatened species;
- the species' recovery priority number;
- the date the species' most recent

Trey Reid/Arkansas Game & Fish Commission

The Magazine Mountain shagreen snail became the first invertebrate to be recovered and removed from federal protection in 2013.

- 5-year review was completed; and
- the species' 5-year review status recommendation from the most recent review.

Species Name

Species are listed in the table by inverted common name within their respective taxonomic groups. Where a species has more than one commonly accepted common or scientific name, the alternate name is indicated in parentheses with an "equals" symbol followed by the alternate name. Most species are listed at the taxonomic level (species or subspecies). If a species is listed only within a

specific geographic boundary, its population information is provided in parentheses after the common name(s). The scientific name is also given in parentheses behind the common name. Many plants and some invertebrates don't have a common name, so only the scientific name is given.

Each species' name is hyperlinked to the corresponding species profile page in the Service's Environmental Conservation Online System (ECOS). Species profile pages provide a one-stop source for summary information on individual species. In addition, electronic copies of the species' recovery plan, the most recent

Mary Ellen Urbanski

The Service reclassified the wood stork from endangered to threatened in June 2014, reflecting a highly successful conservation and recovery effort spanning three decades.

5-year status review, and relevant Federal Register publications may be accessed from the species profile page.

Lead Region

This indicates the Service Region with lead responsibility for the species (see Map on inside back cover). For example, a number “6” indicates a species for which the Mountain-Prairie Regional Office has lead responsibility. Some species are wide ranging and may be found in more than one region, although only the lead region is indicated here. Additional information regarding a species’ range may be found on the species’ profile page in ECOS, accessible via the corresponding hyperlinked “species name” in this report.

Date Listed

This indicates the date the species was added to the Federal Lists of Threatened and Endangered Wildlife and Plants. In some instances, species listings have been revised. For revisions related to taxonomic splits, i.e., what was originally listed as a single species is now recognized as multiple species or subspecies, we maintain the original listing date with the original species and report the date of the revision for the newly listed taxa. As a rule of thumb, if the individuals receiving the protections of the ESA are unchanged by the revision, we report the original listing date and vice versa.

Active Plan Date

This indicates the date of the species’ active recovery plan. If a

species has more than one active recovery plan, all active plan dates will be shown in this column. An “N/A” in this column indicates that a species does not yet have an approved recovery plan. “Exempt” in this column indicates that this species is exempt from needing a recovery plan. Species are “Exempt” if we determine that developing a recovery plan will not promote the conservation of the species.

Plan Status

Updates on the development and implementation of recovery plans are provided in this Report. Recovery plans are an important tool in the Service’s mission to recover listed species, as they provide guidance on the direction, strategy, and benchmarks for

recovery. They also provide indicators for when it may be appropriate to evaluate the status of the species. As we have consistently demonstrated in previous Recovery Reports to Congress, the Service is continuing to make improvements in finalizing recovery plans for threatened and endangered species. The Service remains committed to its goal of having at least one recovery plan for every listed domestic species, where it promotes the conservation of the species, and continues to finalize and implement recovery plans as a tool for delisting species and reclassifying species from endangered to threatened. By the end of this reporting period 78% (1,148) of all domestic species under the jurisdiction of the Service

had recovery plans (27 of which were drafted or finalized during this reporting period). Of the species with recovery plans, 4% (only 49) had draft recovery plans that were waiting to be finalized. Although 78% is a decrease in the overall number of listed domestic species with recovery plans, compared to the 85% we reported in the 2012 biennial report, it is important to point out that during this reporting period the Service listed an additional 141 domestic species. These new listings brought the number of species in need of recovery plans from 196, as reported in 2012, to a total of 330 by the close of FY 2014. While recovery planning is underway for these newly listed species it is not

expected that recovery plans would be available so soon after listing. The status of recovery plan development is reported as indicated below:

- **F:** Final plan has been approved by the Regional Director and a Notice of Availability has been published in the Federal Register.
- **D:** Draft plan has been approved by the Regional Director and a Notice of Document Availability for Review and Comment has been published in the Federal Register.
- **RD(#):** Draft of the revised plan has been approved by the Regional Director and published in the Federal Register as available for public comment. The draft of the first revision to the final plan is recorded as RD(1), draft of the second revision to the final plan is recorded as RD(2), etc.
- **RF(#):** Final revision has been approved by the Regional Director and a Notice of Availability has been published in the Federal Register. The first revision is recorded as RF(1), the second revision is RF(2), etc.
- **Exempt:** Species that are exempted from recovery plan development. Species are “exempt” if the Service has determined that developing a recovery plan will not promote the conservation of the species. Usually, such a finding is made for species that are presumed extinct. For a few species, we have decided not to prepare a plan because we have determined that some other document fulfills the recovery planning needs (e.g., Modoc sucker).
- **N/A:** The species does not yet have an approved recovery plan.

The Service proposed removing the Delmarva Peninsula fox squirrel from federal protection in 2014, after conservation measures by public and private partners helped recover the species across much of its historic range.

Guy Willey

Number of Recovery Actions Implemented

The “number of recovery actions implemented” represents the cumulative number of recovery actions identified in

the implementation schedules of the recovery documents (in the Recovery Plans database) that qualify as implemented as of September 30, 2014. Recovery actions are defined as actions relevant to eliminating or reducing the threats identified in listing rules, recovery plans, and through subsequent 5-year reviews that are identified as such in the Recovery Plans database. A recovery action in the Recovery Plans database is counted as “implemented” if it has an action status of ongoing current, ongoing not current, partially complete, or complete. An “N/A” in this column indicates that the species does not yet have an approved recovery plan. “Exempt” in this column indicates that the species is exempt from needing a recovery plan.

Estimated Costs for Recovery

This column indicates the estimated costs of recovering the species as reported in their active recovery plans. The cost to recover species is spread out amongst the numerous Federal, state, and local

governments, Tribes, and nonprofit organizations involved in species recovery. These rough estimates are determined by the Service and its partners based on the best information available at the time of recovery plan development.

In many cases, this estimate is a minimum estimate because many plans include recovery actions for which the costs are yet to be determined. In addition, it may have been feasible to estimate the cost of implementation for only the initial fiscal years of plan implementation. In any case in which an estimate to delisting was determined (including partial estimates) we have included the values in this report.

Multi-species plans often only report an estimated cost for recovery for all species in the plan, thus a single action might benefit multiple species simultaneously; however, this is not the case in every multi-species plan. Therefore, the total cost provided in the multi-species plan has been associated with every species from the plan. In the 2014 Report, the use of a double

asterisk (**) beside an estimated cost for recovery designates species for which the total estimated cost from a multi-species plan is provided.

Cost estimates are not adjusted for inflation, but are relevant to the year the plan was completed. For species with more than one active recovery plan, all estimated costs to recovery are displayed in order with the corresponding recovery plans. Data are reported only for those recovery plans which provide an estimated cost for delisting (including partial estimates). An “UNK” in this column indicates that the recovery plan only provides a cost estimated for improving the species status from endangered to threatened or that no cost estimate is reported. An “N/A” in this column indicates that the species does not yet have an approved recovery plan. “Exempt” in this column indicates that the species is exempt from needing a recovery plan. The Service is committed to pursuing the recovery of listed species in a cost-effective way through its partnerships.

U.S. Navy

The Service announced that the island night lizard – found on three of the Channel Islands off the southern California coast – had recovered and no longer required federal protection in March 2014.

Rick Swart/Oregon Department of Fish and Wildlife

Culminating a 20-year partnership with many public and private partners, the Service proposed the removal of the Oregon chub from federal protection in February 2014. The chub would become the first fish to reach recovery.

It is important to note that the requirement for recovery plans to include estimates of the time and cost to carry out site-specific management actions necessary to achieve recovery did not exist until 1988, when Congress amended the ESA. Thus, recovery plans developed prior to this date do not include such estimates. Furthermore, the 1988 amendments to the ESA require that we estimate the cost to recovery to the maximum extent practicable. Where it is not possible to develop an estimate, such as when all actions needed for recovery are not known, a plan does not include an estimate and explains why one cannot be developed.

Estimated Time to Recovery

This reports the estimated number of years (from the date of the active plan) the recovery plan forecasts

it will take the species to recover in order to begin delisting. All time estimates are based on the assumption that adequate resources are available to implement all recovery actions identified as necessary for the recovery of the species in a timely fashion. Data are reported only for those recovery plans which provide an estimate of time to delisting. An “UNK” in this column indicates that the recovery plan only reports the time estimated to reclassification, not delisting, or that the time to delisting is expected to be determined at some later date. An “N/A” in this column indicates that the species does not yet have an approved recovery plan. “Exempt” in this column indicates that the species is exempt from needing a recovery plan. For species with multiple active recovery plans, the longest estimated time to recovery

is shown.

As stated above, the requirement for recovery plans to include estimates of the time and cost to carry out site-specific management actions necessary to achieve recovery did not exist until 1988, when Congress amended the ESA. Thus, recovery plans developed prior to this date do not include such estimates. Furthermore, the 1988 amendments to the ESA require that we estimate the cost to recovery to the maximum extent practicable. Where it is not possible to develop an estimate, such as when all actions needed for recovery are not known, a plan does not include an estimate and explains why one cannot be developed.

Listing Classification

The species’ listing classification, as of September 30, 2014, is identified as a threatened species (T) or an

A June 2013 survey of endangered millerbirds on Hawai'i's Laysan Island found the bird's population more than doubled from the original total of 50 translocated birds released by partners in 2011 and 2012.

endangered species (E). At the close of this reporting period, the Service had lead responsibility for recovering 1,478 federally listed threatened species (307) and endangered species (1,171), 141 (24 threatened and 117 endangered) of which were listed during this 2-year reporting period.

Recovery Priority Number

The first step for the conservation of any species is to prevent its extinction. Thus, the species with the highest degree of threat have the highest priority for preparing and implementing recovery plans. Additionally, appropriate use of the limited resources available to implement the ESA must be considered. To

this end, each species is assigned a recovery priority from 1 to 18 according to the degree of threats, recovery potential, and taxonomic distinctness. In addition, a species' rank may be elevated by adding a "C" designation to its numerical rank to indicate that it is, or may be, in conflict with construction or other development projects, or other forms of economic activity. Species with a high priority rank (1, 1C, 2, 2C) are those with the highest risk of extinction and a high potential for recovery. Species with a low rank (16, 17, 18) are those with the lowest risk of extinction and low recovery potentials. See 48 FR 43098-43105 (Sept. 21, 1983), and Table 3 on 48 FR 51935 (Nov. 15, 1983) for additional information

on this prioritization system.

Although Recovery Priority Numbers (RPNs) are intended to serve as guidelines for prioritizing development and implementation of recovery plans, many other factors affect how we allocate limited recovery resources. Thus, while individual regions and field offices prioritize funding for listed species based on a variety of factors that likely include the species recovery priority rankings, degree of threat and potential for success, many other factors affect how we allocate our limited recovery funding. These other factors include the number of species benefitting from an action, partnership opportunities, leveraging of funding with other partners, and whether the action will promote recovery or improve species status over a large geographic area. In addition, some recovery funding is necessarily expended to maintain a species status or move a species closer to recovery and delisting. As a species moves closer towards achieving recovery, the degree of threats to the species decreases, and is reflected in a lower RPN. However, without continued funding for ongoing or remaining recovery actions, it is often impossible to maintain a species' improved status or to delist the species. Therefore, some funding decisions are made based on the need to maintain a species' improved status, on the ability to move a species closer to recovery, or to move a species to the point that it is fully recovered and ready for delisting.

While the Service's RPN guidelines are intended to be used as a guide for prioritizing recovery planning and implementation rather than being an inflexible framework, we have undertaken several steps to ensure that RPNs are regularly reviewed and updated. These practices help RPNs keep pace with the on-the-ground conditions for federally listed species, and increase their relevance in decision-making. We include review of RPNs

as part of our periodic species 5-year status reviews required by section 4(c)(2) of the ESA. We also update RPNs as needed in our Threatened and Endangered Species System so that the RPN displayed in the Service's databases won't lag behind the actual species' condition. This allows us to better communicate our recovery progress and priorities to our partners and stakeholders.

Date Five-Year Review Completed

The completion date is the date the most recent 5-year review was signed by the Service's Regional Director or appropriate delegated authority. An "N/A" in this column indicates that a 5-year review recommendation is not yet available.

Five-Year Review Status Recommendation

Five-year review status recommendations are included in this report. A 5-year review is a periodic review of the status of species listed under the ESA, which

Marla Trollan/USFWS

Thirty endangered black-footed ferrets were released in October 2013 onto cattle rancher Gary Walker's land in Colorado, bolstering the state's wild population.

is conducted at least once every 5 years. The purpose of a 5-year review is to ensure that listed species have the appropriate level of protection under the ESA. The reviews assess each threatened species and endangered species to determine whether its status

has changed since the time of its listing or its last status review and whether it should be classified differently or delisted. Our 5-year review process uses the same ESA standards that are applied in the original listing process. We publish notices in the Federal Register announcing the species we are reviewing, allowing for public engagement in the process.

The outcome of a 5-year review does not change the status of a species. However, if the Service's 5-year review recommends that a change in classification is warranted, we may propose to reclassify or delist a species through a separate rulemaking process that includes public review and comment, as defined in the ESA. No change in status of the species may occur until the completion of the rulemaking process. We engage in rulemaking based on the results of 5-year reviews as our priorities dictate and our resources allow.

All status reviews that are conducted on a listed species may fulfill the requirements of a 5-year review. For example, if the Service is petitioned to reclassify a species, the status review that would be conducted for the 12-month finding

In July 2014, biologists found 400 endangered winged maple leaf mussels at an abandoned research site in the St. Croix River, following successful reintroduction efforts completed in 2005 and 2006.

Gary Wege/USFWS

Service biologist Joseph Brandt and Beth Pratt of the National Wildlife Federation release condor #628 in June 2014, following treatment for lead contamination.

may qualify as a 5-year review. Also, an internally-driven status review that is conducted on a listed species because the Service is considering splitting it into two or more distinct population segments (DPSs), combining DPSs, or for other reasons, may also qualify as a 5-year review. However, status reviews may only fulfill the requirement of a 5-year review if: (1) the review addresses the status of the species described on the List; (2) a Federal Register notice announces that the species is under active review; and (3) a conclusion is made regarding the appropriate classification of the species. Further, it is important to note that a proposed reclassification of a species may occur without a 5-year review. The Secretary of the Interior may review the status of any species at any time (50 CFR 424.21). Five-year status reviews are posted to the individual species profile pages in ECOS. Profile pages can be easily accessed by clicking on the hyperlinked species

name in this report or by going to <http://ecos.fws.gov/ecp/> and searching for the species by name. The 5-year review status recommendation of each species is

identified in this Report as one of the following outcomes:

- **No change to listed status:** Species for which no change in classification is recommended. Because species' declines often occur over the course of decades or centuries prior to their listing, achieving recovery often requires substantial time and resources. It may take many years and generations of a species before the species has recovered enough to be delisted or reclassified to a threatened species, as the Service must often immediately focus on stabilizing critically depleted populations when a species is first listed. The Service may recommend that a species' listing status remain unchanged, even though the species has made great progress towards recovery since its listing. Thus, a 5-year review status recommendation of "no change" does not reflect a species' decline or lack of progress towards recovery. It simply means that during the status review, biologists found that the threats neither increased enough to warrant a reclassification to an

For the first time in 100 years, two endangered Puerto Rican parrots born in the wild fledged the nest successfully in 2014.

A male jaguar photographed by automatic wildlife cameras in Santa Rita Mountains in October 2013, as part of an ongoing jaguar survey conducted by the University of Arizona.

endangered species (for those species listed as threatened), nor decreased enough to warrant reclassification to a threatened species (for those species listed as endangered) or delisting.

- **Reclassify to T:** The species' status has substantially improved such that it should be reclassified from an endangered species to a threatened species, thus demonstrating the species' responsiveness to the recovery actions implemented by the Service and its partners.
- **Delist:** The best available scientific and commercial information indicate that the species is neither an endangered species nor a threatened species for the following reasons: (1) the species is extinct; (2) the species has recovered and is no longer an endangered species or threatened species; and/or (3) the original scientific data used at the time the species was classified were in error.
- **Reclassify to E:** Species for which the best available information indicates a decline in the species' status since its

listing or previous 5-year review such that it is now in danger of extinction throughout all or a significant portion of its range.

- **Revision:** This recommendation is used only in the Recovery Report. It reflects a 5-year status review recommendation to revise the listed entity. For example, a 5-year review may recommend a change in how a species is listed because of a recent taxonomic revision.
- **In progress:** For species with this status, a 5-year status review was ongoing as of September 30, 2014.
- **Not yet initiated:** For species with this status, a 5-year status review has not yet been started.
- **Species Listed < 5 years:** For species with this status, a 5-year status review is not yet due.

Five-Year Review Status Recommendations Data Analysis:

The Service continued to make significant progress towards completing 5-year reviews during Fiscal Years 2013 and 2014. As of September 30, 2014, 5-year reviews have been completed for

87% (1,099) of the domestic species listed for 5 or more years and under the jurisdiction of the Service; 20% (215) of which were completed during Fiscal Years 2013-2014. This represents a 7% increase from where we stood at the end of the previous reporting period.

In addition to completed reviews, by the end of this reporting period 5-year reviews have been initiated for 28% (358) of the domestic species (158 for the first time and 200 representing a subsequent cycle of 5-year review for the species). Of the species listed for five or more years, less than 1% (8) are being reported as not having 5-year status reviews initiated by the end of the reporting period. Thus, as of September 30, 2014, 5-year status reviews have been completed or initiated for nearly 100% of all listed domestic species under the jurisdiction of the Service.

Of the 1,099 5-year reviews completed, 1% (7) recommend a revision to the listed entity, 1% (13) recommend reclassifying from threatened to endangered, 92% (1,016) recommend no change in status for the species, 4% (39) recommend reclassifying from endangered to threatened, and 2% (24) recommend delisting (2 due to error, 11 due to extinction, and 11 due to recovery).
