Monthly Energy Review

June 1989

Energy Information Administration

Rirst Half 1989

Monthly Energy Review

The Monthly Energy Review presents current data on production, consumption, stocks, imports, exports, and prices of the principal energy commodities in the United States. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear-powered facilities.

Publication of this report is in keeping with responsibilities given the Energy Information Administration in Public Law 95-91 (Section 205(a)(2)), which states:

The Administrator shall be responsible for carrying out a central, comprehensive, and unified energy data and information program which will collect, evaluate, assemble, analyze and disseminate data and information . . .

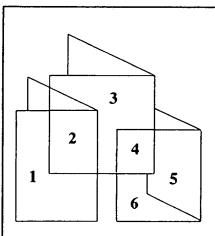

The Monthly Energy Review is intended to provide timely energy information to Members of Congress, to Federal and State agencies, and to the general public.

Subscriptions

This publication is available from the Superintendent of Documents, U.S. Government Printing Office (GPO). Prices and ordering information for this and other Energy Information Administration (EIA) publications may be obtained from the GPO or from EIA's National Energy Information Center (NEIC). Addresses and telephone and telecommunications device for the deaf (TDD) numbers appear below.

Higher Prices Yield Improved Energy Industry Financial Results in the First Half of 1989

By T. Crawford Honeycutt ¹

Abstract. This article traces key financial trends in the U.S. energy industry as a whole and in several of the industry's major segments for the first half of 1989. Financial data for companies are included for two broad groups-fossil fuel producers and rate-regulated utilities. Data were taken from published information provided by publicly traded companies. Sources include the Wall Street Journal, corporate reports, and energy trade publications.

Introduction

Corporate profits are an important measure of the health of the Nation's energy industries. Profitable industries attract new entrants and increased investment, while unprofitable industries decline, as firms exit. Low profits may also lead to changes in the way firms do business, stimulating restructuring and cost-cutting.

The profit measure shown in this article is net income from continuing operations, excluding extraordinary gains or losses that a company may report from the sale or valuation change of a major asset or for reserve provisions relative to possible future adverse legal judgments. In this article, first-half 1989 net income of publicly traded companies in the energy industry is examined and compared with first-half 1988 net in-

come. That intertemporal comparison reflects actual operating results rather than accounting changes.

Several major petroleum companies disclose income disaggregated by lines of business and geographic area. Where possible, disaggregated information is used to shed light on industry financial trends. Although the disaggregated income concept varies by company and is not strictly comparable to corporate net income, relative movements in income by lines of business and geographic area are useful indicators of short-term changes in profitability.

Financial and Energy Overview

Domestic crude oil prices rose 13 percent in the first half of 1989, and most other energy prices followed suit.² Domestic production of most energy sources increased, but crude oil production decreased by 5 percent. Declining crude oil production together with greater refined product demand led to a 10-percent increase in crude oil net imports in the first 6 months of 1989 compared with the first half of 1988.

With both prices and production up, most segments of the energy industry registered greater net income in the first half of 1989 than in the first half of 1988.³ For the 226 energy companies included in this article, net income was \$20.9 billion in the first half of 1989, 6 percent above year-ago levels (Table FE1).

Net income of industrial companies outside the energy industry rose at a lesser 2-percent rate between the second quarter of 1988 and the second quarter of 1989.⁴ This difference in the growth of net income suggests that the gap in profitability between the energy industry and other industrial companies narrowed slightly

¹The author is an economist in the Office of Energy Markets and End Use of the Energy Information Administration.

²The energy data used in this article are taken from the Energy Information Administration, *Monthly Energy Review June* 1989, DOE/EIA-0035(89/06) (Washington, DC, September 1989).

³The financial data in this article are from Energy Information Administration, "U.S. Energy Industry Financial Developments," 1989 Second Quarter (Washington, DC, September 1989).

⁴Second-quarter data for the nonenergy group are from the Wall Street Journal, August 7, 1989. (First-half data are not available.) The Wall Street Journal group is adjusted to exclude energy and non-manufacturing companies. Many of the companies in the group are also included in the S&P 400. The S&P 400 contains aggregate data for 400 large U.S. industrial companies compiled by Standard & Poor's Compustat Services, Inc.

Table FE1. Energy Industry Net Income, First Half, 1988 and 1989 (Million Dollars)

Energy Segment	1989	1988	Percent Change
ossil Fuel Industries			
Major Petroleum Companies (19)	11,079.6	10,252.3	8.1
Independent Oil and Gas Producers (41)	294.1	90.4	225.5
Independent Refiner/Marketers (8)	242.7	227.0	6.9
Oil Field Companies (24)	248.8	184.4	34.9
Petroleum Subtotal (92)	11,865.3	10,754.1	10.3
Coal Producers (7)	81.4	97.4	-16.4
Fossil Fuel Subtotal (99)	11,946.6	10,851.5	10.1
ate Regulated Energy Industries			
Natural Gas Transmission (17)	993.7	867.5	14.5
Natural Gas Distribution (26)	650.2	641.1	1.4
Electric Utilities (84)	7,344.3	7,373.3	4
Rate-Regulated Subtotal (127)	8,988.2	8,881.9	1.2
Total Energy Industries (226)	20,934.9	19,733.3	6.1

Notes: The number of companies is reported in parentheses. Components may not sum to totals due to independent rounding. Sources: Energy Information Administration compilation of data from quarterly reports of energy companies to stockholders and "Earnings Digest," Wall Street Journal, various issues, July and August 1989.

(Figure FE1), despite the usual drop in energy companies' profitability between the first and second quarters.

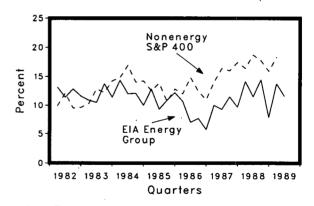

Independent oil and gas producers showed the greatest relative improvement in earnings, as oil prices rose faster than oil production declined. The independents' net income rose 226 percent in the first half of 1989, to \$294 million. As a group, oil field companies also registered a substantial increase in net income. However, positive earnings were concentrated among oil field equipment suppliers and service companies. Drillers continued to report losses, albeit at a reduced level from first-half 1988. Coal production was the only energy segment that reported a noticeably reduced level of net income in the first half of 1989, a 16-percent decline. Work stoppages and softer prices appear to have been contributing factors.

The net income of independent refiner/marketers increased modestly, by 7 percent. However, the results among that group of companies were mixed. Five of the group reported higher net income and the other three reported decreased net income. A later section of this article shows that profitability of that energy segment only recently returned to levels comparable with the profitability of U.S. industry overall.

Among the rate-regulated energy segments, the natural gas transmission companies reported the largest growth

in net income. Those companies continued to adjust to the altered regulatory environment caused by a series of Federal Energy Regulatory Commission (FERC) orders in recent years.⁵

Figure FE1. EIA Energy Group and Nonenergy S&P 400, Return on Equity, 1982-1989

Note: The data for the second quarter of 1989 are estimated.
Sources: Companies' reports to stockholders; "Earnings Digest," Wall Street Journal (various issues, July and August 1989); and Standard and Poor's Compustat Services, Inc., COMPUSTAT II Quarterly Data Item 8 (Income Before Extraordinary Items) and Data Item 60 (Total Equity), August 1989.

⁵These and other developments are reviewed in Energy Information Administration, *Growth in Unbundled Natural Gas Transportation Services: 1982-1987*, DOE/EIA-0525 (Washington, DC, May 1989).

The improved financial performance of the natural gas transmission companies reflects the recovery from the plunge in their net income that occurred shortly after the implementation of the FERC orders.

Major Petroleum Companies Post Modest Improvement

The major petroleum companies' net income in the first half of 1989 rose by 8 percent, to \$11.1 billion.⁶ Major petroleum companies, as a group, have diversified energy operations. They own substantial oil production and refining interests overseas, they produce about 25 percent of U.S. coal, and many major oil companies also have large chemical operations.

Reductions in income from foreign petroleum operations largely offset income gains from chemical operations and domestic energy lines of business (Table FE2). Income from foreign oil and gas production declined 25 percent in the first half of 1989 compared with the first half of 1988. North Sea oil and gas producers reported that reduced output and operating difficulties reduced North Sea production and adversely affected their earnings. Other multinational companies noted that reduced foreign natural gas revenue was a negative factor in their financial performance in the second quarter of 1989.

By contrast, domestic oil and gas production operations of major petroleum companies yielded a 36-percent increase in income. The main source of improved income was higher oil prices which more than offset continued declines in U.S. oil production. Reduced exploration expenses also contributed to favorable financial performance.

Income from the major petroleum companies' domestic refining/marketing operations declined 15 percent in the first half of 1989. Oil prices rose more rapidly than refined products prices during the first quarter thereby squeezing margins. By the second quarter, product prices caught up with crude oil prices and refining margins improved.

The major petroleum companies' chemical operations have been important sources of income growth since the fourth quarter of 1985 (Q485). The average quarterly increase in income from chemical operations over the period Q485 through 1988 was 57 percent.⁷ In the first half of 1989, the pace of earnings growth from these operations fell to 20 percent. Some of the com-

panies noted that reduced demand and lower margins for some products were sources of reduced income growth.

Capital expenditures of the major petroleum companies in 1989 declined 2 percent for the first 6 months compared with 1988. Expenditures for domestic oil and gas production fell 28 percent, but foreign oil and gas expenditures rose 16 percent. Refining and marketing activities continued to be growing investment targets, with expenditures for those operations rising 23 percent. The steepest reduction in expenditures, 31 percent, was for businesses outside of petroleum.

Oil and Gas Producers' Income Surged Higher

Crude oil prices rose substantially during the first half of 1989. Early in the year, major Persian Gulf producers reduced output in an apparent return to quota discipline. Oil markets were beginning to discount that factor when the Exxon Valdez ran aground. By the time it became apparent that relatively little output would be lost in Alaska, U.K. North Sea production was further disrupted by an accident. Finally, the Organization of Petroleum Exporting Countries (OPEC) meeting at the beginning of June created expectations of future quota discipline that kept prices high through the end of the second quarter.

Increasing refined product demand also contributed to higher oil prices. U.S. petroleum consumption rose 1.1 percent in the first half of 1989,8 while Japanese consumption increased 4.2 percent in the first 3 months of the year, and European consumption grew by 0.9 percent in the same period (the most recent period for which data are available).9

Net income of U.S. oil and gas producers continued to recover from the low levels of 1988. The 13-percent rise in U.S. crude oil prices more than offset the adverse effects of the 5-percent decline in U.S. crude oil production between the first half of 1988 and 1989. For the 41 independent oil and gas producers included in this article, net income increased more than threefold during the first half of 1989, from \$90.4 million to \$294.1 million over the period (Table FE1). For the eight major petroleum companies that separately reported their U.S. oil and gas operations, income from those operations rose 36 percent in the first half of 1989 compared with the level in 1988 (Table FE2).

⁶The 19 companies considered "major" for this article are Amerada Hess, American Petrofina, Amoco, Atlantic Richfield, Chevron, Coastal, Du Pont, Exxon, Kerr McGee, Mobil, Murphy, Occidental, Phillips, Shell, Sun, Texaco, Union Pacific, Unocal, and USX.

⁷Calculated from data presented in Energy Information Administration, "U.S. Energy Industry Financial Developments," Second Quarter 1989 (Washington, DC, September 1989) and previous editions.

Refining/Marketing Results Were Mixed

In recent years, U.S. refined product price movements have lagged changes in crude oil costs. A consequence of that pattern has been that during periods of rising crude oil prices refiners' margins are initially squeezed and then begin to recover. That pattern was repeated in the first half of 1989. The gross refining margin in the first quarter dipped sharply and then recovered to high levels in the second quarter (Figure FE2). Gasoline prices led the recovery, rising from March through June. The rise in gasoline prices was largely a lagged response to the upswing in crude oil prices which began in late 1988.10 Increased refined product demand and higher refinery capacity utilization rates tended to reinforce higher margins. However, the increase in gross refiner margin overstates profitability increases, partly due to the increased cost required to produce a higher proportion of premium gasoline and to meet more stringent environmental standards.

Figure FE2. Gross Refining Margin, 1982-1989

Note: Data for the second quarter of 1989 are Energy Information Administration estimates. Source: Energy Information Administration, *Petroleum Marketing Monthly*, May 1989, DOE/ElA-0380(89/05) (Washington, DC, August 1989), Tables 1, 4, and 5.

¹⁰Energy Information Administration, Monthly Energy Review June 1989, DOE/EIA-0035(89/06) (Washington, DC, September 1989), Table o A

On balance, independent refiner/marketers' net income increased at a 7-percent rate for the first 6 months, reflecting the drop in margins in the first quarter of 1989 and higher operating costs. Major petroleum companies registered a decrease in their U.S. refining/marketing operations. For the 10 majors that separately reported those operations, U.S. refining/marketing income in the second quarter of 1989 was up 7 percent compared with the second quarter of 1988 (Table FE2). The decline was primarily the result of prolonged refinery maintenance for some companies and the absence of Star Enterprise from Texaco's 1989 results.

A Perspective on U.S. Refining/Marketing Profitability

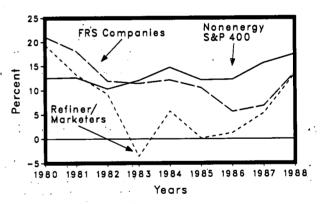

Gross refining margin and refined product demand are the main sources of short-term changes in U.S. refining/marketing profitability. Short-term movements in refining/marketing profitability (as measured by return on equity)¹² generally reflect movements in the gross refining margin. The quarterly return on equity for independent U.S. refiner/marketers and the gross refining margin have evidenced a somewhat positive relationship (simple correlation coefficient of 0.6).¹³ Despite the positive relationship between margins and short-term refining/marketing profitability, additional factors have influenced the longer term swings in profitability.

Since the decontrol of oil prices in early 1981, the profitability of U.S. refining/marketing was below that of U.S. industry in general, as represented in Figure FE3 by the nonenergy Standard and Poor 400 companies. Throughout most of the 1980's, U.S. refiners and marketers have had to adjust to significant changes in product market demand and in the composition of crude oil supply. From 1981 through 1986, U.S. crude oil distillation capacity fell by 3 million barrels per day and the number of refineries declined from 324 to 218. Over the same period, U.S. refiners' capacity to produce higher octane, unleaded gasoline rose from 61 percent of crude oil distillation capacity to 70 percent and capacity directed toward processing heavier, higher sulfur crude oils rose from 24 percent to 34

percent. 16 During this period of substantial adjustment of capacity, profitability of the independents' and the majors' U.S. refining/marketing operations was generally low.

The profitability of the major petroleum companies, as represented by the 22 major energy companies that report to EIA's Financial Reporting System, also was well below the profitability of U.S. industry for most of the decade. However the majors' profitability generally exceeded the profitability of the more specialized U.S. refiners because the majors are vertically integrated, have substantial foreign operations, and are diversified into businesses outside petroleum. Those characteristics insulated them somewhat from the lesser financial returns to refining/marketing. Within the majors' operations, U.S. refining/marketing was less profitable than the balance of their other businesses. The annual return on investment¹⁷ for their U.S. refining/marketing operations matched or exceeded their overall profitability only in 1986 and 1988 (Figure FE4).

Marketing, 1980-1988

Source: Energy Information Administration, Form EIA-28, "Financial Reporting System."

In summary, the profitability of U.S. refining and marketing only recently appeared to be approaching parity with the rest of U.S. industry. The improvement was achieved after a wrenching adjustment to longer term changes in market conditions and in the context of recent high refining margins.

Despite Lower Drilling Activity, Oil Field Profitability Improved

Despite the large increase in crude oil prices, domestic drilling activity failed to recover. Crude oil prices averaged about \$2 per barrel higher in 1989 than in 1988. The weekly rig count, however, fell to an average of 781 for the first half of the year compared with an average of 950 rigs in the first half of 1988.18 Further, major petroleum companies continued to report sharply reduced domestic exploration and development expenditures. For example, the majors reported that domestic exploration and development expenditures were 28 percent less in the first half of 1989 than in 1988, while foreign exploration and development expenditures increased 16 percent (Table FE2). The growth in foreign exploration expenditures continued a trend by the major petroleum companies to increasingly focus exploration and development efforts in areas outside the United States.

Lower drilling rates should have been bad news for oil field companies, but, on the contrary, net income of oil field companies rose 35 percent for the first 6 months (Table FE1). Sharply reduced losses by contract drillers accounted for most of the improvement. Apparently, the surviving drillers obtained higher prices for their services, as indicated by increased revenue. Further, additional improvements were due to lower costs that resulted from earlier cost cutting, asset writedowns, and restructuring. The oil field service and equipment companies' net income was essentially unchanged from last year.

Coal Producers Reported Mixed Results

Although coal prices were down slightly during the first half of 1989, coal production increased 6 percent compared with the level in the first half of 1988. About half of the growth in coal production went to exports, and U.S. coal export volume increased 22 percent in the first half of 1989. Second-quarter coal production was only marginally affected by the United Mine Workers' strike against the Pittston Company. Pittston's reduced output was probably offset by increased production elsewhere. A series of wildcat strikes and "memorial days" did reduce coal production slightly in late June.

Coal prices paid by electric utilities during May 1989 (the most recent month for which data are available), declined 3 percent from prices paid in May 1988.²⁰ Electric utilities in the West paid higher prices for coal, while electric utilities in the rest of the United States (particularly New England) paid lower prices.

As a result of those factors, coal producers' financial results were mixed. Seven independent coal producers collectively reported a 16-percent decline in net income in the first half of 1989 compared with the level in the first half of 1988 (Table FE1). Four companies registered improved financial results, while three companies posted lower earnings.

Income from the coal operations of the major petroleum companies rose 11 percent in the first half of 1989 (Table FE2). The majors' coal income was boosted by increased profits from the foreign coal subsidiary of one major producer. Large-scale producers of Western coal appeared to be doing better, both on prices and volumes, than Appalachian producers.

¹⁹Calculated from data presented in Energy Information Administration, "U.S. Energy Industry Financial Developments," Second Quarter 1989 (Washington, DC, September 1989), Table 2.

Rate-Regulated Energy Industries

The 127 rate-regulated energy companies covered in this article reported first-half net income of \$9 billion, a 1-percent increase compared with net income in first-half 1988. The rate-regulated energy industries include natural gas transmission and distribution companies and electric utilities.

Natural Gas Companies

The net income of gas transmission and distribution companies benefited from flat to declining wellhead gas prices and increased end-user gas prices. The companies' improved results also reflected their adjustment to the evolving regulatory environment of recent years. The distribution companies' net income increased by 1 percent in the first half of 1989 compared with the same period last year (Table FE1). The transmission companies' net income increased 15 percent.

Electric Utilities

U.S. electricity generation was 3 percent greater in the first half of 1989 than in the first half of 1988. The revenue of the 84 electric utilities covered in this article increased by an even greater 6 percent in the first half of the year.²¹ A 3-percent increase in residential electricity rates contributed to this result.²²

Electric utility earnings were mixed. Electric utilities with significant hydroelectric capacity benefited from a return to normal snowfall patterns in the Western United States. On the other hand, several nuclear power stations were shut down for maintenance and refueling during the second quarter of 1989, forcing their owners to substitute for the lost output with higher marginal cost fossil fuel-generated electricity. Overall, electric utility net income was nearly flat in the first half of the year, down only 0.4 percent from net income in the first half of 1988.

²¹Calculated from data presented in Energy Information Administration, "U.S. Energy Industry Financial Developments," Second Quarter 1989 (Washington, DC, September 1989), Table 2.

²²Energy Information Administration, Monthly Energy Review June 1989, DOE/EIA-0035(89/06) (Washington, DC, September 1989), Table 9.9.

Section 1. Energy Summary

U.S. Energy Markets in the First Half of 1989

U.S. energy consumption in the first half of 1989 reached 41 quadrillion Btu, up 1.1 percent from the level of consumption in the first half of the 1988 (Table 1.1). That rate of growth was the slowest since the first half of 1986.

Several factors combined to temper the growth in energy consumption. The U.S. economy expanded at a slower pace. Real gross national product increased 3.3 percent in the first quarter of 1989 versus 5.1 percent in the first quarter of 1988, and 3.0 percent in the sec-

ond quarter of 1989 versus 4.9 percent in the second quarter of 1988. Milder weather in the first half of the year tended to reduce energy requirements for space heating and cooling.

Rising crude oil prices also tended to moderate energy demand. The U.S. refiners' cost of crude oil averaged \$17.72 per barrel in the first half of 1989, up 13 percent from the cost in the first half of 1988. End-use prices of some petroleum products reflected that increase. For example, the average price of finished motor gasoline (excluding taxes) rose 16 percent.

Consumption of petroleum registered the most sluggish growth of the three major fossil fuels. It totaled 17

^{*}Based on daily rates prior to rounding.

Production and consumption totals exclude wood, waste, geothermal, wind, photovoltaic, and solar thermal energy except for small amounts used by electric utilities to generate electricity for distribution.

Includes crude oil, lease condensate, and natural gas plant liquids.

⁴Other is hydroelectric and nuclear electric power, and electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

Includes petroleum products.

fincludes supplemental gaseous fuels.

Other is hydroelectric and nuclear electric power; electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy; and net imports of electricity and coal coke.

hincludes crude oil, lease condensate, petroleum products, pentanes plus, unfinished oils, gasoline blending components, and imports of crude oil for the Strategic Petroleum Reserve.

Minus sign indicates exports are greater than imports.

Other is net imports of electricity and coal coke.

Note: Totals may not equal sum of components due to independent rounding.

Sources: Energy Information Administration (EIA), Monthly Energy Review Section 1 and EIA calculations.

quadrillion Btu in the first half of 1989, up less than 1 percent from the first half of 1988. Natural gas consumption rose to 10 quadrillion Btu, up 1.9 percent, and coal consumption rose to 9 quadrillion Btu, also up 1.9 percent.

At 33 quadrillion Btu, U.S. energy production in the first half of 1989 was unchanged from the first-half 1988 level. A 6-percent decline in crude oil production plus a much smaller decline (0.4 percent) in natural gas production offset gains of 6 percent in coal production and 1 percent in other energy production.

Continued increases in U.S. energy net imports were required to meet the widening gap between supply and demand. Energy net imports totaled 7 quadrillion Btu in the first half of 1989, up 5 percent from the level in the first half of 1988. Petroleum, which accounts for most of the U.S. energy trade in terms of quantity and value, registered a 9-percent increase in net imports. That increase was partially offset by a 23-percent increase in coal net exports.

Production: Mixed Results

Of the 33 quadrillion Btu of energy produced in the first half of 1989, coal accounted for 11 quadrillion Btu, while petroleum (crude oil, lease condensate, and natural gas plant liquids) and natural gas each accounted for about 9 quadrillion Btu. Coal's share of production (33 percent) exceeded petroleum's share (28 percent) for the second consecutive year.

In physical units, first-half-year production of petroleum averaged 9.4 million barrels per day, the lowest level since at least 1973 (the first year for which data are available in this publication). In the Lower 48 restates, production of crude oil and lease condensate continued to decline, falling 6 percent to 5.9 million barrels per day. Production of crude oil and lease condensate in Alaska fell to 1.9 million barrels per day, down 7 percent from production in the first half of 1988.

First-half production of natural gas declined to 8.4 trillion cubic feet. In contrast to petroleum and natural gas, coal production continued at a record pace, reaching 486 million short tons for the first half of 1989.

Although milder weather in the first half of 1989 tended to depress demand for electricity, net generation increased 3 percent compared with generation in the first half of 1988. Net electricity generation from all sources totaled 1,340 billion kilowatthours. Coal-fired net generation of electricity increased 2 percent to 751 billion kilowatthours, over half of the total.

There was some evidence that electric utilities continued to switch to petroleum: net generation of electricity

from petroleum rose 35 percent to 83 billion kilowatthours. Net generation from natural gas fell slightly (0.1 percent) to 121 billion kilowatthours.

Hydroelectric generation in the first half of the year rose to 139 billion kilowatthours, up 17 percent from the level in the first half of 1988. A big jump in second-quarter generation accounted for most of the increase.

In contrast, nuclear-based generation declined from the record level of 256 billion kilowatthours in the first half of 1988 to 239 billion kilowatthours in the first half of 1989. The 6-percent decline ended 8 consecutive years of first-half increases.

Slower Growth in Energy Consumption

U.S. energy consumption totaled 41 quadrillion Btu in the first half of 1989, up 1.1 percent from the first-half 1988 level. By comparison, first-half 1988 consumption had increased 4.6 percent from the first-half 1987 level.

Although on a percentage basis, petroleum registered the smallest increase in consumption of the three major fossil fuels, petroleum consumption still accounted for the largest share (41 percent) of U.S. total energy consumption. Natural gas consumption accounted for a 26-percent share and coal consumption accounted for a 23-percent share.

In the first half of 1989, the ratio of total energy consumption in thousand Btu to constant-dollar GNP (a measure of the energy intensity of the economy) was 19.6, 2.5 percent below the ratio in the first half of 1988. By comparison, the ratio for the year in 1973 was 27.1.

Continued Growth in Imports

Despite higher prices for crude oil, the major U.S. net energy import in terms of volume, net imports of all forms of energy combined rose 5 percent in the first half of 1989 compared with the level in the first half of 1988. The volume of net imports-nearly 7 quadrillion Btu--as well as the rate of increase continued to generate concern about dependence on foreign sources of supply.

Petroleum net imports increased 9 percent in the first half of 1989 compared with net imports in the first half of 1988, and natural gas net imports increased 4 percent. Those increases more than offset the 23-percent increase in coal net exports.

Reliance on Foreign Oil

In the first half of 1989, net imports of petroleum reached 7.0 million barrels per day, equal to 41 percent of U.S. petroleum products supplied. U.S. dependence on foreign sources of oil reached its highest level since the first half of 1979.

The Organization of Petroleum Exporting Countries (OPEC) continued to expand its U.S. markets. In the first half of 1989, OPEC supplied over half of petroleum total imports--3.9 million barrels per day, an increase of 17 percent from OPEC imports in the first half of 1988. Non-OPEC total imports rose less than 1 percent. Total imports from Mexico increased 6 percent, while total imports from Canada declined 7 percent.

The Energy Trade Deficit

Higher oil prices contributed to an increase in the first-half 1989 energy trade deficit, which rose to \$21 billion, up about \$4 billion from the first-half 1988 deficit. Energy net imports continued to account for a sizable share of the total U.S. merchandise trade deficit-42 cents out of every dollar.

Increases in Most Energy Prices

The increase in crude oil prices contributed to higher prices for finished motor gasoline and residual fuel oil, and prices of natural gas and electricity registered modest increases. The price of distillate fuel oil declined.

Selected Petroleum Products

Higher crude oil prices, the Environmental Protection Agency's imposition of Reid vapor pressure regulations, and normal seasonal increases all combined to drive up motor gasoline prices in the first half of the year. The price (excluding taxes) of finished motor gasoline to end users averaged \$0.76 per gallon in the first half of 1989, the highest first-half price since 1985.

The average price (excluding taxes) of residual fuel to end users rose 12 percent to \$0.38 per gallon. Despite the increase, the residual fuel oil price remained well below prices in the early 1980's.

In contrast, the price (excluding taxes) of distillate fuel oil to end users declined, falling 2 percent to \$0.56 per gallon in the first half of 1989. That price was the lowest recorded during the first half of the year since 1979.

Natural Gas

The city-gate price of natural gas averaged \$2.96 per thousand cubic feet in the first half of 1989, up 5 percent from the average price in the first half of 1988. The price increase was passed through to the three end-use sectors differently. The price to the industrial sector, which consumed the most natural gas and paid the lowest rates, rose only 0.3 percent. The price to both the residential and commercial sectors rose 3 percent.

Electricity

At 6.3 cents per kilowatthour, the average retail price of electricity to all consumers in the first half of 1989 was up 2 percent from the first-half 1988 level. On a dollar-per-Btu basis, electricity remained one of the most expensive sources of energy.

The Outlook for 1989

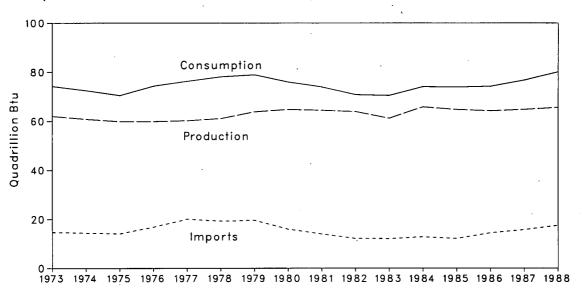

The price of imported crude oil is projected to average \$17.40 per barrel in 1989. U.S. crude oil production is projected to decline to 7.8 million barrels per day in 1989, down 0.4 million barrels per day from the 1988 level, while petroleum demand is expected to rise by 0.1 million barrels per day to 17.4 million barrels per day. Increases in petroleum net imports are projected to keep pace with the production shortfall. Petroleum net imports are expected to reach 7.2 million barrels per day, the equivalent of 41 percent of projected petroleum consumption.

A Note on Sources and Calculations

The projections cited in "The Outlook for 1989" are base case projections from the Energy Information Administration (EIA), Short-Term Energy Outlook July 1989, DOE/EIA-0202(89/3Q) (Washington, DC, July 1989), Table 1. Historical energy data are from tables elsewhere in this issue of the Monthly Energy Review and from EIA calculations based on the data in the tables. Calculations of percent changes are based on unrounded daily rates.

^{*}For definitions, see Notes at end of section.

Excludes wood, waste, geothermal, wind, photovoltaic, and solar thermal energy except for small amounts used by electric utilities to generate

electricity for distribution.

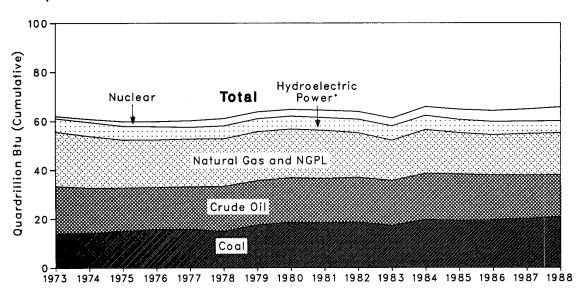

The sum of domestic energy production and net imports of energy does not equal domestic energy consumption. The difference is attributed to stock changes; losses and gains in conversion, transportation, and distribution; the addition of blending compounds; shipments of anthracite to U.S. Armed Forces in Europe; and adjustments to account for discrepancies between reporting systems.

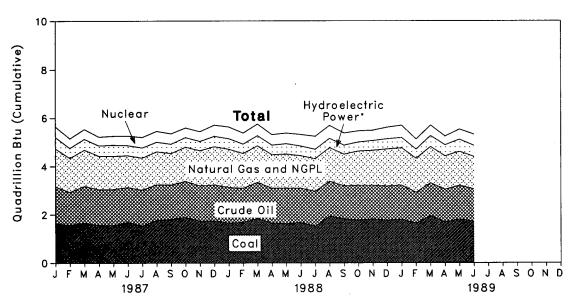

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent

^{*}Net imports equals imports minus exports. Minus sign indicates exports are greater than imports.

bincludes crude oil, lease condensate, and imports of crude oil for the Strategic Petroleum Reserve.

eIncludes petroleum products, unfinished oils, pentanes plus, and gasoline blending components.

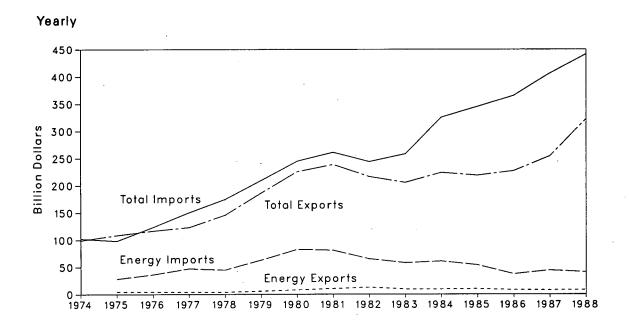

dAssumed to be hydroelectricity and estimated at the average input heat rate for fossil fuel steam-electric power plant generation, which has ranged from 10.3 to 10.5 thousand Btu per kilowatthour since 1973. Actual rates applied in converting kilowatthour to Btu are listed by year in

the Appendix of this publication: E=Estimate.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

^{*}Beginning in October 1977, Strategic Petroleum Reserves are included.

^bNet imports equals imports minus exports. Imports from members of the Organization of Petroleum Exporting Countries (OPEC) exclude indirect imports, which are petroleum products imported primarily from Caribbean and West European areas and refined from crude oil produced by OPEC.

The Arab members of OPEC are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. Net imports from the Neutral Zone between Kuwait and Saudi Arabia are included in net imports from "Arab OPEC."

OPEC consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Annual averages may not equal average of quarters due to independent rounding.

Notes and Sources for the Energy Summary Section

Notes

- 1. Energy Production: Production of energy includes production of coal, crude oil and lease condensate, natural gas plant liquids, natural gas (dry), electric utility and industrial production of hydroelectric power, and electricity generated from nuclear power. Production also includes electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available. The volumetric data are converted to approximate heat contents (Btu values) of these energy sources using the conversion factors provided in the Appendix.
- 2. Energy Consumption: Consumption of energy includes consumption of coal, natural gas (including supplemental gaseous fuels), petroleum products supplied, electric utility and industrial production of hydroelectric power, net imports of electricity (assumed to be hydroelectricity), net imports of coal coke, and electricity generated from nuclear power. Consumption also includes electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available. Approximate heat contents (Btu values) are derived using the conversion factors provided in the Appendix.
- 3. Energy Imports: Energy imports include imports of coal, crude oil (including crude oil imported for the Strategic Petroleum Reserve), petroleum products, natural gas, electricity (assumed to be hydroelectricity), and coal coke. Approximate heat contents (Btu values) are derived using the conversion factors provided in the Appendix. For further information on electricity, see "Note for imports and exports of electricity" under Note 7 of the Notes and Sources for the Consumption Section.
- 4. Energy Exports: Energy exports include coal, crude oil, petroleum products, natural gas, electricity produced from hydroelectric power, and coal coke. Approximate heat contents (Btu values) are derived using the conversion factors provided in the Appendix. For more information on electricity, see "Note for imports and exports of electricity" under Note 7 of the Notes and Sources for the Consumption Section.
- 5. Merchandise Trade Value: Import data presented are based on the customs value. That value does not include insurance and freight and is consequently lower than the cost, insurance, and freight (CIF) value, which is also reported by the Bureau of the Census. All export

data, and import data prior to 1981, are on a free alongside ship (f.a.s.) basis.

"Trade Balance" is exports minus imports; a positive balance indicates a surplus trade value and a negative balance indicates a deficit trade value. The "Energy" columns include mineral fuels, lubricants, and related material. "All Other" and "Total" columns include foreign exports (i.e., reexports) and nonmonetary gold and Department of Defense Grant-aid shipments. The "All Other" columns are calculated by subtracting "Energy" from "Total."

"Imports" represent general imports (i.e., entries for immediate consumption, entries into customs bonded warehouses, and entries for the Strategic Petroleum Reserve). The statistics reflect both government and nongovernment imports of merchandise from foreign countries into the U.S. customs territory (which includes the 50 United States, the District of Columbia, and Puerto Rico) and the Virgin Islands. The statistics exclude imports into Guam, American Samoa, and other U.S. possessions, as well as shipments between the United States and Puerto Rico and the Virgin Islands, between the United States and other U.S. possessions, and between any two of those outlying areas.

6. The Consumer Price Index: The values for the Consumer Price Index, All Urban Consumers, All Items, 1982-84=100, are as follows:

1973	44.4	1987:	1st Quarter	111.6
1974	49.3		2nd Quarter	113.1
1975	53.8		3rd Quarter	114.4
1976	56.9		4th Quarter	115.4
1977	60.6		Year	113.6
1978	65.2	1988:	1st Quarter	116.1
1979	72.6		2nd Quarter	117.5
1980	82.4		3rd Quarter	119.1
1981	90.9		4th Quarter	120.3
1982	96.5		Year	118.3
1983	99.6	1989	1st Quarter	121.7
1984	103.9		2nd Quarter	123.6
1985	107.6			
1986	109.6			

7. Degree-Days: Degree-days are relative measurements of outdoor air temperature. Cooling degree-days are defined as deviations of the mean daily temperature at a sampling station above a base temperature equal to 65 °F by convention. Heating degree-days are deviations of the mean daily temperature below 65 °F. For example, if a weather station recorded a mean daily temperature of 78 °F, cooling degree-days for that station would be 13 (and heating degree-days, 0). A weather station recording a mean daily temperature of 40 °F would report 25 heating degree-days (and 0 cooling degree-days).

There are several degree-day data bases maintained by the National Oceanic and Atmospheric Administra-

tion. The information published in the Monthly Energy Review (MER) is developed by the National Weather Service Climate Analysis Center, Camp Springs, MD. The data are available weekly with monthly summaries and are based on mean daily temperatures recorded at about 200 major weather stations around the country. The temperature information recorded at those weather stations is used to calculate statewide degreeday averages based on population. The State figures are then aggregated into Census Divisions and into the national average. The population weights currently used represent resident State population data estimated for 1980 by the U.S. Department of Commerce, Bureau of the Census. The data shown in the MER are available sooner than the Historical Climatology Series 5-1 and 5-2 developed by the National Climatic Center, Asheville, NC, which compiles data from some 8,000 weather stations.

Passenger Car Efficiency: Indices are prepared from statistics published by the U.S. Department of Transportation, Federal Highway Administration, Federal Highway Statistics Division. 1967-1985: "Highway Statistics Summary to 1985," Table VM-201A; 1986 and 1987: Highway Statistics, Table VM-1.

Section 2. Consumption

U.S. total energy consumption in June 1989 was 6.4 quadrillion Btu. Petroleum products accounted for 44 percent²³ of the energy consumed in June 1989, while coal accounted for 24 percent and natural gas accounted for 20 percent.

Residential and commercial sector consumption was 2.1 quadrillion Btu in June 1989, up 1 percent from the June 1988 level. The sector accounted for 32 percent of June 1989 total consumption, down 1 percentage point from its 33-percent share in June 1988.

Industrial sector consumption was 2.4 quadrillion Btu in June 1989, up 2 percent from the June 1988 level. The industrial sector accounted for 38 percent of June 1989 total consumption, about the same share as in June 1988.

Transportation sector consumption of energy was 1.9 quadrillion Btu in June 1989, up 1 percent from the June 1988 level. The sector consumed 30 percent of June 1989 total consumption, about the same share as in June 1988.

Electric utility consumption of energy totaled 2.5 quadrillion Btu in June 1989, up 1 percent from the June 1988 level. Coal contributed 53 percent of the energy consumed by electric utilities in June 1989, while nuclear electric power contributed 19 percent; hydroelectric power and natural gas 11 percent each; petroleum 5 percent; and wood, waste, geothermal, wind, photovoltaic, and solar thermal energy, about 1 percent.

Table 2.1 Energy Consumption Summary for June 1989 (Quadrillion (10¹⁵) Btu)

otal Energy Consumptiond	2.080	2.429	1.891		6.402		

^{*}Small amounts of coal consumed for transportation are reported as industrial sector consumption.

bincludes supplemental gaseous fuels. Transportation sector is pipeline fuel only.

Other is electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

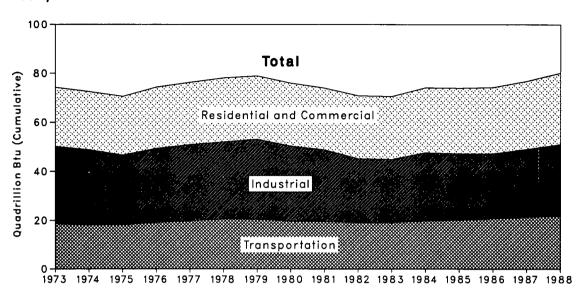

⁴Excludes wood, waste, geothermal, wind, photovoltaic, and solar thermal energy except for small amounts used by electric utilities to generate electricity for distribution.

Note: Totals may not equal sum of components due to independent rounding and the use of sector-specific conversion factors. Additional Notes and Sources: See end of section.

²³Percentage changes are based on numbers in the following tables.

^{*}Includes supplemental gaseous fuels.

Pincludes petroleum products reported as "oil consumed in steam plants" through 1979 and "heavy oil" from 1980 forward, which are assumed to be residual fuel oil; petroleum products reported as "oil consumed in gas turbine and internal combustion engine plants" through 1979 and "light oil" from 1980 forward, which are assumed to be distillate fuel oil and kerosene; and petroleum coke.

Includes net imports of electricity.

Other is electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. Additional Notes and Sources: See end of section.

Notes and Sources for the Consumption Section

- 1. Total Energy Consumed: Total energy consumed includes coal, natural gas (including supplemental gaseous fuels), petroleum products supplied, electric utility and industrial generation of hydroelectric power, net imports of electricity generated from hydroelectric power, and electricity generated from nuclear power. Total energy consumed also includes electricity generated from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available.
- 2. Economic Sectors: Energy use is assigned to the major economic sectors according to the following guidelines as closely as possible:
 - Residential and Commercial Sector-- private household establishments (which consume energy primarily for space heating, water heating, air conditioning, refrigeration, cooking, and clothes drying); nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; health, social, and educational institutions; and Federal, State, and local governments. Street lights, pumps, bridges, and public swimming pools are also included.
 - Industrial sector--manufacturing, construction, mining, agriculture, fishing, and forestry establishments.
 - Transportation sector--private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads and railways (including streetcars), aircraft, ships, barges, and natural gas pipelines.
 - Electric utility sector--privately- and publiclyowned establishments that generate electricity primarily for use by the public.
- 3. Conversion Factors: See the conversion factors listed in the Appendix.
- 4. Coal: Coal is anthracite, bituminous coal, (including sub-bituminous coal), and lignite. Sources:
 - 1973 through September 1977: U.S. Department of the Interior (DOI), Bureau of Mines (BOM), Minerals Yearbook and Minerals Industry Surveys.
 - Electric Utilities--October 1977 forward: Energy Information Administration (EIA), EIA Form 759 (formerly FPC Form 4), "Monthly Power Plant Report."
 - Other Industrial--October 1977 through December 1979: EIA, EIA Form 3, "Monthly Fuel Consumption Report Manufacturing Plants"; January 1980 forward: EIA, EIA Form 3, "Quarterly

- Fuel Consumption Report Manufacturing Plants" and EIA Form 6, "Coal Distribution Report."
- Coke Plants--October 1977 through December 1980: EIA, EIA Form 5/5A, "Coke and Coal Chemicals Monthly/Annual"; January 1981 through December 1984: EIA, EIA Form 5/5A, "Coke and Coal Chemicals Quarterly/Annual Supplement"; January 1985 forward: EIA, EIA Form 5/5A, "Coke Plant Report," quarterly.
- Residential and Commercial--October 1977 through December 1979: EIA, EIA Form 2, "Monthly Coal Report, Retail Dealers and Upper Lake Docks"; January 1980 forward: EIA, EIA Form 6, "Coal Distribution Report."
- 5. Natural Gas: Natural gas consumption by end-use sector is based on data presented in Table 4.3 of this report. For Section 2 calculations, lease and plant fuel consumption are added to the industrial sector deliveries and pipeline fuel represents the transportation sector's use of natural gas. Values in Btu are derived using the conversion factors provided in the Appendix. Sources:
 - 1973 through 1975: DOI, BOM, Minerals Yearbook, "Natural Gas" chapter.
 - 1976 through 1978: EIA, Energy Data Reports, "Natural Gas, Annual."
 - 1979: EIA, Natural Gas Production and Consumption 1979.
 - 1980 through 1987: EIA, Natural Gas Annual.
 - 1988 forward: EIA, EIA-857, "Monthly Report of Natural Gas Purchases and Deliveries to Consumers," and EIA computations.
 - Electric utilities consumption--1973 through 1976: FPC Form 4, "Monthly Power Plant Report." 1977 through 1981: Federal Energy Regulatory Commission (FERC), FPC Form 4, "Monthly Power Plant Report." 1982 forward: EIA, EIA Form 759, "Monthly Power Plant Report."
 - American Gas Association, "Monthly Gas Utility Statistical Report," residential sector and commercial sector monthly sales data for 1973 through 1979 used to estimate monthly consumption values from EIA annual consumption values.
- 6. Petroleum: Petroleum consumption by end-use is the sum of all individual petroleum products estimated to be consumed in each end-use sector. First, total consumption by product is determined. Petroleum consumption in this section of the Monthly Energy Review (MER) is the series called "petroleum products supplied" in Section 3. Sources for petroleum products supplied by individual products are:
 - 1973 through 1975: DOI, BOM, Mineral Industry Surveys, "Petroleum Statement, Annual."

- 1976 through 1980: EIA, Energy Data Reports, "Petroleum Statement, Annual."
- 1981 through 1987: EIA, Petroleum Supply Annual.
- 1988 forward: EIA, Petroleum Supply Monthly.

Specific petroleum products' end-use allocation procedures follow:

- Aviation Gasoline--All product supplied is assigned to the transportation sector.
- Asphalt--All product supplied is assigned to the industrial sector.
- Distillate Fuel

Electric Utility Sector, All Periods.

Monthly and annual consumption in 1973 through 1979 is assumed to be the amount of oil (minus small amounts of kerosene and kerosene-type jet fuel deliveries) reported as consumed in internal combustion and gas turbine engine plants. From January 1980, electric utility consumption of distillate fuel is assumed to be the petroleum products reported as "light oil" (minus small amounts of kerosene deliveries through 1982) consumed at utilities.

Sources: 1973 through September 1977--FPC Form 4, "Monthly Power Plant Report;" October 1977 through 1981--FERC, FPC Form 4, "Monthly Power Plant Report;" 1982 forward--EIA, Form EIA-759, "Monthly Power Plant Report."

Non-Electric Utility Sectors, Annual Estimates Through 1987.

The aggregate non-electric utility use of distillate fuel is total distillate fuel supplied minus the electric utility consumption. The non-electric utility annual totals are allocated into the individual non-electric utility sectors in proportion to the amount of distillate fuel delivered to end users, grouped into sectors from EIA's "Deliveries of Fuel Oil and Kerosene" ("Deliveries") reports (based primarily on data collected by Form EIA-821 previously Form EIA-172) as follows:

- Residential sector deliveries are directly from the "Deliveries" reports for 1979 through 1987. Prior to 1979, each year's deliveries subtotal of the heating plus industrial category is split into residential, commercial, and industrial (including farm) in proportion to the 1979 shares;
- Commercial sector deliveries are directly from the "Deliveries" reports for 1979 through 1987. Prior to 1979, each year's deliveries subtotal of the heating plus industrial category is split into residential, commercial, and industrial (including farm) in proportion to the 1979 shares;
- Industrial sector deliveries for 1979 through 1987 are the sum of deliveries for industrial, farm,

oil company, off-highway, diesel, and all other uses. Prior to 1979, each year's deliveries subtotal of the heating plus industrial category is split into residential, commercial, and industrial (including farm) in proportion to the 1979 shares, and this estimated industrial portion is added to oil company, off-highway diesel, and all other uses; and

- Transportation sector deliveries are the sum of deliveries for railroad, vessel bunkering, and onhighway diesel, and military uses for all years.

Non-Electric Utility Sectors, Monthly Estimates Through 1987.

- -Residential and commercial sector monthly consumption is estimated by allocating the annual sector estimates described above into months in proportion to each month's share of the year's sales of No. 2 heating oil as reported in the "Monthly Report of Heating Oil Sales" by the Ethyl Corporation from 1973 through 1980 and the American Petroleum Institute for 1981 and 1982, and the Energy Information Administration, Form EIA-782-A, "Refiners/Gas Plant Operators' Monthly Petroleum Product Sales Report," No. 2 Fuel Oil Sales to End Users and for Resale, for 1983 through 1987.
- The transportation sector highway use portion is allocated into the months in proportion to each month's share of the year's total sales for highway use as reported by the Federal Highway Administration's Table MF-25, "Private and Commercial Highway Use of Special Fuels by Months." The remaining transportation use of distillate fuel (i.e., for railroads, vessel bunkering, and military use) is evenly distributed over the months, adjusted for the number of days per month.
- Industrial sector monthly estimates are made by subtracting the residential and commercial, transportation, and electric utility sector estimates from each month's total distillate fuel supplied.

Non-Electric Utility Sectors, 1988 Forward.

Each month's non-electric utility consumption subtotal is disaggregated into the major end-use sectors in proportion to the shares each sector held of the non-electric utility subtotal in the same month in 1987.

- Jet Fuel--Through 1982, small amounts of kerosene-type jet fuel were consumed by the electric utility sector. Kerosene-type jet fuel deliveries to electric utilities as reported on the FERC-423 (formerly FPC-423) were used as estimates of this consumption. All remaining jet fuel (kerosene-type and naphtha-type) is consumed by the transportation sector.
- Kerosene--Total product supplied monthly is allocated to the major end-use sectors in proportion to annual deliveries grouped into end-use sectors

from EIA's "Deliveries of Fuel Oil and Kerosene" ("Deliveries") reports Form EIA-172) as follows:

- Residential sector deliveries are directly from the "Deliveries" reports for 1979 through 1987. Deliveries for 1987 are used as estimates for succeeding periods. Prior to 1979, each year's deliveries category called "heating" is split into residential, commercial, and industrial in proportion to the 1979 shares;
- Commercial sector deliveries are directly from the "Deliveries" reports for 1979 through 1987. Deliveries for 1987 are used as estimates for succeeding periods. Prior to 1979, each year's deliveries category called "heating" is split into residential, commercial, and industrial in proportion to the 1979 shares; and
- Industrial sector deliveries are directly from the "Deliveries" reports for 1979 through 1987. Deliveries for 1987 are used as estimates for succeeding periods. Prior to 1979, each year's deliveries category called "heating" is split into residential, commercial and industrial in proportion to the 1979 shares, and this estimated industrial (including farm) portion is added to "all other uses."
- Liquefied Petroleum Gases (LPG)--The annual shares of LPG's total consumption that are estimated to be consumed by each end-use sector are applied to each month's total LPG consumption (i.e., product supplied) to create monthly end-use consumption estimates. The annual end-use shares are calculated in the following manner:
 - Sales of LPG to the residential and commercial sector are converted from thousand gallons per year to thousand barrels per year and are assumed to be the annual consumption of LPG by the sector;
 - The quantity of LPG sold each year for consumption in internal combustion engines is allocated between the transportation and industrial sectors based on data for special fuels used on highways published by the U.S. Department of Transportation, Federal Highway Administration, in *Highway Statistics*. The allocations of LPG sold for internal combustion use range from 38 percent in the transportation sector and 62 percent in the industrial sector in 1973 to 66 percent transportation and 34 percent industrial in 1987.
 - LPG consumed annually by the industrial sector is estimated as the difference between LPG's total supplied and the estimated consumption by the sum of the residential and commercial sector and the transportation sector. The industrial sector includes LPG used by chemical plants as raw materials or solvents and for use in the production of synthetic rubber; refinery fuel use; use as synthetic natural gas feedstock and use in

secondary recovery projects; all farm use; LPG sold to gas utility companies for distribution through the mains; and a portion of the use of LPG as an internal combustion engine fuel.

The sources of the annual sales data for creating annual end-use shares are:

- 1973 through 1982: EIA's "Sales of Liquefied Petroleum Gases and Ethane" reports, based primarily on data collected by Form EIA-174.
- 1983: End-use consumption estimates for 1983 are based on 1982 end-use consumption because the collection of data under Form EIA-174 was discontinued after data year 1982.
- 1984 through 1987: American Petroleum Institute (API), "Sales of Natural Gas Liquids and Liquefied Refinery Gases" based on an LPG sales survey jointly sponsored by API, the Gas Processors Association, and the National Liquefied Petroleum Gas Association.
- 1988 forward: The 1987 source is used to estimate succeeding periods.
- Lubricants--Total product supplied is allocated to the industrial and transportation sectors for all months according to proportions developed from annual sales of lubricants to those two sectors from U.S. Department of Commerce, Bureau of the Census, Current Industrial Reports, "Sales of Lubricating and Industrial Oils and Greases." The 1973 shares are applied to 1973 and 1974; the 1975 shares are applied to 1975 and 1976; and the 1977 shares are applied to 1977 forward.
- Motor Gasoline--Total product supplied monthly is allocated to the major end-use sectors in proportion to aggregations of annual sales categories formed from the U.S. Department of Transportation, Federal Highway Administration Highway Statistics, Tables MF-21, MF-24, and MF-25, as follows:
 - Commercial sales are the sum of sales for public non-highway use and miscellaneous and unclassified uses;
 - Industrial sales are the sum of sales for agriculture, construction, and industrial and commercial use as classified in the *Highway Statistics*; and
 - Transportation sales are the sum of sales for highway use (minus the sales of special fuels, which are primarily diesel fuel and are accounted for in the transportation sector of distillate fuel) and sales for marine use.
- Petroleum Coke--The portion consumed by the electric utility sector is from EIA Form 759, "Monthly Power Plant Report" (formerly FPC Form 4). The remaining petroleum coke is assigned to the industrial sector.

• Residual Fuel

Electric Utility Sector, All Periods.

Monthly and annual consumption 1973 through 1979 is assumed to be the amount of oil reported as consumed in steam-electric power plants. From January 1980, electric utility consumption of residual fuel is assumed to be the petroleum products reported as "heavy oil" consumed at utilities.

Sources: 1973 through September 1977--FPC Form 4, "Monthly Power Plant Report;" October 1977 through 1981--FERC, FPC Form 4, "Monthly Power Plant Report;" 1982 forward--EIA, Form EIA-759, "Monthly Power Plant Report."

Non-Electric Utility Sectors, Annual Estimates Through 1987.

The aggregate non-electric utility use of residual fuel is total residual fuel supplied minus the electric utility consumption. The non-electric utility annual totals are allocated into the individual non-electric utility sectors in proportion to the amount of residual fuel delivered to end users, grouped into sectors from EIA's "Deliveries of Fuel Oil and Kerosene" ("Deliveries") reports (based primarily on data collected by Form EIA-821, previously Form EIA-172) as follows:

- Commercial sector deliveries are directly from the "Deliveries" reports for 1979 through 1987. Prior to 1979, each year's deliveries subtotal of the heating plus industrial category is split into commercial and industrial in proportion to the 1979 shares;
- Industrial sector deliveries for 1979 through 1987 are the sum of deliveries for industrial, oil company, and all other uses. Prior to 1979, each year's deliveries subtotal of the heating plus industrial category is split into commercial and industrial in proportion to the 1979 shares; and this estimated industrial portion is added to oil company and all other uses; and
- Transportation sector deliveries are the sum of deliveries for railroad, vessel bunkering, and military uses for all years.

Non-Electric Utility Sectors, Monthly Estimates Through 1987.

- Commercial sector monthly consumption is estimated by allocating the annual commercial sector estimates described above into months in proportion to each month's share of the year's sales of No. 2 fuel oil as reported in the "Monthly Report of Heating Oil Sales" by the Ethyl Corporation for 1973 through 1980 and the American Petroleum Institute for 1981 and 1982, and the Energy Information Administration, Form

EIA-782-A, "Refiners/Gas Plant Operators' Monthly Petroleum Product Sales Report," No. 2 Fuel Oil Sales to End Users and for Resale, 1983 through 1987.

- Transportation sector monthly estimates are made by evenly distributing the annual sector estimate over the months, adjusted for the number of days per month.
- Industrial sector monthly estimates are made by subtracting the commercial, transportation, and electric utility sector estimates from each month's total residual fuel supplied.

Non-Electric Utility Sectors, 1988 Forward.

Each month's non-electric utility consumption subtotal is disaggregated into the major end-use sectors in proportion to the shares each sector held of the non-electric utility subtotal in the same month in 1987.

- Road Oil--All product supplied is assigned to the industrial sector.
- All Other Petroleum Products--The product supplied of all remaining petroleum products is assigned to the industrial sector.
- 7. Hydroelectric Power: Includes electricity generated by hydroelectric power at electric utilities, small amounts in the industrial sector, and net imports of electricity, which are assumed to be generated by hydroelectric power and are included in the electric utilities sector.

Sources for electric utilities sector:

- 1973 through 1976: FPC, Form 4, "Monthly Power Plant Report."
- 1977 through 1981: FERC, FPC Form 4, "Monthly Power Plant Report."
- 1982 forward: EIA, EIA Form 759, "Monthly Power Plant Report."

Sources for industrial sector:

- 1973 through 1978: FPC Form 4, Monthly Power Plant Report for plants with generating capacity exceeding 10 megawatts and FPC Form 12-C, Industrial Electric Generating Capacity, for all other plants.
- 1979: FPC Form 4, Monthly Power Plant Report for plants with generating capacity exceeding 10 megawatts and EIA estimates for all other plants.
- 1980 forward: Annual generation estimated by EIA as the average generation over the 6-year period of 1974 through 1979; monthly generation estimated to be in proportion to each month's hydroelectricity generation in the electric utility industry in 1980.

Note for imports and exports of electricity:

• Monthly electricity imports and exports estimates for 1982 forward were revised in the May 1984 MER. The revisions do not cause discontinuity in the annual data series: the data continue to come from the same source. The monthly data series, however, are discontinuous because monthly data from January 1982 forward are now available from the same source as the annual data. Estimates for monthly values prior to 1982, published in previous issues, were developed by converting the annual value to a daily rate and multiplying by the number of days in the month. Accordingly, month-to-month analyses are not comparable when taken across the transition date of January 1982. Monthly analyses on either side of that date will be comparable. There is no known bias in either the annual data or the monthly data since January 1982.

Sources for imports and exports of electricity:

- 1973 through 1980: DOE, Economic Regulatory Administration, "Report on Electric Energy Exchanges with Canada and Mexico."
- 1981: DOE, Office of Energy Emergency Operations, "Report on Electric Energy Exchanges with Canada and Mexico for Calendar Year 1981," April 1982 (revised June 1982).
- 1982 and 1983: DOE, Economic Regulatory Administration, *Electricity Exchanges Across International Borders*.
- 1984 through 1987: DOE, Economic Regulatory Administration, Electricity Transactions Across International Borders.
- 1988: DOE, Assistant Secretary for Fossil Energy, Office of Fuels Programs, Electricity Transactions Across International Borders.
- 1989 forward: EIA estimates.
- 8. Nuclear Electric Power and Wood, Waste, Geothermal, Wind, Photovoltaic, and Solar Thermal Energy Sources Connected to Electric Utility Distribution Systems: Sources:
 - 1973 through 1976: FPC, Form 4, "Monthly Power Plant Report."
 - 1977 through 1981: FERC, FPC Form 4, "Monthly Power Plant Report."
 - 1982 forward: EIA, EIA Form 759, "Monthly Power Plant Report."
- 9. Net Imports of Coal Coke: Net imports means imports minus exports, and a minus sign indicates that exports are greater than imports. Sources:
 - 1973 through 1975: DOI, BOM, Minerals Yearbook, "Coke and Coal Chemicals," chapter.

- 1976 through 1980: EIA, Energy Data Report, "Coke and Coal Chemicals," annual.
- 1981: EIA, Energy Data Report, "Coke Plant Report," quarterly.
- 1982 forward: EIA, Quarterly Coal Report.
- 10. Electricity: Sales of electricity represent consumption. From the sources cited below the following electricity sales categories are available: residential, commercial, industrial, and other. For the end-use estimates in this section, the "other" category (which is primarily sales for use in government buildings) is added to the commercial sector except for approximately 4 percent used by railroads and railways and accounted for in the transportation sector. Sales of electricity are converted into Btu at the rate of 3,412 Btu per kilowatthour. Sources of sales data:
 - 1973 through 1976: FPC, Form 5, "Monthly Statement of Electric Operating Revenue and Income."
 - 1977 through February 1980: EIA, FPC Form 5, "Monthly Statement of Electric Operating Revenue and Income."
 - March 1980 through December 1982: EIA, FERC Form 5, "Electric Utility Company Monthly Statement."
 - January 1983 forward: EIA, EIA Form 826, "Electric Utility Company Monthly Statement."
- 11. Electrical System Energy Losses: Electrical system energy losses are calculated as the difference between total energy input at electric utilities and the total energy content of electricity sold to end-use consumers. Most of those losses occur at steam-electric power plants (conventional and nuclear) in the conversion of heat energy into mechanical energy to turn electric generators. The loss is a thermodynamically necessary feature of the steam-electric cycle. Part of the energy input-to-output losses are a result of imputing fossil energy equivalent inputs for hydroelectric and other energy sources, since there is no generally accepted practice for measuring those thermal conversion rates. In addition to conversion losses, other losses include power plant use of electricity, transmission and distribution of electricity from power plants to end-use consumers (also called "line-losses"), and unaccounted for electricity. Total losses are allocated to the end-use sectors in proportion to each sector's share of total electricity sales. Overall, approximately 67 percent of total energy input is lost in conversion; of electricity generated, approximately 5 percent is lost in plant use and 9 percent in transmission and distribution. Calculated electrical system energy losses may be less than actual losses, because primary consumption does not include the energy equivalent of utility purchases of electricity from non-electric utilities and from Canada and Mexico, although they are included in electricity sales.

Section 3. Petroleum

Total petroleum imports²⁴ averaged 8.6 million barrels per day in August 1989, 3 percent²⁵ more than the July 1989 rate and 16 percent more than the August 1988 rate.

In August 1989, 17.5 million barrels per day of petroleum products were supplied for domestic use, 7 percent more than the previous month but the same as the August 1988 rate. Motor gasoline accounted for 43 percent of the total; distillate fuel oil, 18 percent; and residual fuel oil, 6 percent.

Motor gasoline supplied during August 1989 averaged 7.6 million barrels per day, 4 percent higher than the previous month but about the same level as the August 1988 rate. Stocks of motor gasoline totaled 219 million barrels at the end of August 1989, 10 million barrels

below the stock level at the end of July 1989 and 1 million barrels below the stock level 1 year earlier.

In August 1989, 3.1 million barrels of distillate fuel oil were supplied per day, 19 percent higher than the July 1989 rate and 8 percent higher than the August 1988 rate. Distillate fuel oil ending stocks for August 1989 were 116 million barrels, 1 million barrels above the stock level in the previous month but 10 million barrels lower than the stock level 1 year earlier.

Residual fuel oil supplied in August 1989 averaged 1.1 million barrels per day, 17 percent lower than the previous month and 19 percent lower than the August 1988 rate. Residual fuel oil stocks measured 41 million barrels at the end of August 1989, 2 million barrels lower than the previous month but 3 million barrels higher than the stock level 1 year earlier.

Estimates (except of crude production) for the most current month are based on Energy Information Administration (EIA) weekly data and will be revised to conform with data from the EIA Petroleum Reporting System as available. For the most recent month, crude production is an EIA estimate based on historical and provisional data through May 1989.

²⁴Total import data include imports into the Strategic Petroleum Reserve.

²⁵Percentage changes are based on numbers shown in the following tables.

^{*}Includes lease condensate.

^bA negative number indicates a decrease in stocks and a positive number indicates an increase.

Stocks are totals as of end of period.

Stocks are totals as of end of period.

Includes crude oil, natural gas plant liquids, other hydrocarbons, and alcohol.

Includes stocks located in the Strategic Petroleum Reserve.

Includes crude oil for storage in the Strategic Petroleum Reserve.

Net imports equals imports minus exports.

Due to a rounding difference, this value is 1,603 in the *Petroleum Supply Annual* and *Petroleum Supply Monthly.*In January 1975, 1981, and 1983, numerous respondents were added to surveys affecting stocks reported and stock change calculations. See Note 4 at end of section.

^{*}Includes lease condensate.

bStocks are totals as of end of period.

^oA negative number indicates a decrease in stocks and a positive number indicates an increase.

^dStrategic Petroleum Reserve.

Beginning in January 1983, crude oil used directly as fuel is shown as product supplied.

Stocks of Alaskin crude oil in transit were included beginning in January 1981. Stock changes are calculated using new basis stock levels. See Notes 4 and 5 at end of section.

^{*}Excludes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

b"Other OPEC" consists of Ecuador, Gabon, Iraq, Kuwait, and Qatar. Prior to January 1988, imports from the Neutral Zone between Kuwait and Saudi Arabia are included in imports from Saudi Arabia. From January 1988 forward, those imports are included in imports from "Other OPEC." o"Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members.

d"Total Arab OPEC" consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. Imports from the Neutral Zone are included in imports from "Total Arab OPEC."

A small amount of Iranian crude oil entered the United States (defined in this publication as the 50 States and the District of Columbia) in January 1988 from the Virgin Islands. The oil originated in Iran and was exported to the Virgin Islands prior to the signing of Executive Order 12613 on October

^{29, 1987.}Footnotes continued on following page.

Footnotes continued.

fincludes petroleum imported into the United States indirectly from members of OPEC, primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

R=Revised data. (s)=Less than 500 barrels per day.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. • Beginning in October 1977, Strategic Petroleum Reserve imports are included.

Sources: See end of section.

^{*}Stocks are totals as of end of period.

*Beginning in 1981, excludes blending components.

eA negative number indicates a decrease in stocks and a positive number indicates an increase. Includes gasohol.

[•]Includes motor gasoline blending components.

In January 1975, 1981, and 1983, numerous respondents were added to surveys affecting stocks reported and stock change calculations. See Note 4 at end of section.

Beginning in January 1981, survey forms were modified. See Note 1 at end of section.

R=Revised data. E=Estimate. (s)=Less than 500 barrels per day.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. Sources: See end of section.

^{*}Includes pentanes plus, other hydrocarbons and alcohol, unfinished oil, gasoline blending components, and all finished petroleum products except finished motor gasoline, distillate fuel oil, residual fuel oil, and liquefied petroleum gases.

bA negative number indicates a decrease in stocks and a positive number indicates an increase.

Stocks are totals as of end of period.

In January 1975, 1981, 1983, and 1984, a new stock basis was established affecting stocks reported and stock change calculations. See Note 4 at end of this section.

^{*}Due to a rounding difference, this value is 2,869 in the *Petroleum Supply Annual* and the *Petroleum Supply Monthly*.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. Sources: See end of section.

Notes and Sources for the Petroleum Section

Notes

1. The Energy Information Administration (EIA) uses a number of sources and methods to maintain the survey respondent lists. On a regular basis, survey managers review industry publications such as the Oil and Gas Journal and Oil Daily for information on facilities or companies starting up or closing down operations. Those sources are augmented by articles in newspapers, letters from respondents indicating changes in status, and information received from survey systems.

Every 3 years an extensive survey is conducted to update the frames completely. The updating involves consolidating information from every known source including State agencies, Federal agencies (e.g., Environmental Protection Agency, Corps of Engineers, Census Bureau, etc.), and private industry directories. The effort also includes the evaluation of the impact of potential frame changes on the historical time series of data published from these respondents. The results of this frame study are usually implemented in January to provide a full year under the same frame.

- 2. Motor Gasoline: Beginning in January 1981, the EIA expanded its universe to include non-refinery blenders; redefined motor gasoline into two categories (finished leaded and finished unleaded); and separated blending components from finished motor gasoline as a reporting category. Also, survey forms were modified to describe refinery operations more accurately. For further details, see the EIA, Petroleum Supply Monthly.
- 3. Distillate and Residual Fuel Oils: The requirement to report crude oil burned on leases and pipelines as either distillate or residual fuel oil has been eliminated. Prior to January 1981, the refinery input of unfinished oils number typically exceeded the number for available supply of unfinished oils. That discrepancy was assumed to be due to the redesignation of distillate and residual fuel oils received as such, but used as an unfinished oil input by the receiving refinery. The imbalance between supply and disposition of unfinished oils would then be subtracted from the production of distillate and residual fuel oils. Two-thirds of that difference was subtracted from distillate and one-third from residual. Beginning in January 1981, the EIA modified its survey forms to account for redesignated product

and discontinued the above-mentioned adjustment. For further details, see the EIA, Petroleum Supply Monthly.

- 4. New Stock Basis: In January 1975, 1981, and 1983, numerous respondents were added to bulk terminal and pipeline surveys affecting subsequent stocks reported and stock change calculations. Using the expanded coverage (new basis), the end-of-year stocks, in million barrels, would have been:
 - Crude Oil: 1982--645 (Total) and 351 (Other Primary).
 - Crude Oil and Petroleum Products: 1974--1,121; 1980--1,425; and 1982--1,462.
 - Motor Gasoline: 1974--225; 1980--263; 1982--244 (Total) and 203 (Finished).
 - Distillate Fuel Oil: 1974--224; 1980--205; and 1982--186.
 - Residual Fuel Oil: 1974--75; 1980--91; and 1982--68.
 - Liquefied Petroleum Gases: 1974--113; 1980--128; and 1982--103.
 - Other Petroleum Products: 1974--220; 1980--249; and 1982--259.
 - Stock change calculations beginning in 1975, 1981, and 1983, were made using new basis stock levels.

In January 1984, changes were made in the reporting of natural gas liquids. As a result, unfractionated stream, which was formerly included in "Other Petroleum Products Supply and Disposition" table, is now reported on a component basis (ethane, propane, normal butane, isobutane, and pentanes plus). Most of these stocks now appear in the "Liquefied Petroleum Gases Supply and Disposition" table. This change affects stocks reported and stock withdrawals in each table. Under the new basis, end-of-year 1983 stocks, in million barrels would have been:

- Liquefied Petroleum Gases: 1983--108.
- Other Petroleum Products: 1983--248.
- 5. Stocks of Alaskan Crude Oil: Stocks of Alaskan Crude oil in transit were included for the first time in January 1981. The major impact of this change is on the reporting of stock change calculations. Using the expanded coverage (new basis), 1980 end-of-year stocks, in million barrels, would have been 488 (Total) and 380 (Other Primary).

Section 4. Natural Gas

Total dry natural gas production in the United States during July 1989 was an estimated 1.3 trillion cubic feet, 1 percent²⁶ higher than the previous July.

Consumption of natural and supplemental gas in July 1989 was 1.2 trillion cubic feet, 4 percent above the level in July 1988.

Deliveries to residential consumers in June 1989 (latest data available) were 161 billion cubic feet, 5 percent higher than the previous June. Total deliveries to industrial consumers during June were 539 billion cubic feet, 11 percent higher than in June 1988.

Deliveries to residential consumers during the first 6 months of 1989 totaled 2,983 trillion cubic feet, 1 percent less than residential deliveries during the same period of 1988. During the first 6 months, industrial deliveries were 3,382 trillion cubic feet, 5 percent more than in the first half of 1988.

Imports of natural gas in July 1989 were 110 billion cubic feet, 11 percent higher than in the previous July.

Stocks of working gas²⁷ in underground natural gas storage reservoirs at the end of July 1989 totaled 2.6 trillion cubic feet, 3 percent above the level of stocks available 1 year earlier. Net injections into storage during July 1989 were 317 billion cubic feet, 16 percent more than during the previous July.

²⁶Percentage changes are based on numbers shown in the following tables.

²⁷Gas available for withdrawal.

^{*}Data for 1980 through 1987 include underground storage and liquefied natural gas storage. All other data include underground storage only. Computation procedures are discussed in Note 8 at end of section.

^{*}See Notes at end of section.

Data for 1978 forward do not include in-transit receipts and deliveries.

⁴May include unknown quantities of nonhydrocarbon gases.

[•]See Note 7 at end of section.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. • Data through 1987 are final. Subsequent data are preliminary.

Sources: See end of section.

^{*}Total underground storage capacity at the end of each calendar year (in billion cubic feet): 1978–6,890; 1979–6,929; 1980–7,434; 1981–7,805; 1982–7,915; 1983–7,985; 1984–9,043; 1985–8,087; 1986–8,145; 1987 and 1988–8,124. Current capacity is 8,124. PFor 1980 through 1987, data differ from those shown on Table 4.2, which includes liquefied natural gas storage for that period. Positive numbers indicate injections are greater than withdrawals. Negative numbers indicate withdrawals are greater than injections. Net injections or withdrawals may not exact the difference between applicable coding stocks. See Note 8, 21 and 4 section. withdrawais may not equal the difference between applicable ending stocks. See Note 8 at end of section.

Withdrawais may not equal the difference between applicable ending stocks. See Note 6 at end of section.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. • Data through 1987 are final. Subsequent data are preliminary.

Sources: See end of section.

Figure 4.1 Natural Gas Consumption, Production, and Imports

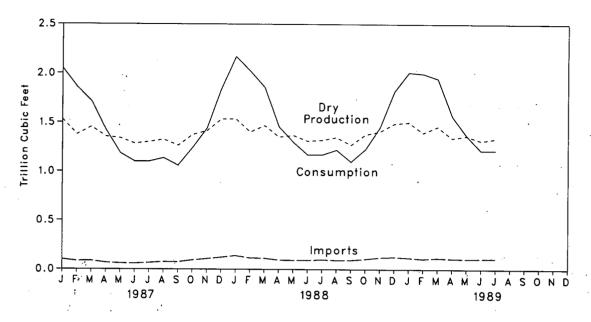

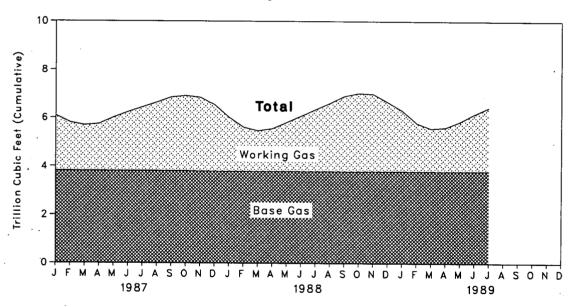

Figure 4.2 Natural Gas in Storage, End of Period

Notes and Sources for the Natural Gas Section

Notes

1. Nonhydrocarbon Gases Removed: Annual data on nonhydrocarbon gases removed from marketed production--carbon dioxide, helium, hydrogen sulfide, and nitrogen--are from the Energy Information Administration (EIA) Natural Gas Annual (NGA) 1987. These data are not available for periods prior to 1980. For 1987, of the 32 producing States, 22 reported data on nonhydrocarbon gases removed. These 22 States accounted for 58 percent of total 1987 gross withdrawals. In addition, gross withdrawals data from four States, which together accounted for 38 percent of the 1987 total production, did not include all or most of the nonhydrocarbon gases removed on leases. Two States reported quantities unknown but considered insignificant. For further information see the EIA Natural Gas Monthly (NGM).

Monthly data are reported by three States and computed for six States. All monthly data are considered preliminary until after publication of the EIA NGA for that year. For further information on methods of estimating preliminary monthly data, see the EIA NGM.

Monthly data are revised and considered final after publication of the EIA NGA by proportionally allocating the differences between annual data published in the EIA NGA and the sum of the preliminary monthly data (January-December).

2. Production: Annual data. Final annual data are from the EIA NGA 1987.

Estimated Monthly Data. All data for the two most recent months presented are estimated. Some of the data for earlier months are also estimated or computed. For a discussion of computation and estimation procedures, see the EIA NGM.

Preliminary monthly data. All monthly data are considered preliminary until after publication of the EIA NGA for that year. Preliminary monthly data are gathered from reports from the Interstate Oil Compact Commission and the U.S. Minerals Management Service. Volumetric data are converted, as necessary to a standard 14.73 psia pressure base. Unless there are major changes, data are not revised until after publication of the EIA NGA.

Final monthly data. The difference between annual production data published in the EIA NGA 1987 and the sum of preliminary monthly data (January-December) is allocated proportionally to the preliminary monthly data.

3. Extraction Loss: Extraction loss is the reduction in volume of natural gas resulting from the removal of natural gas liquid constituents at natural gas processing plants.

Annual data for extraction loss are from the EIA NGA for which they have been estimated based on the type and quantity of liquid products extracted from the gas stream and the calculated volume of such products at standard conditions. For a detailed explanation of the calculations used to derive estimated extraction losses, see the EIA NGA.

Preliminary monthly data are estimated based on extraction loss as an annual percentage of marketed production. This percentage is applied to each month's marketed production to estimate monthly extraction loss.

Monthly data are revised and considered final after the publication of the EIA NGA. Final monthly data are estimated by allocating annual extraction loss data to each month based on its total natural gas disposition.

4. Supplemental Gaseous Fuels: Supplemental gaseous fuels are mainly synthetic natural gas, propane-air, and refinery gas. Other gases may also be included such as, coke oven gas, biomass gas, manufactured gas, and air injected for Btu stabilization.

Annual data beginning with 1980 are from the EIA NGA 1987. Unknown quantities of supplemental gaseous fuels are included in consumption data for 1979 and earlier years.

All monthly data are considered preliminary until after the publication of the EIA NGA for that year. Monthly estimates are based on the annual ratio of supplemental gaseous fuels to the sum of dry gas production, net imports, and net withdrawals from storage. This ratio is applied to the monthly sum of these three elements to compute a monthy supplemental gaseous fuels figure.

5. Imports and Exports: The United States imports natural gas via pipeline from Mexico and Canada, and liquefied natural gas (LNG) (except in 1986) via tanker from Algeria. One shipment of LNG was received in December 1986 from Indonesia. The United States exports natural gas via pipeline to Mexico and Canada and liquefied natural gas via tanker to Japan.

Annual and final monthly data are published from the annual Form FPC-14, "Annual Report for Importers and Exporters of Natural Gas," which requires data to be reported by month for the calendar year.

Preliminary monthly data are EIA estimates. For a discussion of estimation procedures, see the EIA NGM. Preliminary data are revised after the publication of the EIA U.S. Imports and Exports of Natural Gas for that year.

6. Consumption: Consumption includes pipeline fuel use, lease and plant fuel use, and deliveries to consuming sectors.

All final data are from the EIA NGA. All monthly data are considered preliminary until after publication of the EIA NGA. For more detailed information on the methods of estimating preliminary and final monthly data, see the EIA NGM.

7. Unaccounted For: Represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas disposition. These differences may be due to quantities lost or to the effects of data reporting problems. Reporting problems include differences due to the net result of conversions of flow data metered at varying temperature and pressure bases and converted to a standard temperature and pressure base; the effect of variations in company accounting and billing practices; differences between billing cycle and calendar period time frames; and imbalances resulting from the merger of data reporting systems which vary in scope, format, definitions, and type of respondents.

The increase of 0.2 trillion cubic feet (Tcf) in the "Unaccounted for" category in 1983 followed by a decline of 0.5 trillion cubic feet in 1984 reflected unusually large differences resulting from the use of the annual billing cycle (essentially December 15, through the following December 14) consumption data in conjunction with calendar year supply data. Record cold temperatures during the last half of December 1983 resulted in a reported 0.3 Tcf increase in net withdrawals from underground storage for peak shaving as compared with the same period in 1982, but the effect of this cold weather was reflected primarily in 1984 consumption data. For underground storage data, see Table F2 in the May 1985 NGM, which was published in July 1985.

8. Natural Gas Storage: Gas in storage at the end of a reporting period may not equal the quantity derived by adding or subtracting net injections or withdrawals from the quantity in storage at the end of the previous period. This difference is due to changes in the quantity of native gas included in the base gas and/or losses in base gas due to migration from storage reservoirs.

All monthly data concerning underground storage are collected from the essentially identical Forms FPC-8

and EIA-191. Monthly data are revised after publication of the EIA Underground Natural Gas Storage in the United States for that heating year (April through March). In addition, injection and withdrawal data from the FPC-8/EIA-191 survey are adjusted to correspond to data from Form EIA-176 following publication of the EIA Natural Gas Annual.

The final monthly and annual storage and withdrawal data for 1980 through 1987 include both underground and liquefied natural gas (LNG) storage. Underground storage data are taken from the FPC-8/EIA-191 surveys in the manner described earlier. Annual data on LNG additions and withdrawals are taken from Form EIA-176. Monthly data are estimated by computing the ratio of each month's underground storage additions and withdrawals to annual underground storage additions and withdrawals and applying it to annual LNG data.

Section 5. Oil and Gas Resource Development

In August 1989, the number of crews engaged in seismic exploration increased by 7 from the previous month. The August 1989 total of 136 crews was 52 lower than in the previous August. Of the total, 110 were land crews and 26 were marine vessels. The number of land crews was down by 46 from August 1988 and the number of marine vessels was down by 6.

The August 1989 rotary rig count of 886 was 6 percent higher than in the previous month but 5 percent lower than in August 1988. Of the total number of rigs in operation, 772 were onshore and 114 were offshore. The number of onshore rigs was down 4 percent from

the number in August 1988 and the number of offshore rigs was down 7 percent.

Exploratory and development well completions during July 1989 totaled an estimated 2,220, up 2 percent from the previous month but 9 percent lower than the July 1988 total. Oil well completions were 820, down 20 percent from the level in July 1988, and gas well completions totaled 690, up 17 percent from the July 1988 total. Total footage drilled in July 1989 was 10.24 million feet, up 1 percent from the total in June 1989 but down 12 percent from the total in July 1988.

Notes: • Includes exploratory and development wells; excludes service wells, stratigraphic tests, and core tests. • Geographic coverage is the 50 States and the District of Columbia. • Totals and averages may not equal sum of components due to subsequent revisions and independent rounding.
• Due to the method of estimation, data shown on this page are frequently revised. See end of section.

Notes and Sources for the Oil and Gas Resource Development Section

Notes

Beginning in the March 1985 Monthly Energy Review (MER), the Energy Information Administration (EIA) revised the exploratory and development wells drilled data series. In order to present a consistent series, historical as well as current statistics were adjusted.

In previous issues, the MER published statistics based on data on well completions reported to the American Petroleum Institute during a given month, as opposed to data on wells actually completed during the month. Because of the time lag from date of well completion to date of reporting, data on well completions reported are not as accurate an indicator of drilling activity as are data on well completions. For example, during 1982 well completions reported continued to rise even though the number of wells actually completed fell. Starting in the March 1985 issue of the MER, published figures have been EIA estimates of the number of wells actually completed in a given month and are shown in thousands, rounded to two decimal places. The associated footage drilled is shown in millions, also rounded to two decimal places.

The EIA estimates are calculated using an adjustment process that imputes total well counts and footage by type and class based on partial counts of well completions available from the reported data. That is, based on statistical analysis of the incomplete reported data, the process imputes the missing portions to determine values for total well completions and footage. Estimates for a given month are first published in the *MER* for that month, that is estimates for June 1984 are first

published in the June 1984 MER. Revisions to the estimates are scheduled for the 6th, 12th, and 24th months following initial publication, as newly reported data refine the accuracy of the estimate. Unscheduled revisions to the published data will also be made when the latest estimate differs by more than 15 percent during the first 5 months, more than 10 percent during the next 6 months, more than 5 percent during the following 6 months, or more than 2 percent thereafter through 5 years. After 5 years, the actual reported data will be published.

The three well types considered are oil, gas, and dry. By convention, wells with both oil and gas zones are categorized as oil. Well classes are either development or exploratory; wells in any other class have been deleted. Exploratory well categories considered are new field wildcat, new pool wildcat, deeper pool test, or extension (American Association of Petroleum Geologists well classification codes 1 through 5).

Additional information may be obtained from "Estimating Well Completions," the feature article published in the March 1985 *MER*.

Section 6. Coal

Coal production in July 1989 totaled 65 million short tons, 6 percent lower than in July 1988.

Electric utility coal consumption in June 1989 totaled 64 million short tons, 2 percent lower than in June 1988. During the first 6 months of 1989 coal consumption at electric utilities was 369 million short tons, 2 percent above the 363 million short tons consumed during the first 6 months of 1988.

Electric utility coal stocks were 149 million short tons at the end of June 1989, 8 percent less than at the end of June 1988.

Exports of coal in June 1989 totaled 10 million short tons, 20 percent more than in June 1988. Coal exports for January through June 1989 totaled 50 million short tons, 22 percent higher than exports during the same period in 1988.

Imports of coal in June 1989 totaled 218 thousand short tons, 15 percent less than in June 1988. Coal imports during the first 6 months of 1989 totaled 1 million short tons, 8 percent more than imports during the first 6 months of 1988.

Notes and Sources for the Coal Section

Notes

1. Production: Preliminary monthly estimates of national coal production are the sum of weekly estimates developed by the Energy Information Administration (EIA) and published in the Weekly Coal Production report. When a week extends into a new month, production is allocated on a daily basis and added to the appropriate month. Weekly estimates are based on Association of American Railroads data showing the number of railcars loaded with coal during the week by Class I and certain other railroads. This number is converted into tons of coal by EIA using the average number of tons of coal per railcar loaded reported in the most recent Quarterly Freight Commodity Statistics from the Interstate Commerce Commission. If an average coal tonnage per railcar loaded is not available for a specific railroad, the national average is used. To derive the estimate of total weekly production, the total rail tonnage for the week is divided by the ratio of quarterly production shipped by rail and total quarterly production. Data for the corresponding quarter of previous years are used to derive this ratio. This method insures that the seasonal variations are preserved in the production estimates.

When preliminary quarterly data become available, the monthly and weekly estimates are adjusted to conform to the quarterly figure. The adjustment procedure uses State-level production data and is explained in the Quarterly Coal Report. Initial estimates of annual production published in January of the following year are based on preliminary production data covering the first 9 months (three quarters) and weekly/monthly estimates for the fourth quarter. The fourth quarter estimates may or may not be revised when preliminary data become available in March of the following year, depending on the magnitude of the difference between the estimates and the preliminary data. In any event, all quarterly, monthly, and weekly production figures are adjusted to conform to the final annual production data published in the Monthly Energy Review in the fall of the following year.

- 2. Consumption: Coal consumption data are reported by major end-use sector.
 - Electric Utilities--Both monthly and quarterly consumption data for electric utility plants are directly from reported data.
 - Coke Plants--Prior to 1980, monthly coke plant consumption data were directly from reported data. From 1980 through 1987, coke plant consumption estimates were derived by proportioning reported quarterly data using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported.

- Beginning in January 1988, monthly coke plant consumption estimates are derived from the reported quarterly data using monthly ratios of raw steel production data from the American Iron and Steel Institute. The ratios are the monthly raw steel production from open hearth and basic oxygen process furnaces as a proportion of the quarterly production from those kinds of furnaces.
- Other Industrial--Prior to 1978, monthly consumption data for the other industrial sector (i.e., all industrial users minus coke plants) were derived by using reported data to modify baseline consumption figures from the most recent Bureau of the Census Annual Survey of Manufactures or Census of Manufactures. For 1978 and 1979, monthly estimates were derived from data reported on Forms EIA-3 and EIA-6. From 1980 through 1987, monthly figures were estimated by proportioning quarterly data using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported on Form EIA-3. Quarterly consumption data were derived by adding beginning stocks at manufacturing plants to current receipts and subtracting ending stocks at manufacturing plants. In this calculation, current receipts were taken as the greater of either reported receipts from manufacturing plants (Form EIA-3) or reported shipments to the other industrial sector (Form EIA-6), thereby ensuring that agriculture, forestry, fishing, mining, and construction consumption were included where appropriate. Starting in January 1988, monthly consumption for the other industrial sector is estimated from reported quarterly data using ratios derived from industrial production indices published by the Board of Governors of the Federal Reserve System. Indices for six major industry groups are used as the basis for calculating the ratios: foods (SIC 20); paper and products (SIC 26); chemicals and products (SIC 28); petroleum products (SIC 29); clay, glass, and stone products (SIC 32); and primary metals (SIC 33). The monthly ratios are computed as the monthly sum of the weighted indices as a proportion of the quarterly sum of the weighted indices, using the 1977 proportion as the weights.
- Residential and Commercial--Prior to 1980, monthly consumption estimates for the residential and commercial sector were derived by using reported data to modify baseline figures developed by the Bureau of Mines. From 1980 through 1987, monthly estimates were derived by proportioning reported quarterly data using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported on Form EIA-2. During 1981 and 1982, the estimates were also modified to reflect air temperature degree-days. Quarterly consumption data were directly from reported data and were defined as distribution to the residential and commercial sector as reported by coal producers and distrib-

utors on Form EIA-6. Beginning in January 1988, monthly residential and commercial consumption estimates are derived from reported quarterly data using monthly national average population weighted heating/cooling degree-days obtained from the National Oceanic and Atmospheric Administration. The monthly ratios are the monthly national sum of heating and cooling degree-days as a proportion of the quarterly national sum. Quarterly consumption data are directly from reported data.

- 3. Stocks: Coal stocks data are reported by major enduse sector.
 - Electric Utilities--Both monthly and quarterly stocks at electric utility plants are directly from reported data.
 - Coke Plants--Prior to 1980, monthly stocks at coke plants were directly from reported data.
 From 1980 forward, coke plant stocks are estimated by using one-third of the current quarterly change to indicate the monthly change in stocks.
 Quarterly stocks are directly from data reported on Form EIA-5.
 - Other Industrial--Prior to 1978, stocks for the other industrial sector were derived by using reported data to modify baseline figures from a one-time Bureau of Mines survey of consumers. For 1978 through 1982, monthly estimates were derived by judgmentally proportioning reported quarterly data based on representative seasonal patterns of supply and demand. From 1983 forward, other industrial coal stocks are estimated as indicated above for coke plants. Quarterly stocks are directly from data reported on Form EIA-3 and therefore include only manufacturing industries; data for agriculture, forestry, fishing, mining, and construction stocks are not available.
 - Residential and Commercial--Prior to 1980, monthly and quarterly stock data for the residential and commercial sector were directly from reported data. Monthly and quarterly stock data are not available for the residential and commercial sector after December 1979.
 - Producers and Distributors--Quarterly stocks at producers and distributors are directly from reported data. Monthly data are estimated by using one-third of the current quarterly change to indicate the monthly change in stocks.
- **4. Imports and Exports:** All coal import and export figures are directly from data reported monthly by the Bureau of the Census.

5. Additional Information: More information concerning coal production, consumption, and stocks data and estimation procedures may be obtained in EIA's Quarterly Coal Report, DOE/EIA-0121.

Section 7. Electric Utilities

During June 1989, electric utilities generated 235 billion kilowatthours of electricity, 1 percent²⁸ above the June 1988 generation level. Coal-fired generation totaled 128 billion kilowatthours, 3 percent lower than the June 1988 level. Nuclear generation totaled 43 billion kilowatthours, 3 percent below the level 1 year earlier. Hydroelectric generation was 26 billion kilowatthours in June 1989, 37 percent above the June 1988 level. Natural gas-fired generation was 25 billion kilowatthours in June 1989, 8 percent lower than the June 1988 level. Petroleum-fired generation totaled 13 billion kilowatthours, 29 percent above the level 1 year earlier.

During the first half of 1989, electric utilities generated 1,340 billion kilowatthours of electricity, 3 percent above the first half 1988 generation level. Coal-fired generation totaled 751 billion kilowatthours, 2 percent above the first half 1988 level. Nuclear generation totaled 239 billion kilowatthours, 6 percent below the level 1 year earlier. Hydroelectric generation was 139 billion kilowatthours in the first half of 1989, 16 percent above the first half 1988 level. Natural gas-fired generation was 121 billion kilowatthours, almost 1 percent below the level 1 year earlier. Petroleum-fired generation totaled 83 billion kilowatthours, 34 percent above the first half 1988 level.

Sales of electricity to all ultimate consumers in the United States in June 1989 were 220 billion kilowatthours, 4 percent above June 1988 sales. Sales to industrial consumers totaled 78 billion kilowatthours in June 1989, 5 percent above the level in June 1988. Sales to residential consumers during June 1989 were 71 billion kilowatthours, 5 percent above the level of sales during the previous June. Commercial sales were 62 billion kilowatthours, 1 percent higher than the amount sold to commercial consumers 1 year earlier. In June 1989, other sales totaled 8 billion kilowatthours, 12 percent above the June 1988 level.

During the first half of 1989, sales of electricity to all ultimate consumers in the United States were 1,275 billion kilowatthours, 3 percent above the first-half 1988 sales. Sales to industrial consumers totaled 444 billion kilowatthours in June 1989, 3 percent higher than the level of sales during the same period in 1988. Sales to residential consumers were 438 billion kilowatthours, 2 percent above the level of sales during the first half of 1988. Commercial sales were 349 billion kilowatthours, 3 percent more than the amount sold to commercial consumers 1 year earlier. During the first half of 1989 other sales totaled 44 billion kilowatthours, 11 percent higher than the first half 1988 level.

Electric utility consumption of petroleum (excluding petroleum coke) during June 1989 was 21 million barrels, 28 percent above the June 1988 level. Coal consumption during June 1989 was 64 million short tons, 2 percent lower than consumption in June 1988. During June 1989, electric utilities consumed 259 billion cubic feet of natural gas, 8 percent below the June 1988 consumption level.

During the first half of 1989 electric utility consumption of petroleum (excluding petroleum coke) was 140 million barrels, 35 percent above the first half 1988 level. Coal consumption during the first half of 1989 was 369 million short tons, 2 percent higher than consumption during the first half of 1988 rate. During the first half of 1989, electric utilities consumed 1,267 billion cubic feet of natural gas, less than 1 percent above the first half 1988 consumption level.

On June 30, 1989, electric utility stocks of all types of coal totaled 149 million short tons, 8 percent lower than the level on June 30, 1988. Stocks of petroleum (excluding petroleum coke) on June 30, 1989, totaled 67 million barrels, 3 percent below the level on June 30, 1988.

²⁸Percentage changes are based on numbers shown in the following tables.

Table 7.1 Net Generation of Electricity by Electric Utilities (Million Kilowatthours)

Includes fuel oil Nos. 2, 4, 5, and 6, crude oil, kerosene, and petroleum coke.

bincludes supplemental gaseous fuels.

^{*}Other is electricity produced from geothermal, wood, waste, wind, photovoltaic, and solar thermal energy sources connected to electric utility distribution systems.

^{*}Electricity sales to all ultimate consumers.

bincludes sales of electricity to Government, railways, street lighting authorities, and sales not included elsewhere.

^{*}Beginning in January 1986, monthly Form EIA-826 electricity sales estimates, which are preliminary Form EIA-861 values, are based on a new sample and new expansion factors from data reported on Form EIA-861.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

Sources: Old Series: • 1973 through February 1980: Federal Power Commission, FPC Form 5, "Monthly Statement of Electric Operating Revenue and Income," • March 1980 through 1982: Federal Energy Regulatory Commission, FERC Form 5, "Electric Utility Company Monthly Statement," • 1983 through 1985, Energy Information Administration, Form EIA-826, "Electric Utility Company Monthly Statement." New Series: • 1984 and 1995 annual data: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report." • 1986 annual data and 1987 monthly and annual data: Energy Information Administration, Form EIA-826, "Electric Utility Company Monthly Statement." • 1988 forward: Energy Information Administration, Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions."

^{*}Heavy oil includes Grade Nos. 4, 5, and 6, and residual fuel oils.

bLight oil includes Grade No. 2 heating oil, kerosene, and jet fuel.

cincludes supplemental gaseous fuels.

dPrior to 1980, petroleum consumption data were not disaggregated by type of fuel. Disaggregation by prime mover type is provided in Table 7.5.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

Section 8. Nuclear

In June 1989, U.S. nuclear generating units produced a total of 43 net terawatthours (billion kilowatthours) of electricity, 3 percent²⁹ lower than in June 1988. Nuclear units generated at an average capacity factor of 61.4 percent, 3 percentage points below the level in June 1988. Nuclear power supplied 18.3 percent of the total electricity generated in June 1989, compared with 19.0 percent in June 1988.

Nuclear generation during the first 6 months of 1989 decreased 6 percent compared with generation in the first 6 months of 1988. The average monthly nuclear share of electricity for the first 6 months of 1989 was 17.8 percent compared with 19.6 percent for the same period in 1988. During the first half of 1989, the average monthly nuclear capacity factor for U.S. nuclear units was 57.1 percent compared with 62.3 percent in 1988.

No Low or Full Power Operating Licenses were issued by the Nuclear Regulatory Commission (NRC) during June 1989. On May 26, 1989, Seabrook 1, a 1,186 netmegawatt-electric (MWe) unit located in Seabrook, New Hampshire, was issued a Low Power Operating License by the NRC authorizing fuel loading and lowpower testing.

On June 30, 1989, there were 110 operable nuclear generating units in the United States, with a collective net summer generating capability of 97 million kilowatts of electricity. (This total does not include Shoreham, as it is not currently scheduled to operate). Of the 110 operable units, 29 units generated at less than 25 percent of capacity and 14 units were out of service at least part of the month for maintenance or refueling.

As of June 30, there were 122 domestic nuclear generating units in all stages of construction and operation, with an aggregate design capacity of 114 million net kilowatts.

²⁹Percentage changes are based on numbers shown in the following tables.

Figure 8.1 Nuclear and Total Net Generation of Electricity

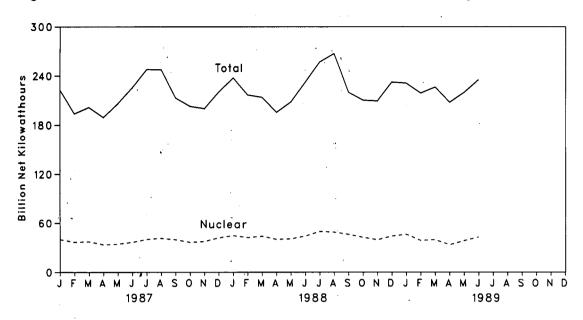

Figure 8.2 Nuclear Power Plants' Capacity Factor and Share of Total Net Generation

Monthly data are the status as of the last day of the month. Annual data are the status as of December 31 of each year.

See Note 1 at end of section.

See Note 2 at end of section.

⁴Net design electrical rating (DER) is used because many of the units were canceled prior to being assigned a net summer capability.

See Note 3 at end of section.

On the December 31, 1988, Form EIA-254 "Semiannual Report on Status of Reactor Construction," the two planned units were re-

Seabrook 2 has been deleted from this category because its construction permit expired in October 1988.

⁹Shoreham received a Full Power Operating License in April 1989. Since the unit is not currently scheduled to operate, it has not been included in the "Operable" column.

Note: Geographic coverage is the 50 States and the District of Columbia.

Sources: See end of section.

Notes and Sources for the Nuclear Section

Notes

1. Operable Units: Nuclear generating units that have been issued a Full Power Operating License by the Nuclear Regulatory Commission (NRC). The Hanford-N unit (840 megawatt-electric (MWe) net summer capability), was included prior to cold shutdown by the Department of Energy (DOE) in February 1988. The Shippingport unit (net summer capability of 60 MWe) operated by DOE was included prior to retirement from service on October 1, 1982, except during March 1974 through August 1977, when it was excluded because of a major core modification outage. The DOE-operated Experimental Breeder Reactor 2 unit (EBR-2) is not included because the electricity it generates is not distributed commercially.

Six units were deleted subsequent to their removal from service: Peach Bottom 1 (net summer capability of 40 MWe) and Indian Point 1 (net summer capability of 265 MWe), both out of service since November 1974; Humboldt Bay (net summer capability of 65 MWe), down since August 1976 for major seismic modifications and subsequently officially retired; Dresden 1 (net summer capability of 200 MWe), out of service since January 1979 for major modifications and officially retired in August 1984; Three Mile Island 2 (net summer capability of 880 MWe), whose core was severely damaged by a loss-of-coolant accident in March 1979; and LaCrosse (net summer capability of 51 MWe), out of service as of April 30, 1987.

Six units with Full Power Operating Licenses have been shut down by the NRC for an extended period. The names of the six units, their net summer capabilities, and dates of shut down are as follows: Browns Ferry 1, 1,065 MWe, March 1985; Browns Ferry 2, 1,065 MWe, September 1984; Browns Ferry 3, 1,065 MWe, March 1985; Peach Bottom 3, 1,035 MWe, March 1987; Nine Mile Point 1, 610 MWe, December 1987; and Shoreham, 809 MWe, April 1989.

- 2. In Startup: One unit, Seabrook 1 (1,186 MWe), has been issued a Low Power Operating License by the NRC authorizing fuel loading and low power testing prior to issuance of a Full Power Operating License.
- 3. Capacity: Nuclear generating units may have more than one type of net capacity rating including:
- (a) Net Summer Capability--The steady hourly output which generating equipment is expected to supply to system load exclusive of auxiliary power, as demonstrated by test at the time of summer peak demand.

Auxiliary power of a typical nuclear power plant is about 5 percent of gross generation.

- (b) Net Design Capacity or Net Design Electrical Rating (DER)--The nominal net electrical output of the unit, specified by the utility and used for plant design.
- 4. Monthly Capacity Factors: The monthly capacity factors are computed as the actual monthly generation divided by the maximum possible generation for that month. The maximum possible generation is the number of hours in the month multiplied by the monthly net summer capability. This fraction is then multiplied by 100 to obtain a percentage. Annual capacity factors are averages of the monthly values for that year.

Section 9. Price

Crude Oil. The average price of domestic crude oil purchased at the wellhead was \$16.40 per barrel in June 1989, 21 percent above the level in June 1988. The refiner acquisition cost of imported crude oil in June 1989 was \$18.27 per barrel, 18 percent above the June 1988 level. The cost of domestic crude oil in June 1989 was \$18.57, an increase of 17 percent from the June 1988 average.

Motor Gasoline. The national city average retail price of leaded regular gasoline at all types of stations was \$1.08 per gallon in July 1989, 16 percent higher than the price in July 1988. The price of unleaded regular gasoline at all types of stations was \$1.09 per gallon in July 1989, 13 percent higher than the price in July 1988. The price of unleaded premium gasoline averaged \$1.26 per gallon in July 1989, 13 percent higher than the price in July 1988.

Residual Fuel Oil. The average price, excluding taxes, of residual fuel oil sold to end users in June 1989 was 39 cents per gallon, 5 percent below the previous month's price but 17 percent above the June 1988 average. The average resale price, excluding taxes, of residual fuel oil in June 1989 was 35 cents per gallon, 6 percent below the May 1989 average but 15 percent above the price 1 year earlier.

Aviation Fuel. The average price, excluding taxes, of aviation gasoline sold to end users in June 1989 was \$1.07 per gallon about the same as the price in the previous month and 23 percent above the price in June 1988. The average price, excluding taxes, of kerosenetype jet fuel sold to end users in June 1989 was 56 cents per gallon, 3 percent below the previous month's price but 6 percent higher than the June 1988 average.

No. 2 Distillate Fuel Oil. The June 1989 national average price, excluding taxes, of heating oil sold to residential customers was 84 cents per gallon, 3 percent

below the May 1989 price but 6 percent higher than the June 1988 price. The average price for resale was 50 cents per gallon in June 1989, 6 percent below the price in the previous month but 6 percent higher than the June 1988 average.

Electricity. Beginning with January 1986, there are new series of national average price estimates based on a statistically derived sample of both publicly and privately owned electric utilities. Previously, average price estimates were derived from selected privately owned electric utilities and were not national averages.

The mean price of electricity to all ultimate consumers in the United States in June 1989 was 6.59 cents per kilowatthour, 2 percent above the June 1988 mean price. The national retail price of electricity to residential consumers in June 1989 was 8.03 cents per kilowatthour, 2 percent higher than the June 1988 price. The price of electricity to commercial consumers averaged 7.39 cents per kilowatthour in June 1989, 3 percent above the June 1988 price. The June national retail price of electricity to other consumers was 5.68 cents per kilowatthour, 4 percent below the June 1988 price. The average electricity price to industrial users during June 1989 was 4.83 cents per kilowatthour, 4 percent above the price 1 year earlier.

Natural Gas. In May 1989 (latest data available) the average wellhead price of natural gas was \$1.66 per thousand cubic feet, 6 percent more than the May 1988 price. The average price of natural gas delivered to electric utility plants was \$2.39 per thousand cubic feet in May 1989, 12 percent above the May 1988 price. The average price of natural gas used by residential consumers in June 1989 was \$6.52 per thousand cubic feet, unchanged from the June 1988 price. The average price of natural gas used by industrial consumers in June 1989 was \$2.69 per thousand cubic feet, slightly higher than the June 1988 price.

The Free on Board (FOB) cost at the country of origin excludes all costs related to insurance and transportation. See Note 2 at end of section.

PThe Arab members of OPEC are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates.

"Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. The cost of imports from the Neutral Zone between Kuwait and Saudi Arabia is included in the cost of imports from "Total OPEC." ^dNo crude oil was imported.

R=Revised data. NA=Not available. W=Value withheld to avoid disclosure of individual company data.

Notes: • Values for the current 2 months are preliminary. • Prices through 1980 reflect the period of reporting; prices since then reflect the period of loading. Annual averages are the weighted average of the 12 monthly prices, including those prices that were not published. • Cargoes that were purchased on a "netback" basis, or under similar contractual arrangements whereby the actual purchase price is not established at the time the crude is acquired for importation into the United States, are not included in the published data until the actual prices have been determined and reported. Sources: See end of section.

^{*}See Note 3 at end of section

^bThe Arab members of OPEC are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates.

e"Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. The cost of imports from the Neutral Zone between Kuwait and Saudi Arabia is included in the cost of imports from "Total OPEC."

^dNo crude oil was imported.

R=Revised data. NA=Not available. W=Value withheld to avoid disclosure of individual company data.

Notes: • Values for the current 2 months are preliminary. • Prices through 1980 reflect the period of reporting; prices since then reflect the period of loading. Annual averages are the weighted average of the 12 monthly prices, including those prices that were not published. • Cargoes that were purchased on a "netback" basis, or under similar contractual arrangements whereby the actual purchase price is not established at the time the crude is acquired for importation into the United States, are not included in the published data until the actual prices have been determined and reported.

See Note 5 at end of section.

PAlso includes types of gasoline not shown separately.

In September 1981, the Bureau of Labor Statistics changed the weights used in the calculation of average motor gasoline prices. From September 1981 forward, in the average for all types category, gasohol is included and unleaded premium is weighted more heavily.

NA=Not available.

Note: Geographic coverage for 1974 through 1977 is 56 urban areas. For 1978 forward, it is 85 urban areas. • Annual values shown in this table are calculated by EIA as the simple average of the monthly data.

^{*}Sales for resale, that is, wholesale sales, are those made to purchasers who are other than ultimate consumers. Sales to end users are those made directly to the ultimate consumer, including bulk customers such as agriculture, industry, and utilities, as well as residential and commercial customers.

bSee Note 5 at end of section.

R=Revised data.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Values for the current month are preliminary. • Prices prior to 1983 are Energy Information Administration estimates. See Note 6 at end of section.

^{*}Prices are calculated by dividing revenues by sales. Revenues may not correspond to sales for a particular month because of utility billing and accounting procedures. This could result in uncharacteristic increases or decreases in the monthly prices.

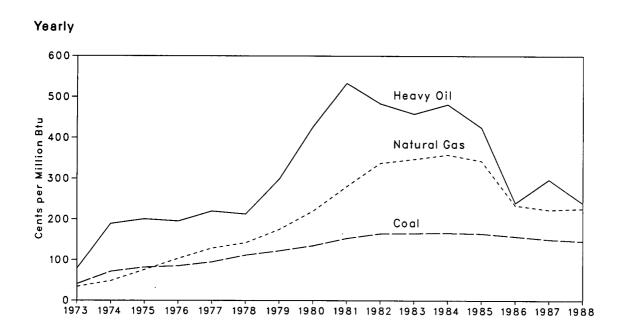

Average price for total sales to ultimate consumers.

Data through 1979 cover privately owned electric utilities in Classes A and B. Data for 1980 forward cover selected privately owned electric utilities in Class A whose electric operating revenues were \$100 million or more during the previous year.

See Note 7 at end of section.

Note: Geographic coverage is the 50 States and the District of Columbia.

^aPrices shown on this page are intended to include all taxes. See Note 9 at end of section. bincludes supplemental gaseous fuels.

NA=Not available.

Data through December 1982 cover all steam-electric utility plants with a capacity of 25 megawatts or greater. From 1974 through 1982, data include peaking units. Beginning with January 1983, data cover steam-electric utility plants with a capacity of 50 megawatts or greater.

The decline from the previous month was primarily the result of refunds in the form of reduced charges.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Data through 1987 are final. Subsequent data are preliminary. Sources: See end of section.

Notes and Sources for the Price Section

Notes

- 1. The average domestic first purchase price represents the average price at which all domestic crude oil is purchased. Prior to February 1976, the price represented an estimate of the average of posted prices; after February 1976, the price represents an average of actual first purchase prices. The data series was previously called "Actual Domestic Wellhead Price."
- 2. FOB literally means "Free on Board." It denotes a transaction whereby the seller makes the product available with an agreement on a given port at a given price; it is the responsibility of the buyer to arrange for the transportation and insurance.
- 3. The landed cost of imported crude oil from selected countries does not represent the total cost of all imported crude. Prior to March 1975, imported crude costs to U.S. company-owned refineries in the Caribbean were not included in the landed cost, and costs of crude oil from countries that export only small amounts to the United States were also excluded. Beginning in March 1975, however, coverage was expanded to include U.S. company-owned refineries in the Caribbean. Landed costs do not include supplemental fees.
- 4. Beginning with January 1981, refiner acquisition costs of crude oil are from data collected on EIA Form 14, the "Refiners' Monthly Cost Report." These prices were previously published from data collected on ERA Form 49, the "Domestic Crude Oil Entitlements Program Refiners Monthly Report." The ERA Form 49 was discontinued with the decontrol of crude oil on January 28, 1981. Crude oil purchases and costs are defined for EIA Form 14 in accordance with conventions used for ERA Form 49. Also, the respondents for the two forms are essentially the same. However, due to possible different interpretations of the filing requirements and a different method for handling prior period adjustments, care must be taken in comparing the data collected on the two forms.

The refiner acquisition cost of crude oil is the average price paid by refiners for crude oil booked into their refineries in accordance with accounting procedures generally accepted and consistently and historically applied by the refiners concerned. Domestic crude oil is that oil produced in the United States or from the outer continental shelf as defined in 43 USC Section 1331. Imported crude oil is either that oil reported on ERA Form 51, the "Transfer Pricing Report," or any crude oil that is not domestic oil. The composite cost is the weighted average of domestic and imported crude oil costs.

Crude oil costs and volumes reported on ERA Form 49 excluded unfinished oils but included the Strategic Petroleum Reserve (SPR). Crude oil costs and volumes reported on the FEA Form P110-M-1 included unfinished oils but excluded SPR. Imported averages derived from ERA Form 49 exclude oil purchased for SPR, whereas the composite averages derived from ERA Form 49 include SPR. None of the prices derived from EIA Form 14 include either unfinished oils or SPR.

5. Several different series of motor gasoline prices are published in this section. U.S. City Average Retail Prices of Motor Gasoline are calculated monthly by the Bureau of Labor Statistics during the development of the Consumer Price Index (CPI). These prices include all Federal, State, and local taxes paid at the time of sale. For the period 1974 through 1978, prices were collected in 56 urban areas. For the period 1978 forward, prices were collected from a new sample of service stations in 85 urban areas selected to represent all urban consumers-about 80 percent of the total U.S. population. The service stations are selected initially, and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full-, mini-, and selfserve).

Refiner and Gas Plant Operator Sales Prices of Finished Motor Gasoline for Resale and to End Users are determined by the Energy Information Administration in a monthly survey of refiners and gas plant operators (Form EIA-782A). The prices do not include any Federal, State, or local taxes paid at the time of sale. Estimates of prices prior to January 1983 are based on FEA Form P302-M-1/EIA-460, "Petroleum Industry Monthly Report for Product Prices," and also exclude all Federal, State, or local taxes paid at the time of sale. Sales for Resale are those made to purchasers who are other-than-ultimate consumers. Sales to End Users are sales made directly to the consumer of the product, including bulk consumers such as agriculture, industry, and utilities, as well as residential and commercial consumers.

6. Starting in January 1983, Form EIA-782, "Monthly Petroleum Product Sales Report," replaced 10 previous surveys. Every attempt was made to continue the most important price series. However, prices published through December 1982 and those published since January 1983 do not necessarily form continuous data series due to changes in survey forms, definitions, instructions, populations, samples, processing systems, and statistical procedures. To provide historical data, continuous annual data series have been generated for 1978-1980, and monthly series for 1981 and 1982, by estimating the prices that would have been published had the EIA-782 survey and system been in operation at that time. This form of estimation was performed after detailed adjustment for product and sales type matching, and for discontinuity due to other factors.

An important difference between the previous and present prices is the distinction between wholesale and resale, and between retail and end user. The resale category continues to include sales among resellers. However, bulk sales to utility, industrial, and commercial accounts previously included in the wholesale category are now counted as made to end users. The end user category continues to include retail sales through company owned and operated outlets but also includes the bulk utility, industrial, and commercial sales. Additional information may be found in "Estimated Historic Time Series for the EIA-782," a feature article reprinted from the December 1983 [3] Petroleum Marketing Monthly published by the Energy Information Administration.

- 7. Beginning with January 1986, national average price estimates are based on a statistically derived sample of both publicly and privately owned electric utilities. Prior to that time, national average price estimates were based on a sample of only privately owned electric utilities. Respondents to Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," formerly the "Electric Utility Company Monthly Statement," consist of a sample of over 200 electric utilities that were statistically chosen using stratification techniques. The respondents were chosen from more than 3,000 electric utilities reporting on Form EIA-861, "Annual Electric Utility Report." This scheme differs from the cut-off sample used prior to January 1986. Data are shown for both the old and new series. Publication of both series will continue until sufficient information exists to estimate historical data based on the new series.
- 8. Heavy fuel oil prices include fuel oils No. 4, No. 5, and No. 6, and topped crude fuel oil prices. The weighted average for all fossil fuels includes both residual fuel oil prices and light oil (No. 2 fuel oil, kerosene, and jet fuel) prices.
- 9. Natural gas prices are intended to include all taxes. Instructions on the data collection forms specifically direct that all U.S., State, and local taxes, surcharges, and/or adjustments billed to consumers are to be included. However, sales and other taxes itemized on consumers' bills are sometimes excluded by the reporting utilities.

- No. 2 Distillate to Residences--January 1983 forward, EIA Form-782A, "Refiners/Gas Plant Operators' Monthly Petroleum Product Sales Report" and EIA-782B, "Resellers/Retailers' Monthly Petroleum Product Sales Report." Prices prior to January 1983 are EIA estimates using data from FEA Form P112-M-1/EIA-9, "No. 2 Heating Oil Supply/Price Monitoring Report" and EIA Form 9A, "No. 2 Distillate Price Monitoring Report." See Note 6 on the previous page for additional information on the estimated data.
- All Other Petroleum Products--January 1983 forward, EIA Form-782A, "Refiners/Gas Plant Operators' Monthly Petroleum Product Sales Report." Prices prior to January 1983 are EIA estimates using data from FEA Form 302-M-1/EIA-460, "Petroleum Industry Monthly Report for Product Prices." See Note 6 on the previous page for additional information on the estimated data.

Natural Gas:

• Average Wellhead--Annual data through 1982 from EIA, Natural Gas Annual, 1973 through 1982. Annual data for 1983 through 1987 from Form EIA-627, "Annual Quantity and Value of Natural Gas Report" and the U.S. Minerals Management Service. Monthly data from January 1988 forward and the 1988 average are estimated primarily on the basis of values reported by State agencies in Mississippi, New Mexico, Oklahoma, and Texas. These States together account for almost 50 percent of total U.S. marketed production. The monthly and annual estimates are adjusted to conform with final reported annual data.

- Imports and Purchases from Producers by Major Interstate Pipeline Companies--FERC Form 11, "Interstate Pipeline Company Purchases, and Industrial Sales".
- City Gate--EIA, October 1983 forward: Form EIA-857, "Monthly Report of Natural Gas Purchases and Deliveries to Consumers."
- Residential, Commercial, Industrial and Consumer Average--Annual data from EIA, Form EIA-176 "Annual Report of Natural and Supplemental Gas Supply and Disposition." Monthly data from EIA, Form EIA-857, "Monthly Report of Natural Gas Purchases and Deliveries to Consumers." Monthly data are adjusted to conform to final reported annual data.

 Electric Utilities--EIA, FPC Form 423, "Monthly Report of Cost and Quality of Fuels for Electric Plants."

Electricity:

- Cost of Fossil Fuels--EIA, FPC Form 423, "Monthly Report of Cost and Quality of Fuels for Electric Plants."
- Retail Prices--EIA, January 1973 through February 1980: FPC Form 5, "Monthly Statement of Electric Operating Revenue and Income"; March 1980 through December 1982: FERC Form 5, "Electric Utility Company Monthly Statement"; January 1983 through December 1986: Form EIA-826, "Electric Utility Company Monthly Statement"; January 1987 forward: Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions."

Section 10. International

Crude Oil Production. World crude oil production during June 1989 was 59 million barrels per day, up 0.2 million barrels per day from the level in the previous month. World crude oil production in the first half of 1989 averaged 59 million barrels per day, up 3 percent from the first half 1988 level.

Organization of Petroleum Exporting Countries (OPEC) production during June 1989 averaged 23 million barrels per day, up 0.6 million barrels per day from the level during the previous month. OPEC production in the first half of 1989 averaged 22 million barrels per day, a 13-percent increase from the first half 1988 average. Production by the Arab members of OPEC during June 1989 averaged 14 million barrels per day, up 0.1 million barrels per day from the May 1989 level. Production by Arab members of OPEC during the first half of 1989 averaged 13 million barrels per day, 12 percent above the first half 1988 level. During June 1989, production increased in the United Arab Emirates by 270 thousand barrels per day, in Kuwait by 100 thousand barrels per day, and in Qatar by 10 thousand barrels per day. Production decreased in Saudi Arabia by 200 thousand barrels per day and in Iraq by 50 thousand barrels per day. Production was unchanged in Algeria and Libya. Among the non-Arab members of OPEC, production during June 1989 increased in Iran by 300 thousand barrels per day, in Nigeria by 100 thousand barrels per day, and in Venezuela by 50 thousand barrels per day. Production was unchanged in Indonesia.

Among the non-OPEC nations, Canada registered a production increase in June 1989 of 19 thousand barrels per day from the level in the previous month. The United Kingdom and the United States registered decreases in production of 189 thousand barrels per day and 147 thousand barrels per day, respectively. Production was unchanged in Mexico, China, and the U.S.S.R.

Petroleum Consumption. In March 1989, consumption in all Organization for Economic Cooperation and Development (OECD) countries was 39 million barrels

per day, almost 1 percent higher than the level in March 1988. Compared with levels 1 year earlier, consumption was higher in Japan by 8 percent and in both Canada and the United States by 2 percent. Consumption in all European OECD countries combined in March 1989 was 13 million barrels per day, 3 percent lower than the level in the previous March. Consumption was higher in Italy by 6 percent but lower in West Germany and in France by 11 percent and 1 percent, respectively, but essentially unchanged in the United Kingdom, compared with levels 1 year earlier.

Petroleum Stocks. For all OECD countries, petroleum stocks at the end of March 1989 totaled 3.4 billion barrels, 2 percent higher than the ending stock level in March 1988. Stocks were higher in Japan by 6 percent and in the United States by 1 percent but lower in Canada by 9 percent, compared with levels 1 year earlier. Stock levels in all European OECD countries as of the end of March 1989 were 1.1 billion barrels, 3 percent higher than in March 1988. Stocks were higher in France by 14 percent, in West Germany by 2 percent, and in Italy by 1 percent but the same level in the United Kingdom, compared with levels 1 year earlier.

Nuclear Electricity Generation. In June 1989, the 20 non-Communist countries with nuclear capacity generated 127 gross terawatthours (billion kilowatthours) of nuclear-generated electricity, slightly more than in June 1988.

Based on *Nucleonics Week* information, as of June 30, 1989, there were 352 operable nuclear generating units in the 20 non-Communist countries. The units had a collective gross generating capacity of 288.7 gigawatts (million kilowatts).

On June 22, 1989, Japan's Tomari-1 unit became commercially operable.

In June 1989, the 110 U.S. units accounted for 103.8 gross gigawatts, 36.0 percent of the total non-Communist nuclear generating capacity.

Footnotes continued on following page.

^{*}Includes lease condensate, excludes natural gas plant liquids.
*Includes about one-half of the production in the Kuwait-Saudi Arabia Neutral Zone. In June 1989, total production in that region amounted to approxi-

mately 390 thousand barrels per day.

"The Arab members of the Organization of Petroleum Exporting Countries (OPEC) are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. Production in the Neutral Zone between Kuwait and Saudi Arabia is included in "Arab OPEC" production.

Footnotes continued

d"Total OPEC" consists of Algeria, Ecuador, Gabon, Indonesia, Iran, Iraq, Kuwalt, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela. Production from the Neutral Zone between Kuwait and Saudi Arabia is included in "Total OPEC" production.

The Persian Gulf Nations are Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and the United Arab Emirates. Production from the Neutral Zone between Kuwait and Saudi Arabia is included in "Persian Gulf Nations" production.

Other is a calculated total derived from the difference between World and the sum of production in Total OPEC, Canada, Mexico, the United Kingdom, the United States, China and the USSR.

World excluding Albania, Bulgaria, China, Cuba, Czechoslovakia, East Germany, Hungary, Kampuchea, Laos, Mongolia, North Korea, Poland, Romania, U.S.S.R., Vietnam, and Yugoslavia.

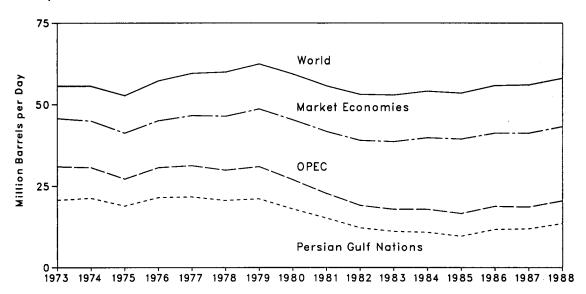

R=Revised data. E=Estimate.

Note: • U.S. geographic coverage is the 50 States and the District of Columbia. • Monthly data are often preliminary figures and may not average to the annual totals because of rounding or because updates to the preliminary monthly data are not available.

Petroleum stocks include crude oil (including strategic reserves), unfinished oils, natural gas plant liquids, and refined products. Petroleum stocks include all nonmilitary petroleum held for storage, regardless of ownership, within each country in bulk terminals, refinery tanks, pipeline tankage, intercoastal tankers, tankers in port, and inland ship bunkers. Data exclude oil held in pipelines (except for the United States), rail and truck cars, sea-going ships'

bunkers, service stations, retail stores, and tankers at sea.

The Organization for Economic Cooperation and Development (OECD) includes Canada, Japan, and the United States, as well as "OECD Europe"

and "Other OECD."

"OECD Europe" consists of Austria, Belgium, Denmark, Finland, France, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and West Germany.

d"Other OECD" consists of Australia, New Zealand, and the U.S. Territories.

R=Revised data. Notes: • U.S. geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. • In the United States in January 1975, 1981, and 1983, numerous respondents were added to bulk terminal and pipeline surveys affecting subsequent stocks reported. Using the new basis, the end-of-year U.S. stocks, in million barrels, would have been 1,121 in 1974, 1,420 in 1980, and

1,462 in 1982. • Data through 1986 are final. Subsequent data are preliminary. Sources: • U.S. data: Energy Information Administration, Petroleum Supply Annual. • OECD data: International Energy Agency, Quarterly Oil Statistics, Monthly Oil Statistics.

^{*}Figures are for gross electricity generation, as opposed to net electricity generation. Net figures are generally less than gross figures by about 5 percent, the difference being the energy consumed by the generating plants themselves.

*Monthly data for the United Kingdom are totals for 4- or 5-week reporting periods, not calendar months.

*Some Central Electricity Generating Board figures were unavailable for March 1988. This number does not reflect the total generation for

⁽s)=Less than 0.05 billion gross kilowatthours. Footnotes continued on following page.

Appendix. Conversion Factors

Using Conversion Factors

Physical conversion factors can be used to compare energy quantities expressed in units of volume and weight. For example, 6.65 barrels of crude oil weighs approximately 1 short ton, as indicated in Table A1.

However, the heat content of a "short ton" of crude oil is greater than the heat content of a short ton of coal. The heat content, measured in British thermal units (Btu), of a given quantity of energy can be calculated using the thermal conversion factors presented in Tables A2 through A9.

Based on the thermal conversion factor shown for crude oil (production) in Table A2, a short ton of crude oil has a heat content of approximately 39 million Btu (6.65 barrels × 5.8 million Btu per barrel = 38.57 million Btu, which rounds to 39). As calculated from the thermal conversion factor for coal (production) in Table A6, a short ton of coal has a heat content of 22

million Btu (1 short ton $\times 21.922$ million Btu per short ton = 21.922 million Btu, which rounds to 22). A short ton of crude oil, therefore, has a heat content almost two times greater than does a short ton of coal.

The thermal conversion factors in Tables A2 through A9 are computed from final annual data. When the current year's final data are not yet available for publication, thermal conversion factors for the current year are computed from the best available data and are labeled "preliminary." The source of each factor is described in a section entitled "Thermal Conversion Factor Source Documentation," which follows Table A9 in this appendix.

Thermal conversion factors for hydrocarbon mixes (Table A2) are weighted averages of the thermal conversion factors for each hydrocarbon included in the mix. For example, in calculating the thermal conversion factor for a 60/40 butane/propane mixture, the thermal conversion factor for butane is weighted 1.5 times more heavily than the thermal conversion factor for propane.

Table A1. Physical Conversion Factors for Energy Units

Unit	Equ	ivalent
Crud	e Oil (Average G	ravity)
1 U.S. barrel	42	U.S. gallons
1 short ton	6.65	barrels
1 metric ton	7.33	barrels
	Coal	
1 short ton	2,000	pounds
1 long ton	2,240	pounds
1 metric ton	2,204.62	pounds
1 metric ton	1,000	kilograms
	Uranium	
1 short ton U ₃ O ₈	0.769	metric ton of uranium
1 short ton UF ₆	0.613	metric ton of uranium
1 metric ton UF ₈	0.676	metric ton of uranium
Wood (Average Dry Har	dwood)
1 cord	1.25	short tons
1 cord	128	cubic feet
1 cubic foot	0.028	cubic meters

^{*}This thermal conversion factor is used for hydroelectric power generation and for wood and waste, wind, photovoltaic, and solar thermal energy consumed at electric utilities.

**Preliminary.

Sources: See "Thermal Conversion Factor Source Documentation," which follows this table.

Thermal Conversion Factor Source Documentation

Approximate Heat Content of Petroleum Products

Asphalt. 1973 forward: The Energy Information Administration (EIA) adopted the thermal conversion factor of 6.636 million British thermal units (Btu) per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement*, Annual, 1956.

Aviation Gasoline. 1973 forward: EIA adopted the thermal conversion factor of 5.048 million Btu per barrel as adopted by the Bureau of Mines from the Texas Eastern Transmission Corporation publication Competition and Growth in American Energy Markets 1947-1985, 1968.

Butane. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 4.326 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Butane-Propane Mixture. 1973 forward: EIA adopted the Bureau of Mines calculation of 4.130 million Btu per barrel based on an assumed mixture of 60 percent butane and 40 percent propane. See "Butane" and "Propane."

Distillate Fuel Oil. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.825 million Btu per barrel as reported in a Bureau of Mines internal memorandum, Bureau of Mines Standard Average Heating Value of Various Fuels, adopted January 3, 1950.

Ethane. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 3.082 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Ethane-Propane Mixture. 1979 forward: EIA calculated 3.308 million Btu per barrel based on an assumed mixture of 70 percent ethane and 30 percent propane. See "Ethane" and "Propane."

Isobutane. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 3.974 million Btu per barrel as published in the California Oil World and Petroleum Petroleum Industry, First Issue, April 1942.

Jet Fuel, Kerosene Type. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as published for "Jet Fuel, Commercial" by the Texas Eastrn Transmission Corporation in the report Competition and Growth in American Energy Markets 1947-1985, 1968.

Jet Fuel, Naphtha Type. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.355 million Btu per barrel as published for "Jet Fuel, Military" by the Texas Eastern Transmission Corporation in the report Competition and Growth in American Energy Markets 1947-1985. 1968.

Kerosene. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as reported in a Bureau of Mines internal memorandum, Bureau of Mines Standard Average Heating Values of Various Fuels, adopted January 3, 1950.

Lubricants. 1973 forward: EIA adopted the thermal conversion factor of adopted the thermal conversion factor of 6.065 million Btu per barrel as estimated by the 6.065 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Miscellaneous Products. 1973 forward: EIA adopted the thermal conversion factor of 5.796 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement*, *Statement*, *Annual*, 1956.

Motor Gasoline. 1973 forward: EIA adopted the Bureau of Minesthermal conversion factor of 5.253 million Btu per barrel as published for "Gasoline, Motor Fuel" by the Texas Eastern Transmission Corporation in the report Competion and Growth in American Energy Markets 1947-1985, 1968.

Natural Gasoline. 1973 forward: EIA adopted the thermal conversion factor of 4.620 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Pentanes Plus. 1984 forward: EIA assumed the thermal conversion factor to be 4.620 million Btu per barrel or equal to that for natural gasoline. See "Natural Gasoline."

Petrochemical Feedstocks, Naphtha 400 Degrees Fahrenheit or Less. 1973 forward: Assumed by EIA to be 5.248 million Btu per barrel, equal to the thermal conversion to the thermal conversion factor for special naphtha. See "Special Naphtha."

Petrochemical Feedstock, Oils Over 400 Degrees Fahrenheit. 1973 forward: Assumed by EIA to be 5.825 million Btu per barrel, equal to the thermal conversion factor for distillate fuel oil. See "Distillate Fuel Oil."

Petrochemical Feedstock, Still Gas. 1973 forward: Assumed by EIA to be 6.000 million Btu per barrel, equal to the thermal conversion factor for still gas. See "Still Gas."

Petroleum Coke. 1973 forward: EIA adopted the thermal conversion factor of 6.024 million Btu per barrel as reported in Btu per short ton in the Bureau of Mines internal Bureau of Mines internal memorandum Bureau of Mines Standard Average Heating Value of Standard Average Heating Value of Various Fuels, adopted Various Fuels, adopted January 3, 1950. The Bureau of Mines calculated this factor by dividing the 30,120,000 Btu per short ton as given in the referenced Bureau of Mines internal memorandum by 5.0 barrels per short ton as given in the Bureau of Mines Form 6-1300-M and successor EIA forms.

Plant Condensate. 1973 forward: Estimated to be 5.418 million Btu per barrel by EIA from data provided by McClanahan Consultants, Inc., Houston, Texas.

Propane. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 3.836 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Residual Fuel Oil. 1973 forward: EIA adopted the therml conversion factor of 6.287 million Btu per barrel as reported in the Bureau of Mines internal memorandum Bureau of Mines Standard Average Heating Values of Various Fuels, adopted January 3, 1950.

Road Oil. 1973 forward: EIA adopted the Bureau of Mines thermal conversion factor of 6.636 million Btu per barrel which was assumed to be equal to that of asphalt (see "Asphalt") and was first published by the Bureau of Mines in the *Petroleum Statement, Annual*, 1970.

Special Naphtha. 1973 forward: EIA adopted the Bureau of Minesthermal conversion factor of 5.248 million Btu per barrel which was assumed to be equal to that of total gasoline (avaiation and motor) factor and was first published in the *Petroleum Statement, Annual, 1970.*

Still Gas. 1973 forward: EIA adopted the Bureau of Mines estimated thermal adopted the Bureau of Mines estimated thermal conversion factor of 6.000 million Btu per barrel and first published in the *Petroleum Statement*, Annual, 1970.

Unfinished Oil. 1973 forward: EIA assumed the thermal conversion factor to be 5.825 million Btu per barrel or equal to that for distillate fuel oil (see "Distillate Fuel Oil") and first published in the Annual Report to Congress, Volume 3, 1977.

Unfractionated Stream. 1979 forward: EIA assumed the thermal conversion factor to be 5.418 million Btu per barrel or equal to that for plant condensate (see "Plant Condensate") and first published in the Annual Report to Congress, Volume 2, 1981.

Wax. 1973 forward: EIA adopted the thermal conversion factor of 5.537 million Btu per barrel as estimated

by the Bureau of Mines and first published in the Petroleum Statement, Annual, 1956.

Approximate Heat Content of Fuels

Petroleum

Crude Oil, Exports. 1973 forward: Assumed by EIA to be 5.800 million Btu per barrel or equal to the thermal conversion factor for crude oil produced in the United States. See "Crude Oil and Lease Condensate, Production."

Crude Oil, Imports. 1973 forward: Calculated annually by EIA by weighting the thermal conversion factor of each type of crude oil imported by the quantity imported. Thermal conversion factors for each type were calculated on a foreign country basis, by determining the average American Petroleum Institute (API) gravity of crude imported from each foreign country from Form ERA-60 in 1977 and converting average API gravity to average Btu content using National Bureau of Standards, Miscellaneous Publication No. 97, Thermal Properties of Petroleum Products, 1933.

Crude Oil and Lease Condensate, Production. 1973 forward: EIA adopted the thermal conversion factor of 5.800 million Btu per barrel as reported in a Bureau of Mines internal memorandum Bureau of Mines Standard Average Heating Values of Various Fuels, adopted January 3, 1950.

Crude Oil and Petroleum Products, Exports. 1973 forward: Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product exported and crude oil exported weighted by the quantity of each petroleum product and crude oil exported. See "Crude Oil, Exports," and "Petroleum Products, Exports."

Crude Oil and Petroleum Products, Imports. 1973 forward: Calculated annually by EIA as the average of the thermalconversion factors for each petroleum product and each type of crude oil imported weighted by the quantity of each petroleum product and each type of crude oil imported. See "Crude Oil, Imports" and "Petroleum Products, Imports."

Natural Gas Plant Liquids, Production. 1973 forward: Calculated annually by EIA as the average of the thermal conversion factors of each natural gas plant liquid produced weighted by the quantity of each natural gas plant liquid produced.

Petroleum Products, Consumption. 1973 forward: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products con-

sumed, weighted by the quantity of each petroleum product consumed.

Petroleum Products, Consumption by Electric Utilities. 1973-1987: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed at electric utilities, weighted by the quantity of each petroleum product consumed at electric utilities. The quantity of petroleum consumed is estimated in the State Energy Data System as documented in the State Energy Data Report. 1988 forward: Estimated by EIA.

Petroleum Products, Consumption by Industrial Users. 1973-1987: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed in the industrial sector, weighted by the estimated quantity of each petroleum product consumed in the industrial sector. The quantity of petroleum products consumed is estimated in the States Energy Data System as documented in the State Energy Data Report. 1988 forward: Estimated by EIA.

Petroleum Products, Consumption by Residential and Commercial Users. 1973-1987: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed by the residential and commercial sector, weighted by the estimated quantity of each petroleum product consumed in the residential and commercial sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in the State Energy Data Report. 1988 forward: Estimated by EIA.

Petroleum Products, Consumption by Transportation Users. 1973-1987: Calculated annually by EIA as the average of the thermal conversion factor for all petroleum products consumed in the transportation sector, weighted by the estimated quantity of each petroleum product consumed in the transportation sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in the State Energy Data Report. 1988 forward: Estimated by EIA.

Petroleum Products, Exports. 1973 forward: Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product weighted by the quantity of each petroleum product exported.

Petroleum Products, Imports. 1973 forward: Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product imported weighted by the quantity of each petroleum product imported.

Petroleum Products, Liquefied Petroleum Gases (LPG) Consumption. 1973 forward: Calculated annually by EIA as the average of the thermal conversion factors of each liquefied petroleum gas consumed weighted by the quantity of each liquefield petroleum gas consumed.

Natural Gas

Natural Gas, Consumption. 1973-1979: EIA adopted the thermal conversion factor calculated annually by the American Gas Association (AGA) and published in Gas Facts, an AGA annual.

1980 forward: Calculated annually by EIA by dividing the total heat content of natural gas consumed by the total quantity natural gas consumed. Heat content and quantity consumed are from Form EIA-176.

Natural Gas, Consumption by Electric Utilities. 1973 forward: Calculated annually by EIA by dividing the total heat content of natural gas received at electric utilities by the total quantity received at electric utilities. The heat contents and receipts are from FERC Form 423 and predecessor forms.

Natural Gas, Consumption by Non-Electric Utility Users. 1973 forward: Calculated annually by EIA by dividing the heat content of natural gas consumed by non-electric utility consumers by the quantity of non-electric utility natural gas consumed. Data are from Forms EIA-176, FERC Form 423, EIA-759, and predecessor forms.

Natural Gas, Exports. 1973 forward: Calculated annually by EIA by dividing the heat content of exported natural gas by the quantity of natural gas exported, both reported on Form FPC-14.

Natural Gas, Imports. 1973 forward: Calculated annually by EIA by dividing the heat content of imported natural gas by the quantity of natural gas imported, both reported on Form FPC-14.

Natural Gas Production, Dry. 1973 forward: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See "Natural Gas, Consumption."

Natural Gas Production, Marketed (Wet). 1973 forward: Calculated annually by EIA by adding the heat content of dry natural gas production and the total heat content of natural gas plant liquids production and dividing this sum by the total quantity of marketed (wet) natural gas production.

Coal and Coal Coke

Anthracite, Consumption. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of anthracite consumed by electric utilities and non-electric utilities by the total quantity of anthracite consumed.

Anthracite, Consumption by Electric Utilities. 1973 forward: Calculated annually by EIA by dividing the heat content of anthracite receipts at electric utilities by the quantity of anthracite received at electric utilities. Heat contents and receipts are from FERC Form 423 and predecessor forms.

Anthracite, Consumption by Non-Electric Utility Users. 1973 forward: Calculated annually by EIA by dividing the heat content of anthracite production less the heat content of the he anthracite consumed at electric utilities, net exports, and shipments to U.S. Armed Forces overseas by the quantity of non-electric utility anthracite consumption less the quantity of anthracite stock changes, losses, and unaccounted for.

Anthracite, Imports and Exports. 1973 forward: EIA assumed the anthracite imports and exports to be freshly mined anthracite having an estimated heat content of 25.40 million Btu per short ton.

Anthracite, Production. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of freshly mined anthracite (estimated to have an average heat content of 25.400 million Btu per short ton) and the heat content of anthracite recovered from culm banks and river dredging (estimated to have a heat content of 17.500 million Btu per short ton) by the total quantity of anthracite production.

Bituminous Coal and Lignite, Consumption. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumed by electric utilities, coal coke plants, other industrial plants, the residential and commercial sector, and the transportation sector by the sum of their respective tonnages.

Bituminous Coal and Lignite, Consumption by Coke Plants. 1973 forward: Estimated by EIA to be 26.800 million Btu per short ton based on an input/output analysis of coal carbonization.

Bituminous Coal and Lignite, Consumption by Electric Utilities. 1973 forward: Calculated annually by EIA by dividing the total heat content of bituminous coal and lignite received at electric utilities by the total quantity received at electric utilities. Heat contents and receipts are from FERC Form 423 and predecessor forms.

Bituminous Coal and Lignite, Consumption by Other Industrial and Transportation Users. 1973: Calculated by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by other industrial users and that of coal consumed at electric utilities in the 1974-1982 period. 1974 forward: Calculated annually by EIA assuming that the bituminous coal and lignite delivered to other industrial users from each coal-producing district (reported on EIA Form 6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to

bituminous coal and lignite received at electric utilities from each of the same coal-producing districts (reported on FERC Form 423). The average Btu value of coal by coal-producing district was applied to the volume of deliveries to other industrial users from each coal-producing district, and the sum total of the heat content was divided by the total volume of deliveries.

Bituminous Coal and Lignite, Consumption by Residential and Commercial Users. 1973: Calculated by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by residential and commercial users and that of coal consumed by electric utilities in the 1974-1982 period. 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to residential and commercial users from each coalproducing district (reported on EIA Form 6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to bituminous coal and lignite received at electric utilities from each of the same coalproducing districts (reported on FERC Form 423). The average Btu value of coal by coal-producing district was applied to the volume of deliveries to residential and commercial users from each coal-producing district, and the total of the heat value was divided by the total volume of deliveries.

Bituminous Coal and Lignite, Exports. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of exported metallurgical coal (estimated to average 27.000 million Btu per short ton) and the heat content of exported steam coal (estimated to have an average thermal content of 25.000 million Btu per short ton) by the total quantity of bituminous coal and lignite exported.

Bituminous Coal and Lignite, Imports. 1973 forward: EIA estimated the average thermal conversion factor to be 25.000 million Btu per short ton.

Bituminous Coal and Lignite, Production. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumption, net exports, stock changes, and unaccounted for by the sum of their respective tonnages. Consumers' stock changes by sectors were assumed to have the same conversion factor as the consumption sector. Producers' stock changes and unaccounted for were assumed to have the same conversion factor as consumption by all users.

Coal, Consumption. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumption by the sum of their respective tonnages.

Coal, Consumption by Electric Utilities. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite received at electric utilities by the sum of their respective tonnages received.

Coal, Consumption by Non-Electric Utility Users. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumed by non-electric utility users by the sum of their respective tonnages.

Coal, Exports. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite exported by the sum of their respective tonnages.

Coal, Imports. 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite imported by the sum of their respective tonnages.

Coal, Production. 1973 forward: Calculated annually by EIA by dividing the sum of the total heat content of bituminous coal and lignite and anthracite production by the sum of their respective tonnages.

Coal Coke, Imports and Exports. 1973 forward: EIA adopted the Bureau of Mines estimate of 24.800 million Btu per short ton.

Approximate Heat Rates for Electricity

Fossil Fuel Steam-Electric Power Plant Generation.
There is no generally accepted practice for measuring

the thermal conversion rates for power plants that generate electricity from hydroelectric, wood and waste, wind, photovoltaic, or solar thermal energy sources. EIA has selected a rate that is equal to the prevailing annual average heat rate factor for fossil-fueled steamelectric power plants in the United States. By using that factor, it is possible to evaluate fossil fuel requirements for replacing those sources during periods of interruption such as droughts. The heat content of a kilowatthour of electricity produced, regardless of the generation process, is 3,412 Btu per kilowatthour. 1973 forward: The weighted annual average heat rate for fossil-fueled steam-electric power plants in the United States, as published by EIA in Historical Plant Cost and Annual Production Expenses for Selected Electric Plants.

Geothermal Energy Power Plant Generation. 1973-1981: Calculated annually by EIA by weighting the average annual heat rates of operating geothermal units by the installed nameplate capacities as reported on Form FPC-12. 1982 forward: Estimated annually by EIA based on an informal survey of relevant plants.

Nuclear Power Plant Generation. 1973 forward: Calculated annually by EIA by dividing the total heat content consumed in reactors at nuclear plants by the total (net) electricity generated by nuclear plants as reported on Form FERC-1, EIA-412 and predecessor forms, and as published beginning with 1982 data in EIA, Historical Plant Cost and Annual Production Expenses for Selected Electric Plants.

Glossary

Anthracite: A hard, black, lustrous coal containing a high percentage of fixed carbon and a low percentage of volatile matter. It is often referred to as hard coal. It includes meta-anthracite and semianthracite and conforms to ASTM Specification D388 for anthracite.

ASTM: The acronym for the American Society for Testing and Materials.

Base Gas: The volume of gas needed as a permanent inventory to maintain adequate underground storage reservoir pressures and deliverability rates throughout the withdrawal season. All native gas is included in the base gas volume.

Bituminous Coal: A coal that is high in carbonaceous matter having a volatility greater than anthracite and a calorific value greater than lignite. In the United States, it is often referred to as soft coal. In this report, "bituminous coal" conforms to ASTM Specification D388 for bituminous and subbituminous coal. It is used primarily for electricity generation, coke production, and space heating.

British Thermal Unit (Btu): The amount of energy required to raise the temperature of 1 pound of water 1 °F at or near 39.2 °F. One Btu is equivalent to about 252 International Steam Table calories. An average Btu content of fuel is a heat value per unit quantity of fuel as determined from tests of fuel samples.

Butane: A normally gaseous, paraffinic hydrocarbon (C_4H_{10}) extracted from natural gas or refinery gas streams. It includes isobutane (branch-chain) and normal butane (straight-chain) and is covered by ASTM Specification 1835 and Natural Gas Processors Specifications for commercial butane. It is used primarily for blending into high-octane gasoline, for residential and commercial heating, and for industrial purposes, especially the manufacture of chemicals and synthetic rubber.

Butylene: A normally gaseous, olefinic hydrocarbon (C_4H_8) recovered from refinery processes. Quantities are included with "normal butane" data.

City Gate Price of Natural Gas: Price of natural gas at the point it is transferred from a pipeline company to a local distribution company.

Coal: Includes all ranks of coal--anthracite, bituminous coal, subbituminous coal, and lignite--conforming to ASTM Specification D388.

Coal Coke: The strong, porous residue, consisting of carbon and mineral ash, that is formed when the volatile constituents of bituminous coal are driven off by heat in the absence of or in a limited supply of air. It is used primarily in blast furnaces for smelting ores, especially iron ore.

Commercial Sector: Nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; health, social, and educational institutions; and Federal, State, and local governments. Street lights, pumps, bridges, and public services are also included. (For allocation of individual fuels to end-use sectors, see the Notes and Sources for Section 2.)

Crude Oil Average Domestic First Purchase Price: The average price at which all domestic crude oil is purchased. Prior to February 1976, the price represented an estimate of the average of posted prices; after February 1976, the price represents an average of actual first purchase prices. This price is frequently called the wellhead price.

Crude Oil (including lease condensate): A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Included are lease condensate and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale. Drip gases are also included, but topped crude oil (residual oil) and other unfinished oils are excluded. Liquids produced at natural gas processing plants and mixed with crude oil are excluded where identifiable.

Crude Oil Refinery Input: Total crude oil (including lease condensate) input to crude oil distillation units and other processing units.

Crude Oil Stocks: Stocks of crude oil and lease condensate held at refineries, in pipelines, at pipeline terminals, and on leases.

Degree-Day Normals: Simple arithmetic averages of monthly or annual degree-days over a long period of time (usually the 30-year period 1951-1980). These may

be simple degree-day normals or population-weighted degree-day normals.

Degree-Days, Cooling: The number of degrees per day that the daily average temperature is above 65 °F. The daily average temperature is the mean of the maximum and minimum temperatures for a 24-hour period.

Degree-Days, Heating: The number of degrees per day that the daily average temperature is below 65 °F. The daily average temperature is the mean of the maximum and minimum temperatures for a 24-hour period.

Degree-Days, Population-Weighted: Heating or cooling degree-days weighted by the population of the area in which the degree-days are recorded. To compute State population-weighted degree-days, each State is divided into from one to nine climatically homogeneous divisions which are assigned weights based on the ratio of the population of the division to the total population of the State. Degree-day readings for each division are multiplied by the corresponding population weight for each division and these products are then summed to arrive at the State population-weighted degree-day figure.

To compute national population-weighted degree-days, the Nation is divided into nine Census regions, each composed of from three to eight States. The regions are assigned weights based on the ratio of the population of the region to the total population of the Nation. Degree-day readings for each region are multiplied by the corresponding population weight for each region and these products are then summed to arrive at the national population-weighted degree-day figure.

Development Well: A well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive.

Distillate Fuel Oil: Light fuel oils distilled during the refining process and used primarily for space heating, on- and off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation. Included are products known as No. 1, No. 2, and No. 4 fuel oils, and No. 1, No. 2, and No. 4 diesel fuels, conforming to ASTM Specifications D396 or D975, respectively. No. 1 fuel oil is a light distillate fuel oil used in vaporizing pot-type burners. No. 2 fuel oil is used in atomizing-type burners for domestic heating or for moderate capacity commercial-industrial burner units. No. 4 fuel oil is a blend of distillate fuel oil and residual fuel oil that is used in commercial burner installations not equipped with preheating facilities; it is used extensively in industrial plants. Diesel fuel oils are used in compressionignition engines.

Dry Hole: An exploratory or development well found to be incapable of producing either oil or gas in suffi-

cient quantities to justify completion as an oil or gas

Electrical System Energy Losses: The amount of energy lost during generation, transmission, and distribution of electricity, including plant use and unaccounted for electrical energy.

Electricity Generation: Net electricity (gross electricity output measured at the generator terminals, minus power plant use) generated at electric utilities. Excludes industrial electricity generation. International data are gross electricity output.

Electricity Sales: The gross electricity output measured at the generator terminals, minus power plant use and transmission and distribution losses. Included in each end-use sector are the following: commercial sales of electricity to businesses that generally require less than 1,000 kilowatts of service; industrial sales of electricity to businesses that generally require more than 1,000 kilowatts of service; residential sales of electricity to residences for household purposes; "other" sales of electricity to government, railways, street lighting authorities, and sales not elsewhere included.

Electric Utility: A corporation, person, agency, authority, or other entity that owns or operates facilities for the generation, transmission, distribution, or sale of electricity, primarily for use by the public.

Electric Utility Sector: Privately and publicly owned establishments that generate electricity primarily for use by the public.

Ethane: A normally gaseous, paraffinic hydrocarbon (C_2H_6) extracted from natural gas or refinery gas streams. It is used primarily as petrochemical feedstock for production of chemicals and plastic materials.

Ethylene: A normally gaseous, olefinic hydrocarbon (C_2H_4) recovered from refinery processes. Quantities are included with "ethane" data.

Exploratory Well: A well drilled to find and produce oil or gas in an unproved area; to find a new reservoir in a field previously found to be productive of oil or gas in another reservoir; or to extend the limit of a known oil or gas reservoir.

Exports: Shipments of goods from the 50 States and the District of Columbia to foreign countries, Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

F.o.b. (free on board) Price of Imported Crude Oil: The f.o.b. price is the price actually charged at the producing country's port of loading. The reported price includes deductions for any rebates and discounts and additions of premiums where applicable; it should be the actual price paid with no adjustments for credit terms.

Fossil Fuel Steam-Electric Power Plant: An electricity generation plant in which the prime mover is a turbine rotated by high-pressure steam produced in a boiler by heat from burning fossil fuels.

Gas Well: A well completed for the production of natural gas from one or more gas zones or reservoirs. (Wells producing both crude oil and natural gas are classified as oil wells.)

Geothermal Energy (as used at electric utilities): Hot water or steam, extracted from geothermal reservoirs in the earth's crust, which is supplied to steam turbines at electric utilities that drive generators to produce electricity.

Gross Energy Consumption: Total energy use including electrical system energy losses.

Gross National Product (GNP): The total value of goods and services produced by the Nation's economy, before deduction of depreciation charges and other allowances for capital consumption. It includes the total purchases of goods and services by private consumers and government, gross private domestic capital investment, and net foreign trade.

Gross Wet Gas Withdrawal: Full well stream volume, including all natural gas plant liquid and nonhydrocarbon gases, but excluding lease condensate. Also includes amounts delivered as royalty payments or consumed in field operations.

Hydroelectric Power: Electricity generated by an electric power plant whose turbines are driven by falling water.

Imports: Receipts of goods into the 50 States and the District of Columbia from foreign countries, Puerto Rico, the Virgin Islands, and other U.S. possessions and territories. (See Petroleum Imports.)

Industrial Sector: Manufacturing, construction, mining, agriculture, fishing, and forestry establishments. (For allocation of individual fuels to end-use sectors, see the Notes and Sources for Section 2.)

Isobutane: See Butane.

Landed Cost of Crude Oil Imports: The price of imported crude oil at the port of discharge. It includes the purchase price at the foreign port plus charges for transporting and insuring the crude oil from the purchase point to the port of discharge. It does not include import tariffs or fees, wharfage charges, or demurrage costs. Coverage includes the United States and its territories.

Lease and Plant Fuel: Natural gas used in lease operations, as gas processing plant fuel, and as net used for gas lift.

Lease Condensate: A natural gas liquid recovered from gas-well gas (associated and nonassociated) in lease separators or natural gas field facilities. Lease condensate consists primarily of pentanes and heavier hydrocarbons. Generally, it is blended with crude oil for refining.

Lignite: A brownish-black coal of low rank with high inherent moisture and volatile matter. It is also referred to as brown coal. It conforms to ASTM Specification D388 for lignite and is used almost exclusively for electric power generation.

Liquefied Petroleum Gases (LPG): Ethane, propane, normal butane, ethane-propane mixtures, propane-butane mixtures, and isobutane produced at natural gas processing plants, including plants that fractionate raw natural gas plant liquids. LPG also includes liquefied refinery gases (ethylene, propylene, butylene, and isobutylene produced from crude oil at refineries).

Motor Gasoline, Finished: A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, that have been blended to form a fuel suitable for use in spark-ignition engines and conforming to ASTM Specification D439. Included are finished leaded gasoline, finished unleaded gasoline, and gasohol. Excluded are blendstock that has not been blended into finished motor gasoline and alcohol that has not been blended into gasohol.

Motor Gasoline, Leaded Premium: A gasoline having an antiknock index of 93 with the use of lead additives or which contains more than 0.05 grams of lead per gallon or more than 0.005 grams of phosphorus per gallon. Includes gasohol.

Motor Gasoline, Leaded Regular: A gasoline having an antiknock index of 89 with the use of lead additives or which contains more than 0.05 grams of lead per gallon or more than 0.005 grams of phosphorus per gallon.

Motor Gasoline, Total: Includes finished leaded motor gasoline (premium and regular), finished unleaded motor gasoline (premium and regular), motor gasoline blending components, and gasohol.

Motor Gasoline, Unleaded Premium: A gasoline having an antiknock index of 90 containing not more than 0.05 grams of lead per gallon and not more than 0.005 grams of phosphorus per gallon. Includes gasohol.

Motor Gasoline, Unleaded Regular: A gasoline having an antiknock index of 87 containing not more than 0.05 grams of lead per gallon and not more than 0.005 grams of phosphorus per gallon.

Natural Gas: A mixture of hydrocarbons (principally methane) and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in underground reservoirs.

Natural Gas Plant Liquids (NGPL): Those natural gas liquids that are recovered from natural gas processing plants, and in some situations, from natural gas field facilities, as well as those that are extracted by fractionators. Natural gas plant liquids are defined according to the published specifications of the ASTM and the Gas Processors Association and are classified as follows: ethane, propane, normal butane, isobutane, pentanes plus, and other products from natural gas processing plants (i.e., products meeting the standards for finished petroleum products produced at natural gas processing plants, such as finished motor gasoline, finished aviation gasoline, special naphthas, kerosene, distillate fuel oil, and miscellaneous products).

Natural Gas Wellhead Price: The annual wellhead price of natural gas is calculated by dividing the total reported value at the wellhead by the total quantity produced as reported by the appropriate agencies of individual producing States, as well as the U.S. Geological Survey (through 1981) and the U.S. Minerals Management Service (from 1982 forward). The price includes all costs prior to shipment from the lease including gathering and compression costs in addition to State production, severance, and similar charges.

An estimate of the U.S. natural gas price is made each month based on monthly natural gas prices from four States: Mississippi, New Mexico, Oklahoma, and Texas.

Net Electricity Generation: Gross generation less electricity consumed at the generating plant for station use. Electricity required for pumping at pumped-storage plants is regarded as plant use and is deducted from gross generation.

Net Energy Consumption: Total energy use excluding electrical system energy losses.

Normal Butane: See Butane.

Nuclear Energy: Electricity generated by an electric power plant whose turbines are driven by steam generated in a reactor by heat from the fissioning of nuclear fuel.

Oil Well: A well completed for the production of crude oil from one or more oil zones or reservoirs. Wells producing both crude oil and natural gas are classified as oil wells.

Organization for Economic Cooperation and Development (OECD): Current members: Australia, Austria, Belgium, Canada, Denmark, Finland, France, West Cermany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom, and the United States and its territories (Guam, Puerto Rico, and the Virgin Islands).

Organization of the Petroleum Exporting Countries (OPEC): Current members: Algeria, Ecuador, Gabon,

Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, United Arab Emirates, and Venezuela.

Pentanes Plus: A mixture of hydrocarbons, mostly pentanes and heavier, extracted from natural gas. This product includes isopentane, natural gasoline, and plant condensate.

Petroleum: A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oils, petroleum products, natural gas plant liquids, and nonhydrocarbon compounds blended into finished petroleum products.

Petroleum Coke: A solid residue that is the final product of the condensation process in cracking. It consists of aromatic hydrocarbons very poor in hydrogen. Calcination of petroleum coke can yield almost pure carbon or artificial graphite suitable for production of carbon or graphite electrodes, structural graphite, motor brushes, dry cells, and similar products. This product is reported as marketable or catalyst coke.

Petroleum Imports: Imports of petroleum into the 50 States and the District of Columbia from foreign countries, Puerto Rico, the Virgin Islands, and other U.S. territories and possessions. Included are imports for the Strategic Petroleum Reserve and withdrawals from bonded warehouses for onshore consumption, offshore bunker use, and military use. Excluded are receipts of foreign petroleum into bonded warehouses and into U.S. territories and U.S. Foreign Trade Zones.

Petroleum Products: Petroleum products are obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosenetype jet fuel, kerosene, distillate fuel oil, residual fuel oil, naphtha less than 400 °F end-point, other oils over 400 °F end-point, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

Petroleum Products Supplied: Total petroleum products supplied is the sum of all petroleum products supplied. For each product, the amount supplied is calculated by summing production, crude oil burned directly, imports, and net withdrawals from primary stocks and subtracting exports.

Petroleum Stocks, Primary: Stocks of crude oil or petroleum products held in storage at (or in) leases, refineries, natural gas processing plants, pipelines, tankfarms, and bulk terminals that can store at least 50,000 barrels of petroleum products or that can receive petroleum products by tanker, barge, or pipeline. Crude oil that is in transit from Alaska, or that is stored on Federal leases or in the Strategic Petroleum Reserve, is included. Excluded are stocks of foreign origin that are held in bonded warehouse storage.

Photovoltaic and Solar Thermal Energy (as used at electric utilities): Energy radiated by the sun as electromagnetic waves (electromagnetic radiation) that is converted at electric utilities into electricity by means of solar (photovoltaic) cells or concentrating (focusing) collectors.

Propane: A normally gaseous, paraffinic hydrocarbon (C_3H_8) . It is extracted from natural gas or refinery gas streams, and includes all products covered by Gas Processors Association Specifications for commercial propane and HD-5 propane and ASTM Specification D1835. Propane is used primarily for residential and commercial heating and cooling, and also as a fuel for transportation. Industrial uses of propane include use as a petrochemical feedstock.

Propylene: A normally gaseous, olefinic hydrocarbon (C_3H_6) recovered from refinery processes. Quantities are included with "propane" data.

Refiner Acquisition Cost: The cost of crude oil to the refiner, including transportation and fees. The composite cost is the weighted average of domestic and imported crude oil costs.

Renewable Energy: Energy obtained from sources that are essentially inexhaustible (unlike, for example, the fossil fuels, of which there is a finite supply). Renewable sources of energy include wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

Reservoir Repressuring: The injection of natural gas into oil and gas reservoir formations for pressure maintenance and cycling.

Residential Sector: Private household establishments, which consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. (For allocation of individual fuels to end-use sectors, see the Notes and Sources for Section 2.)

Residual Fuel Oil: The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations and that conform to ASTM Specifications D396 and 975. Included are No. 5, a residual fuel oil of medium viscosity; Navy Special, for use in steam-powered vessels in government service and in shore power plants; and No. 6, which includes Bunker C fuel oil, and is used for commercial and industrial heating and electricity generation. Imports of residual fuel oil include imported crude oil burned as fuel.

Rotary Rig: A machine, used for drilling wells, that employs a rotating tube attached to a bit for boring holes through rock.

Strategic Petroleum Reserve (SPR): Petroleum stocks maintained by the Federal Government for use during periods of major supply interruption.

Subbituminous Coal: A dull black coal of rank intermediate between lignite and bituminous coal. It conforms to ASTM Specification D388 for subbituminous coal, and is used almost exclusively for electric power generation. In this report, quantities are included with "bituminous coal" data.

Supplemental Gaseous Fuels: Consist primarily of synthetic natural gas, propane-air, and refinery (still) gas. May also include coke oven gas, biomass gas, manufactured gas, and air injected for Btu stabilization.

Synthetic Natural Gas (SNG): A product resulting from the manufacture, conversion, or reforming of hydrocarbons that may be easily substituted for, or interchanged with, pipeline-quality natural gas.

Transportation Sector: Private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads and railways (including streetcars), aircraft, ships, barges, and natural gas pipelines.

Unaccounted for Crude Oil: Represents the arithmetic difference between the indicated demand for crude oil and the total disposition of crude oil. Indicated demand is the sum of crude oil production and imports less changes in crude oil stocks. Total disposition of crude oil is the sum of crude oil input to refineries, crude oil exports, crude oil burned as fuel, and crude oil losses.

United States: Unless otherwise noted, "United States" in this publication means the 50 States and the District of Columbia. U.S. exports include shipments to U.S. Territories, and imports include receipts from U.S. Territories.

Wind Energy (as used at electric utilities): The kinetic energy of wind converted at electric utilities into mechanical energy by wind turbines (i.e., blades rotating from a hub) that drive generators to produce electricity for distribution.

Wood and Waste (as used at electric utilities): Wood energy (see Wood Energy), garbage, bagasse, sewerage gas and other industrial, agricultural, and urban refuse used to generate electricity for distribution.

Wood Energy: Wood and wood products used as fuel. Included are round wood (cord wood), limb wood, wood chips, bark, sawdust, forest residues, charcoal, pulp waste, and spent pulping liquor.

Working Gas: The volume of gas in an underground storage reservoir above the designed level of the base. It may or may not be completely withdrawn during any particular withdrawal season. Conditions permitting, the total working capacity could be used more than once during any season.

Order Form

State Energy Price and Expenditure Report 1987

Published: September 1989
Energy Information Administration
DOE/EIA-0376(87)
Price per copy: \$13.00

The State Energy Price and Expenditure Report 1987 presents energy price and expenditure estimates for the 50 States, the District of Columbia, and the United States for 1970, 1975, and 1980 through 1987. The estimates are provided by energy source (petroleum, natural gas, coal, and electricity) and by major end-use sector (residential, commercial, industrial, transportation, and electric utilities). The 249-page report includes technical documentation describing the data sources and estimation procedures used.

BECAUSE IT'S F

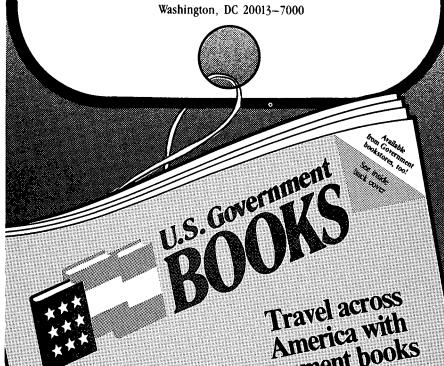

Every year the Government publishes thousands of books. And every year the U.S. Government Printing Office sells these books to the public. Now there's a book that tells you about the Government's new and popular publications—but it's not for sale . . . it's free!

It's our catalog of books—hundreds of books from virtually every Government agency. The subjects range from agriculture, business, children, and diet to science, space, transportation, and vacations. And there are titles on military history, education, hobbies, physical fitness, gardening, and much, much more! There's also a special section for recently published books.

Find out about the Government's new and popular books by sending today for a copy of the book we don't sell. Write-
