Ordering Information

This publication and other Energy Information Administration (EIA) publications may be purchased from the Superintendent of Documents, U.S. Government Printing Office.

All telephone orders should be directed to:

U.S. Government Printing Office
McPherson Square Bookstore
1510 H Street, N.W.
Washington, DC 20005
202-653-2050
FAX : 202-376-5055
9 a.m. to 4:30 p.m., eastern time, M-F

Superintendent of Documents
U.S. Government Printing Office
Washington, DC 20402
202-783-3238
FAX: 202-512-2233
8 a.m. to 4:30 p.m., eastern time, M-F

All mail orders should be directed to:

U.S. Government Printing Office
P.O. Box 371954
Pittsburgh, PA 15250-7954

Complimentary subscriptions and single issues are available to certain groups of subscribers, such as public and academic libraries, Federal, State, local, and foreign governments, EIA survey respondents, and the media. For further information, and for answers to questions on energy statistics, please contact EIA's National Energy Information Center. Address, telephone numbers, and hours are as follows:

National Energy Information Center, EI-231
Energy Information Administration
Forrestal Building, Room 1F-048
Washington, DC 20585

Highlights:

Household Energy Consumption and Expenditures 1990

U.S. households consumed 9.2 quadrillion Btu of energy and paid a total of $110 billion in energy costs in 1990, according to the Energy Information Administration's *Household Energy Consumption and Expenditures 1990*. The report, one of three[1] on how U.S. households use energy, is based on data collected in the eighth Residential Energy Consumption Survey[2] (RECS). Over 5,000 households were surveyed and the results are extrapolated to 94 million households nationwide.

The RECS includes single-family homes, apartments, and mobile homes and covers the six major sources of energy consumed by U.S. households: electricity, natural gas, fuel oil, liquefied petroleum gases (LPG), kerosene, and wood. The triennial survey collects data on housing characteristics, end-use energy consumption and expenditures, stock of energy-consuming appliances, and energy-related behavior. The RECS report presents data both as aggregate totals and as household averages. This "Highlights" reviews some of the major findings of the report.

[1]The other two reports based on the 1990 Residential Energy Consumption Survey are *Household Energy Consumption and Expenditures 1990, Supplement: Regional*, DOE/EIA-0321(90)/S (Washington, DC, February 1993), and *Housing Characteristics 1990*, DOE/EIA-0314(90) (Washington, DC, May 1992).

[2]Energy Information Administration (EIA) surveys can be divided into two broad groups. Supply surveys, directed to suppliers and marketers of energy, yield such data as the residential and commercial consumption data found in section 2 of the *Monthly Energy Review*. Consumption surveys, directed to end users of energy, yield such data as the household energy consumption data found in this "Highlights." For a summary of the differences, see Appendix C in the subject report.

Energy Consumption by U.S. Households in 1990

In 1990, consumption of the major energy sources used in U.S. households (excluding wood[3]) totaled 9.2 quadrillion Btu, about 98 million Btu per household (Table 1). Energy consumption was divided among five end uses—space heating, air conditioning, water heating, refrigerators,[4] and other appliances.

Natural Gas. The dominant source of energy consumed by U.S. households, natural gas, totaled 4.9 quadrillion Btu, 53 percent of the U.S. total in 1990. About 58 million households (61 percent of all households) used natural gas, predominantly for space heating and water heating. Among households using natural gas, consumption averaged 84 million Btu per household.

Electricity. Used by nearly all of the 94 million U.S. households, electricity accounted for the second largest share (33 percent) of total household energy consumption. In 1990, household electricity consumption totaled 3.0 quadrillion Btu. The average consumption per household—32 million Btu—was much lower than the average for natural gas. The reason the average was lower is that it includes many households that also use

[3]Consumption of wood from December 1989 through November 1990 was an estimated 0.6 quadrillion Btu.

[4]In the previous RECS, refrigerators were included in the appliance category. The 1990 RECS is the first to place refrigerators in a separate category. Future RECS will place lighting in a separate category.

Table 1. U.S. Household Energy Consumption and Expenditures, 1990

Energy Source	Households (million)	Total Consumption (quadrillion Btu)	Average[a] Consumption per Household (million Btu)	Total Expenditures (billion dollars)	Average[a] Expenditures per Household (dollars)
Electricity[b]	94.0	3.0	32.3	71.5	761
Natural Gas	57.7	4.9	84.2	27.3	472
Fuel Oil	11.7	1.0	83.4	7.6	652
LPG[c]	8.2	0.3	34.1	3.1	381
Kerosene	5.3	0.1	12.3	0.6	116
All Major Energy Sources	**94.0**	**9.2**	**98.1**	**110.2**	**1,172**

[a]Averages are calculated with only those households using the energy source.

[b]Electricity consumption is measured in terms of the amount *delivered* to the household; no adjustment is made to account for the primary fuels used to produce electricity or for the losses in the transmission and distribution of electricity.

[c]Liquefied petroleum gases.

Note: Totals may not equal sum of components due to independent rounding.

The Average Energy-Consuming U.S. Household

The Typical Housing Unit Was a Conventional Single-Family House

In 1990, the typical housing unit was a single-family, detached house, built before 1980. The house was owned, rather than rented, and was located in the suburbs (Figure 1) and in a temperate climate zone. It contained 1,569 square feet of heated floorspace.

Of the 94 million housing units occupied year round, 66 percent were owner-occupied and 34 percent were rented. Nearly 69 percent of all housing units were conventional single-family houses. Twenty-six percent were multi-family houses and 6 percent were mobile homes.

Household Annual Income Averaged $34,268

Typically, the household consisted of two members and was headed by a white male 47 years old. The gross annual income averaged $34,268 (Figure 2), of which 3.4 percent ($1,172) was spent to purchase energy. Householders with larger incomes lived in larger houses and had more appliances. However, their houses tended to be newer and, therefore, more energy efficient. Older houses were built when energy was less expensive, so less attention was paid to energy-efficient design and construction.

Space Heating Was the Dominant Energy End Use

Energy consumption per household depended primarily on the climate in which the house was located, the main heating source, and, to a lesser extent, the housing unit size and the number of household members. The average household consumed 98 million Btu in 1990. About 53 percent of the total energy consumed was used for space heating (Figure 3). The average household in the coldest climate zone used significantly more total energy than did the average household in the hottest zone because, in general, the heating load in the winter exceeded the cooling load in summer.

another energy source (natural gas, fuel oil, LPG, or kerosene) for the energy-intensive purposes of space heating or water heating.

Fuel Oil. Consumption of 1.0 quadrillion Btu of fuel oil accounted for only 11 percent of the total household energy used in 1990. However, only about 12 million households used fuel oil, and they used it for predominantly one purpose—space heating. Among households using fuel oil, consumption averaged 83 million Btu per household in 1990.

LPG and Kerosene. Significant sources of energy in rural areas, LPG and kerosene played only a minor role nationally. Household consumption of LPG was 0.3 quadrillion Btu, 3 percent of the U.S. total, and consumption of kerosene was 0.1 quadrillion Btu, about 1 percent of the total. Consumption per household averaged 34 million Btu for LPG and 12 million Btu for kerosene.

Wood. Unlike the five major energy sources discussed above, wood is not sold to consumers by a utility or a dealer; instead, much of it is gathered by consumers. Therefore, it is more difficult to estimate wood-related consumption and expenditures. Data from RECS respondents indicate that the 23 million wood-burning households consumed 0.6 quadrillion Btu, more than LPG and kerosene combined. Adding wood consumption to the U.S. total of household energy consumption in 1990 would have caused the total to increase by 6 percent, from 9.2 quadrillion Btu to 9.8 quadrillion Btu.

The Effects of Warmer Weather. Because 1990 was warmer than usual (14 percent warmer than the 30-year average), households used less energy for space heating and more for air conditioning. Overall, however, U.S. households used an estimated 0.75 quadrillion Btu less than they otherwise would have in 1990. Expenditures were about $46 per household lower than they otherwise would have been.

Household Expenditures for Energy in 1990

In 1990, the 94 million U.S. households spent $110 billion on the five major sources of energy consumed by households (Table 1). Expenditures averaged $1,172 per household.

Electricity. Expenditures of $72 billion for electricity exceeded expenditures on the other four energy sources combined. The average expenditure per household, $761, was more than for any of the other sources. Electricity was the most expensive energy source. On a Btu basis, it cost more than four times as much as natural gas, the least expensive source.

Natural gas. Expenditures of $27 billion for natural gas accounted for only 25 percent of total household energy expenditures. The average expenditure per household was only $472, despite the fact that average consumption per household was over two and a half times higher for natural gas than for electricity.

Fuel Oil, LPG, and Kerosene. Expenditures of $11 billion for fuel oil, LPG, and kerosene accounted for only 10 percent of the U.S. total. Expenditures per household averaged $652 for fuel oil, $381 for LPG, and $116 for kerosene.

Regional Data

Even in the South, more energy was consumed for space heating than for any other end use (Table 2). Regional data do indicate, however, that the South used a substantially higher share of its total energy consumption for air conditioning than did the other regions. Natural gas was the most prevalent source of energy for space heating and water heating in all regions of the country, although in the Northeast the use of fuel oil also was prevalent.

Higher Energy Use in New Houses

Houses built in 1988 through 1990 consumed more energy in 1990 than did houses built in 1985 through 1987. The newer houses were slightly larger than the older houses and more newer houses were built in colder regions, but the main reason the newer houses consumed more energy is that they consumed more natural gas. On average, houses heated with natural gas consume more energy than houses heated with electricity. (The comparison is made on the basis of *delivered* energy; no adjustment is made to account for the primary fuels used to produce electricity or for the losses in the transmission and distribution of electricity.) A variety of factors, including the efficiency of the houses and the climate in which they are located, contributed to the higher energy intensity of natural gas-heated houses.

Potential Energy Savings by Replacing Appliances

Due in part to Federal standards, the efficiency of major household appliances is steadily improving. For example, new freezers in 1990 were 95 percent more efficient than new freezers in 1972, new central air conditioners and heat pumps were 40 to 45 percent more efficient, and conventional gas furnaces were 21 percent more efficient. However, because stock turnover is slow, average stock efficiency is low relative to new stock efficiency. The average stock of freezers in 1990 was only 15 percent more efficient than new freezers in 1972, the average stock of central air conditioners and heat pumps was only 15 to 21 percent more efficient, and the average stock of conventional gas furnaces was only 6 percent more efficient.

A significant amount of energy could be saved if old appliances were replaced at a faster rate. For example, if all households were to install new 1990 appliances in place of all appliances 10 years old or more, about 672 trillion Btu (7.3 percent of household energy consumption) could be saved.

Energy Savings Through Demand-Side Management

Demand-side management (DSM) programs at electric utilities offer consumers incentives to modify the timing and level of electricity demand. The 1990 RECS was the first of the RECS to address DSM programs specifically. Survey results show that, although DSM programs were widely available, only 3.9 million single-family households (about 6 percent of those with access to DSM) actually participated.

Of all households that used electricity intensively,[5] those that participated in DSM programs used significantly less electricity for main space heating and cooling than did those households that did not participate. The difference is attributable not to participation in DSM programs, however, but to other characteristics of the households. For example, members of DSM-participating households tend to be older, more affluent, and better educated than nonparticipants. They are more likely to be homeowners, to live in a newer home, and to take active conservation measures. Households with members having characteristics such as those would be expected to consume less electricity.

Survey results show that there are more than 26 million single-family households that use electricity intensively but do not participate in DSM programs for which they are eligible. If they were to participate, energy savings from DSM programs would increase significantly.

[5]For example, those households that used electricity as their primary source of energy for space heating or space cooling or both.

To Order the Report

Household Energy Consumption and Expenditures 1990 is a 365-page report presenting statistical analysis and a series of tables on the consumption of and expenditures for electricity, natural gas, fuel oil, liquefied petroleum gases, kerosene, and wood by a wide range of household and housing unit characteristics. It includes extensive appendices describing how the survey was conducted and the quality of the data. The report may be obtained by using the order form in the back of this publication.

Demand, Supply, and Price Outlook for Low-Sulfur Diesel Fuel

by Tancred Lidderdale*

Abstract

The Clean Air Act Amendments of 1990 established a new, sharply lower standard for the maximum sulfur content of on-highway diesel fuel, to take effect October 1, 1993. Only about one-third of the current output of on-highway diesel fuel, which is used mostly in diesel trucks, meets the new standard. Although it seems likely that the rising demand for low-sulfur diesel fuel can be met, the higher capital and operating costs of increasing low-sulfur diesel production could drive some refiners out of the on-highway diesel fuel business and will lead others to raise prices, probably by 3 to 4 cents per gallon above the price of high-sulfur diesel and other high-sulfur distillates.

Introduction

To help ensure that sulfates in engine exhaust do not prevent manufacturers of heavy-duty diesel engines from meeting new particulate emissions standards for 1994 and later model years,[1] the Clean Air Act Amendments of 1990 (CAAA90) require refiners to reduce the sulfur content of on-highway diesel fuel from current average levels of 0.30 percent by weight to no more than 0.05 percent by weight. The new standard, which goes into effect October 1, 1993, also requires that on-highway diesel fuel have a minimum cetane index of 40 or a maximum aromatic content of 35 percent by volume.[2] (See list of terms and definitions on the following page.) This provision is designed to prevent any future rises in aromatics levels.[3] Since the direct measurement of aromatics is complex, a minimum cetane index of 40 is specified as a surrogate for capping aromatics.[4] Except for California refineries, the level of aromatics does not appear to be a critical issue.

Home heating oil, a distillate product similar to diesel fuel, is not required to meet the new specifications. Off-highway diesel fuel and heating oil not meeting the new standards must be dyed in order to distinguish them from on-highway diesel fuel. The new diesel fuel standard applies nationwide and affects about 46 percent of the total domestic demand for distillate fuel oil (about 8.2 percent of total U.S. petroleum product demand).[5]

Refiners will incur higher operating and capital costs in adapting to the new demand pattern for low-sulfur diesel fuel. These increases will likely yield a price premium of 3 to 4 cents per gallon over heating oil and other high-sulfur distillate fuels. In California, the price premium will probably be higher because of a more

*The author is a refining industry analyst in the Energy Information Administration's Office of Energy Markets and End Use. Comments regarding this article may be directed to Mr. Lidderdale on 202-586-7321.

[1]On March 15, 1985, the Environmental Protection Agency promulgated particulate standards for heavy-duty diesel engines in response to Section 202(a)(3) of the Clean Air Act as amended in 1977 (*Federal Register*, Vol. 50, No. 51, March 15, 1985, p. 10606). During the rulemaking process, heavy-duty diesel engine manufacturers expressed concern that sulfur in diesel fuel could either plug the trap-oxidizers that would be needed to meet the proposed particulate standards or generate significant particulate sulfate emissions that would make it difficult to meet the standards.

[2]Public Law 101-549, Section 211(i), U.S.C. 42, "Clean Air Act Amendments of 1990," enacted on November 15, 1990. Final rule announced by the Environmental Protection Agency in *Federal Register*, Vol. 55, No. 162 (August 21, 1990), pp. 34120-34143, and revised in *Federal Register*, Vol. 57, No. 89 (May 7, 1992), pp. 19535-19539.

[3]The Environmental Protection Agency originally considered a cap on aromatics of 20 percent by volume. However, studies suggested that the benefits from particulate reductions (which did not include cancer benefits) did not justify the costs of reducing the level of aromatics in diesel fuel. *Federal Register*, Vol. 55, No. 162 (August 21, 1990), pp. 34128-34129.

[4]An approximate inverse relationship exists between cetane number and aromatics. A cetane number of 45 corresponds to an aromatics concentration of about 27 percent by volume, while a diesel fuel with a 40 cetane number would contain about 36 percent by volume aromatics. George H. Unzelman, "Higher Diesel Quality Would Constrict Refining," *Oil and Gas Journal* (June 29, 1987), pp. 55-59.

[5]Energy Information Administration, *Fuel Oil and Kerosene Sales 1991*, DOE/EIA-0535(91) (Washington, DC, November 1992), p. 28, and *Petroleum Supply Annual 1991*, DOE/EIA-0340(91)/1 (Washington, DC, May 1993), p. 31.

Definitions

API Gravity: An arbitrary scale expressing the gravity or density of liquid petroleum products. The measuring scale is calibrated in terms of degrees API. A lighter, less dense product has a higher API gravity.

Aromatics: Hydrocarbons characterized by unsaturated ring structures of carbon atoms. Commercial petroleum aromatics are benzene, toluene, and xylene (BTX).

Catalytic Hydrocracking: A refining process that uses hydrogen and catalysts with relatively low temperatures and high pressures for converting middle boiling or residual material to high-octane gasoline, reformer charge stock, jet fuel, and/or high grade distillate fuel oil. The process uses one or more catalysts, depending upon product output, and can handle high sulfur feedstocks without prior desulfurization.

Catalytic Hydrotreating: A refining process for treating petroleum fractions from atmospheric or vacuum distillation units (e.g., naphthas, middle distillates, reformer feeds, residual fuel oil, and heavy gas oil) and other petroleum (e.g., cat cracked naphtha, coker naphtha, gas oil, etc.) in the presence of catalysts and substantial quantities of hydrogen. Hydrotreating includes desulfurization, removal of substances (e.g., nitrogen compounds) that deactivate catalysts, conversion of olefins to paraffins to reduce gum formation in gasoline, and other processes to upgrade the quality of the fractions.

Cetane Number: A measure of the ignition quality of diesel fuel oil. Cetane number is measured by comparing the ignition qualities of a diesel fuel in a test engine against those of a standard mixture of cetane and heptamethylnonane. The cetane "index" is calculated from the physical properties of the fuel, such as API gravity and mid-boiling point, and is a less expensive approximation of the cetane number.

Distillate Fuel Oil: A general classification for one of the petroleum fractions produced in conventional distillation operations. It is used primarily for space heating, on- and off-highway diesel engine fuel (including railroad and agricultural machinery), and electric power generation. Distillate fuel oil is classified into three grades (No. 1, No. 2, and No. 4), which are differentiated by the boiling range of the fuel.

No. 1 Distillate: A volatile distillate fuel with a boiling range between 300 and 575° F that meets the specifications for No. 1 heating or fuel oil as defined in American Society for Testing and Materials (ASTM) Specification D396 and/or specifications for No. 1 diesel fuel as defined in ASTM Specification D975.

No. 1 Diesel Fuel: Used in high-speed diesel engines generally operated under wide variations in speed and load. Includes Type C-B diesel fuel used for city buses and similar operations.

No. 1 Fuel Oil: A light distillate fuel oil intended for use in vaporizing pot-type burners.

No. 2 Distillate: A gas oil type distillate of lower volatility with distillation temperatures at the 90 percent boiling point between 540 and 640° F. No. 2 distillate meets the specifications for No. 2 heating or fuel oil as defined in ASTM D396 and/or specifications for No. 2 diesel fuel as defined in ASTM Specification D975.

No. 2 Diesel Fuel: Used in high speed diesel engines generally operated under uniform speed and load conditions. Includes Type R-R diesel fuel used for railroad locomotive engines and Type T-T for diesel engine trucks.

No. 2 Fuel Oil: Used in atomizing type burners for domestic heating or for moderate capacity commercial-industrial burners.

No. 4 Distillate: This grade is a blend of distillate fuel oil and residual fuel oil stocks that conforms to ASTM Specification D396 or Federal Specification VV-F-815C and/or specifications for No. 4 diesel fuel as defined in ASTM specification D975.

No. 4 Diesel Fuel: Used as a bunker fuel for ships and for other low- and medium-speed diesel engines in sustained constant-speed service.

restrictive aromatics specification, although no projection is attempted here.[6]

This article analyzes the new regulations' impact on distillate fuel markets and evaluates the constraints and costs faced by the petroleum refining industry in complying with them. The article reviews recent trends in demand and quality of on-highway diesel fuel oil and presents short- and long-term forecasts of diesel fuel demand. It discusses domestic and foreign sources of low-sulfur diesel supply and then moves on to an analysis of distillate fuel desulfurization economics, including diesel fuel price seasonality, desulfurization variable and capital costs, sulfur dioxide (SO_2) emissions trading allowances, and the economics of blending lighter, more expensive petroleum fractions, such as kerosene, into diesel fuel. The article concludes with a brief review of events in Los Angeles in January 1985, when the California Air Resources Board reduced the sulfur specification for diesel fuel from 0.5 to 0.05 percent by weight.

Distillate Fuel Oil Demand

Distillate fuel oil is classified into two primary types: diesel fuel and heating oil. On-highway diesel fuel represents about 46 percent of the total domestic demand for distillate fuel. The East Coast, Petroleum Administration for Defense (PAD) District I, and Midwest, PAD District II, account for about two-thirds of the total on-highway diesel fuel market (Table 1).

Since 1979, the average sulfur level in No. 2 diesel has ranged from about 0.25 to 0.30 percent by weight, according to annual surveys conducted by the National Institute for Petroleum and Energy Research (NIPER).[7] About 0.45 million barrels per day of distillate fuel production already meet the 0.05-percent-by-weight sulfur standard, while about 1.8 million barrels per day fall in the 0.05- to 0.25-percent-by-weight range, and around 0.7 million barrels per day fall in the 0.25- to 0.50-percent-by-weight range.[8] The average cetane index of No. 2 diesel fuel produced in the United States has ranged between 45 and 47 from 1979 through 1992, according to the NIPER survey.

Demand for on-highway diesel fuel showed steady growth of about 4.1 percent per year in the 1980's, while demand for other distillates remained flat (Figure 1). Sales of diesel fuel for on-highway use increased

[6]The California Air Resources Board (CARB) has independently enacted more stringent diesel fuel regulations, also due to take effect October 1, 1993. The new CARB regulations require on- and off-highway diesel fuel sold in California to meet both the 0.05 percent sulfur specification and a standard limiting aromatics to no more than 10 percent by volume. The regulations provide an exemption from the latter requirement for certified diesel fuel blends that meet the low-sulfur requirements and achieve emissions equivalent to a standard 10-percent-by-volume-aromatics diesel.

[7]The NIPER survey represents a nonrandom sample of U.S. refineries. In 1992, for example, analytical data for properties of 96 diesel fuel oil samples were submitted to NIPER. The samples were obtained during July and August 1992 from diesel product manufactured by 20 petroleum refining companies in 55 domestic refineries. National Institute of Petroleum and Energy Research, *Diesel Fuel Oils, 1992*, NIPER-177 PPS 92/5 (Bartlesville, OK, October 1992).

from an average of 1.09 million barrels per day in 1984 (38.4 percent of total distillate sales) to 1.34 million barrels per day in 1991 (45.8 percent of total distillate sales).

On-highway diesel fuel has also captured an increasing share of the on-highway fuel market (diesel plus motor gasoline). On-highway diesel fuel's share of the total U.S. market for motor gasoline and diesel fuel rose from 14.0 percent in 1984 to 16.2 percent in 1991.[9] Diesel fuel's increasing share of the on-highway fuel market results from slower gains in diesel vehicle fuel efficiency compared with motor gasoline vehicle fuel efficiency rather than from differences in highway mileage (Table 2).

Diesel fuel sales for automobile use are relatively inconsequential. Sales of diesel-powered cars in the United States grew rapidly from 0.35 percent of all new automobiles sold in 1977 to a peak of 6.10 percent in 1981. Since 1981, however, the diesel engine share of the U.S. new car market has declined steadily. The U.S. diesel new-car market share averaged only 0.9 percent over the 5 years of 1987 to 1991.[10] Diesel car sales in several European countries, on the other hand, continued to grow, exceeding 25 percent of 1988 new car sales in France and Belgium and over 10 percent in West Germany, Italy, and the Netherlands.[11]

The short-term forecast of distillate fuel demand prepared by the Energy Information Administration (EIA) and published quarterly in the *Short-Term Energy Outlook (Outlook)* represents the sum of distillate fuel demand in four sectors of the economy: industrial, residential and commercial, electric utility, and transportation. Distillate demand in the transportation sector includes vessel bunkering, military use, railroad use, and on-highway diesel fuel. On-highway diesel fuel represents about 77 percent of transportation sector distillate demand. The third-quarter 1993 *Outlook* projects distillate demand in the transportation sector to grow by about 5.4 percent in 1993 and 2.2 percent in 1994 (Table 3).

The long-term (20-year) forecast of distillate fuel consumption in the transportation sector shows annual growth of 1.7 percent per year between 1990 and 2010 (42 percent total growth). Fuel consumption by freight trucks is projected to grow steadily at a rate of about 1.3 percent per year (total growth of about 30 percent between 1990 and 2010). Growth in truck travel follows trends in economic activity closely, although fuel consumption by trucks is projected to rise more slowly than real gross domestic product because fuel efficiency is expected to improve by about 11 percent between 1990 and 2010.[12] Diesel trucks are expected to capture a greater share of the short-haul market. In 1989, 54 percent of all energy consumed by freight trucks came from diesel fuel. By 2010, diesel-powered trucks are expected to represent 63 percent of freight truck fuel consumption.[13]

Low-Sulfur Distillate Supply

Because diesel fuel and heating oil are currently so similar, most refineries produce a distillate product that satisfies both diesel and heating oil quality restrictions rather than incur the cost of segregating blend stocks and finished products. According to the National Petroleum

Refiners Association (NPRA), if fuel distribution practices that were in place in 1986 are maintained, about 2.4 million barrels per day of distillate fuel oil would have to meet the low-sulfur requirement. However, only about one-half of this distillate fuel is required for the on-highway diesel fuel market.[14] Segregation of on-highway diesel fuel from other distillates within refineries is expected to reduce desulfurization plant investment and operating costs, although those savings could be more than offset by increased capital and operating costs for additional tankage and inventories in refineries, product distribution systems, and terminals.

Because providing low-sulfur fuel may be prohibitively expensive for some refineries, segregation of fuels between refineries is likely. Some refineries may produce only low-sulfur diesel fuel, while others may produce only high-sulfur distillates for the off-highway and heating oil markets. Refiners unable to produce low-sulfur diesel fuel may abandon the on-highway diesel market or exchange product with refineries producing low-sulfur diesel fuel.

Refiners have four primary options for supplying low-sulfur diesel fuel oil:

- Increase operating severity of existing or new catalytic hydrotreating units through use of more active catalysts or changes in unit operating conditions (temperature, pressure, space velocity, hydrogen-to-oil ratios, etc.).[15]

- Increase production of low-sulfur distillates from catalytic hydrocracking units. Catalytic hydrocracking units are normally operated to convert vacuum gas oil or light cycle oils to naphtha for catalytic reforming into motor gasoline. Selective production of distillate through use of different operating conditions and catalysts is also possible.

- Restrict diesel fuel blending operations to low-sulfur internal refinery streams. Some low-sulfur refinery streams not normally blended into distillate fuels, such as kerosene, could be used for on-highway diesel fuel blending.

- Import low-sulfur diesel fuel.

The refining industry's capability to produce low-sulfur on-highway diesel fuel remains uncertain. It is not clear how many refiners may abandon the on-highway diesel fuel market, what is the rated capacity of existing desulfurization equipment to produce low-sulfur diesel fuel, how strong is the demand for desulfurization capacity by other distillate fuel products, and how large is the capacity of new distillate desulfurization plants planned or under construction. However, most industry reports indicate that there will be sufficient supply of low-sulfur on-highway diesel by the October 1, 1993, CAAA90 deadline.[16]

Hydrotreating and Hydrocracking Capacity: Diesel fuel sulfur reduction is accomplished by either catalytic hydrotreating of distillate fuel or catalytic hydrocracking of heavy fuels, such as residual fuel oil, into low-sulfur distillate. The amount of desulfurization capacity available will affect the amount of capital investment required for compliance with the new sulfur regulations. However, the low-sulfur diesel production capacity of existing desulfurization units is highly uncertain. Some existing catalytic hydrotreating capacity must remain in kerosene or heating oil treatment service, while refiners will continue to maximize motor gasoline production from catalytic hydrocrackers. Furthermore, increasing the level of sulfur removal requires operating desulfurization units under more severe conditions (increased hydrogen volume, higher temperature and pressure, and lower reactor space velocities), which shorten catalyst life and reduce unit capacity. Thus, the increase in desulfurization unit operating severity needed to produce low-sulfur diesel fuel will

[14]National Petroleum Refiners Association, *U.S. Refining Industry Capability To Manufacture Ultra Low Sulfur Diesel Fuels* (Washington, DC, 1986), pp. 1 and 3. Refineries in the 1986 NPRA survey produced 428,000 barrels per day of segregated diesel fuel, 220,000 barrels per day of segregated No. 2 heating oil, and 1,934,000 barrels per day of unsegregated distillate fuel. The 139 refineries responding to the survey represented a total of 14.4 million barrels per day of crude oil distillation capacity (about 98 percent of *operating* capacity as of January 1, 1986).

significantly reduce the rated operating capacity of existing units.

NPRA estimated that full practical utilization of existing distillate hydrotreating capacity (of 1,675,000 barrels per day in their 1986 survey) could result in the production of only 315,785 barrels per day of 0.05-percent-by-weight-sulfur diesel fuel by 21 refineries.[17] Between January 1, 1987, and January 1, 1993, operable crude oil distillation capacity decreased by 3.2 percent while distillate hydrotreating capacity increased by 9.2 percent (or 238,667 barrels per stream day). Additional distillate hydrotreating capacity expansions of 705,720 barrels per day have been announced (Table 4).

Of the 187 refineries that were operable on January 1, 1993, 94 refineries did not have distillate hydrodesulfurization units. The 94 refineries represent about 19 percent of total domestic refining capacity.[18] Most of those refineries are not expected to produce low-sulfur diesel fuel. Only 12 have announced construction of new distillate hydrodesulfurization units.[19]

Blending Kerosene into Diesel Fuel: Small increases in low-sulfur diesel fuel can be obtained by blending in lighter, more expensive petroleum fractions, such as No. 1 distillate or kerosene. NIPER surveys show that the average sulfur contents of Jet-A and No. 1 diesel are close to 0.05 percent by weight. Kerosene-type jet fuel is the largest of these potential sources, with 1991 average sales of 1.3 million barrels per day. Kerosene or No. 1 distillate is routinely blended into diesel fuel during the winter to lower the cloud point (the temperature at which a cloud of wax crystals first appears) and prevent plugging of fuel lines. In some cold northern States, distillate blends containing 30 to 50 percent kerosene are common.[20]

Distillate Imports: Distillate fuel imports into the United States come primarily from three sources: Canada, Venezuela, and the Virgin Islands. In 1992, those three sources accounted for over 93 percent of the average 216,000 barrels per day of distillate fuel imported into the United States. Over the last 6 years, those three sources accounted for over 80 percent of distillate fuel imports.[21]

The ability of the primary foreign distillate fuel oil suppliers to provide low-sulfur diesel fuel depends on their catalytic hydrotreating capacity (Table 5) and ability to segregate low-sulfur internal refinery distillate streams. The Virgin Islands (Hess) refinery is reported to have the largest ratio of distillate hydrotreating to crude oil distillation capacity and may be capable of supplying low-sulfur diesel to the U.S. East Coast. Venezuela, on the other hand, has the lowest ratio of hydrotreating to crude oil distillation capacity. However, Venezuela's U.S. exports of distillate represent only about 17 percent of its total distillate production compared with about 33 percent in the Virgin Islands.[22]

Because Europe has led the United States in increasing restrictions on diesel fuel quality in recent years, European refiners may also be unable to provide low-sulfur diesel for export. The maximum sulfur content for diesel and heating oil is 0.2 by percent by weight in eight countries (Belgium, Denmark, Finland, Germany, Luxembourg, Netherlands, Norway, and Sweden) and 0.3 percent by weight in seven (France, Greece, Ireland, Italy, Spain, Portugal, and the United Kingdom).

Notes: Existing distillate hydrotreating capacity includes kerosene and jet kero treaters.

Sources: Existing capacity from Energy Information Administration, *Petroleum Supply Annual 1992*, DOE/EIA-0340(92/1) (Washington, DC, May 1993). Planned capacity from PennWell Publishing Co., *Oil and Gas Journal* (April 12, 1993), pp.55-57; Gulf Publishing Co., *Hydrocarbon Processing* (October 1992), pp. 6-12; and company announcements in industry publications.

Austria and Switzerland have a maximum sulfur content of 0.15 percent by weight in diesel fuel and 1 percent in heating oil.[23] The European community proposes to limit sulfur in all gas oils and distillates to 0.2 percent by weight by October 1, 1994. A further reduction in the sulfur level of on-highway diesel fuel to 0.05 percent will be required by October 1, 1996.

Distillate Desulfurization Economics

The increase in operating costs and new capital investment required to produce low-sulfur diesel fuel should yield a price premium for low-sulfur diesel over heating oil and other high-sulfur distillate fuels. The significant factors in assessing the market price premium for low-sulfur diesel fuel are (1) the variable costs of operating desulfurization units; (2) the capital cost of new desulfurization capacity required to produce low-sulfur diesel fuel; and (3) the availability of other low-sulfur refinery streams that are not normally blended into distillate fuels (such as kerosene) but which could be used for on-highway diesel fuel blending.

Several industry studies have estimated the incremental cost of producing low-sulfur distillate fuel to be in the range of 1.2 to 7.0 cents per gallon.[24] The analysis presented here projects a low-sulfur diesel market price premium of 3 to 4 cents per gallon over heating oil on the basis of costs faced by the marginal producer. This premium covers higher variable costs of about 1 cent per gallon and capital recovery costs of 2 to 3 cents per gallon. This price premium is consistent with blending of incremental barrels of kerosene into the low-sulfur diesel pool and the observed market response to the low-sulfur diesel regulations imposed by California's South Coast Air Quality Management District (Los Angeles) in 1985.

[23]Energy Information, Ltd., "Low Sulfur Diesel Oil Moves to Center Stage in European Environmental Debate," *Oil Market Listener* (March 13, 1992), p. 2.

[24]Energy Resource Consultants, Inc., and Sobotka Consultants, Inc., *Diesel Fuel Quality Effects on Emissions, Durability, and Performance* (Washington, DC, September 30, 1985). Environmental Protection Agency, *Federal Register*, Vol. 54, No. 163 (August 24, 1989), p. 35278. Cambridge Energy Research Associates, *The U.S. Refining Industry: Facing the Challenges of the 1990s* (Cambridge, MA, January 1992).

Not all refiners will respond the same way to the new low-sulfur market constraint. Some refiners may abandon production of low-sulfur diesel fuel completely. For example, even though the cost to small refiners may be lowered by the SO_2 trading allowances, the credits may not be enough to offset the higher production and capital costs they face. Desulfurization variable production costs are estimated to range from 0.7 cent per gallon for large refiners to 3.1 cents per gallon for small refiners. Capital service costs for new desulfurization capacity are projected to range from 1.1 cents per gallon for large refiners to 7.0 cents per gallon for small refiners. The net cost to small refiners with salable allowances for sulfur dioxide emissions may be lower by about 0.2 to 2.4 cents per gallon.

Diesel Fuel Price Seasonality: Although demand for diesel fuel is highest in the summer months, diesel fuel prices are expected to remain tied to prices for heating oil, a seasonal fuel with a winter peak in demand and prices (Figure 2).[25] Because a significant proportion of

[25]Differences in the average refiner prices for diesel fuel and heating oil are usually less than 1 cent per gallon. The reported price differences may result from averaging different regional prices and market shares or price premiums on special diesel fuel blends that include additives, such as pour-point and cloud-point depressants used in the winter.

Table 5. Foreign Distillate Hydrotreating Capacity, January 1, 1993
(Barrels per Calendar Day)

Country	Number of Refineries	Crude Oil Distillation Capacity	Distillate Hydrotreating Capacity	Hydrotreating as Percent of Crude Distillation Capacity
Canada	26	1,871,500	314,500	16.8
Venezuela	6	1,167,000	95,300	8.2
Virgin Islands	1	545,000	165,000	30.2

Source: PennWell Publishing Co., *Oil and Gas Journal* (December 21, 1992), pp. 52-95.

the winter supply of heating oil must come from inventory, an incentive must exist for refiners to store distillates produced during the low heating oil demand summer months for delivery during the winter heating season. The price of distillate fuel oil typically swings by about 10 cents per gallon from a June low to a December peak and provides the incentive.[26]

Because of the price swing, there will be no incentive for refiners to produce low-sulfur, on-highway diesel fuel during the winter for delivery in the high diesel fuel demand summer months (a course that would be equivalent to a buy high, sell low strategy). Thus, low-sulfur diesel fuel production capacity must be sufficient to meet the peak summer diesel fuel demand. This requirement implies that there may be excess low-sulfur diesel fuel production capacity during the winter. Under such conditions, refiners may be able to recover variable costs, but not capital costs, in the low-sulfur diesel fuel price premium. However, two factors will serve to reduce the potential winter excess capacity condition. First, since the swing in diesel fuel demand is only about 21 percent of peak summer demand (Figure 2), normal desulfurization unit turnarounds (e.g., catalyst replacement) would be scheduled for winter months, thereby minimizing excess capacity. Second, because total distillate fuel oil demand is lowest during the summer, some excess desulfurization capacity is already available during the summer months for low-sulfur diesel production.

Desulfurization Variable Costs: Increasing the level of sulfur removal from distillate fuel requires operation of hydrodesulfurization units under more severe operating conditions (increased hydrogen volume, higher temperature and pressure, and lower reactor space velocities) that increase operating costs.

Refineries responding to the 1986 NPRA survey claimed that the increase in desulfurization variable costs would range from 0.7 to 3.1 cents per gallon of low-sulfur distillate fuel, depending on capacity (Table 6). The average for the United States is closer to the lower end of this range (at 0.9 cents per gallon), with higher unit costs being characteristic of the smaller (and less complex) refineries. Small refineries are disadvantaged because they typically do not have access to inexpensive hydrogen (which is produced as a by-product from naphtha reformers) and cannot benefit from economies of scale because they do not have existing desulfurization capacity to build on.

Desulfurization Capital Costs: Estimated capital costs in the 1986 NPRA survey ranged from $660 per barrel of low-sulfur distillate for large refiners to $4,328 per barrel of low-sulfur distillate for small refiners. Estimated capital service charges ranged from 1.1 cents per gallon of low-sulfur distillate fuel for large refiners to 7.0 cents per gallon of low-sulfur distillate for small refiners (Table 7). The average for the United States (2.2 cents per gallon) is again closer to the lower end of the range. The estimated capital service cost for large refineries is significantly lower than that for small refineries because of economies of scale and the availability of existing hydrogen production and sulfur recovery capacity, which reduces necessary capital investment.

Some refineries may not be able to make the needed investment in catalytic hydrogenation, hydrogen production, and sulfur recovery units. Those refineries may have to abandon the on-highway diesel fuel market. The National Petroleum Council (NPC) describes this as a niche strategy, focused on home heating oil and off-highway diesel fuel and most likely to be followed by small refineries.[27] Refineries that do not produce low-sulfur distillate may arrange for product exchanges of heating oil for low-sulfur diesel produced by refiners with excess desulfurization capacity, with appropriate value adjustments.

Thirty-seven refineries in the NPRA survey, with a distillate production capacity of about 415,000 barrels

[26]Author's calculation using regression analysis of diesel fuel price from 1982 to the present (controlling for changes in deseasonalized crude oil price).

per day, indicated that they could not make the needed improvements in diesel fuel quality because of investment capital or environmental permitting constraints. The small and medium refineries in the NPRA survey were reported to be the most susceptible to the constraints, with 33 out of 92 refineries unable to build new facilities. Fifty-six percent of small refineries (defined as having a capacity of less than 30,000 barrels per day crude oil) and 28 percent of medium-sized refineries (having a capacity of 30,000 to 100,000 barrels per day of crude oil) reported being unable to build new desulfurization units.

Sulfur Dioxide Emissions Allowances: Because small refiners would face greater capital and operating costs to meet the new low-sulfur standard than larger refiners, CAAA90 grants SO_2 allowances to small refiners that produce complying on-highway diesel fuel.[28] Small refiners may sell their SO_2 allowances to other sources affected by the CAAA90 (e.g., electric utilities that burn high-sulfur coal) or bank them for future use. CAAA90 defines small refiners as those companies with average 1990 crude oil throughput of 137,500 barrels per calendar day or less and further stipulates that the crude oil throughput of individual qualifying refineries be 50,000 barrels per calendar day or less. Based on data reported monthly to EIA, 90 refineries, which accounted for 12.9 percent of total U.S. distillate production in 1990, may qualify for allowances.[29]

One SO_2 allowance corresponds to 1 ton (2,000 pounds) of SO_2. For typical diesel fuel (32.4 API gravity), about 1,478 barrels of low-sulfur diesel fuel would be awarded one SO_2 allowance.[30] The value of the allowances ranges from $131 to $1,500 each[31] and corresponds to a credit to small refiners of 0.2 to 2.4 cents per gallon of low-sulfur diesel fuel produced.

The maximum number of allowances that can be allocated annually to a small refiner is 1,500, which would correspond to low-sulfur diesel production of about 6,075 barrels per calendar day. In any given year, the total number of allowances awarded to all small refiners may not exceed 35,000 (about 141,750 barrels per day of low-sulfur diesel). Allowances may be allocated to small refiners from October 1, 1993, through December 31, 1999.

Blending Kerosene into Diesel Fuel: Small increases in low-sulfur diesel fuel supply can be obtained by blending in lighter, more expensive petroleum fractions, such as No. 1 distillate or kerosene. Over the last 5 years, the spot price of jet kerosene waterborne cargoes on the U.S. Gulf Coast (USGC) has averaged 2.9 cents per gallon higher than the spot USGC waterborne No. 2 fuel oil price (excluding the Iraq Desert Shield months).[32] This option should be viewed only as a spot or short-term solution to low-sulfur diesel fuel supply. Kerosene blend stocks are of lower quality than diesel fuel because of their lower heating values, which would yield lower diesel engine fuel efficiency. Furthermore, proposed U.S. military conversion from JP-4 naphtha-type jet fuel to JP-8 or Jet-A jet kerosene will place greater demand pressure on the price of the kerosene cut of the crude oil barrel, tending to reduce the cost effectiveness of blending jet kerosene into diesel fuel.[33]

Transportation and Distribution: NPC has noted that changing patterns of transportation and distribution could, in some regions, bring about relatively modest increases in the costs of moving product from supply to market. Cost increases could result from either having to move diesel fuel longer distances because fewer refineries will be producing on-highway diesel, or from having to build additional infrastructure to allow segregation of low-sulfur diesel fuel.[34]

The Petroleum Marketers Association of America argued that it would cost small marketers an average of $40,000 to upgrade storage facilities to handle segregated fuel and an average $60,000 to handle the delivery of segregated fuels, with the average cost to handle segregated fuels being about 1.5 cents per gallon.[35] A later study done by ICF Inc. for the Environmental Protection Agency estimated costs to marketers of 0.1 to 0.4 cent per gallon, depending on density of marketers, diesel share of distillate market, and population density.[36]

The Los Angeles Experience: One limited historical example of low-sulfur diesel fuel pricing is available. On January 1, 1985, the California Air Resources Board required all southern California refiners producing over 50,000 barrels per day to reduce sulfur in diesel fuel sold in the South Coast Air Quality Management District (Los Angeles) from 0.5 to 0.05 percent. During the first week of 1985, Chevron offered 0.05 percent diesel at 2 cents per gallon more than high-sulfur diesel, while ARCO priced its low-sulfur diesel at 4 cents per gallon above its high-sulfur diesel.[37] A comparison of Platt's refinery and terminal price reports for the Los Angeles and San Francisco No. 2 distillate terminals reveals a possible premium of over 3 cents per gallon for diesel fuel sold in Los Angeles. During the 4 years before January 1, 1985, diesel fuel in Los Angeles averaged 1.5 cents per gallon less than in San Francisco. In the 4 years after the regulation took effect, the price of diesel in Los Angeles was 1.7 cents per gallon more than the San Francisco price.[38] Examining daily diesel rack price postings reveals that on January 2, 1985, Los Angeles had a price advantage of 0.625 cents per gallon (72.5 cents per gallon in Los Angeles versus 73.1 cents per gallon in San Francisco), which became a 4-cent per gallon disadvantage by January 11, 1985 (75.6 cents per gallon in Los Angeles versus 71.6 cents per gallon in San Francisco). Although this is supportive evidence of the 3- to 4-cents-per-gallon market price premium for low-sulfur diesel fuel, it is not conclusive because of other unidentified market supply and demand forces that may have affected regional prices.

Section 1. Energy Overview

Energy production during May 1993 totaled 5.5 quadrillion Btu, a 0.1-percent decrease compared with the level of production during May 1992. Coal production decreased 6.2 percent, petroleum production dropped 3.9 percent, and natural gas production increased 2.6 percent. All other forms of energy production combined were up 16.4 percent from the level of production during May 1992.

Energy consumption during May 1993 totaled 6.4 quadrillion Btu, 1.0 percent below the level of consumption during May 1992. Natural gas consumption decreased 11.8 percent, coal consumption was down 0.2 percent, and petroleum consumption rose 0.1 percent. Consumption of all other forms of energy combined increased 14.7 percent compared with the level 1 year earlier.

Net imports of energy during May 1993 totaled 1.4 quadrillion Btu, 12.3 percent above the level of net imports 1 year earlier. Net imports of petroleum increased 7.1 percent, and net imports of natural gas were down 13.1 percent. Net exports of coal fell 37.0 percent compared with the level in May 1992.

[a] Excludes wood, waste, geothermal, wind, photovoltaic, and solar thermal energy, except for small amounts used by electric utilities to generate electricity for distribution.

[b] The sum of domestic energy production and net imports of energy does not equal domestic energy consumption. The difference is attributed to stock changes; losses and gains in conversion, transportation, and distribution; the addition of blending compounds; shipments of anthracite to U.S. Armed Forces in Europe; and adjustments to account for discrepancies between reporting systems.

R=Revised data.

Notes: • For definitions, see Notes 1 through 4 at end of section. • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

[a] Includes lease condensate.

[b] Electric utility and industrial generation.

[c] "Other" production is electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

[d] Excludes wood, waste, geothermal, wind, photovoltaic, and solar thermal energy, except for small amounts used by electric utilities to generate electricity for distribution.

R=Revised data.

[a] Crude oil, lease condensate, and imports of crude oil for the Strategic Petroleum Reserve.

[b] Petroleum products, unfinished oils, pentanes plus, and gasoline blending components.

[c] Assumed to be hydroelectricity and estimated at the average input heat rate for fossil-fuel steam-electric power plant generation, which has ranged from 10.2 thousand Btu to 10.5 thousand Btu per kilowatthour since 1973. Actual heat rates applied in converting kilowatthours to Btu are listed by year in Table A9.

R=Revised data. E=Estimate. (s)=Less than +0.5 trillion Btu and greater than -0.5 trillion Btu.

Notes: • See Notes 3 and 4 at end of section. • Net imports equals imports minus exports. Minus sign indicates exports are greater than imports. • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

R=Revised data.

Notes: • Monthly data are not adjusted for seasonal variations. • The U.S. import statistics reflect both government and nongovernment imports of merchandise from foreign countries into the U.S. customs territory, which comprises the 50 States, the District of Columbia, Puerto Rico, and the Virgin Islands. • See Note 5 at end of section. • Totals may not equal sum of components due to independent rounding.

Sources: See end of section.

[a] Net Imports is imports minus exports. Imports from members of the Organization of Petroleum Exporting Countries (OPEC) exclude indirect imports, which are petroleum products primarily from Caribbean and West European areas and refined from crude oil produced by OPEC.

[b] The Arab members of OPEC are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. Net imports from the Neutral Zone between Kuwait and Saudi Arabia are included in net imports from Arab OPEC.

[c] OPEC currently consists of Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members.

Notes: • Beginning in October 1977, Strategic Petroleum Reserves are included. • Geographic coverage is the 50 States and the District of Columbia. • Annual averages may not equal average of quarters due to independent rounding.

Energy Summary Notes

1. Energy Production: Production of energy includes production of coal, crude oil and lease condensate, natural gas plant liquids, natural gas (dry), electric utility and industrial production of hydroelectric power, and electricity generated from nuclear power. Production also includes electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available. Approximate heat contents (Btu values) are derived by using the conversion factors provided in Appendix A.

2. Energy Consumption: Consumption of energy includes consumption of coal, natural gas (including supplemental gaseous fuels), petroleum products supplied, electric utility and industrial production of hydroelectric power, net imports of electricity (assumed to be hydroelectricity), net imports of coal coke, and electricity generated from nuclear power. Consumption also includes electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available. Approximate heat contents (Btu values) are derived by using the conversion factors provided in Appendix A.

3. Energy Imports: Energy imports include imports of coal, crude oil (including crude oil imported for the Strategic Petroleum Reserve), petroleum products, natural gas, electricity (assumed to be hydroelectricity), and coal coke. Approximate heat contents (Btu values) are derived by using the conversion factors provided in Appendix A. For further information on electricity, see "Note for imports and exports of electricity" under Note 8 of the Notes and Sources for the Energy Consumption Section.

4. Energy Exports: Energy exports include coal, crude oil, petroleum products, natural gas, electricity produced from hydroelectric power, and coal coke. Approximate heat contents (Btu values) are derived by using the conversion factors provided in Appendix A. For more information on electricity, see "Note for imports and exports of electricity" under Note 8 of the Notes and Sources for the Energy Consumption Section.

5. Merchandise Trade Value: Import data presented are based on the customs value. That value does not include insurance and freight and is consequently lower than the cost, insurance, and freight (CIF) value, which is also reported by the Bureau of the Census. All export data, and import data prior to 1981, are on a free alongside ship (f.a.s.) basis.

"Balance" is exports minus imports; a positive balance indicates a surplus trade value and a negative balance indicates a deficit trade value. "Energy" includes mineral fuels, lubricants, and related material. "Non-Energy Balance" and "Total Merchandise" include foreign exports (i.e., reexports) and nonmonetary gold and Department of Defense Grant-Aid shipments. The "Non-Energy Balance" is calculated by subtracting the "Energy" from the "Total Merchandise Balance."

"Imports" consist of government and nongovernment shipments of merchandise into the 50 States, the District of Columbia, Puerto Rico, the U.S. Virgin Islands, and the U.S. Foreign Trade Zones. They reflect the total arrival from foreign countries of merchandise that immediately entered consumption channels, warehouses, the Foreign Trade Zones, or the Strategic Petroleum Reserve. They exclude shipments between the United States, Puerto Rico, and U.S. possessions, shipments to U.S. Armed Forces and diplomatic missions abroad for their own use, U.S. goods returned to the United States by its Armed Forces, and in-transit shipments.

6. The Consumer Price Index: The values for the Consumer Price Index, All Urban Consumers, All Items, 1982-84=100, are as follows:

1973	44.4	1990:	1st Quarter	128.0
1974	49.3		2nd Quarter	129.3
1975	53.8		3rd Quarter	131.6
1976	56.9		4th Quarter	133.7
1977	60.6		Year	130.7
1978	65.2	1991:	1st Quarter	134.8
1979	72.6		2nd Quarter	135.6
1980	82.4		3rd Quarter	136.7
1981	90.9		4th Quarter	137.7
1982	96.5		Year	136.2
1983	99.6	1992:	1st Quarter	138.7
1984	103.9		2nd Quarter	139.8
1985	107.6		3rd Quarter	140.9
1986	109.6		4th Quarter	141.9
1987	113.6		Year	140.3
1988	118.3	1993:	1st Quarter	143.1
1989	124.0			

7. Degree-Days: Degree-days are relative measurements of outdoor air temperature. Cooling degree-days are defined as deviations of the mean daily temperature at a sampling station above a base temperature equal to 65° F by convention. Heating degree-days are deviations of the mean daily temperature below 65° F. For example, if a weather station recorded a mean daily temperature of 78° F, cooling degree-days for that station would be 13 (and heating degree-days, 0). A weather station recording a mean daily temperature of 40° F would report 25 heating degree-days (and 0 cooling degree-days).

There are several degree-day databases maintained by the National Oceanic and Atmospheric Administration. The information published in the *Monthly Energy Review (MER)* is developed by the National Weather Service Climate Analysis Center, Camp Springs, MD. The data are available weekly with monthly summaries and are based on mean daily temperatures recorded at

about 200 major weather stations around the country. The temperature information recorded at those weather stations is used to calculate statewide degree-day averages based on population. The State figures are then aggregated into Census Divisions and into the national average. The population weights currently used represent resident State population data estimated for 1980 by the U.S. Department of Commerce, Bureau of the Census. The data shown in the *MER* are available sooner than the Historical Climatology Series 5-1 and 5-2 developed by the National Climatic Center, Asheville, NC, which compiles data from some 8,000 weather stations.

Section 2. Energy Consumption

U.S. total energy consumption in May 1993 was 6.4 quadrillion Btu. Petroleum products accounted for 43 percent[1] of the energy consumed in May 1993, while coal accounted for 23 percent and natural gas accounted for 20 percent.

Residential and commercial sector consumption was 2.0 quadrillion Btu in May 1993, down 2 percent from the May 1992 level. The sector accounted for 31 percent of May 1993 total consumption, down 1 percentage point form its 32-percent share in May 1992.

Industrial sector consumption was 2.4 quadrillion Btu in May 1993, down 3 percent from the May 1992 level. The industrial sector accounted for 38 percent of May 1993 total consumption, down 1 percentage point from its 39-percent share in May 1992.

Transportation sector consumption of energy was 2.0 quadrillion Btu in May 1993, up 3 percent from the May 1992 level. The sector accounted for 31 percent of May 1993 total consumption, up 1 percentage point from its 30-percent share in May 1992.

Electric utility consumption of energy totaled 2.3 quadrillion Btu in May 1993, up 1 percent from the May 1992 level. Coal contributed 53 percent of the energy consumed by electric utilities in May 1993, while nuclear electric power contributed 23 percent; hydroelectric power 13 percent; natural gas 7 percent; petroleum 2 percent; and wood, waste, geothermal, wind, photovoltaic, and solar thermal energy, about 1 percent.

Table 2.1 Energy Consumption Summary for May 1993

(Quadrillion Btu)

Energy Source	End-Use Sectors				Electric Utilities	Total

Other[d]	–	–	–	–	.014	.014
Primary Consumption	**.568**	**1.523**	**1.963**	**4.052**	**2.347**	**6.399**
Electricity	.452	.280	.001	.733	–	–
Net Consumption	**1.020**	**1.803**	**1.965**	**4.786**	–	–
Electrical System Energy Losses	.995	.616	.002	1.613	–	–
Total Consumption[e]	**2.015**	**2.419**	**1.967**	**6.399**	–	–

[a] Totals for coal and natural gas may not equal sum of sectors due to the use of sector-specific conversion factors.

[b] Small amounts of coal consumed for transportation are reported as industrial sector consumption.

[c] Includes supplemental gaseous fuels. Transportation sector is pipeline fuel only.

[d] "Other" is electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

[e] Excludes wood, waste, geothermal, wind, photovoltaic, and solar thermal energy, except for small amounts used by electric utilities to generate electricity for distribution.

– =Not applicable.

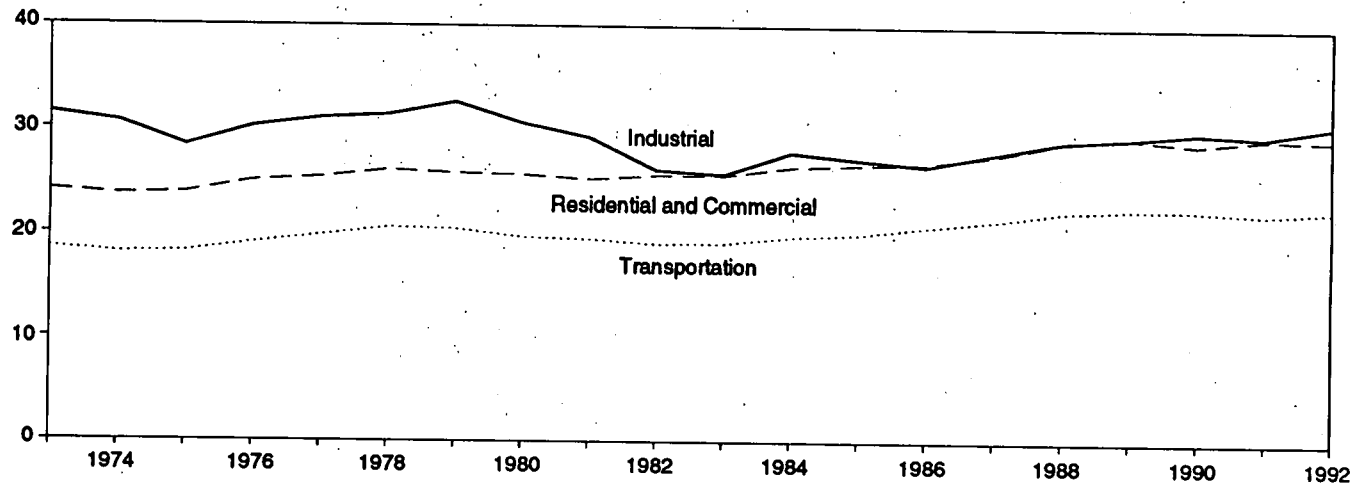
Note: Totals may not equal sum of components due to independent rounding.

Additional Notes and Sources: See Tables 2.2-2.6 and end of section.

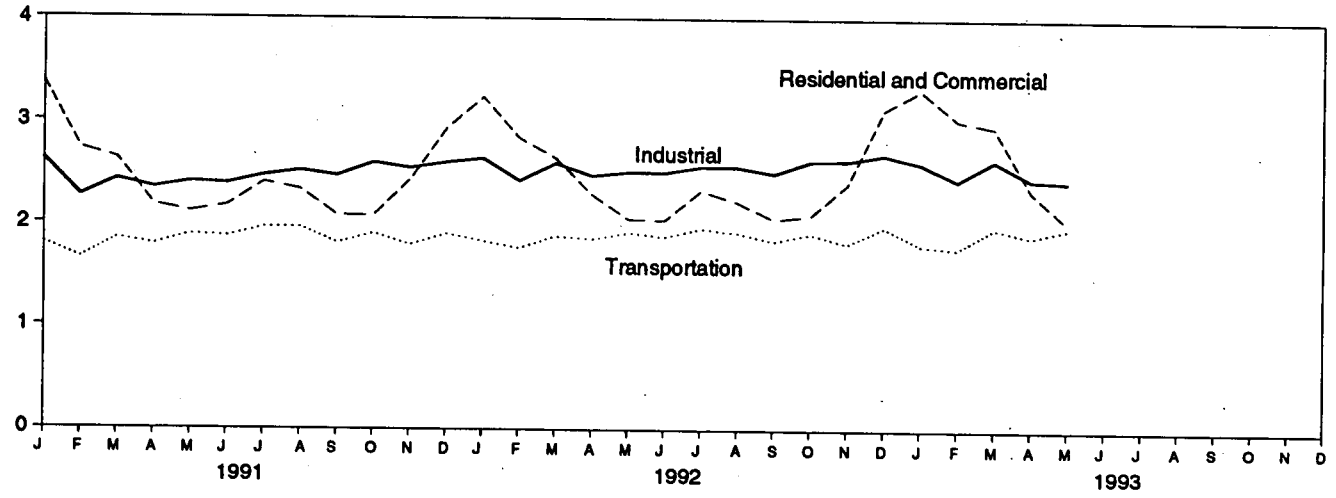
[1]Percentage changes are based on numbers in the following tables.

Figure 2.1 Energy Consumption by End-Use Sector
(Quadrillion Btu)

Consumption by End-Use Sector, 1973-1992



Consumption by End-Use Sector, Monthly



Consumption by End-Use Sector, May

[a] Includes supplemental gaseous fuels.

[b] Petroleum products reported as "oil consumed in steam plants" through 1979 and "heavy oil" from 1980 forward, which are assumed to be residual fuel oil; petroleum products reported as "oil consumed in gas turbine and internal combustion engine plants" through 1979 and "light oil" from 1980 forward, which are assumed to be distillate fuel oil, kerosene, and petroleum coke.

[c] Includes net imports of electricity.

[d] "Other" is electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

R=Revised data.

Notes: • Geographic coverage is the 50 States and the District of Columbia.

• Totals may not equal sum of components due to independent rounding.

Additional Notes and Sources: See end of section.

Energy Consumption Notes and Sources

The data in this section of the *Monthly Energy Review* (*MER*) are obtained initially from a group of energy-related surveys, typically called "supply surveys," conducted by the Energy Information Administration (EIA). Supply surveys are those surveys directed to suppliers and marketers of specific energy sources. They measure the quantities of specific energy sources produced, or the quantities supplied to the market, or both. The data obtained from the EIA's supply surveys are integrated to yield the summary consumption statistics published in this section (and in Section 1) of the *MER*. Users of the EIA's energy consumption statistics should be aware of a second group of energy-related surveys, typically called "consumption surveys." Consumption surveys gather information on the types of energy consumed by end users of energy, along with the characteristics of those end users that can be associated with energy use. For example, the Manufacturing Energy Consumption Survey belongs to the consumption survey group because it collects information directly from end users (the manufacturing establishments). There are important differences between the supply and consumption surveys that need to be taken into account in any analysis that uses both data sources. For information on those differences, see *Energy Consumption by End-Use Sector, A Comparison of Measures by Consumption and Supply Surveys*, DOE/EIA-0533, Energy Information Administration, Washington, DC, April 6, 1990. The numbered notes that follow elaborate on essential information in Section 2.

1. Total Energy Consumed: Total energy consumed includes coal, natural gas (including supplemental gaseous fuels), petroleum products supplied, electric utility and industrial generation of hydroelectric power, net imports of electricity generated from hydroelectric power, and electricity generated from nuclear power. Total energy consumed also includes electricity generated from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available.

2. Economic Sectors: Energy use is assigned to the major economic sectors according to the following guidelines as closely as possible:

- Residential—All private residences, whether occupied or vacant, owned or rented, including single-family homes, multifamily housing units, and mobile homes. Secondary homes, such as summer homes, are also included. Institutional housing, such as school dormitories, hospitals, and military barracks, generally are not included in the residential sector; they are included in the commercial sector.
- Commercial—Business establishments that are not engaged in transportation or in manufacturing or other types of industrial activity (agriculture, mining, or construction). Commercial establishments include hotels, motels, restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; religious and nonprofit organizations; health, social, and educational institutions; and Federal, State, and local governments. Street lights, pumps, bridges, and public services are also included if the establishment operating them is considered commercial.
- Industrial—Manufacturing industries, which make up the largest part of the sector, along with mining, construction, agriculture, fisheries, and forestry. Establishments in the sector range from steel mills to small farms to companies assembling electronic components.
- Transportation—Private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads and railways (including streetcars), aircraft, ships, barges, and natural gas pipelines.
- Electric Utility—Privately and publicly owned establishments that generate, transmit, distribute, and sell electricity primarily for use by the public and meet the definition of an electric utility. Nonutility power producers are not included in the electric utility sector.

Although the end-use allocations are made according to these aggregations as closely as possible, some data are collected by using different classifications. For example, data on agricultural use of natural gas are collected and reported in the commercial sector, rather than in the industrial sector. Since agricultural use of natural gas cannot be identified separately, it is included in the commercial sector in this report. Another example is master-metered condominiums and apartments, and buildings with a combination of residential and commercial units. In many cases, the metering and billing practices cause residential energy usage of electricity, natural gas, or fuel oil to be included in the commercial sector. No adjustments for these discrepancies were made.

3. Conversion Factors: See the conversion factors listed in Appendix A.

4. Coal: Coal is anthracite, bituminous coal (including subbituminous coal), and lignite. Sources:

- 1973-September 1977: U.S. Department of the Interior (DOI), Bureau of Mines (BOM), *Minerals Yearbook* and *Minerals Industry Surveys*.
- Electric Utilities—October 1977 forward: Energy Information Administration (EIA), Form EIA-759 (formerly Form FPC-4), "Monthly Power Plant Report."
- Other Industrial—October 1977-December 1979: EIA, Form EIA-3, "Monthly Coal Consumption Report - Manufacturing Plants"; January 1980 for-

ward: EIA, Form EIA-3, "Quarterly Coal Consumption Report - Manufacturing Plants," and Form EIA-6, "Coal Distribution Report."

- Coke Plants—October 1977-December 1980: EIA, Form EIA-5/5A, "Coke and Coal Chemicals - Monthly/Annual"; January 1981-December 1984: EIA, Form EIA-5/5A, "Coke Plant Report - Quarterly/Annual Supplement"; January 1985 forward: EIA, Form EIA-5/5A, "Coke Plant Report," quarterly.
- Residential and Commercial—October 1977-December 1979: EIA, Form EIA-2, "Monthly Coal Report, Retail Dealers - Upper Lake Docks"; January 1980 forward: EIA, Form EIA-6, "Coal Distribution Report."

5. Natural Gas: Natural gas consumption by end use is based on data presented in Table 4.3 of this report. For Section 2 calculations, lease and plant fuel consumption are added to industrial deliveries, and pipeline fuel represents transportation use of natural gas. Values in Btu are derived by using the conversion factors provided in Appendix A. Sources:

- 1973-1975: DOI, BOM, *Minerals Yearbook*, "Natural Gas" chapter.
- 1976-1978: EIA, "Energy Data Reports," *Natural Gas, Annual.*
- 1979: EIA, *Natural Gas Production and Consumption 1979.*
- 1980-1991: EIA, *Natural Gas Annual.*
- 1992 and 1993: EIA, *Natural Gas Monthly.*
- Electric Utilities—1973-1976: Form FPC-4, "Monthly Power Plant Report"; 1977-1981: Federal Energy Regulatory Commission (FERC), Form FPC-4, "Monthly Power Plant Report"; 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."
- American Gas Association, "Monthly Gas Utility Statistical Report," residential and commercial monthly sales data for 1973-1979, which are used to estimate monthly consumption values from EIA annual consumption values.

6. Petroleum: Petroleum consumption by end use is the sum of all individual petroleum products estimated to be consumed in each end-use sector. First, total consumption by product is determined. Petroleum consumption in this section of the *Monthly Energy Review (MER)* is the series called "petroleum products supplied" in Section 3. Sources for petroleum products supplied by individual products are:

- 1973-1975: DOI, BOM, *Mineral Industry Surveys*, "Petroleum Statement, Annual."
- 1976-1980: EIA, *Energy Data Reports*, "Petroleum Statement, Annual."
- 1981-1991: EIA, *Petroleum Supply Annual.*
- 1992 and 1993: EIA, *Petroleum Supply Monthly.*

Specific petroleum products' end-use allocation procedures follow:

- **Aviation Gasoline**—All product supplied is assigned to the transportation sector.
- **Asphalt**—All product supplied is assigned to the industrial sector.
- **Distillate Fuel**—Product supplied is assigned to electric utilities and non-electric utilities as follows:

Electric Utilities, All Periods.

Monthly and annual consumption for 1973-1979 is assumed to be the amount of oil (minus small amounts of kerosene and kerosene-type jet fuel deliveries) reported as consumed in internal combustion and gas turbine engine plants. From January 1980, electric utility consumption of distillate fuel is assumed to be the petroleum products reported as "light oil" (minus small amounts of kerosene deliveries through 1982) consumed at electric utilities.

Sources: 1973-September 1977: FPC, Form FPC-4, "Monthly Power Plant Report"; October 1977-1981: FERC, Form FPC-4, "Monthly Power Plant Report"; 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."

Sectors Other Than Electric Utilities, Annual Estimates Through 1991.

The aggregate non-electric utility use of distillate fuel is total distillate fuel supplied minus the electric utility consumption. The non-electric utility annual consumption totals are allocated to the individual non-electric utility sectors (residential, commercial, industrial, and transportation) in proportion to the share of "adjusted sales" of each end-use sector, as reported in EIA's *Fuel Oil and Kerosene Sales* report series (DOE/EIA-0535), which is based primarily on data collected by Form EIA-821, previously Form EIA-172. "Adjusted sales" are sales that have been adjusted at the PAD district level to equal EIA volume estimates of petroleum products supplied in the U.S. market. Following are notes on the individual sector groupings:

- Since 1979, the residential sector adjusted sales total is directly from the *Sales* reports. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into residential, commercial, and industrial (including farm) in proportion to the 1979 shares.

- Since 1979, the commercial sector adjusted sales total is directly from the *Sales* reports. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into residential, commer-

cial, and industrial (including farm) in proportion to the 1979 shares.

- Since 1979, the industrial sector adjusted sales total is the sum of the adjusted sales for industrial, farm, oil company, off-highway, diesel, and all other uses. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into residential, commercial, and industrial (including farm) in proportion to the 1979 shares, and this estimated industrial portion is added to oil company, off-highway diesel, and all other uses.

- The transportation sector adjusted sales total is the sum of the adjusted sales for railroad, vessel bunkering, on-highway diesel, and military uses for all years.

Sectors Other Than Electric Utilities, Monthly Estimates Through 1991.

- Residential and commercial monthly consumption is estimated by allocating the annual estimates described above into months in proportion to each month's share of the year's sales of No. 2 heating oil as reported in the "Monthly Report of Heating Oil Sales" by the Ethyl Corporation from 1973-1980 and the American Petroleum Institute for 1981 and 1982, and the EIA, Form EIA-782A, "Refiners/Gas Plant Operators' Monthly Petroleum Product Sales Report," No. 2 Fuel Oil Sales to End Users and for Resale, since 1983.

- The transportation highway use portion is allocated into the months in proportion to each month's share of the year's total sales for highway use as reported by the Federal Highway Administration's Table MF-25, "Private and Commercial Highway Use of Special Fuels by Months." The remaining transportation use of distillate fuel (i.e., for railroads, vessel bunkering, and military use) is evenly distributed over the months, adjusted for the number of days per month.

- Industrial monthly estimates are made by subtracting the residential and commercial, transportation, and electric utility sector estimates from each month's total distillate fuel supplied.

Sectors Other Than Electric Utilities, 1992 and 1993

Each month's non-electric utility consumption subtotal is disaggregated into the major end-use sectors in proportion to the shares each sector held of the non-electric utility subtotal in the same month in 1991.

- **Jet Fuel**—Through 1982, small amounts of kerosene-type jet fuel were consumed by electric utilities. Kerosene-type jet fuel deliveries to electric utilities as reported on the Form FERC-423 (formerly Form FPC-423) were used as estimates of this consumption. All remaining jet fuel (kerosene-type and naphtha-type) is consumed by the transportation sector.
- **Kerosene**—Total product supplied monthly is allocated to the major end-use sectors in proportion to annual sales grouped into end-use sectors from EIA's *Fuel Oil and Kerosene Sales (Sales)* reports (based primarily on data collected by Form EIA-821, previously Form EIA-172), as follows:

  - Residential deliveries are directly from the *Sales* reports for 1979-1991. Sales for 1991 are used as estimates for succeeding periods. Prior to 1979, each year's sales category called "heating" is split into residential, commercial, and industrial in proportion to the 1979 shares.

  - Commercial sales are directly from the *Sales* reports for 1979-1991. Sales for 1991 are used as estimates for succeeding periods. Prior to 1979, each year's sales category called "heating" is split into residential, commercial, and industrial in proportion to the 1979 shares.

  - Industrial sales are directly from the *Sales* reports for 1979-1991. Sales for 1991 are used as estimates for succeeding periods. Prior to 1979, each year's sales category called "heating" is split into residential, commercial and industrial in proportion to the 1979 shares, and this estimated industrial (including farm) portion is added to all other uses.
- **Liquefied Petroleum Gases (LPG)**—The annual shares of LPG's total consumption that are estimated to be consumed by each end-use sector are applied to each month's total LPG consumption (i.e., product supplied) to create monthly end-use consumption estimates. The annual end-use shares are calculated in the following manner:

  - Sales of LPG to the residential and commercial sector are converted from thousand gallons per year to thousand barrels per year and are assumed to be the annual consumption of LPG by the sector.

  - The quantity of LPG sold each year for consumption in internal combustion engines is allocated between the transportation and industrial sectors on the basis of data for special fuels used on highways published by the U.S. Department of Transportation, Federal Highway Administration, in *Highway Statistics*. The allocations of LPG sold for internal combustion engine use to the transportation sector range from a high of 67 percent in 1981 to a low of 37 percent in 1987.

  - LPG consumed annually by the industrial sector is estimated as the difference between LPG's total supplied and the estimated consumption by the sum of the residential and commercial sector and the transportation sector. The industrial sector includes LPG used by chemical plants as raw materials or solvents and for use in the production of synthetic

rubber; refinery fuel use; use as synthetic natural gas feedstock and use in secondary recovery projects; all farm use; LPG sold to gas utility companies for distribution through the mains; and a portion of the use of LPG as an internal combustion engine fuel.

The sources of the annual sales data for creating annual end-use shares are:

- 1973-1982: EIA's "Sales of Liquefied Petroleum Gases and Ethane" reports, based primarily on data collected by Form EIA-174.

- 1983: End-use consumption estimates for 1983 are based on 1982 end-use consumption because the collection of data under Form EIA-174 was discontinued after data year 1982.

- 1984-1991: American Petroleum Institute (API), "Sales of Natural Gas Liquids and Liquefied Refinery Gases," which is based on an LPG sales survey jointly sponsored by API, the Gas Processors Association, and the National Liquefied Petroleum Gas Association.

- 1992 and 1993: The 1991 source is used to estimate succeeding periods.

- **Lubricants**—Total product supplied is allocated to the industrial and transportation sectors for all months according to proportions developed from annual sales of lubricants to the two sectors from U.S. Department of Commerce, Bureau of the Census, *Current Industrial Reports*, "Sales of Lubricating and Industrial Oils and Greases." The 1973 shares are applied to 1973 and 1974; the 1975 shares are applied to 1975 and 1976; and the 1977 shares are applied to 1977 forward.

- **Motor Gasoline**—Total product supplied monthly is allocated to the major end-use sectors in proportion to aggregations of annual sales categories formed from the U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics*, Tables MF-21, MF-24, and MF-25, as follows:

  - Commercial sales are the sum of sales for public non-highway use and miscellaneous and unclassified uses.

  - Industrial sales are the sum of sales for agriculture, construction, and industrial and commercial use as classified in the *Highway Statistics*.

  - Transportation sales are the sum of sales for highway use (minus the sales of special fuels, which are primarily diesel fuel and are accounted for in the transportation sector of distillate fuel) and sales for marine use.

- **Petroleum Coke**—The portion consumed by electric utilities is from Form EIA-759, "Monthly Power Plant Report" (formerly Form FPC-4). The remaining petroleum coke is assigned to the industrial sector.

- **Residual Fuel**—Product supplied is assigned to electric utilities and non-electric utilities as follows:

  Electric Utilities, All Periods.

  Monthly and annual consumption for 1973-1979 is assumed to be the amount of oil reported as consumed in steam-electric power plants. From January 1980 forward, electric utility consumption of residual fuel is assumed to be the petroleum products reported as heavy oil consumed at electric utilities.

  Sources: 1973-September 1977: Form FPC-4, "Monthly Power Plant Report"; October 1977-1981: FERC, Form FPC-4, "Monthly Power Plant Report"; 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."

  Sectors Other Than Electric Utilities, Annual Estimates Through 1991.

  The aggregate non-electric utility use of residual fuel is total residual fuel supplied minus the electric utility consumption. The non-electric utility annual totals are allocated into the individual non-electric utility sectors in proportion to the amount of residual fuel sold to end users, grouped into sectors from EIA's *Fuel Oil and Kerosene Sales* (*Sales*) reports (based primarily on data collected by Form EIA-821, previously Form EIA-172), as follows:

  - Since 1979, commercial sales data are directly from the *Sales* reports. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into commercial and industrial in proportion to the 1979 shares.

  - Since 1979, industrial sales data are the sum of sales for industrial, oil company, and all other uses. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into commercial and industrial in proportion to the 1979 shares, and this estimated industrial portion is added to oil company and all other uses.

  - Transportation sales are the sum of sales for railroad, vessel bunkering, and military uses for all years.

  Sectors Other Than Electric Utilities, Monthly Estimates Through 1991.

  - Commercial sector monthly consumption is estimated by allocating the annual commercial sector estimates described above into months in proportion to each month's share of the year's sales of No. 2 fuel oil as reported in the "Monthly Report

of Heating Oil Sales" by the Ethyl Corporation for 1973-1980 and the American Petroleum Institute for 1981 and 1982, and the EIA, Form EIA-782A, "Refiners/Gas Plant Operators' Monthly Petroleum Product Sales Report," No. 2 Fuel Oil Sales to End Users and for Resale, since 1983.

- Transportation monthly estimates are made by evenly distributing the annual sector estimate over the months, adjusting for the number of days per month.

- Industrial monthly estimates are made by subtracting the commercial, transportation, and electric utility sector estimates from each month's total residual fuel supplied.

Sectors Other Than Electric Utilities, 1992 and 1993

Each month's non-electric utility consumption subtotal is disaggregated into the major end-use sectors in proportion to the shares each sector held of the non-electric utility subtotal in the same month in 1991.

- **Road Oil**—All product supplied is assigned to the industrial sector.
- **All Other Petroleum Products**—The product supplied of all remaining petroleum products is assigned to the industrial sector.

7. Nuclear Electric Power and Wood, Waste, Geothermal, Wind, Photovoltaic, and Solar Thermal Energy Sources Connected to Electric Utility Distribution Systems: Sources:

- 1973-1976: FPC, Form FPC-4, "Monthly Power Plant Report."
- 1977-1981: FERC, Form FPC-4, "Monthly Power Plant Report."
- 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."

8. Hydroelectric Power: Includes electricity generated by hydroelectric power at electric utilities, small amounts in the industrial sector, and net imports of electricity, which are assumed to be generated by hydroelectric power and are included in the electric utilities sector.

Sources for electric utilities sector:

- 1973-1976: FPC, Form FPC-4, "Monthly Power Plant Report."
- 1977-1981: FERC, Form FPC-4, "Monthly Power Plant Report."
- 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."

Sources for industrial sector:

- 1973-1978: FPC, Form FPC-4, "Monthly Power Plant Report," for plants with generating capacity exceeding 10 megawatts, and FPC, Form FPC-12C, "Industrial Electric Generating Capacity," for all other plants.
- 1979: FPC, Form FPC-4, "Monthly Power Plant Report," for plants with generating capacity exceeding 10 megawatts and EIA estimates for all other plants.
- 1980 forward: Annual generation estimated by EIA as the average generation over the 6-year period of 1974-1979; monthly generation estimated to be in proportion to each month's hydroelectricity generation in the electric utility industry in 1980.

Sources for imports and exports of electricity:

- 1973-September 1977: Unpublished Federal Power Commission data.
- October 1977-1980: Unpublished Economic Regulatory Administration (ERA) data.
- 1981: DOE, Office of Energy Emergency Operations, "Report on Electric Energy Exchanges with Canada and Mexico for Calendar Year 1981," April 1982 (revised June 1982).
- 1982 and 1983: DOE, ERA, *Electricity Exchanges Across International Borders.*
- 1984-1986: DOE, ERA, *Electricity Transactions Across International Borders.*
- 1987 and 1988: DOE, ERA, Form ERA-781R, "Annual Report of International Electrical Export/Import Data."
- 1989-1991: DOE, Assistant Secretary for Fossil Energy, Form FE-781-R, "Annual Report of International Electrical Export/Import Data."
- 1992 forward: EIA estimates based on preliminary data from the National Energy Board of Canada and DOE, Assistant Secretary for Fossil Energy.

9. Net Imports of Coal Coke: Net imports means imports minus exports, and a minus sign indicates that exports are greater than imports. Sources:

- 1973-1975: DOI, BOM, *Minerals Yearbook,* "Coke and Coal Chemicals" chapter.
- 1976-1980: EIA, *Energy Data Report,* "Coke and Coal Chemicals" annual.
- 1981: EIA, *Energy Data Report,* "Coke Plant Report," quarterly.
- 1982 forward: EIA, *Quarterly Coal Report.*

10. Electricity: End-use consumption of electricity is based on Table 7.2 sales data. "Other," which is primarily for use in government buildings, is added to the commercial sector, except for approximately 4 percent used by railroads and railways and attributed to the

transportation sector. For 1973-1983 and 1992 forward, "Monthly Series" data are used directly. For 1984-1991, monthly estimates are created by dividing each month's "Monthly Series" value by the "Monthly Series" total for the year and multiplying by the "Annual Series" value for the year. Kilowatthours are converted to Btu at the rate of 3,412 Btu per kilowatthour. See Table 7.2 for sources of the electricity sales data.

11. Electrical System Energy Losses: Electrical system energy losses are calculated as the difference between total energy input at electric utilities and the total energy content of electricity sold to end-use consumers. Most of those losses occur at steam-electric power plants (conventional and nuclear) in the conversion of heat energy into mechanical energy to turn electric generators. The loss is a thermodynamically necessary feature of the steam-electric cycle. Part of the energy input-to-output losses is a result of imputing fossil energy equivalent inputs for hydroelectric and other energy sources, since there is no generally accepted practice for measuring those thermal conversion rates. In addition to conversion losses, other losses include power plant use of electricity, transmission and distribution of electricity from power plants to end-use consumers (also called "line losses"), and unaccounted for electricity. Total losses are allocated to the end-use sectors in proportion to each sector's share of total electricity sales. Overall, approximately 67 percent of total energy input is lost in conversion; of electricity generated, approximately 5 percent is lost in plant use and 9 percent is lost in transmission and distribution. Calculated electrical system energy losses may be less than actual losses, because primary consumption does not include the energy equivalent of utility purchases of electricity from non-electric utilities and from Canada and Mexico, although they are included in electricity sales.

Section 3. Petroleum

Total petroleum imports[2] averaged 8.3 million barrels per day in July 1993, 5 percent[3] lower than the previous month's rate and 2 percent lower than the July 1992 rate.

In June 1993 (latest month for which data are available), 17.0 million barrels per day of petroleum products were supplied for domestic use, slightly higher than the June 1992 rate. Motor gasoline accounted for 45 percent of the total; distillate fuel oil, 17 percent; and residual fuel oil, 5 percent.

Motor gasoline supplied during June 1993 (latest month for which data are available), averaged 7.7 million barrels per day, 3 percent higher than the June 1992 rate. Total motor gasoline stocks were 213 million barrels at the end of July 1993, 7 million barrels below the stock level in the previous month and 2 million barrels below the level 1 year earlier.

Distillate fuel oil supplied during July 1993 averaged 2.8 million barrels per day, 1 percent lower than the previous month's rate but 4 percent higher than the July 1992 rate. Distillate fuel oil ending stocks for July 1993 were 121 million barrels, 12 million barrels above the stock level in the previous month and 6 million barrels above the stock level 1 year earlier.

Residual fuel oil supplied in July 1993 averaged 1.0 million barrels per day, 15 percent higher than the previous month's rate but slightly lower than the July 1992 rate. Residual fuel oil stocks measured 42 million barrels at the end of July 1993, 4 million barrels below the stock level in the previous month but 2 million barrels above the stock level 1 year earlier.

Estimates (except of crude production) for the most current month are based on Energy Information Administration (EIA) weekly data and will be revised to conform with data from the EIA Petroleum Reporting System as available. For the most recent month, crude production is an EIA estimate based on historical and provisional data through April 1993.

[2]Total import data include imports into the Strategic Petroleum Reserve.
[3]Percentage changes are based on numbers shown in the following tables.

Table 3.1a Petroleum Overview: Field Production, Stock Change, Petroleum Products Supplied, and Ending Stocks

	Field Production			Stock Change[a]			Ending Stocks[b]
	Total Domestic[c]	Crude Oil	Natural Gas Plant Production	Crude Oil[d]	Petroleum Products	Petroleum Products Supplied	Crude Oil[d] and Petroleum Products

[a] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[b] Stocks are totals as of end of period.
[c] Includes crude oil, natural gas plant liquids, and other liquids.
[d] Includes stocks located in the Strategic Petroleum Reserve.
[e] See Note 4 at end of section.
[f] See Note 6 at end of section.
[g] Beginning in 1993, includes fuel ethanol blended into finished motor gasoline and oxygenate production from merchant MTBE (methyl tertiary butyl ether) plants.

PE=Preliminary estimate. R=Revised data. NA=Not available. E=Estimate.

Notes: • Crude oil includes lease condensate. • Geographic coverage is the 50 States and the District of Columbia.

[a] Includes crude oil for storage in the Strategic Petroleum Reserve.
[b] Net imports equals imports minus exports.
[c] See Note 6 at end of section.
R=Revised data. E=Estimate.
Notes: • Geographic coverage is the 50 States and the District of Columbia.
• Totals may not equal sum of components due to independent rounding.
Sources: • 1973-1980: Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S1. • 1981 forward: EIA, *Petroleum Supply Monthly*, August 1993, Table S1.

[a] Strategic Petroleum Reserve.
[b] A balancing item.
[c] Beginning in January 1983, crude oil used directly as fuel is shown as product supplied.
[d] See Note 6 at end of section.
PE=Preliminary estimate. R=Revised data. – =Not applicable. E=Estimate.

Notes: • Crude oil includes lease condensate. • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

Sources: • 1973-1980: Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S2. • 1981 forward: EIA, *Petroleum Supply Monthly*, August 1993, Table S2.

[a] Stocks are totals as of end of period.
[b] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[c] Strategic Petroleum Reserve.
[d] Beginning in January 1983, crude oil used directly as fuel is shown as product supplied.
[e] See Note 6 at end of section.
[f] Stocks of Alaskan crude oil in transit are included from January 1981 forward. See Note 5 at end of section.
[g] See Note 4 at end of section.

R=Revised data. – =Not applicable. E=Estimate. (s)=Less than 500 barrels per day.

Notes: • Crude oil includes lease condensate. • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

Sources: • 1973-1980: Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S2. • 1981 forward: EIA, *Petroleum Supply Monthly*, August 1993, Table S2.

[a] Excludes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

[b] Imports from the Neutral Zone between Kuwait and Saudi Arabia are included in Saudi Arabia.

(s)=Less than 500 barrels per day.

Notes: • Beginning in October 1977, Strategic Petroleum Reserve imports are included. • Geographic coverage is the 50 States and the District of Columbia.

[a] Includes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

(s)=Less than 500 barrels per day.

Notes: • Beginning in October 1977, Strategic Petroleum Reserve imports are included. • Geographic coverage is the 50 States and the District of Columbia.

Sources: • **1973-1980:** Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S3. • **1981 forward:** EIA, *Petroleum Supply Monthly*, August 1993, Table S3.

[a] Includes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

[b] As of January 1993, includes petroleum imported from Ecuador, which withdrew from OPEC on December 31, 1992.

R=Revised data. (s)=Less than 500 barrels per day.

Notes: • Beginning in October 1977, Strategic Petroleum Reserve imports are included. • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

Sources: • 1973-1980: Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S3. • 1981 forward: EIA, *Petroleum Supply Monthly*, August 1993, Table S3.

[a] Stocks are totals as of end of period.
[b] From 1981 forward, blending components are excluded.
[c] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[d] Includes motor gasoline blending components, but excludes oxygenates, which are reported separately.
[e] See Note 4 at end of section.
[f] See Note 2 at end of section.
[g] Beginning in 1993, motor gasoline production and product supplied include blending of fuel ethanol and an adjustment to correct for the imbalance of motor gasoline blending components. See Note 2 at end of section.
[h] See Note 1 at end of section.

R=Revised data. NA=Not available. E=Estimate. (s)=Less than 500 barrels per day.

Note: Geographic coverage is the 50 States and the District of Columbia.

[a] Beginning in January 1983, crude oil used directly as residual fuel oil is reported as crude oil product supplied on Table 3.2b rather than as residual fuel oil product supplied.

[b] A negative number indicates a decrease in stocks and a positive number indicates an increase.

[c] Stocks are totals as of end of period.

[d] See Note 4 at end of section.

[e] See Note 3 at end of section.

R=Revised data. – =Not applicable. E=Estimate. (s)=Less than 500 barrels per day.

Note: Geographic coverage is the 50 States and the District of Columbia.

[a] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[b] Stocks are totals as of end of period.
[c] See Note 4 at end of section.
[d] See Note 6 at end of section.
[e] Beginning in 1993, other petroleum products production, exports, and products supplied include an adjustment to oxygenates and motor gasoline blending components.
(s)=Less than 500 barrels per day.

Notes: • Other petroleum products include pentanes plus, other hydrocarbons and oxygenates, unfinished oils, gasoline blending components, and all finished petroleum products except finished motor gasoline, distillate fuel oil, residual fuel oil, jet fuel, and liquefied petroleum gases. • Geographic coverage is the 50 States and the District of Columbia.

Sources: • **1973-1980:** Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S9. • **1981 forward:** EIA, *Petroleum Supply Monthly*, August 1993, Table S10.

Petroleum Notes

1. The Energy Information Administration (EIA) uses a number of sources and methods to maintain the survey respondent lists. On a regular basis, survey managers review such industry publications as the *Oil and Gas Journal* and *Oil Daily* for information on facilities or companies starting up or closing down operations. Those sources are augmented by articles in newspapers, letters from respondents indicating changes in status, and information received from survey systems.

To supplement routine frames maintenance and to provide more thorough coverage, a comprehensive frames investigation is conducted every 3 years. This investigation results in the reassessment and recompilation of the complete frame for each survey. The effort also includes the evaluation of the impact of potential frame changes on the historical time series of data published from these respondents. The results of this frame study are usually implemented in January to provide a full year under the same frame.

In 1991, the EIA conducted a frame identifier survey of companies that produce, blend, store, or import oxygenates. A summary of the results from the identification survey was published in the *Weekly Petroleum Status Report* dated February 12, 1992, and in the February 1992 issue of the *Petroleum Supply Monthly.* In order to continue to provide relevant information about U.S. and regional gasoline supply, the EIA conducted a second frame identifier survey of those companies during 1992. As a result, numerous respondents were added to the monthly surveys effective in January 1993. See Explanatory Note 7 in the *Petroleum Supply Monthly.*

2. Motor Gasoline: Beginning in January 1981, the EIA expanded its universe to include non-refinery blenders and separated blending components from finished motor gasoline as a reporting category. Also, survey forms were modified to describe refinery operations more accurately.

Beginning with the reporting of January 1993 data, the EIA made adjustments to the product supplied series for finished motor gasoline. It was recognized that motor gasoline statistics published by the EIA through 1992 were underreported because the reporting system was (1) not collecting all fuel ethanol blending, and (2) there was a misreporting of motor gasoline blending components that were blended into finished gasoline. The adjustments are incorporated into EIA's data beginning in January 1993. To facilitate data analysis across the 1992-1993 period, EIA has prepared a table of 1992 data adjusted according to the 1993 basis. See *Petroleum Supply Monthly,* March 1993, Table H3.

3. Distillate and Residual Fuel Oils: The requirement to report crude oil in pipelines or burned on leases as either distillate or residual fuel oil has been eliminated. Prior to January 1981, the refinery input of unfinished oils typically exceeded the available supply of unfinished oils. That discrepancy was assumed to be due to the redesignation of distillate and residual fuel oils received as such but used as unfinished oil inputs by the receiving refinery. The imbalance between supply and disposition of unfinished oils would then be subtracted from the production of distillate and residual fuel oils. Two-thirds of that difference was subtracted from distillate and one-third from residual. Beginning in January 1981, the EIA modified its survey forms to account for redesignated product and discontinued the above-mentioned adjustment.

Beginning in January 1993, the end-of-month stocks of distillate fuel oil are split into two sulfur categories (0.05 percent sulfur or less and greater than 0.05 percent sulfur) to meet Environmental Protection Agency requirements effective in October 1992. For further details, see the EIA, *Petroleum Supply Monthly.*

4. New Stock Basis: In January 1975, 1979, 1981, and 1983, numerous respondents were added to bulk terminal and pipeline surveys, affecting subsequent stocks reported and stock change calculations. Using the expanded coverage (new basis), the end-of-year stocks, in million barrels, would have been:

- Crude Oil: 1982—645 (Total) and 351 (Other Primary).
- Crude Oil and Petroleum Products: 1974—1,121; 1980—1,425; and 1982—1,461.
- Motor Gasoline: 1974—225; 1980—263; 1982—244 (Total) and 202 (Finished).
- Distillate Fuel Oil: 1974—224; 1980—205; and 1982—186.
- Residual Fuel Oil: 1974—75; 1980—91; and 1982—69.
- Jet Fuel: 1974—30 (Total) and 24 (Kerosene Type); 1980—42 (Total) and 36 (Kerosene Type); and 1982—39 (Total) and 32 (Kerosene Type).
- Liquefied Petroleum Gases: 1974—113; 1978—136; 1980—128; and 1982—102.
- Propane and Propylene: 1978—86; 1980—69; and 1982—57.
- Other Petroleum Products: 1974—190; 1980—207; and 1982—219.

Stock change calculations beginning in 1975, 1979, 1981, and 1983 were made by using new basis stock levels.

In January 1984, changes were made in the reporting of natural gas liquids. As a result, unfractionated stream, which was formerly included in the "Other Petroleum Products Supply and Disposition" table, is now reported on a component basis (ethane, propane, normal butane, isobutane, and pentanes plus). Most of these stocks now appear in the "Liquefied Petroleum Gases Supply

and Disposition" table. This change affects stocks reported and stock change calculations in each table. Under the new basis, end-of-year 1983 stocks, in million barrels, would have been:

- Liquefied Petroleum Gases: 1983—108.
- Propane and Propylene: 1983—55.
- Other Petroleum Products: 1983—210.

In January 1993, changes were made in the monthly surveys to begin collecting bulk terminal and pipeline stocks of oxygenates. This change affected stocks reported and stock change calculations. However, a new basis stock level was not calculated for 1992 end-of-year stocks.

5. Stocks of Alaskan Crude Oil: Stocks of Alaskan Crude oil in transit were included for the first time in January 1981. The major impact of this change is on the reporting of stock change calculations. Using the expanded coverage (new basis), 1980 end-of-year stocks, in million barrels, would have been 488 (Total) and 380 (Other Primary).

6. Data Discrepancies: Due to differences internal to EIA data processing systems, some small discrepancies exist between data in the *Monthly Energy Review* (*MER*) and the *Petroleum Supply Annual* (*PSA*) and *Petroleum Supply Monthly* (*PSM*). The data that have discrepancies are footnoted in Section 3 tables and summarized here.

Table	Data Series	Year Average	*MER* Data	*PSA* and *PSM* Data
3.1a	Natural Gas Plant Production	1976	1,604	1,603
3.1b	Exports, Total	1979	471	472

3.2b	Crude Losses	1980	14	15
3.5	Stock Change	1974	10	9
3.5	Stock Change	1975	-41	-40
3.8	Total Production	1982	1,527	1,525
3.10	Products Supplied	1982	1,857	1,856

Section 4. Natural Gas

Total dry natural gas production in the United States during June 1993 was an estimated 1.5 trillion cubic feet, 3 percent[4] higher than production during the previous June. Dry natural gas production during the first half of 1993 was 9.1 trillion cubic feet, 4 percent above production during the first half of 1992.

Consumption of natural and supplemental gas in June 1993 was 1.1 trillion cubic feet, 10 percent below the level in June 1992. Consumption of natural and supplemental gas during the first half of 1993 was 11 trillion cubic feet, slightly lower than consumption during the first half of 1992.

Deliveries to residential consumers in May 1993 (latest date for which data are available) were 230 billion cubic feet, 8 percent lower than the previous May's deliveries. Total deliveries to industrial consumers during May 1993 were 575 billion cubic feet, 10 percent below the previous May's level.

Imports of natural gas in June 1993 were 193 billion cubic feet, 19 percent higher than imports in the previous June. Imports of natural gas during the first half of 1993 were 1.1 trillion cubic feet, 7 percent higher than imports during the first half of 1992.

Stocks of working gas[5] in underground natural gas storage reservoirs at the end of June 1993 totaled 2.1 trillion cubic feet, 3 percent below the level of stocks available 1 year earlier. Net injections into storage during June 1993 were 373 billion cubic feet, 17 percent above the amount injected during the previous June.

[4]Percentage changes are calculated by using unrounded data.
[5]Gas available for withdrawal.

[a] Data for 1980-1991 include underground storage and liquefied natural gas storage. All other data include underground storage only. Computation procedures are discussed in Note 8 at end of section.

[b] See Notes at end of section.

[c] Data for 1978 forward do not include in-transit receipts and deliveries.

[d] May include unknown quantities of nonhydrocarbon gases.

[e] See Note 7 at end of section.

R=Revised data. NA=Not available. E=Estimate.

Notes: • Geographic coverage is the 50 States and the District of Columbia.
• Totals may not equal sum of components due to independent rounding.

[a] Total underground storage capacity at the end of each calendar year (in billion cubic feet): 1975--6,280 (first year for which data are available); 1976--6,544; 1977--6,678; 1978--6,890; 1979--6,929; 1980--7,434; 1981--7,805; 1982--7,915; 1983--7,985; 1984--8,043; 1985--8,087; 1986--8,145; 1987, 1988, and 1989--8,124; 1990--8,125; 1991--7,993; and 1992--7,932. Current capacity remains at 7,932.

[b] For 1980-1991, data differ from those shown on Table 4.2, which includes liquefied natural gas storage for that period.

[c] Positive numbers indicate injections are greater than withdrawals. Negative numbers indicate withdrawals are greater than injections. Net injections or withdrawals may not equal the difference between applicable ending stocks. See Note 8 at end of section.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

Natural Gas Notes

1. Nonhydrocarbon Gases Removed: Annual data on nonhydrocarbon gases removed from marketed production—carbon dioxide, helium, hydrogen sulfide, and nitrogen—are from the Energy Information Administration (EIA) *Natural Gas Annual (NGA) 1991*. Data are not available for periods prior to 1980. Monthly data are reported by three States and computed for six States. Monthly data are preliminary until after publication of the EIA *NGA*. Differences between annual data published in the EIA *NGA* and the sum of the preliminary monthly data (January-December) are allocated proportionally to the months to create final monthly data. For further information on methods of estimating preliminary monthly data, see the EIA *Natural Gas Monthly (NGM)*.

2. Production.

- Annual data: Final annual data are from the EIA *NGA*.
- Estimated monthly data: Data for the two most recent months presented are estimated. Some of the data for earlier months are also estimated or computed. For a discussion of computation and estimation procedures, see the EIA *NGM*.
- Preliminary monthly data: Monthly data are considered preliminary until after publication of the EIA *NGA*. Preliminary monthly data are gathered from reports to the Interstate Oil Compact Commission and the U.S. Minerals Management Service. Volumetric data are converted, as necessary, to a standard 14.73 psi pressure base. Unless there are major changes, data are not revised until after publication of the EIA *NGA*.
- Final monthly data: Differences between annual data in the EIA *NGA* and the sum of preliminary monthly data (January-December) are allocated proportionally to the months to create final monthly data.

3. Extraction Loss: Extraction loss is the reduction in volume of natural gas resulting from the removal of natural gas liquid constituents at natural gas processing plants.

Annual data for extraction loss are from the EIA *NGA*, where they are estimated on the basis of the type and quantity of liquid products extracted from the gas stream and the calculated volume of such products at standard conditions. For a detailed explanation of the calculations used to derive estimated extraction losses, see the EIA *NGA*.

Preliminary monthly data are estimated on the basis of extraction loss as an annual percentage of marketed production. This percentage is applied to each month's marketed production to estimate monthly extraction loss.

Monthly data are revised and considered final after the publication of the EIA *NGA*. Final monthly data are estimated by allocating annual extraction loss data to the months on the basis of total natural gas marketed production data from the EIA *NGA*.

4. Supplemental Gaseous Fuels: Supplemental gaseous fuels are mainly synthetic natural gas, propane-air, and refinery gas. Other gases, such as coke oven gas, biomass gas, manufactured gas, and air injected for Btu stabilization, may also be included.

Annual data beginning with 1980 are from the EIA *NGA*. Unknown quantities of supplemental gaseous fuels are included in consumption data for 1979 and earlier years.

Monthly data are considered preliminary until after the publication of the EIA *NGA*. Monthly estimates are based on the annual ratio of supplemental gaseous fuels to the sum of dry gas production, net imports, and net withdrawals from storage. The ratio is applied to the monthly sum of the three elements to compute a monthly supplemental gaseous fuels figure.

5. Imports and Exports: The United States imported natural gas via pipeline from Mexico (until 1984) and Canada and liquefied natural gas (LNG) (except in 1986) via tanker from Algeria. One shipment of LNG was received in December 1986 from Indonesia. The United States exports natural gas via pipeline to Mexico and Canada and LNG via tanker to Japan.

Annual and final monthly data are from the annual Form FPC-14, "Annual Report for Importers and Exporters of Natural Gas," which requires data to be reported by month for the calendar year.

Preliminary monthly data are EIA estimates. For a discussion of estimation procedures, see the EIA *NGM*. Preliminary data are revised after the publication of the EIA *U.S. Imports and Exports of Natural Gas*.

6. Consumption: Consumption includes pipeline fuel use, lease and plant fuel use, and deliveries to consuming sectors.

Final data are from the EIA *NGA*. Monthly data are considered preliminary until after publication of the EIA *NGA*. For more detailed information on the methods of estimating preliminary and final monthly data, see the EIA *NGM*.

7. Balancing Item: The balancing item for natural gas represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas disposition. The differences may be due to quantities lost or to the effects of data reporting problems. Reporting problems include differences due to the net result of conversions of flow data metered at varying temperature and pressure bases

and converted to a standard temperature and pressure base; the effect of variations in company accounting and billing practices; differences between billing cycle and calendar period time frames; and imbalances resulting from the merger of data reporting systems which vary in scope, format, definitions, and type of respondents.

The increase of 0.2 trillion cubic feet (Tcf) in the "Balancing Item" category in 1983, followed by a decline of 0.5 Tcf in 1984, reflected unusually large differences resulting from the use of the annual billing cycle (essentially December 15 through the following December 14) consumption data in conjunction with calendar year supply data. Record cold temperatures during the last half of December 1983 resulted in a reported 0.3 Tcf increase in net withdrawals from underground storage for peak shaving as compared with the same period in 1982, but the effect of this cold weather was reflected primarily in 1984 consumption data. For underground storage data, see Table F2 in the May 1985 *NGM*, which was published in July 1985.

8. Natural Gas Storage: Gas in storage at the end of a reporting period may not equal the quantity derived by adding or subtracting net injections or withdrawals from the quantity in storage at the end of the previous period. The difference is due to changes in the quantity of native gas included in the base gas and/or losses in base gas due to migration from storage reservoirs.

Monthly underground storage data are collected from the Forms FERC-8 (interstate data) and EIA-191 (intrastate data). Beginning in January 1991, all data are collected on the revised Form EIA-191. Injection and withdrawal data from the FERC-8/EIA-191 survey are adjusted to correspond to data from Form EIA-176 following publication of the EIA *NGA*.

The final monthly and annual storage and withdrawal data for 1980-1989 include both underground and liquefied natural gas (LNG) storage. Annual data on LNG additions and withdrawals are from Form EIA-176. Monthly data are estimated by computing the ratio of each month's underground storage additions and withdrawals to annual underground storage additions and withdrawals and applying the ratio to the annual LNG data.

Section 5. Oil and Gas Resource Development

A total of 80 seismic exploration crews were active in July 1993, 11 more than the previous year. Of the total, 65 were land crews and 15 were aboard marine vessels. The number of land crews was up by 5, and the number of operating marine vessels increased by 6 vessels from the July 1992 count.

The July 1993 rotary rig count of 741 was 7 percent higher than the count in the previous month and 10 percent higher than the count in July 1992. Of the total number of rigs in operation, 656 were onshore and 85 were offshore. The number of onshore rigs was up 4 percent from the number in July 1992, and the number of offshore rigs was up 77 percent.

Total footage drilled in July 1993 was 11.31 million feet, up 10 percent from footage drilled in June 1993 and up 19 percent from that drilled in July 1992.

The estimated number of exploratory and development gas and oil wells drilled during July 1993 was 1,686, 7 percent higher than the number drilled in June 1993 and 32 percent higher than the number drilled in July 1992. The estimated number of oil wells drilled was 740 and the estimated number of gas wells was 946, up 5 percent and 65 percent, respectively, from the July 1992 levels. The estimated number of dry holes drilled in July 1993 was 631, 23 percent higher than the number drilled in June 1993 and 11 percent higher than the number drilled in July 1992.

R=Revised data.

Notes: • Service wells, stratigraphic tests, and core tests are excluded. • Geographic coverage is the 50 States and the District of Columbia. • Due to the method of estimation, data shown on this page are frequently revised.

See end of section.

Sources: Energy Information Administration computations, which are based on well reports submitted to the American Petroleum Institute by the Petroleum Information Corporation, Denver, Colorado.

Oil and Gas Resource Development Notes

Three well types are considered in the *Monthly Energy Review (MER)* drilling statistics: "completed for oil," "completed for gas," and "dry hole." Wells that productively encounter both crude oil and natural gas are categorized as "completed for oil." Both development wells and exploratory wells (new field wildcats, new pool tests, and extension tests) are included in the statistics. All other classes of wells drilled in connection with the search for producible hydrocarbons are excluded.

Prior to the March 1985 *MER*, drilling statistics consisted of completion data for the above types and classes of wells as reported to the American Petroleum Institute (API) during a given month. Due to time lags between the date of well completion and the date of completion reporting to the API, as-reported well completions proved to be an inaccurate indicator of drilling activity. During 1982, for example, as-reported well completions rose, while the number of actual completions fell. Consequently, the drilling statistics published since the March 1985 *MER* are Energy Information Administration-generated (EIA) estimates produced by statistically imputing well counts and footage based on the partial data available from the API.

Estimates for a given month are first published in the *MER* for that month. Revisions of the "oil," "gas," and "dry" components are made in the 6th, 12th, and 24th subsequent months, as newly reported data allow refinement of the estimates. Unscheduled revisions may also occur when the latest estimate differs by more than 15 percent during the first 5 months, more than 10 percent during the next 6 months, or more than 2 percent thereafter through 5 years. After 5 years, the reported API data are published in lieu of EIA-generated estimates. Additional information about the EIA estimation methodology may be found in "Estimating Well Completions," the feature article published in the March 1985 *MER*.

Section 6. Coal

Coal production in June 1993 totaled 83 million short tons, 3 percent[6] higher than coal production in June 1992. Coal production for January through June 1993 totaled 482 million short tons, 4 percent lower than the 500 million short tons produced during the comparable period of 1992.

Electric utility coal consumption in May 1993 totaled 60 million short tons, 1 percent lower than the consumption level in May 1992.

Electric utility coal stocks were 150 million short tons at the end of May 1993, compared with 166 million short tons at the end of May 1992.

Coal exports in May 1993 totaled 6 million short tons, 36 percent lower than exports in May 1992. Coal imports in May 1993 totaled 298 thousand short tons, 12 percent lower than imports in May 1992.

[6]Calculated values are computed using unrounded data.

Coal Notes

1. Production: Preliminary monthly estimates of national coal production are the sum of weekly estimates developed by the Energy Information Administration (EIA) and published in the *Weekly Coal Production* report. When a week extends into a new month, production is allocated on a daily basis and added to the appropriate month. Weekly estimates are based on Association of American Railroads data showing the number of railcars loaded with coal during the week by Class I and certain other railroads. This number is converted into tons of coal by EIA by using the average number of tons of coal per railcar loaded reported in the most recent "Quarterly Freight Commodity Statistics" from the Interstate Commerce Commission. If an average coal tonnage per railcar loaded is not available for a specific railroad, the national average is used. To derive the estimate of total weekly production, the total rail tonnage for the week is divided by the ratio of quarterly production shipped by rail and total quarterly production. Data for the corresponding quarter of previous years are used to derive this ratio. This method insures that the seasonal variations are preserved in the production estimates.

When preliminary quarterly data become available, the monthly and weekly estimates are adjusted to conform to the quarterly figure. The adjustment procedure uses State-level production data and is explained in EIA's *Quarterly Coal Report*. Initial estimates of annual production published in January of the following year are based on preliminary production data covering the first 9 months (three quarters) and weekly/monthly estimates for the fourth quarter. The fourth quarter estimates may or may not be revised when preliminary data become available in March of the following year, depending on the magnitude of the difference between the estimates and the preliminary data. In any event, all quarterly, monthly, and weekly production figures are adjusted to conform to the final annual production data published in the *Monthly Energy Review* in the fall of the following year.

2. Consumption: Coal consumption data are reported by major end-use sector. Estimated data for the most recent months (designated by an "E") are derived from forecasted values shown in the EIA *Short-Term Energy Outlook* (DOE/EIA-0202) table titled "Supply and Disposition of Coal: Mid World Oil Price Case." The monthly estimates are one-third of the quarterly values shown in the then current issue of the publication, regularly released in February, May, August, and November. The estimates are revised quarterly as collected data become available from the data sources. Sector-specific information follows.

- Residential and Commercial—Prior to 1980, monthly consumption estimates for the residential and commercial sector were derived by using reported data to modify baseline figures developed by the Bureau of Mines. From 1980-1987, monthly estimates were derived by proportioning reported quarterly data by using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported on Form EIA-2. During 1981 and 1982, the estimates were also modified to reflect air temperature degree-days. Quarterly consumption data were directly from reported data and were defined as distribution to the residential and commercial sector as reported by coal producers and distributors on Form EIA-6. Beginning in January 1988, monthly residential and commercial consumption estimates are derived from reported quarterly data by using monthly national average population weighted heating/cooling degree-days obtained from the National Oceanic and Atmospheric Administration. The monthly ratios are the monthly national sum of heating and cooling degree-days as a proportion of the quarterly national sum. Quarterly consumption data are directly from reported data.
- Coke Plants—Prior to 1980, monthly coke plant consumption data were taken directly from reported data. From 1980-1987, coke plant consumption estimates were derived by proportioning reported quarterly data by using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported. Beginning in January 1988, monthly coke plant consumption estimates are derived from the reported quarterly data by using monthly ratios of raw steel production data from the American Iron and Steel Institute. The ratios are the monthly raw steel production from open hearth and basic oxygen process furnaces as a proportion of the quarterly production from those kinds of furnaces.
- Other Industrial—Prior to 1978, monthly consumption data for the other industrial sector (i.e., all industrial users minus coke plants) were derived by using reported data to modify baseline consumption figures from the most recent Bureau of the Census Annual Survey of Manufactures or Census of Manufactures. For 1978 and 1979, monthly estimates were derived from data reported on Forms EIA-3 and EIA-6. From 1980-1987, monthly figures were estimated by proportioning quarterly data by using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported on Form EIA-3. Quarterly consumption data were derived by adding beginning stocks at manufacturing plants to current receipts and subtracting ending stocks at manufacturing plants. In this calculation, current receipts were the greater of either reported receipts from manufacturing plants (Form EIA-3) or reported shipments to the other industrial sector (Form EIA-6), thereby ensuring that agriculture, forestry, fishing, mining, and construction consumption data were included where appropriate. Starting in January 1988, monthly consumption for the other industrial sector is estimated from reported quarterly data by using

ratios derived from industrial production indices published by the Board of Governors of the Federal Reserve System. Indices for six major industry groups are used as the basis for calculating the ratios: foods (SIC 20); paper and products (SIC 26); chemicals and products (SIC 28); petroleum products (SIC 29); clay, glass, and stone products (SIC 32); and primary metals (SIC 33). The monthly ratios are computed as the monthly sum of the weighted indices as a proportion of the quarterly sum of the weighted indices by using the 1977 proportion as the weights.

- Electric Utilities—Monthly consumption data for electric utility plants are directly from reported data.

3. Stocks: Coal stocks data are reported by major end-use sector. Estimated data for the most recent months (designated by an "E") are derived from forecasted values shown in the EIA *Short-Term Energy Outlook* (DOE/EIA-0202) table titled "Supply and Disposition of Coal: Mid World Oil Price Case." The monthly estimates are one-third of the quarterly values shown in the then current issue of the publication, regularly released in February, May, August, and November. The estimates are revised quarterly as collected data become available from the data sources. Sector-specific information follows.

- Coke Plants—Prior to 1980, monthly stocks at coke plants were taken directly from reported data. From 1980 forward, coke plant stocks are estimated by using one-third of the current quarterly change to indicate the monthly change in stocks. Quarterly stocks are directly from data reported on Form EIA-5.
- Other Industrial—Prior to 1978, stocks for the other industrial sector were derived by using reported data to modify baseline figures from a one-time Bureau of Mines survey of consumers. For 1978-1982, monthly estimates were derived by judgmentally proportioning reported quarterly data based on representative seasonal patterns of supply and demand. From 1983 forward, other industrial coal stocks are estimated as indicated above for coke plants. Quarterly stocks are taken directly from data reported on Form EIA-3 and therefore include only manufacturing industries; data for agriculture, forestry, fishing, mining, and construction stocks are not available.
- Electric Utilities—Monthly stocks data at electric utility plants are taken directly from reported data.
- Producers and Distributors—Quarterly stocks at producers and distributors are taken directly from reported data. Monthly data are estimated by using one-third of the current quarterly change to indicate the monthly change in stocks.

4. Imports and Exports: All coal import and export figures are taken directly from data reported monthly by the Bureau of the Census.

5. Additional Information: EIA's *Quarterly Coal Report* provides additional information about coal data and estimation procedures.

6. Data Discrepancies: Due to differences internal to EIA data processing systems, some small discrepancies exist between data in the *Monthly Energy Review (MER)* and the *Quarterly Coal Report (QCR)*. The data that have discrepancies are footnoted in Section 6 tables and summarized here.

Table	Data Series	Year	*MER* Data	*QCR* Data
6.1	Consumption	1980	702,729	702,730

Section 7. Electricity

During May 1993, electric utilities generated 222 billion kilowatthours of electricity, 1 percent[7] higher than the May 1992 generation level. Coal-fired generation totaled 121 billion kilowatthours, 2 percent lower than the May 1992 level. Nuclear generation totaled 50 billion kilowatthours, 10 percent above the level 1 year earlier. Hydroelectric generation totaled 29 billion kilowatthours, 32 percent above the May 1992 level. Natural gas-fired generation was 16 billion kilowatthours, 30 percent below the May 1992 level. Petroleum-fired generation totaled 5 billion kilowatthours, 2 percent above the level 1 year earlier.

Sales of electricity to all ultimate consumers in the United States in May were 215 billion kilowatthours, 1 percent higher than sales during May 1992. Sales to residential consumers during May 1993 were 64 billion kilowatthours, 1 percent below the level of sales during the previous year. Sales to industrial consumers totaled 82 billion kilowatthours in May 1993, 2 percent above the level a year ago. Commercial sales were 61 billion kilowatthours, 1 percent above the level of commercial sales 1 year earlier. In May 1993, other sales totaled 8 billion kilowatthours, 2 percent below the May 1992 level.

Electric utility consumption of coal during May 1993 was 60 million short tons, 1 percent below consumption in May 1992. Petroleum consumption (excluding petroleum coke) during May 1993 was 9 million barrels, 2 percent below the May 1992 level. During May 1993, electric utilities consumed 167 billion cubic feet of natural gas, 29 percent below the May 1992 consumption level.

On May 31, 1993, electric utility stocks of all types of coal totaled 150 million short tons, 9 percent below the level on May 31, 1992. Stocks of petroleum (excluding petroleum coke) on May 31, 1993, totaled 65 million barrels, 7 percent below the level on May 31, 1992.

[7]Percentage changes are based on numbers shown in the following tables.

[a] Includes supplemental gaseous fuel.

[b] Includes fuel oil Nos. 2, 4, 5, and 6, crude oil, kerosene, and petroleum coke.

[c] "Other" is electricity produced from geothermal, wood, waste, wind, photovoltaic, and solar thermal energy sources connected to electric utility distribution systems.

Notes: • Geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding.

Section 8. Nuclear Energy

In May 1993, U.S. nuclear generating units produced a total of 50 net terawatthours (billion kilowatthours) of electricity, 10 percent[8] more than in May 1992. Nuclear units generated at an average capacity factor of 68.4 percent, 7 percentage points higher than in May 1992. Nuclear power supplied 22.6 percent of the total electric utility-generated electricity in May 1993, compared with 20.7 percent in May 1992.

No low- or full power licenses for nuclear power plants were issued by Nuclear Regulatory Commission during May 1993.

On May 31, 1993, there were 109 operable nuclear generating units in the United States, with a collective net summer capability of 99.0 million kilowatts of electricity. Of the 109 operable units, 24 units generated at less than 25 percent of capacity because of maintenance, refueling, or repair outage, and 19 of the 24 units generated no electricity during the month.

Two operable units, Browns Ferry 1 and 3, have been shut down since March 1985. Each unit had a capacity of 1,065 megawatts electric.

As of May 31, there were 116 domestic nuclear generating units in all stages of construction and operation. The aggregate net design capacity of operable units was 101.0 million kilowatts, and the design capacity of units under construction was 8.5 million kilowatts, for a total design capacity of 109.6 million kilowatts.

[8]Percentage changes are based on numbers shown in the following tables.

Nuclear Energy Notes

1. Operable Units: Nuclear generating units that have been issued a full-power license by the Nuclear Regulatory Commission (NRC).

Exceptions: The Shippingport (60 MWe) and the Hanford-N (840 MWe) nuclear units were included in the operable units until 1982 and 1988, respectively. The Shippingport unit was excluded from the operable category during March 1974-August 1977 due to a major core modification outage. Hanford-N, an unlicensed unit used for defense material production, was included in the operable category because power was produced as by-product and sold commercially. Three Mile Island 2 (880 MWe) experienced a major accident in 1979 and, although that unit still retains its operating license and site cleanup continues, there is no plan to restart it. Therefore, it has not been included in the operable category since March 1979. Although Shoreham received a full-power license in April 1989, the unit is not currently scheduled to operate and, therefore, has not been included in the operable category. Rancho Seco (873 MWe) was shut down by the Sacramento Municipal Utility District (SMUD) in June 1989 following a referendum on its continued operation. Because there are currently no plans to operate it as a nuclear unit, it is no longer included as an operable unit but is identified as a unit shut down for an extended period. As soon as SMUD and the NRC formalize the plant's official retirement, it will be noted as such in this report. The Department of Energy-operated Experimental Breeder Reactor 2 unit is not a commercial reactor and is therefore not included in the operable category.

In addition, seven units have been retired and therefore removed from the operable category. Those units are: Peach Bottom 1 (40 MWe) and Indian Point 1 (265 MWe), both retired in 1974; Humboldt Bay (65 MWe), officially retired in 1976; Dresden 1 (200 MWe), retired in August 1979; LaCrosse (51 MWe), retired in May 1987; Fort Saint Vrain (217 MWe), retired in August 1989; Yankee Rowe 1 (185 MWe), retired in February 1992; San Onofre 1 (436 MWe), retired in December 1992; and Trojan (1,104 MWe), retired in January 1993.

2. In Startup: The period of time between a nuclear generating unit's initial fuel loading date and the issuance of its full-power license. During that period, the unit is undergoing low-power testing and the maximum level of operation is 5 percent of the unit's design thermal rating.

3. Capacity: Nuclear generating units may have more than one type of net capacity rating, including the following:

(a) Net Summer Capability—The steady hourly output that generating equipment is expected to supply to system load, exclusive of auxiliary power, as demonstrated by test at the time of summer peak demand. Auxiliary power of a typical nuclear power plant is about 5 percent of gross generation.

(b) Net Design Capacity or Net Design Electrical Rating (DER)—The nominal net electrical output of a unit, specified by the utility and used for plant design.

4. Monthly Capacity Factors: The monthly capacity factors are computed as the actual monthly generation divided by the maximum possible generation for that month. The maximum possible generation is the number of hours in the month multiplied by the net summer capability at the end of the month. That fraction is then multiplied by 100 to obtain a percentage. Annual capacity factors are averages of the monthly values for that year.

Section 9. Energy Prices

Crude Oil. The average price of domestic crude oil purchased at the wellhead was $15.97 per barrel in May 1993, 3 percent below the level in May 1992. The refiner acquisition cost of imported crude oil in May 1993 was $17.89 per barrel, 5 percent below the May 1992 level. The average cost of domestic crude oil in May 1993 was $18.43, 2 percent less than the May 1992 average.

Motor Gasoline. The national city average retail price of unleaded regular gasoline at all types of stations was $1.13 per gallon in June 1993, 4 percent lower than the price in June 1992. The price of unleaded premium gasoline averaged $1.32 per gallon in June 1993, 3 percent lower than the price in June 1992.

Residual Fuel Oil. The average price, excluding taxes, of residual fuel oil sold to end users in May 1993 was 37 cents per gallon, 2 percent higher than the previous month's price and 11 percent above the May 1992 average. The average resale price, excluding taxes, of residual fuel oil in May 1993 was 31 cents per gallon, 7 percent lower than the April 1993 average but 2 percent above the price 1 year earlier.

Aviation Fuel. The average price, excluding taxes, of aviation gasoline sold to end users in May 1993 was $1.02 per gallon, 1 percent higher than the previous month's price but slightly lower than the May 1992 price. The average price, excluding taxes, of kerosene-type jet fuel sold to end users in May 1993 was 60 cents per gallon, slightly higher than the previous month's average price but 2 percent lower than the May 1992 average price.

No. 2 Distillate Fuel Oil. The May 1993 national average price, excluding taxes, of heating oil sold to residential customers was 91 cents per gallon, 2 percent lower than the April 1993 price and 2 percent lower than the May 1992 price. The average price of No. 2 fuel oil sold to all end users was 60 cents per gallon in May 1993, 4 percent lower than the April 1993 price and 2 percent lower than the May 1992 price.

Electricity. The average price of electricity sold to all ultimate consumers in the United States in May 1993 was 6.8 cents per kilowatthour, 1 percent above the May 1992 mean price. The price of electricity sold to residential consumers in May 1993 averaged 8.6 cents per kilowatthour, 2 percent above the May 1992 price. The price of electricity sold to commercial consumers averaged 7.7 cents per kilowatthour in May 1993, 1 percent above the May 1992 price. The price of electricity sold to other consumers was 6.9 cents per kilowatthour, 6 percent above the May 1992 price. The price of electricity sold to industrial users in May 1993 averaged 4.7 cents per kilowatthour, 2 percent lower than the price 1 year earlier.

Beginning with January 1986, there were new series of national average price estimates based on a statistically derived sample of both publicly and privately owned electric utilities. Previously, average price estimates were derived from selected privately owned electric utilities and were not national averages.

Natural Gas. The estimated average wellhead price of natural gas for May 1993 was $2.02 per thousand cubic feet, 29 percent above the May 1992 price.

The average price of natural gas delivered to electric utility plants was $2.75 per thousand cubic feet in April 1993 (latest date for which data are available), 33 percent above the April 1992 price. The average price of natural gas used by residential consumers in May 1993 was $6.70 per thousand cubic feet, 9 percent above the May 1992 price. The average price of natural gas used by commercial consumers in May 1993 was $5.20 per thousand cubic feet, 13 percent higher than the May 1992 price. The average price of natural gas used by industrial consumers in May 1993 was $3.24 per thousand cubic feet, 33 percent above the May 1992 price.

[a] The Arab members of OPEC are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates.

[b] Current members of OPEC are Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. Prior to 1993, Ecuador was also a member. The cost of imports from the Neutral Zone between Kuwait and Saudi Arabia is included in the cost of imports from "Total OPEC."

[c] Based on October, November, and December data only.

[d] No data reported.

R=Revised data. NA=Not available. W=Value withheld to avoid disclosure of individual company data.

Notes: • The Free on Board (F.O.B) cost at the country of origin excludes all costs related to insurance and transportation. See Note 2 at end of section. • Values for the current 2 months are preliminary. • Prices through 1980 reflect the period of reporting; prices after 1980 reflect the period of loading. • Annual averages are averages of the monthly prices, including prices not published, weighted by volume. • Cargoes that are purchased on a "netback" basis, or under similar contractual arrangements whereby the actual purchase price is not established at the time the crude oil is acquired for importation into the United States, are not included in the published data until the actual prices have been determined and reported.

[a] "Other" is public street and highway lighting, other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

[b] Average price for total sales to ultimate consumers.

[c] Annual values are the sum of the monthly revenue divided by the sum of the monthly sales. Data through 1979 cover privately owned electric utilities in Classes A and B. Data for 1980-1985 cover selected privately owned electric utilities in Class A whose electric operating revenue was $100 million or more during the previous year. See Note 7 at end of section.

NA=Not available. – =Not applicable.

Notes: • Prices are calculated by dividing revenue by sales. Revenue may not correspond to sales for a particular month because of electric utility billing and accounting procedures. That lack of correspondence could result in uncharacteristic increases or decreases in the monthly prices. See Note 7 at end of section. • Geographic coverage is the 50 States and the District of Columbia.

[a] Includes supplemental gaseous fuels.

[b] Heavy fuel oil includes fuel oils No. 4, No. 5, and No. 6, and topped crude oil. The weighted averages for petroleum and all fossil fuels include both heavy and light oil (No. 2 fuel oil, kerosene, and jet fuel) prices. Data do not include petroleum coke.

[c] Data for 1973-1982 do not include small quantities of rerefined motor oil, bunker oil, and liquefied petroleum gas.

Notes: • Data for 1973-1982 cover all electric generating plants at which the generator nameplate capacity of all steam-electric units combined totaled 25 megawatts or greater. From 1974-1982, peaking units were included in the data and counted towards the 25-megawatt-or-greater total. Data for 1983-1990 cover all electric generating plants at which the generator nameplate capacity of all steam-electric units combined totaled 50 megawatts or greater. Data for 1991 forward cover all electric generating plants at which the generator nameplate capacity of all steam-electric units and combined-cycle units combined totaled 50 megawatts or greater. • Geographic coverage is the 50 States and the District of Columbia.

Sources: • **1973-1979:** Annual data for quantity are simple sums of unrounded monthly values and for cost are averages of monthly values, weighted by quantities, from the following: **1973-May 1977**—Federal Power Commission, Form FPC-423, "Monthly Report on Cost and Quality of Fuels for Electric Utility Plants." **June 1977-December 1977**—Federal Energy Regulatory Commission, Form FERC-423, "Monthly Report on Cost and Quality of Fuels for Electric Utility Plants." **1978 and 1979**—Energy Information Administration (EIA), Form FERC-423, "Monthly Report on Cost and Quality of Fuels for Electric Utility Plants." • **1980:** EIA, *Electric Power Monthly*, April 1991, Table 33. • **1981:** EIA, *Electric Power Monthly*, April 1992, Table 33. • **1982 and 1991 monthly data:** EIA, *Electric Power Monthly*, April 1993, Table 33. • **1983 forward (except 1991 monthly data):** EIA, *Electric Power Monthly*, August 1993, Table 33.

[a] Includes supplemental gaseous fuels.

[b] See Note 8 at end of section.

R=Revised data. NA=Not available. E=Estimate.

Notes: • Prices shown on this page are intended to include all taxes. See Note 8 at end of section. • Geographic coverage is the 50 States and the District of Columbia. • Wellhead annual and year-to-date prices are simple averages of the monthly prices; all other annual and year-to-date prices are volume-weighted averages of the monthly prices.

Sources: • **1973-1986: Wellhead**—Energy Information Administration (EIA), *Natural Gas Annual 1991*, Table 95. **Major Interstate Pipeline Companies, 1974-1977**—Calculated from revenue and sales data reported to the Federal Power Commission (FPC), Form FPC-11, "Natural Gas Pipeline Company Monthly Statement." **Major Interstate Pipeline Companies, 1978-1983**—EIA, *Natural Gas Monthly*, December 1984, Table 10. **Major Interstate Pipeline Companies, 1984-1986**—EIA, *Natural Gas Monthly*, December 1989, Table 4. **City Gate, 1984-1986**—EIA, *Natural Gas Monthly*, December 1989, Table 4. **Delivered to Consumers, 1973-1986**—EIA, *Natural Gas Annual 1991*, Table 98. • **1987 forward:** EIA, *Natural Gas Monthly*, August 1993, Table 4.

Energy Prices Notes

1. The average domestic first purchase price represents the average price at which all domestic crude oil is purchased. Prior to February 1976, the price represented an estimate of the average of posted prices; beginning with February 1976, the price represents an average of actual first purchase prices. The data series was previously called "Actual Domestic Wellhead Price."

2. F.O.B. literally means "Free on Board." It denotes a transaction whereby the seller makes the product available with an agreement on a given port at a given price; it is the responsibility of the buyer to arrange for the transportation and insurance.

3. The landed cost of imported crude oil from selected countries does not represent the total cost of all imported crude. Prior to March 1975, imported crude costs to U.S. company-owned refineries in the Caribbean were not included in the landed cost, and costs of crude oil from countries that export only small amounts to the United States were also excluded. Beginning in March 1975, however, coverage was expanded to include U.S. company-owned refineries in the Caribbean. Landed costs do not include supplemental fees.

4. Beginning with January 1981, refiner acquisition costs of crude oil are from data collected on Form EIA-14, "Refiners' Monthly Cost Report." Those costs were previously published from data collected on Form ERA-49, "Domestic Crude Oil Entitlements Program Refiners Monthly Report." Form ERA-49 was discontinued with the decontrol of crude oil on January 28, 1981. Crude oil purchases and costs are defined for Form EIA-14 in accordance with conventions used for Form ERA-49. Also, the respondents for the two forms are essentially the same. However, due to possible different interpretations of the filing requirements and a different method for handling prior period adjustments, care must be taken when comparing the data collected on the two forms.

The refiner acquisition cost of crude oil is the average price paid by refiners for crude oil booked into their refineries in accordance with accounting procedures generally accepted and consistently and historically applied by the refiners concerned. Domestic crude oil is that oil produced in the United States or from the outer continental shelf as defined in 43 USC Section 1331. Imported crude oil is either that oil reported on Form ERA-51, "Transfer Pricing Report," or any crude oil that is not domestic oil. The composite cost is the weighted average of domestic and imported crude oil costs.

Crude oil costs and volumes reported on Form ERA-49 excluded unfinished oils but included the Strategic Petroleum Reserve (SPR). Crude oil costs and volumes reported on Form FEA-P110-M-1, "Refiners' Monthly Cost Allocation Report," included unfinished oils but excluded SPR. Imported averages derived from Form ERA-49 exclude oil purchased for SPR, whereas the composite averages derived from Form ERA-49 include SPR. None of the prices derived from Form EIA-14 include either unfinished oils or SPR.

5. Several different series of motor gasoline prices are published in this section. U.S. City Average Retail Prices of Motor Gasoline are calculated monthly by the Bureau of Labor Statistics during the development of the Consumer Price Index (CPI). These prices include all Federal, State, and local taxes paid at the time of sale. For the period 1974-1977, prices were collected in 56 urban areas. For the period 1978 forward, prices were collected from a new sample of service stations in 85 urban areas selected to represent all urban consumers—about 80 percent of the total U.S. population. The service stations are selected initially, and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full-, mini-, and self-serve).

Refiner prices of finished motor gasoline for resale and to end users are determined by the Energy Information Administration (EIA) in a monthly survey of refiners and gas plant operators (Form EIA-782A). The prices do not include any Federal, State, or local taxes paid at the time of sale. Estimates of prices prior to January 1983 are based on Form FEA-P302-M-1/EIA-460, "Petroleum Industry Monthly Report for Product Prices," and also exclude all Federal, State, or local taxes paid at the time of sale. Sales for resale are those made to purchasers who are other-than-ultimate consumers. Sales to end users are sales made directly to the consumer of the product, including bulk consumers, such as agriculture, industry, and utilities, as well as residential and commercial consumers.

6. Starting in January 1983, Form EIA-782, "Monthly Petroleum Product Sales Report," replaced 10 previous surveys. Every attempt was made to continue the most important price series. However, prices published through December 1982 and those published since January 1983 do not necessarily form continuous data series due to changes in survey forms, definitions, instructions, populations, samples, processing systems, and statistical procedures. To provide historical data, continuous series were generated for annual data 1978-1982 and for monthly data 1981 and 1982 by estimating the prices that would have been published had Form EIA-782 survey and system been in operation at that time. This form of estimation was performed after detailed adjustment was made for product and sales type matching and for discontinuity due to other factors. An important difference between the previous and present prices is the distinction between wholesale and resale and between retail and end user. The resale category continues to include sales among resellers. However, bulk sales to utility, industrial, and commercial accounts previously included in the wholesale category are now counted as made to end users. The end-user category continues to include retail sales through company owned

and operated outlets but also includes the bulk utility, industrial, and commercial sales. Additional information may be found in Estimated Historic Time Series for the EIA-782, a feature article reprinted from the December 1983 [3] *Petroleum Marketing Monthly*, published by EIA.

7. National average electricity prices are shown in two data series. The "Annual Series" is based on data from more than 3,000 publicly and privately owned electric utilities that report on Form EIA-861, "Annual Electric Utility Report." The "Monthly Series" is based on data from over 400 utilities statistically chosen as a stratified sample of the utilities that report on Form EIA-861. The selected utilities report monthly on Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," formerly the "Electric Utility Company Monthly Statement." Annual values shown for the monthly series are the sum of the monthly revenue divided by the sum of the monthly sales. Prior to January 1986, only privately owned utilities were included in the monthly survey and the sample was chosen by using cut-off, rather than stratification, techniques.

8. Natural gas prices are intended to include all taxes. Instructions on the data collection forms specifically direct that all Federal, State, and local taxes, surcharges, and/or adjustments billed to consumers are to be included. However, sales and other taxes itemized on consumers' bills are sometimes excluded by the reporting utilities.

Delivered-to-consumers prices for 1987 forward represent natural gas delivered and sold to residential, commercial, industrial, and electric utility consumers. They do not include the price of natural gas delivered to industrial and commercial consumers on behalf of third parties. Volumes of natural gas delivered on behalf of third parties are included in the consumption data shown in Table 4.3. Additional information is available in the EIA *Natural Gas Monthly*, Appendix C.

Electric utility data for 1973-1982 cover all electric generating plants at which the generator nameplate capacity of all steam-electric units combined totaled 25 megawatts or greater. From 1974-1982, peaking units were included in the data and counted towards the 25-megawatt-or-greater total. Data for 1983-1990 cover all electric generating plants at which the generator nameplate capacity of all steam-electric units combined totaled 50 megawatts or greater. Data for 1991 forward cover all electric generating plants at which the generator nameplate capacity of all steam-electric units and combined-cycle units together totaled 50 megawatts or greater.

Section 10. International Energy

Crude Oil Production. World crude oil production during May 1993 was 60 million barrels per day, down 0.1 million barrels per day from the level in the previous month.

Organization of Petroleum Exporting Countries (OPEC) production during May 1993 averaged 25 million barrels per day, up 0.1 million barrels per day from the level during the previous month. Production by the Arab members of OPEC in May 1993 averaged 16 million barrels per day, down slightly from the April 1993 level. During May 1993, production increased in Kuwait by 67 thousand barrels per day and in Qatar by 20 thousand barrels per day. Production decreased in Saudi Arabia by 82 thousand barrels per day and in the United Arab Emirates by 40 thousand barrels per day. Production remained unchanged in Algeria, Iraq, and Libya. Among the non-Arab members of OPEC, production during May 1993 increased in Iran by 150 thousand barrels per day and in Indonesia by 30 thousand barrels per day. Production remained unchanged in Nigeria and Venezuela.

Among the non-OPEC nations, production during May 1993 increased in the United Kingdom by 50 thousand barrels per day and in China by 5 thousand barrels per day. Production decreased in the former U.S.S.R. 70 thousand barrels per day, in the United States by 64 thousand barrels per day, and in Mexico by 25 thousand barrels per day. Production remained unchanged in Canada.

Petroleum Consumption. In March 1993, consumption in all Organization for Economic Cooperation and Development (OECD) countries was 40.7 million barrels per day, 5 percent higher than the March 1992 rate. Consumption rates were higher than a year ago in Italy, Japan, and the United States (each +6 percent), Canada and the United Kingdom (each +5 percent), and France and Germany (each +2 percent), compared with the levels in March 1992.

Petroleum Stocks. For all OECD countries, petroleum stocks at the end of March 1993 totaled 3.5 billion barrels, 2 percent higher than the ending stock level in March 1992. Stock levels were higher than the levels 1 year ago in the United Kingdom (+4 percent) and in Japan and the United States (each +1 percent). Germany was unchanged, compared with levels 1 year earlier. Stocks were lower in France (-3 percent) and Italy and Canada (each -2 percent), compared with levels 1 year earlier.

Nuclear Electricity Generation. Based on *Nucleonics Week* information for May 1993, reporting countries with nuclear capacity generated 147 gross terawatthours[9] of nuclear-generated electricity, 7 percent more than in May 1992.

A new nuclear unit became operable during May 1993. India's Kakrapar-1, a 220-gross megawatt pressurized heavy-water reactor, became commercially operable on May 6, 1993.

As of May 31, 1993, there were 357 operable nuclear generating units in the reporting countries. The units had a collective gross generating capacity of 302.6 gigawatts.[10] The 109 U.S. units accounted for 105.3 gross gigawatts, 34.8 percent of the total reported nuclear generating capacity.

[9]One terawatthour equals 1 billion kilowatthours.
[10]One gigawatt equals 1 million kilowatts.

[a] Includes about one-half of the production in the Kuwait-Saudi Arabia Neutral Zone from 1973 through July 1990 and in June 1991. Kuwaiti Neutral Zone output was discontinued following Iraq's invasion of Kuwait on August 2, 1990, but was resumed in June 1991. In May 1993, Neutral Zone production by both Kuwait and Saudi Arabia totaled about 325 thousand barrels per day.

[b] The Arab members of the Organization of Petroleum Exporting Countries (OPEC) are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. Production in the Neutral Zone between Kuwait and Saudi Arabia is included in "Arab OPEC."

Notes: • Crude oil includes lease condensate but excludes natural gas plant liquids. • U.S. geographic coverage is the 50 States and the District of Columbia. • Monthly data are often preliminary figures and may not average to the annual totals because of rounding or because updates to the preliminary monthly data are not available.

[a] "Total OPEC" consists of Algeria, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela. Production from the Neutral Zone between Kuwait and Saudi Arabia is included in "Total OPEC."

[b] The Persian Gulf Nations are Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and the United Arab Emirates. Production from the Neutral Zone between Kuwait and Saudi Arabia is included in "Persian Gulf Nations."

[c] "Other" is a calculated total derived from the difference between "World" and the sum of production in "Total OPEC," Canada, Mexico, the United Kingdom, the United States, China, and the former U.S.S.R.

R=Revised data. E=Estimate.

Notes: • Crude oil includes lease condensate but excludes natural gas plant liquids. • U.S. geographic coverage is the 50 States and the District of Columbia. • Monthly data are often preliminary figures and may not average to the annual totals because of rounding or because updates to the preliminary monthly data are not available.

[a] Through December 1990, the data for Germany are for the former West Germany only. Beginning with January 1991, the data for Germany are for the unified Germany, i.e., the former East Germany and West Germany.

[b] "OECD Europe" consists of Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, and the United Kingdom.

[c] "Other OECD" consists of Australia, New Zealand, and the U.S. Territories.

R=Revised data.

Notes: • The Organization for Economic Cooperation and Development (OECD) consists of Canada, Japan, and the United States, as well as "OECD Europe" and "Other OECD." • U.S. geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. • Data through 1990 are final. Subsequent data are preliminary.

[a] Through December 1990, the data for Germany are for the former West Germany only. Beginning with January 1991, the data for Germany are for the unified Germany, i.e., the former East Germany and West Germany.

[b] "OECD Europe" consists of Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, and the United Kingdom.

[c] "Other OECD" consists of Australia, New Zealand, and the U.S. Territories.

R=Revised data.

Notes: • Petroleum stocks include crude oil (including strategic reserves), unfinished oils, natural gas plant liquids, and refined products. Petroleum stocks include all nonmilitary petroleum held for storage, regardless of ownership, within each country in bulk terminals, refinery tanks, pipeline tankage, intercoastal tankers, tankers in port, and inland ship bunkers. Data exclude oil held in pipelines (except for those in the United States), rail and truck cars, sea-going ships' bunkers, service stations, retail stores, and tankers at sea. • The Organization for Economic Cooperation and Development (OECD) consists of Canada, Japan, and the United States, as well as "OECD Europe" and "Other OECD." • U.S. geographic coverage is the 50 States and the District of Columbia. • Totals may not equal sum of components due to independent rounding. • In the United States in January 1975, 1981, and 1983, numerous respondents were added to bulk terminal and pipeline surveys, thereby affecting subsequent stocks reported. Using the new basis, the end-of-year U.S. stocks, in million barrels, would have been 1,121 in 1974, 1,425 in 1980, and 1,461 in 1982. • Data through 1990 are final. Subsequent data are preliminary.

[a] Monthly data for the United Kingdom are totals for 4- or 5-week reporting periods, not calendar months.

[b] "Total" equals nuclear-generated electricity from all countries except Bulgaria, China, Cuba, Czechoslovakia, Hungary, North Korea, Poland, Romania, the former U.S.S.R., and Slovenia (formerly Yugoslavia).

R=Revised data. E=Estimate.

Notes: • Net figures are generally less than gross figures by about 5 percent, the difference being the energy consumed by the generating plants themselves. • U.S. geographic coverage is the 50 States and the District of Columbia. • Monthly data may not sum to annual totals due to independent rounding and because precommercial generation is included in some annual totals but not in the monthly data. • Data for countries may not sum to world totals due to independent rounding.

Appendix A. Thermal Conversion Factors

The thermal conversion factors presented in the following eight tables can be used to estimate the heat content in British thermal units (Btu) of a given amount of energy measured in physical units, such as barrels or cubic feet. For example, 10 barrels of asphalt have a heat content of approximately 66.36 million Btu (10 barrels x 6.636 million Btu/barrel = 66.36 million Btu).

Thermal conversion factors for hydrocarbon mixes (Table A1) are weighted averages of the thermal conversion factors for each hydrocarbon included in the mix. For example, in calculating the thermal conversion factor for a 60-40 butane-propane mixture, the thermal conversion factor for butane is weighted 1.5 times more heavily than the thermal conversion factor for propane.

In general, the annual thermal conversion factors presented in Tables A1 through A8 are computed from final annual data. However, if the current year's final data are not available in time for publication, thermal conversion factors for the current year are computed from the best available data and are labeled "preliminary." The source of each factor is described in the section entitled "Thermal Conversion Factor Source Documentation," which follows Table A8 in this appendix.

Table A1. Approximate Heat Content of Petroleum Products

(Million Btu per Barrel)

Petroleum Product	Heat Content	Petroleum Product	Heat Content
Asphalt	6.636	Petrochemical Feedstocks	
Aviation Gasoline	5.048	Naphtha Less Than 401° F	5.248
Butane	4.326	Other Oils Equal to or Greater Than 401° F	5.825
Butane-Propane Mixture[a]	4.130	Still Gas	6.000
Distillate Fuel Oil	5.825	Petroleum Coke	6.024
Ethane	3.082	Plant Condensate	5.418
Ethane-Propane Mixture[b]	3.308	Propane	3.836
Isobutane	3.974	Residual Fuel Oil	6.287
Jet Fuel, Kerosene Type	5.670	Road Oil	6.636
Jet Fuel, Naphtha Type	5.355	Special Naphthas	5.248
Kerosene	5.670	Still Gas	6.000
Lubricants	6.065	Unfinished Oils	5.825
Motor Gasoline	5.253	Unfractionated Stream	5.418
Natural Gasoline and Isopentane	4.620	Waxes	5.537
Pentanes Plus	4.620	Miscellaneous	5.796

[a] 60 percent butane and 40 percent propane.
[b] 70 percent ethane and 30 percent propane.
Source: See "Thermal Conversion Factor Source Documentation," which follows Table A8.

Table A2. Approximate Heat Content of Crude Oil, Crude Oil and Products, and Natural Gas Plant Liquids

(Million Btu per Barrel)

	Crude Oil			Crude Oil and Products		Natural Gas Plant Liquids

Thermal Conversion Factor Source Documentation

Approximate Heat Content of Petroleum and Natural Gas Plant Liquids

Asphalt. The Energy Information Administration (EIA) adopted the thermal conversion factor of 6.636 million British thermal units (Btu) per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Aviation Gasoline. EIA adopted the Bureau of Mines thermal conversion factor of 5.048 million Btu per barrel as published for "Gasoline, Aviation" by the Texas Eastern Transmission Corporation in Appendix V of *Competition and Growth in American Energy Markets 1947-1985,* a 1968 release of historical and projected statistics.

Butane. EIA adopted the Bureau of Mines thermal conversion factor of 4.326 million Btu per barrel as published in the *California Oil World and Petroleum Industry,* First Issue, April 1942.

Butane-Propane Mixture. EIA adopted the Bureau of Mines calculation of 4.130 million Btu per barrel based on an assumed mixture of 60 percent butane and 40 percent propane. See **Butane** and **Propane.**

Crude Oil, Exports. Assumed by EIA to be 5.800 million Btu per barrel or equal to the thermal conversion factor for crude oil produced in the United States. See **Crude Oil and Lease Condensate, Production.**

Crude Oil, Imports. Calculated annually by EIA by weighting the thermal conversion factor of each type of crude oil imported by the quantity imported. Thermal conversion factors for each type were calculated on a foreign country basis, by determining the average American Petroleum Institute (API) gravity of crude imported from each foreign country from Form ERA-60 in 1977 and converting average API gravity to average Btu content by using National Bureau of Standards, Miscellaneous Publication No. 97, *Thermal Properties of Petroleum Products,* 1933.

Crude Oil and Lease Condensate, Production. EIA adopted the thermal conversion factor of 5.800 million Btu per barrel as reported in a Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, adopted January 3, 1950."

Crude Oil and Petroleum Products, Exports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product

exported and crude oil exported weighted by the quantity of each petroleum product and crude oil exported. See **Crude Oil, Exports** and **Petroleum Products, Exports.**

Crude Oil and Petroleum Products, Imports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product and each type of crude oil imported weighted by the quantity of each petroleum product and each type of crude oil imported. See **Crude Oil, Imports** and **Petroleum Products, Imports.**

Distillate Fuel Oil. EIA adopted the Bureau of Mines thermal conversion factor of 5.825 million Btu per barrel as reported in a Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Value of Various Fuels, adopted January 3, 1950."

Ethane. EIA adopted the Bureau of Mines thermal conversion factor of 3.082 million Btu per barrel as published in the *California Oil World and Petroleum Industry,* First Issue, April 1942.

Ethane-Propane Mixture. EIA calculated 3.308 million Btu per barrel based on an assumed mixture of 70 percent ethane and 30 percent propane. See **Ethane** and **Propane.**

Isobutane. EIA adopted the Bureau of Mines thermal conversion factor of 3.974 million Btu per barrel as published in the *California Oil World and Petroleum Industry,* First Issue, April 1942.

Jet Fuel, Kerosene Type. EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as published for "Jet Fuel, Commercial" by the Texas Eastern Transmission Corporation in Appendix V of *Competition and Growth in American Energy Markets 1947-1985,* a 1968 release of historical and projected statistics.

Jet Fuel, Naphtha Type. EIA adopted the Bureau of Mines thermal conversion factor of 5.355 million Btu per barrel as published for "Jet Fuel, Military" by the Texas Eastern Transmission Corporation in Appendix V of *Competition and Growth in American Energy Markets 1947-1985,* a 1968 release of historical and projected statistics.

Kerosene. EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as reported in a Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, adopted January 3, 1950."

Liquefied Petroleum Gases (LPG) Consumption. Calculated annually by EIA as the average of the thermal conversion factors of each liquefied petroleum gas consumed, weighted by the quantity of each liquefied petroleum gas consumed.

Lubricants. EIA adopted the thermal conversion factor of 6.065 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Miscellaneous Products. EIA adopted the thermal conversion factor of 5.796 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Motor Gasoline. EIA adopted the Bureau of Mines thermal conversion factor of 5.253 million Btu per barrel as published for "Gasoline, Motor Fuel" by the Texas Eastern Transmission Corporation in Appendix V of *Competition and Growth in American Energy Markets 1947-1985,* a 1968 release of historical and projected statistics.

Natural Gas Plant Liquids, Production. Calculated annually by EIA as the average of the thermal conversion factors of each natural gas plant liquid produced weighted by the quantity of each natural gas plant liquid produced.

Natural Gasoline. EIA adopted the thermal conversion factor of 4.620 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Pentanes Plus. EIA assumed the thermal conversion factor to be 4.620 million Btu per barrel or equal to that for natural gasoline. See **Natural Gasoline.**

Petrochemical Feedstocks, Naphtha Less Than 401 Degrees Fahrenheit. Assumed by EIA to be 5.248 million Btu per barrel, equal to the thermal conversion factor for special naphtha. See **Special Naphtha.**

Petrochemical Feedstocks, Oils Equal to or Greater Than 401 Degrees Fahrenheit. Assumed by EIA to be 5.825 million Btu per barrel, equal to the thermal conversion factor for distillate fuel oil. See **Distillate Fuel Oil.**

Petrochemical Feedstocks, Still Gas. Assumed by EIA to be 6.000 million Btu per barrel, equal to the thermal conversion factor for still gas. See **Still Gas.**

Petroleum Coke. EIA adopted the thermal conversion factor of 6.024 million Btu per barrel as reported in Btu per short ton in the Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Value of Various Fuels, adopted January 3, 1950." The Bureau of Mines calculated this factor by dividing 30,120,000 Btu per short ton, as given in the referenced Bureau of Mines internal memorandum, by 5.0 barrels per short ton, as given in the Bureau of Mines Form 6-1300-M and successor EIA forms.

Petroleum Products, Total Consumption. Calculated annually by EIA as the average of the

thermal conversion factors for all petroleum products consumed, weighted by the quantity of each petroleum product consumed.

Petroleum Products, Consumption by Electric Utilities. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed at electric utilities, weighted by the quantity of each petroleum product consumed at electric utilities. The quantity of petroleum consumed is estimated in the State Energy Data System as documented in the *State Energy Data Report.*

Petroleum Products, Consumption by Industrial Users. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed in the industrial sector, weighted by the estimated quantity of each petroleum product consumed in the industrial sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in the *State Energy Data Report.*

Petroleum Products, Consumption by Residential and Commercial Users. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed by the residential and commercial sector, weighted by the estimated quantity of each petroleum product consumed in the residential and commercial sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in the *State Energy Data Report.*

Petroleum Products, Consumption by Transportation Users. Calculated annually by EIA as the average of the thermal conversion factor for all petroleum products consumed in the transportation sector, weighted by the estimated quantity of each petroleum product consumed in the transportation sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in the *State Energy Data Report.*

Petroleum Products, Exports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product, weighted by the quantity of each petroleum product exported.

Petroleum Products, Imports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product imported, weighted by the quantity of each petroleum product imported.

Plant Condensate. Estimated to be 5.418 million Btu per barrel by EIA from data provided by McClanahan Consultants, Inc., Houston, Texas.

Propane. EIA adopted the Bureau of Mines thermal conversion factor of 3.836 million Btu per barrel as published in the *California Oil World and Petroleum Industry,* First Issue, April 1942.

Residual Fuel Oil. EIA adopted the thermal conversion factor of 6.287 million Btu per barrel as reported in the Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, adopted January 3, 1950."

Road Oil. EIA adopted the Bureau of Mines thermal conversion factor of 6.636 million Btu per barrel, which was assumed to be equal to that of asphalt (see **Asphalt**) and was first published by the Bureau of Mines in the *Petroleum Statement, Annual, 1970.*

Special Naphtha. EIA adopted the Bureau of Mines thermal conversion factor of 5.248 million Btu per barrel, which was assumed to be equal to that of total gasoline (aviation and motor) factor and was first published in the *Petroleum Statement, Annual, 1970.*

Still Gas. EIA adopted the Bureau of Mines estimated thermal conversion factor of 6.000 million Btu per barrel and first published in the *Petroleum Statement, Annual, 1970.*

Unfinished Oil. EIA assumed the thermal conversion factor to be 5.825 million Btu per barrel or equal to that for distillate fuel oil (see **Distillate Fuel Oil**) and first published in the *Annual Report to Congress, Volume 3, 1977.*

Unfractionated Stream. EIA assumed the thermal conversion factor to be 5.418 million Btu per barrel or equal to that for plant condensate (see **Plant Condensate**) and first published in the *Annual Report to Congress, Volume 2, 1981.*

Waxes. EIA adopted the thermal conversion factor of 5.537 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Approximate Heat Content of Natural Gas

Natural Gas, Total Consumption. 1973-1979: EIA adopted the thermal conversion factor calculated annually by the American Gas Association (AGA) and published in *Gas Facts,* an AGA annual publication. 1980 forward: Calculated annually by EIA by dividing the total heat content of natural gas consumed by the total quantity of natural gas consumed. The heat content and quantity consumed are from Form EIA-176. Published sources are: 1980-1990: EIA, *Natural Gas Annual 1990, Volume 2,* Table 15. 1991 forward: 1990 value used as an estimate.

Natural Gas, Consumption by Electric Utilities. Calculated annually by EIA by dividing the total heat content of natural gas received at electric utilities by the total quantity received at electric utilities. The heat contents and receipts are from Form FERC-423 and predecessor forms.

Natural Gas, Consumption by Sectors Other Than Electric Utilities. Calculated annually by EIA by dividing the heat content of all natural gas consumed less the heat content of natural gas consumed at electric utilities by the quantity of all natural gas consumed less the quantity of natural gas consumed at electric utilities. Data are from Forms EIA-176, FERC-423, EIA-759, and predecessor forms.

Natural Gas, Exports. Calculated annually by EIA by dividing the heat content of exported natural gas by the quantity of natural gas exported, both reported on Form FPC-14.

Natural Gas, Imports. Calculated annually by EIA by dividing the heat content of imported natural gas by the quantity of natural gas imported, both reported on Form FPC-14.

Natural Gas Production, Dry. Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See **Natural Gas Consumption.**

Natural Gas Production, Marketed (Wet). Calculated annually by EIA by adding the heat content of dry natural gas production and the total heat content of natural gas plant liquids production and dividing this sum by the total quantity of marketed (wet) natural gas production.

Approximate Heat Content of Coal and Coal Coke

Anthracite, Total Consumption. Calculated annually by EIA by dividing the sum of the heat content of anthracite consumed by electric utilities and all other sectors combined by the total quantity of anthracite consumed.

Anthracite, Consumption by Electric Utilities. Calculated annually by EIA by dividing the heat content of anthracite receipts at electric utilities by the quantity of anthracite received at electric utilities. Heat contents and receipts are from Form FERC-423 and predecessor forms.

Anthracite, Consumption by Sectors Other Than Electric Utilities. Calculated annually by EIA by dividing the heat content of anthracite production less the heat content of the anthracite consumed at electric utilities, net exports, and shipments to U.S. Armed Forces overseas by the quantity of anthracite consumed by sectors other than electric utilities less the quantity of anthracite stock changes, losses, and "unaccounted for."

Anthracite, Imports and Exports. EIA assumed the anthracite imports and exports to be freshly mined anthracite having an estimated heat content of 25.40 million Btu per short ton.

Anthracite, Production. Calculated annually by EIA by dividing the sum of the heat content of freshly mined anthracite (estimated to have an average heat content of 25.400 million Btu per short ton) and the heat content of anthracite recovered from culm banks and river dredging (estimated to have a heat content of 17.500 million Btu per short ton) by the total quantity of anthracite production.

Bituminous Coal and Lignite, Total Consumption. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumed by electric utilities, coal coke plants, other industrial plants, the residential and commercial sector, and the transportation sector by the sum of their respective tonnages.

Bituminous Coal and Lignite, Consumption by Coke Plants. Estimated by EIA to be 26.800 million Btu per short ton on the basis of an input/output analysis of coal carbonization.

Bituminous Coal and Lignite, Consumption by Electric Utilities. Calculated annually by EIA by dividing the total heat content of bituminous coal and lignite received at electric utilities by the total quantity received at electric utilities. Heat contents and receipts are from Form FERC-423 and predecessor forms.

Bituminous Coal and Lignite, Consumption by Other Industrial and Transportation Users. 1973: Calculated by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by other industrial users and that of coal consumed at electric utilities in the 1974-1982 period. 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to other industrial users from each coal-producing area (reported on Form EIA-6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to that of bituminous coal and lignite received at electric utilities from each of the same coal-producing areas (reported on Form FERC-423). The average Btu value of coal by coal-producing area was applied to the volume of deliveries to other industrial users from each coal-producing area, and the sum total of the heat content was divided by the total volume of deliveries. Coal-producing areas are the Bureau of Mines coal-producing districts for 1974 through 1989 and coal-producing States for 1990 forward.

Bituminous Coal and Lignite, Consumption by Residential and Commercial Users. 1973: Calculated by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by residential and commercial users and that of coal consumed by electric utilities in the 1974-1982 period. 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to residential and commercial

users from each coal-producing area (reported on Form EIA-6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to that of bituminous coal and lignite received at electric utilities from each of the same coal-producing areas (reported on Form FERC-423). The average Btu value of coal by coal-producing area was applied to the volume of deliveries to residential and commercial users from each coal-producing area, and the total of the heat value was divided by the total volume of deliveries. Coal-producing areas are the Bureau of Mines coal-producing districts for 1974 through 1989 and coal-producing States for 1990 forward.

Bituminous Coal and Lignite, Exports. Calculated annually by EIA by dividing the sum of the heat content of exported metallurgical coal (estimated to average 27.000 million Btu per short ton) and the heat content of exported steam coal (estimated to have an average thermal content of 25.000 million Btu per short ton) by the total quantity of bituminous coal and lignite exported.

Bituminous Coal and Lignite, Imports. EIA estimated the average thermal conversion factor to be 25.000 million Btu per short ton.

Bituminous Coal and Lignite, Production. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumption, net exports, stock changes, and unaccounted for by the sum of their respective tonnages. Consumers' stock changes by sectors were assumed to have the same conversion factor as that of the consumption sector. Producers' stock changes and unaccounted for were assumed to have the same conversion factor as that for consumption by all users.

Coal, Consumption. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumption by the sum of their respective tonnages.

Coal, Consumption by Electric Utilities. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite received at electric utilities by the sum of their respective tonnages received.

Coal, Consumption by Sectors Other Than Electric Utilities. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumed by sectors other than electric utilities by the sum of their respective tonnages.

Coal, Exports. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite exported by the sum of their respective tonnages.

Coal, Imports. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite imported by the sum of their respective tonnages.

Coal, Production. Calculated annually by EIA by dividing the sum of the total heat content of bituminous coal and lignite and anthracite production by the sum of their respective tonnages.

Coal Coke, Imports and Exports. EIA adopted the Bureau of Mines estimate of 24.800 million Btu per short ton.

Approximate Heat Rates for Electricity

Fossil-Fueled Steam-Electric Plant Generation. There is no generally accepted practice for measuring the thermal conversion rates for power plants that generate electricity from hydroelectric, wood and waste, wind, photovoltaic, or solar thermal energy sources. Therefore, EIA has selected a rate that is equal to the prevailing annual average heat rate factor for fossil-fueled steam-electric power plants in the United States. By using that factor, it is possible to evaluate fossil fuel requirements for replacing those sources during periods of interruption such as droughts. The heat content of a kilowatthour of electricity produced, regardless of the generation process, is 3,412 Btu per kilowatthour. 1973-1990: The weighted annual average heat rate for fossil-fueled steam-electric power plants in the United States, as published by EIA in *Electric Plant Cost and Power Production Expenses 1990*, Table 11. 1991 forward: 1990 value used as an estimate.

Geothermal Energy Plant Generation. 1973-1981: Calculated annually by EIA by weighting the average annual heat rates of operating geothermal units by the installed nameplate capacities as reported on Form FPC-12. 1982 forward: Estimated annually by EIA on the basis of an informal survey of relevant plants.

Nuclear Steam-Electric Plant Generation. Calculated annually by EIA by dividing the total heat content consumed in nuclear generating units by the total (net) electricity generated by nuclear generating units. The heat content and electricity generation are reported on Form FERC-1, Form EIA-412, and predecessor forms. The factors, beginning with 1982 data, are published in the following EIA reports—1982: *Historical Plant Cost and Annual Production Expenses for Selected Electric Plants 1982*, page 215. 1983-1990: *Electric Plant Cost and Power Production Expenses 1990*, Table 15. 1991 forward: 1990 value used as an estimate.

Appendix B. Metric and Other Physical Conversion Factors

Data presented in the *Monthly Energy Review* and in other Energy Information Administration publications are expressed in units, such as British thermal units, barrels, cubic feet, and short tons, that historically have been used in the United States. However, because U.S. activities involve foreign nations, most of which use metric units of measure, the United States is committed to making the transition to the metric system.

The metric conversion factors presented in Table B1 can be used to calculate the metric-unit equivalents of values expressed in U.S. units. For example, 500 short tons are the equivalent of 453.6 metric tons (500 short tons X 0.9071847 metric tons/short tons = 453.6 metric tons).

The conversion factors presented in Table B2 can be used to calculate equivalents in various physical units commonly used in energy analyses. For example, 10 U.S. barrels are the equivalent of 420 U.S. gallons (10 barrels X 42 gallons/barrel = 420 gallons).

Table B1. Metric Conversion Factors

Type of Unit	U.S. Unit		Conversion Factor		Metric Unit
Mass	Short Tons	X	0.907 184 7	=	Metric Tons (t)
	Short Tons Uranium Oxide (U_3O_8)	X	0.769	=	Metric Tons Uranium (U)
	Short Tons Uranium Fluoride (UF_6)	X	0.613	=	Metric Tons Uranium (U)
	Long Tons	X	1.016	=	Metric Tons (t)
	Pounds (lb)	X	0.453 592 37[a]	=	Kilograms (kg)
	Pounds Uranium Oxide (lb U_3O_8)	X	0.384 645[b]	=	Kilograms Uranium (KgU)
	Ounces, Avoirdupois (oz)	X	28.349 52	=	Grams (g)
Volume	Barrels of Oil (bbl)	X	0.158 987 3	=	Cubic Meters (m^3)
	Cubic Yards (yd^3)	X	0.764 555	=	Cubic Meters (m^3)
	Cubic Feet (ft^3)	X	0.028 316 85	=	Cubic Meters (m^3)
	U.S. Gallons (gal)	X	3.785 412	=	Liters (L)
	Ounces, Fluid (fl oz)	X	29.573 53	=	Milliliters (ml)
	Cubic Inches (in^3)	X	16.387 06	=	Milliliters (ml)
Length	Miles (mi)	X	1.609 344[a]	=	Kilometers (km)
	Yards (yd)	X	0.914 4[a]	=	Meters (m)
	Feet (ft)	X	0.304 8[a]	=	Meters (m)
	Inches (in)	X	2.54[a]	=	Centimeters (cm)
Area	Acres	X	0.404 69	=	Hectares (ha)
	Square Miles (mi^2)	X	2.589 988	=	Square Kilometers (km^2)
	Square Yards (yd^2)	X	0.836 127 4	=	Square Meters (m^2)
	Square Feet (ft^2)	X	0.092 903 04[a]	=	Square Meters (m^2)
	Square Inches (in^2)	X	6.451 6[a]	=	Square Centimeters (cm^2)
Temperature	Degrees Fahrenheit[c] (° F)	X	5/9 (after subtracting 32)[a]	=	Degrees Celsius (° C)
Energy	British Thermal Units (Btu)	X	1, 055.056	=	Joules (J)
	Calories (cal)	X	4.186 8	=	Joules (J)
	Kilowatthours (kWh)	X	3.6	=	Megajoules (MJ)

[a]Exact conversion.
[b]Calculated by the Energy Information Administration.
[c]To convert degrees Celsius (° C) to degrees Fahrenheit (° F), multiply by 9/5, then add 32.

Appendix C. List of Special Features

The following is a complete list of all the special features that have appeared in the *Monthly Energy Review* since the first issue was published in October 1974. There are four categories of special features on the list. "Feature Articles" cover a wide range of energy-related subjects in depth. "Highlights" summarize the most important information presented in the subject Energy Information Administration (EIA) report. "Energy Previews" provide brief overviews of EIA preliminary energy data on a given topic. "EIA Data News" items present information on recent changes in the scope, design, methodology, and findings of the EIA's energy surveys and data bases. Questions and comments about special features may be directed to Barbara T. Fichman by telephone on 202-586-5737 or by FAX on 202-586-0018.

Special Feature	Cover Date
1993	
Energy Preview: Residential Transportation Energy Consumption Survey, Preliminary Estimates, 1991	January 1993
EIA Data News: Natural Gas Transported for the Account of Others	February 1993
Highlights: *Federal Energy Subsidies: Direct and Indirect Interventions in Energy Markets*	July 1993
1992	
Energy Preview: Residential Energy Consumption and Expenditures Preliminary Estimates, 1990	April 1992
EIA Data News: Oxygenate Data Collection Begins	May 1992
Highlights: *Lighting in Commercial Buildings*	June 1992
Feature Article: Demand, Supply, and Price Outlook for Oxgenated Gasoline, Winter 1992-1993	August 1992
EIA Data News: EIA Statistics on Electric Utility Demand-Side Management	September 1992
EIA Data News: EIA Statistics on Nonutility Power Producers	October 1992
Highlights: *Derived Annual Estimates of Manufacturing Energy Consumption, 1974-1988*	November 1992
Feature Article: Energy Efficiency in the Manufacturing Sector	December 1992
1991	
Highlights: *U.S. Energy Industry Financial Developments, 1990 Fourth Quarter*	March 1991
Feature Article: U.S. Wholesale Electricity Transactions	April 1991
1990	
Feature Article: Refining Results Highlight Energy Companies' First-Half Profit Performance	June 1990
Highlights: *U.S. Oil and Gas Reserves by Year of Field Discovery*	August 1990
1989	
Feature Article: A Review of Valdez Oil Spill Market Impacts	March 1989
Feature Article: Monthly U.S. Crude Oil Production Estimates	March 1989
Feature Article: Superconductivity and Energy Production and Consumption	May 1989
Highlights: *Commercial Buildings Consumption and Expenditures 1986*	May 1989
Feature Article: Higher Prices Yield Improved Energy Industry Financial Results in the First Half of 1989	June 1989
Feature Article: The Future Structure of the U.S. Commercial Nuclear Power Equipment Manufacturing Industry	July 1989
Highlights: *Potential Costs of Restricting Chlorofluorocarbon Use*	September 1989
Highlights: *Manufacturing Energy Consumption Survey: Changes in Energy Efficiency, 1980-1985*	October 1989
Highlights: *Household Energy Consumption and Expenditures 1987, Part 1: National Data*	November 1989
Feature Article: Improved Energy Profits Offset by Refining Results in 1989	December 1989

Special Feature	Cover Date
1988	
Feature Article: Measures of Energy Consumption, Expenditures, and Prices	May 1988
Highlights: *Characteristics of Commercial Buildings 1986*	June 1988
Feature Article: The U.S. Energy Industry's Financial Recovery Continued in the First Half of 1988	June 1988
Feature Article: A U.S. Perspective on Condensate	June 1988
Feature Article: State Energy Severance Taxes, 1972-1987	July 1988
Highlights: *Manufacturing Energy Consumption Survey: Consumption of Energy, 1985*	September 1988
Highlights: *Profiles of Foreign Direct Investment in U.S. Energy 1987*	October 1988
Highlights: *Manufacturing Energy Consumption Survey: Fuel Switching, 1985*	November 1988
Feature Article: Increased Refining Income Led U.S. Energy Industry Financial Recovery in 1988	December 1988
1987	
Feature Article: Manufacturing Sector Energy Consumption, 1985 Provisional Estimates	January 1987
Highlights: *Consumption and Expenditures, April 1984 Through March 1985, Part 1: National Data*	April 1987
Highlights: *Consumption and Expenditures, April 1984 Through March 1985, Part 2: Regional Data*	May 1987
Feature Article: U.S. Energy Industry Financial Developments, 1987 Second Quarter	June 1987
Feature Article: End-Use Consumption of Residential Energy	July 1987
Highlights: *Uranium Industry Annual 1986*	September 1987
Highlights: *Potential Oil Production from ANWR*	October 1987
Highlights: *Profiles of Foreign Direct Investment in U.S. Energy 1986*	November 1987
Feature Article: The U.S. Energy Industry in 1987: A Slow Recovery	December 1987
1986	
Feature Article: State Motor Gasoline Taxes, 1960-1985	March 1986
Feature Article: The Impact of Low Oil Prices on Electric Utility Fuel Choice	June 1986
Feature Article: U.S. Energy Industry Financial Developments, 1986 Second Quarter	June 1986
Highlights: *International Energy Annual 1985*	September 1986
Feature Article: U.S. Energy Industry Financial Developments, 1986	December 1986
1985	
Highlights: *Annual Energy Review 1984*	January 1985
Highlights: *Performance Profiles of Major Energy Producers 1983*	February 1985
Feature Article: Estimating Well Completions	March 1985
Highlights: *State Energy Price and Expenditure Report 1970-1982*	March 1985
Highlights: *State Energy Data Report, Consumption Estimates, 1960-1983*	April 1985
Highlights: *Annual Outlook for U.S. Electric Power 1985*	June 1985
Highlights: *Short-Term Energy Outlook, Volume 1, October 1985*	August 1985
Highlights: *Analysis of Growth in Electricity Demand, 1980-1984*	August 1985
Highlights: *Profiles of Foreign Direct Investment in U.S. Energy 1984*	November 1985
Highlights: *Performance Profiles of Major Energy Producers 1984*	December 1985
1984	
Highlights: *Annual Energy Review 1983*	February 1984
Highlights: *Annual Energy Outlook 1983*	March 1984
Highlights: *State Energy Data Report, Consumption Estimates, 1960-1982*	March 1984
Highlights: *State Energy Price and Expenditure Report, 1970-1981*	May 1984
Highlights: *Solar Collector Manufacturing Activity 1983*	June 1984
Highlights: *International Energy Annual 1983*	September 1984
Highlights: *Estimates of U.S. Wood Energy Consumption, 1980-1983*	September 1984
Highlights: *Energy Conservation Indicators 1983 Annual Report*	November 1984
Highlights: *Annual Energy Outlook 1984*	December 1984

Special Feature	Cover Date
1983	
Highlights: *Residential Energy Consumption Survey: Consumption and Expenditures*	January 1983
Highlights: *Residential Energy Consumption Survey: Housing Characteristics*	February 1983
Feature Article: The Effect of Weather on Energy Use	April 1983
Feature Article: Trends in U.S. Energy Since 1973	May 1983
Feature Article: Data Series on Petroleum Use at Electric Utilities	July 1983
Highlights: *Energy Price and Expenditure Data Report, 1970-1980*	July 1983
Highlights: *Railroad Deregulation: Impact on Coal*	August 1983
Highlights: *Port Deepening and User Fees: Impact on U.S. Coal Exports*	August 1983
Highlights: *U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves, 1982 Annual Report*	September 1983
Feature Article: Residential Energy Consumption, 1978 Through 1981	September 1983
Feature Article: Exploring for Oil and Gas	November 1983
Feature Article: The Influence of Federal Actions on Petroleum Exploration	December 1983[2]
Feature Article: Aggregate Statistics: Accurate or Misleading?	December 1983[3]
1982	
Feature Article: The Interstate and Intrastate Natural Gas Markets	January 1982
Feature Article: Natural Gas Drilling and Production Under the Natural Gas Policy Act	February 1982
Highlights: *U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves, 1981 Annual Report*	September 1982
Feature Article: Impacts of Financial Constraints on the Electric Utility Industry	October 1982
Highlights: *Energy Company Development Patterns in the Postembargo Era*	November 1982
1981	
Feature Article: Changes in 1981 Petroleum Data Series	May 1981
Feature Article: Information Services of the Energy Information Administration	September 1981
Feature Article: An Overview of Natural Gas Markets	December 1981

Glossary

Anthracite: A hard, black, lustrous coal containing a high percentage of fixed carbon and a low percentage of volatile matter. Often referred to as hard coal. It conforms to ASTM Specification D388-84 for anthracite, meta-anthracite, and semianthracite.

Asphalt: A dark-brown-to-black cement-like material containing bitumens as the predominant constituents obtained by petroleum processing. The definition includes crude asphalt as well as the following finished products: cements, fluxes, the asphalt content of emulsions (exclusive of water), and petroleum distillates blended with asphalt to make cutback asphalts.

ASTM: The American Society for Testing and Materials.

Aviation Gasoline Blending Components: Naphthas that are used for blending or compounding into finished aviation gasoline (e.g., straight-run gasoline, alkylate, and reformate). Excludes oxygenates (alcohols and ethers), butane, and pentanes plus.

Aviation Gasoline, Finished: All special grades of gasoline for use in aviation reciprocating engines, as given in ASTM Specification D910 and Military Specification MIL-G-5572. Excludes blending components that will be used in blending or compounding into finished aviation gasoline.

Barrel (petroleum): A unit of volume equal to 42 U.S. gallons.

Base (Cushion) Gas: The volume of gas needed as a permanent inventory to maintain adequate underground storage reservoir pressures and deliverability rates throughout the withdrawal season. All native gas is included in the base gas volume.

Bituminous Coal: A dense black coal, often with well-defined bands of bright and dull material, with a moisture content usually less than 20 percent. Often referred to as soft coal. It is the most common coal and is used primarily for generating electricity, making coke, and space heating. It conforms to ASTM Specification D388-84 for bituminous coal. In this report, bituminous coal includes subbituminous coal.

British Thermal Unit (Btu): The quantity of heat needed to raise the temperature of 1 pound of water by 1° F at or near 39.2° F. See **Heat Content of a Quantity of Fuel, Gross** and **Heat Content of a Quantity of Fuel, Net.**

Butane: A normally gaseous straight-chain or branched-chain hydrocarbon (C_4H_{10}). It is extracted from natural gas or refinery gas streams. It includes isobutane and normal butane and is designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial butane.

- *Isobutane:* A normally gaseous branched-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of 10.9° F. It is extracted from natural gas or refinery gas streams.
- *Normal Butane:* A normally gaseous straight-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of 31.1° F. It is extracted from natural gas or refinery gas streams.

Butylene: An olefinic hydrocarbon (C_4H_8) recovered from refinery processes.

Capacity Factor: The ratio of the electrical energy produced by a generating unit for a given period of time to the electrical energy that could have been produced at continuous full-power operation during the same period.

CIF: See **Cost, Insurance, Freight.**

City Gate: A point or measuring station at which a distribution gas utility receives gas from a natural gas pipeline company or transmission system.

Coal: A black or brownish-black solid, combustible substance formed by the partial decomposition of vegetable matter without access to air. The rank of coal, which includes anthracite, bituminous coal, subbituminous coal, and lignite, is based on fixed carbon, volatile matter, and heating value. Coal rank indicates the progressive alteration, or coalification, from lignite to anthracite. Lignite contains approximately 9 to 17 million Btu per ton. The heat contents of subbituminous and bituminous coal range from 16 to 24 million Btu per ton, and from 19 to 30 million Btu per ton, respectively. Anthracite contains approximately 22 to 28 million Btu per ton.

Coal Coke: A hard, porous product made from baking bituminous coal in ovens at temperatures as high as 2,000° F. It is used both as a fuel and as a reducing agent in smelting iron ore in a blast furnace.

Commercial Sector: The commercial sector, as defined economically, consists of business establishments that are not engaged in transportation or in manufacturing or other types of industrial activity (agriculture, mining, or construction). Commercial establishments include hotels, motels,

restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; religious and nonprofit organizations; health, social, and educational institutions; and Federal, State, and local governments. Street lights, pumps, bridges, and public services are also included if the establishment operating them is considered commercial.

Completion: The installation of permanent equipment for the production of oil or gas. If a well is equipped to produce only oil or gas from one zone or reservoir, the definition of a well (classified as an oil well or gas well) and the definition of a completion are identical. However, if a well is equipped to produce oil and/or gas separately from more than one reservoir, a well is not synonymous with a completion.

Conversion Factor: A number that translates units of one system into corresponding values of another system. Conversion factors can be used to translate physical units of measure for various fuels into Btu equivalents.

Cost, Insurance, Freight (CIF): A type of sale in which the buyer of the product agrees to pay a unit price that includes the f.o.b. value of the product at the point of origin plus all costs of insurance and transportation. This type of transaction differs from a "delivered" purchase in that the buyer accepts the quantity as determined at the loading port (as certified by the Bill of Loading and Quality Report) rather than pay on the basis of the quantity and quality ascertained at the unloading port. It is similar to the terms of an f.o.b. sale, except that the seller, as a service for which he is compensated, arranges for transportation and insurance.

Crude Oil f.o.b. Price: The crude oil price actually charged at the oil-producing country's port of loading. Includes deductions for any rebates and discounts or additions of premiums, where applicable. It is the actual price paid with no adjustment for credit terms.

Crude Oil (Including Lease Condensate): A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Included are lease condensate and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale. Drip gases are also included, but topped crude oil (residual oil) and other unfinished oils are excluded. Where identifiable, liquids produced at natural gas processing plants and mixed with crude oil are likewise excluded.

Crude Oil Landed Cost: The price of crude oil at the port of discharge, including charges associated with the purchase, transporting, and insuring of a cargo from the purchase point to the port of discharge. The cost does not include charges incurred at the discharge port (e.g., import tariffs or fees, wharfage charges, and demurrage).

Crude Oil Refinery Input: The total crude oil put into processing units at refineries.

Crude Oil Stocks: Stocks of crude oil and lease condensate held at refineries, in pipelines, at pipeline terminals, and on leases.

Crude Oil Used Directly: Crude oil consumed as fuel by crude oil pipelines and on crude oil leases.

Cubic Foot (natural gas): A unit of volume equal to 1 cubic foot at a pressure base of 14.73 pounds standard per square inch absolute and a temperature base of 60° F.

Degree-Day Normals: Simple arithmetic averages of monthly or annual degree-days over a long period of time (usually the 30-year period 1951-1980). The averages may be simple degree-day normals or population-weighted degree-day normals.

Degree-Days, Cooling (CDD): The number of degrees per day that the daily average temperature is above 65° F. The daily average temperature is the mean of the maximum and minimum temperatures for a 24-hour period.

Degree-Days, Heating (HDD): The number of degrees per day that the daily average temperature is below 65° F. The daily average temperature is the mean of the maximum and minimum temperatures for a 24-hour period.

Degree-Days, Population-Weighted: Heating or cooling degree-days weighted by the population of the area in which the degree-days are recorded. To compute State population-weighted degree-days, each State is divided into from one to nine climatically homogeneous divisions, which are assigned weights based on the ratio of the population of the division to the total population of the State. Degree-day readings for each division are multiplied by the corresponding population weight for each division and those products are then summed to arrive at the State population-weighted degree-day figure. To compute national population-weighted degree-days, the Nation is divided into nine Census regions comprised of from three to eight States, which are assigned weights based on the ratio of the population of the region to the total population of the Nation. Degree-day readings for each region are multiplied by the corresponding population weight for each region and those products are then summed to arrive at the national population-weighted degree-day figure.

Design Electrical Rating, Net: The nominal net electrical output of a nuclear unit as specified by the electric utility for the purpose of plant design.

Development Well: A well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive.

Distillate Fuel Oil: A general classification for one of the petroleum fractions produced in conventional distillation operations. Included are products known as No. 1, No. 2, and No. 4 fuel oils and No. 1, No. 2, and No. 4 diesel fuels. It is used primarily for space heating, on-and off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation.

Dry Hole: An exploratory or development well found to be incapable of producing either oil or gas in sufficient quantities to justify completion as an oil or gas well.

Dry Natural Gas Production (as a decrement from gas reserves): The volume of natural gas withdrawn from reservoirs during the report year less (1) the volume returned to such reservoirs in cycling, repressuring of oil reservoirs, and conservation operations; (2) shrinkage resulting from the removal of lease condensate and plant liquids; and (3) nonhydrocarbon gases, where they occur in sufficient quantity to render the gas unmarketable. Volumes of gas withdrawn from gas storage reservoirs and native gas that has been transferred to the storage category are not considered production. This is not the same as marketed production, since the latter also excludes vented and flared gas but contains liquids.

Dry Natural Gas Production (as an increment to gas supply): Gross withdrawals from production reservoirs less gas used in reservoir repressuring, amounts vented and flared, nonhydrocarbons removed, and various natural gas constituents, such as ethane, propane, and butane, removed at natural gas processing plants. The parameters for measurement are 60° F and 14.73 pounds standard per square inch absolute.

Electrical System Energy Losses: The amount of energy lost during generation, transmission, and distribution of electricity, including plant and unaccounted-for uses.

Electricity Generation: The process of producing electric energy or transforming other forms of energy into electric energy. Also the amount of electric energy produced or expressed in watthours (Wh).

Electricity Generation, Gross: The total amount of electric energy produced by the generating station or stations, measured at the generator terminals.

Electricity Generation, Net: Gross generation less electricity consumed at the generating plant for station use. Electricity required for pumping at pumped-storage plants is regarded as plant use and is deducted from gross generation.

Electricity Production: Net electricity (gross electricity output measured at generator terminals minus power plant use) generated by publicly and privately owned electric utilities. Excludes industrial electricity generation (except autogeneration of hydroelectric power).

Electricity Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. "Other" sales include sales for public street and highway lighting and other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Electric Power Plant: A station containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy.

Electric Utility: A corporation, person, agency, authority, or other legal entity or instrumentality that owns and/or operates facilities for the generation, transmission, distribution, or sale of electric energy, primarily for use by the public, and that files forms listed in the *Code of Federal Regulations*, Title 18, Part 141. Facilities that qualify as cogenerators or small power producers under the Public Utility Regulatory Policies Act are not considered electric utilities.

Electric Utility Sector: The electric utility sector consists of privately and publicly owned establishments that generate, transmit, distribute, or sell electricity primarily for use by the public and that meet the definition of an electric utility. Nonutility power producers are not included in the electric utility sector.

End-Use Sectors: The residential, commercial, industrial, and transportation sectors of the economy.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Energy Consumption: The use of energy as a source of heat or power or as an input in the manufacturing process.

Energy Consumption, End-Use: Primary end-use energy consumption is the sum of fossil fuel consumption by the four end-use sectors (residential, commercial, industrial, and transportation) and generation of hydroelectric power by nonelectric utilities. **Net end-use energy consumption** includes

electric utility sales to those sectors but excludes electrical system energy losses. **Total end-use energy consumption** includes both electric utility sales to the four end-use sectors *and* electrical system energy losses.

Energy Consumption, Total: The sum of fossil fuel consumption by the five sectors (residential, commercial, industrial, transportation, and electric utility) plus hydroelectric power, nuclear electric power, net imports of coal coke, and electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

Energy Source: A substance, such as petroleum, natural gas, or coal, that supplies heat or power. In Energy Information Administration reports, electricity and renewable forms of energy, such as biomass, geothermal, wind, and solar, are considered to be energy sources.

Ethane: A normally gaseous straight-chain hydrocarbon (C_2H_6). It is a colorless, paraffinic gas that boils at a temperature of -127.48° F. It is extracted from natural gas and refinery gas streams.

Ethylene: An olefinic hydrocarbon (C_2H_4) recovered from refinery processes or petrochemical processes.

Exploratory Well: A well drilled to find and produce oil or gas in an unproved area, to find a new reservoir in a field previously found to be productive of oil or gas in another reservoir, or to extend the limit of a known oil or gas reservoir.

Exports: Shipments of goods from the 50 States and the District of Columbia to foreign countries and to Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

f.a.s.: See **Free Alongside Ship.**

Federal Energy Regulatory Commission (FERC): The Federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification. FERC is an independent regulatory agency within the Department of Energy and is the successor to the Federal Power Commission.

Federal Power Commission (FPC): The predecessor agency of the Federal Energy Regulatory Commission. The Federal Power Commission was created by an Act of Congress under the Federal Water Power Act on June 10, 1920. It was charged originally with regulating the electric power and natural gas industries. It was abolished on September 30, 1977, when the Department of Energy was created. Its functions were divided between the Department of Energy and the Federal Energy Regulatory Commission, an independent regulatory agency.

First Purchase Price: The marketed first sales price of domestic crude oil, consistent with the removal price defined by the provisions of the Windfall Profits Tax on Domestic Crude Oil (Public Law 96-223, Sec. 4998 (c)).

Flared Natural Gas: Natural gas burned in flares on the base site or at gas processing plants.

f.o.b.: See **Free on Board.**

Footage Drilled: Total footage for wells in various categories, as reported for any specified period, includes (1) the deepest total depth (length of well bores) of all wells drilled from the surface, (2) the total of all bypassed footage drilled in connection with reported wells, and (3) all new footage drilled for directional sidetrack wells. Footage reported for directional sidetrack wells does not include footage in the common bore, which is reported as footage for the original well. In the case of old wells drilled deeper, the reported footage is that which was drilled below the total depth of the old well.

Former U.S.S.R.: See **U.S.S.R.**

Fossil Fuel: Any naturally occurring organic fuel, such as petroleum, coal, and natural gas.

Fossil Fuel Steam-Electric Power Plant: An electricity generation plant in which the prime mover is a turbine rotated by high-pressure steam produced in a boiler by heat from burning fossil fuels.

Free Alongside Ship (f.a.s.): The value of a commodity at the port of exportation, generally including the purchase price, plus all charges incurred in placing the commodity alongside the carrier at the port of exportation.

Free on Board (f.o.b.): A transaction whereby the seller makes the product available within an agreed-on period at a given port at a given price. It is the responsibility of the buyer to arrange for the transportation and insurance.

Fuel Ethanol: An anhydrous, denatured aliphatic alcohol (C_2H_5OH) intended for motor gasoline blending. See **Oxygenates.**

Full-Power Operation: Operation of a nuclear generating unit at 100 percent of its design capacity. Full-power operation precedes commercial operation.

Gasohol: A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol but sometimes methanol) limited to 10 percent by volume

of alcohol. Gasohol is included in finished leaded and unleaded motor gasoline.

Gas-Turbine Electric Power Plant: A plant in which the prime mover is a gas turbine. A gas turbine typically consists of an axial-flow air compressor, one or more combustion chambers where liquid or gaseous fuel is burned and the hot gases expand to drive the generator and then are used to run the compressor.

Gas Well: A well completed for the production of natural gas from one or more gas zones or reservoirs. (Wells producing both crude oil and natural gas are classified as oil wells.)

Geothermal Energy: Energy from the internal heat of the Earth, which may be residual heat, friction heat, or a result of radioactive decay. The heat is found in rocks and fluids at various depths and can be extracted by drilling and/or pumping.

Geothermal Energy (as used at electric utilities): Hot water or steam extracted from geothermal reservoirs in the Earth's crust and supplied to steam turbines at electric utilities that drive generators to produce electricity.

Gross Domestic Product (GDP): The total value of goods and services produced by labor and property located in the United States. As long as the labor and property are located in the United States, the supplier (that is, the workers and, for property, the owners) may be either U.S. residents or residents of foreign countries.

Heat Content of a Quantity of Fuel, Gross: The total amount of heat released when a fuel is burned. Coal, crude oil, and natural gas all include chemical compounds of carbon and hydrogen. When those fuels are burned, the carbon and hydrogen combine with oxygen in the air to produce carbon dioxide and water. Some of the energy released in burning goes into transforming the water into steam and is usually lost. The amount of heat spent in transforming the water into steam is counted as part of gross heat content but is not counted as part of net heat content. Also referred to as the higher heating value. Btu conversion factors typically used in EIA represent gross heat content.

Heat Content of a Quantity of Fuel, Net: The amount of usable heat energy released when a fuel is burned under conditions similar to those in which it is normally used. Also referred to as the lower heating value. Btu conversion factors typically used in EIA represent gross heat content.

Heavy Oil: The fuel oils remaining after the lighter oils have been distilled off during the refining process. Except for start-up and flame stabilization, virtually all petroleum used in steam-electric power plants is heavy oil.

Hydrocarbon: An organic chemical compound of hydrogen and carbon in the gaseous, liquid, or solid phase. The molecular structure of hydrocarbon compounds varies from the simplest (methane, the primary constituent of natural gas) to the very heavy and very complex.

Hydroelectric Power: The production of electricity from the kinetic energy of falling water.

Hydroelectric Power Plant: A plant in which the turbine generators are driven by falling water.

Imports: Receipts of goods into the 50 States and the District of Columbia from foreign countries and from Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Industrial Sector: The industrial sector comprises manufacturing industries, which make up the largest part of the sector, along with mining, construction, agriculture, fisheries, and forestry. Establishments in the sector range from steel mills, to small farms, to companies assembling electronic components.

Internal Combustion Electric Power Plant: A power plant in which the prime mover is an internal combustion engine. Diesel or gas-fired engines are the principal types used in electric power plants. The plant is usually operated during periods of high demand for electricity.

Jet Fuel: The term includes kerosene-type jet fuel and naphtha-type jet fuel. Kerosene-type jet fuel is a kerosene-quality product used primarily for commercial turbojet and turboprop aircraft engines. Naphtha-type jet fuel is a fuel in the heavy naphthas range used primarily for military turbojet and turboprop aircraft engines.

Kerosene: A petroleum distillate that has a maximum distillation temperature of 401° F at the 10-percent recovery point, a final boiling point of 572° F, and a minimum flash point of 100° F. Included are the two grades designated in ASTM D3699 (No. 1-K and No. 2-K) and all grades of kerosene called range or stove oil. Kerosene is used in space heaters, cook stoves, and water heaters; it is suitable for use as an illuminant when burned in wick lamps.

Lease and Plant Fuel: Natural gas used in well, field, and lease operations (such as gas used in drilling operations, heaters, dehydrators, and field compressors), and as fuel in natural gas processing plants.

Lease Condensate: A natural gas liquid recovered from gas well gas (associated and non-associated) in lease separators or natural gas field facilities. Lease condensate consists primarily of pentanes and heavier hydrocarbons.

Light Oil: Lighter fuel oils distilled off during the refining process. Virtually all petroleum used in internal combustion and gas-turbine engines is light oil.

Lignite: A brownish-black coal of low rank with a high content of moisture and volatile matter. Often referred to as brown coal. It is used almost exclusively for electric power generation. It conforms to ASTM Specification D388-84 for lignite.

Liquefied Natural Gas (LNG): Natural gas (primarily methane) that has been liquefied by reducing its temperature to -260° F at atmospheric pressure.

Liquefied Petroleum Gases (LPG): Ethane, ethylene, propane, propylene, normal butane, butylene, and isobutane produced at refineries or natural gas processing plants, including plants that fractionate new natural gas plant liquids.

Low-Power Testing: The period of time between a nuclear generating unit's initial fuel loading date and the issuance of its operating (full-power) license. The maximum level of operation during that period is 5 percent of the unit's design thermal rating.

Lubricants: Substances used to reduce friction between bearing surfaces or as process materials either incorporated into other materials used as processing aids in the manufacturing of other products or as carriers of other materials. Petroleum lubricants may be produced either from distillates or residues. Other substances may be added to impart or improve certain required properties. Excluded are byproducts of lubricating oil refining, such as aromatic extracts derived from solvent extraction or tars derived from deasphalting. Included are all grades of lubricating oils from spindle oil to cylinder oil and those used in greases. Lubricant categories are paraffinic and naphthenic.

Methanol: A light, volatile alcohol (CH_3OH) eligible for motor gasoline blending. See **Oxygenates.**

Miscellaneous Petroleum Products: All finished petroleum products not classified elsewhere—for example, petrolatum, lube refining byproducts (aromatic extracts and tars), absorption oils, ram-jet fuel, petroleum rocket fuels, synthetic natural gas feedstocks, and specialty oils.

Motor Gasoline Blending Components: Naphthas that will be used for blending or compounding into finished motor gasoline (e.g., straight-run gasoline, alkylate, reformate, benzene, toluene, and zylene). Excluded are oxygenates (alcohols and ethers), butane, and pentanes plus.

Motor Gasoline, Finished: A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, that has been blended to form a fuel suitable for use in spark-ignition engines. Motor gasoline, as given in ASTM Specification D439 or Federal Specification VV-G-1690B, includes a range in distillation temperatures from 122 to 158° F at the 10-percent recovery point and from 365 to 374° F at the 90-percent recovery point. Motor gasoline includes reformulated motor gasoline, oxygenated motor gasoline, and other finished motor gasoline. Blendstock is excluded until blending has been completed.

- *Reformulated Motor Gasoline*: Motor gasoline, formulated for use in motor vehicles, the composition and properties of which are certified as "reformulated motor gasoline" by the Environmental Protection Agency.
- *Oxygenated Motor Gasoline*: Motor gasoline, formulated for use in motor vehicles, that has an oxygen content of 1.8 percent or higher by weight.
- *Other Finished Motor Gasoline:* Motor gasoline that is not included in the reformulated or oxygenated categories.

Motor Gasoline, Finished Gasohol: A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol, but sometimes methanol) in which 10 percent or more of the product is alcohol.

Motor Gasoline, Finished Leaded: Motor gasoline that contains more than 0.05 gram of lead per gallon or more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating. Includes leaded gasohol. Blendstock is excluded until blending has been completed. Alcohol that is to be used in the blending of gasohol is also excluded.

Motor Gasoline, Finished Leaded Premium: Motor gasoline having an antiknock index, calculated as (R+M)/2, greater than 90 and containing more than 0.05 gram of lead per gallon or more than 0.005 gram of phosphorus per gallon.

Motor Gasoline, Finished Leaded Regular: Motor gasoline having an antiknock index, calculated as (R+M)/2, greater than or equal to 87 and less than or equal to 90 and containing more than 0.05 gram of lead or 0.005 gram of phosphorus per gallon.

Motor Gasoline, Finished Unleaded: Motor gasoline containing not more than 0.05 gram of lead per gallon and not more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating. Includes unleaded gasohol. Blendstock is excluded until blending has been completed. Alcohol that is to be used in the blending of gasohol is also excluded.

Motor Gasoline, Finished Unleaded Midgrade: Motor gasoline having an antiknock index, calculated as (R+M)/2, greater than or equal to 88 and less than

or equal to 90 and containing not more than 0.05 gram of phosphorus per gallon.

Motor Gasoline, Finished Unleaded Premium: Motor gasoline having an antiknock index, calculated as (R+M)/2, greater than 90 and containing not more than 0.05 gram of lead or 0.005 gram of phosphorus per gallon.

Motor Gasoline, Finished Unleaded Regular: Motor gasoline having an antiknock index, calculated as (R+M)/2, of 87 containing not more than 0.05 gram of lead per gallon and not more than 0.005 gram of phosphorus per gallon.

Motor Gasoline Retail Prices: Motor gasoline prices calculated each month by the Bureau of Labor Statistics (BLS) in conjunction with the construction of the Consumer Price Index (CPI). Those prices are collected in 85 urban areas selected to represent all urban consumers—about 80 percent of the total U.S. population. The service stations are selected initially, and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full-, mini-, and self-service).

Motor Gasoline, Total: Includes finished leaded motor gasoline (premium and regular), finished unleaded motor gasoline (premium, midgrade, and regular), motor gasoline blending components, and gasohol.

MTBE (Methyl Tertiary Butyl Ether): An ether, $(CH_3)_3COCH_3$, intended for motor gasoline blending. See **Oxygenates.**

Naphtha: A genetic term applied to a petroleum fraction with an approximate boiling range between 122 and 400° F.

Natural Gas: A mixture of hydrocarbons (principally methane) and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in underground reservoirs.

Natural Gas, Dry: The marketable portion of natural gas production, which is obtained by subtracting extraction losses, including natural gas liquids removed at natural gas processing plants, from total production.

Natural Gas Marketed Production: Gross withdrawals of natural gas from production reservoirs, less gas used for reservoir repressuring; nonhydrocarbon gases removed in treating and processing operations; and quantities vented and flared.

Natural Gas Plant Liquids (NGPL): Natural gas liquids recovered from natural gas in processing plants and, in some situations, from natural gas field facilities, as well as those extracted by fractionators. Natural gas plant liquids are defined according to the published specifications of the Gas Processors Association and the American Society for Testing and Materials as follows: ethane, propane, normal butane, isobutane, pentanes plus, and other products from natural gas processing plants (i.e., products meeting the standards for finished petroleum products produced at natural gas processing plants, such as finished motor gasoline, finished aviation gasoline, special naphthas, kerosene, distillate fuel oil, and miscellaneous products).

Natural Gas Wellhead Price: The wellhead price of natural gas is calculated by dividing the total reported value at the wellhead by the total quantity produced as reported by the appropriate agencies of individual producing States and the U.S. Minerals Management Service. The price includes all costs prior to shipment from the lease, including gathering and compression costs, in addition to State production, severance, and similar charges.

Natural Gas, Wet: Natural gas prior to the extraction of liquids and other miscellaneous products.

Net Consumption: See **Energy Consumption, End-Use.**

Nuclear Electric Power: Electricity generated by an electric power plant whose turbines are driven by steam generated in a reactor by heat from the fissioning of nuclear fuel.

Nuclear Electric Power Plant: A single-unit or multiunit facility in which heat produced in one or more reactors by the fissioning of nuclear fuel is used to drive one or more steam turbines.

Nuclear Reactor: An apparatus in which the nuclear fission chain can be initiated, maintained, and controlled so that energy is released at a specific rate. The reactor includes fissionable material (fuel), such as uranium or plutonium; fertile material; moderating material (unless it is a fast reactor); a heavy-walled pressure vessel; shielding to protect personnel; provision for heat removal; and control elements and instrumentation.

Offshore: That geographic area that lies seaward of the coastline. In general, the coastline is the line of ordinary low water along with that portion of the coast that is in direct contact with the open sea or the line marking the seaward limit of inland water.

Oil: See **Crude Oil (Including Lease Condensate).**

Oil Well: A well completed for the production of crude oil from one or more oil zones or reservoirs. Wells producing both crude oil and natural gas are classified as oil wells.

Operable (nuclear): A U.S. nuclear generating unit is considered operable after it completes low-power testing and is issued a full-power operating license by the Nuclear Regulatory Commission. A foreign nuclear generating unit is considered operable once it has generated electricity to the grid.

Organization for Economic Cooperation and Development (OECD): Current members are Australia, Austria, Belgium, Canada, Denmark, Finland, France, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States and its territories (Guam, Puerto Rico, and the Virgin Islands), and Germany.

Organization of Petroleum Exporting Countries (OPEC): Countries that have organized for the purpose of negotiating with oil companies on matters of oil production, prices, and future concession rights. Current members are Algeria, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.

Oxygenated Motor Gasoline: See **Motor Gasoline, Finished.**

Oxygenates: Any substance which, when added to motor gasoline, increases the amount of oxygen in that motor gasoline blend. Through a series of waivers and interpretive rules, the Environmental Protection Agency (EPA) has determined the allowable limits for oxygenates in unleaded gasoline. The "Substantially Similar" Interpretive Rules (56 FR [February 11, 1991]) allows blends of aliphatic alcohols other than methanol and aliphatic ethers, provided the oxygen content does not exceed 2.7 percent by weight. The "Substantially Similar" Interpretive Rules also provide for blends of methanol up to 0.3 percent by volume exclusive of other oxygenates, and butanol or alcohols of a higher molecular weight up to 2.75 percent by weight. Individual waivers pertaining to the use of oxygenates in unleaded motor gasoline have been issued by the EPA. They include:

- *Fuel Ethanol.* Blends of up to 10 percent by volume anhydrous ethanol (200 proof).
- *Methanol.* Blends of methanol and gasoline-grade tertiary butyl alcohol (GTBA) such that the total oxygen content does not exceed 3.5 percent by weight and the ratio of methanol to GTBA is less than or equal to 1. It is also specified that this blended fuel must meet ASTM volatility specifications.
  Blends of up to 5.0 percent by volume methanol with a minimum of 2.5 percent by volume co-solvent alcohols having carbon number of 4 or less (i.e., ethanol, propanol, butanol, and/or GTBA). The total oxygen must not exceed 3.7 percent by weight, and the blend must meet ASTM volatility specifications as well as phase separation and alcohol purity specifications.
- *MTBE (Methyl tertiary butyl ether).* Blends up to 15.0 percent by volume MTBE that must meet the ASTM D4814 specifications. Blenders must take precautions that the blends are not used as base gasolines for other oxygenated blends.

Pentanes Plus: A mixture of hydrocarbons, mostly pentanes and heavier, extracted from natural gas. Includes isopentane, natural gasoline, and plant condensate.

Petrochemical Feedstocks: Chemical feedstocks derived from petroleum principally for the manufacture of chemicals, synthetic rubber, and a variety of plastics. The categories reported are naphthas less than 401° F endpoint and other oils equal to or greater than 401° F endpoint.

Petroleum: A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oils, petroleum products, natural gas plant liquids, and nonhydrocarbon compounds blended into finished petroleum products.

Petroleum Coke: A residue that is the final product of the condensation process in cracking. The product is either marketable petroleum coke or catalyst petroleum coke.

Petroleum Coke, Catalyst: The carbonaceous residue that is deposited on and deactivates the catalyst used in many catalytic operations (e.g., catalytic cracking). Carbon is deposited on the catalyst, thus deactivating the catalyst. The catalyst is reactivated by burning off the carbon, which is used as a fuel in the refining process. That carbon or coke is not recoverable in a concentrated form.

Petroleum Coke, Marketable: Those grades of coke produced in delayed or fluid cokers that may be recovered as relatively pure carbon. Marketable petroleum coke may be sold as is or further purified by calcining.

Petroleum Consumption: The sum of all refined petroleum products supplied. For each refined petroleum product, the amount supplied is calculated by adding production and imports, then subtracting changes in primary stocks (net withdrawals are a plus quantity and net additions are a minus quantity) and exports.

Petroleum Imports: Imports of petroleum into the 50 States and the District of Columbia from foreign countries and from Puerto Rico, the Virgin Islands, and other U.S. territories and possessions. Included are imports for the Strategic Petroleum Reserve and withdrawals from bonded warehouses for onshore consumption, offshore bunker use, and military use. Excluded are receipts of foreign petroleum into

bonded warehouses and into U.S. territories and U.S. Foreign Trade Zones.

Petroleum Products: Products obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

Petroleum Products Supplied: See **Petroleum Consumption.**

Petroleum Stocks, Primary: For individual products, quantities that are held at refineries, in pipelines, and at bulk terminals that have a capacity of 50,000 barrels or more, or that are in transit thereto. Stocks held by product retailers and resellers, as well as tertiary stocks held at the point of consumption, are excluded. Stocks of individual products held at gas processing plants are excluded from individual product estimates but are included in other oils estimates and total.

Photovoltaic and Solar Thermal Energy (as used at electric utilities): Energy radiated by the sun as electromagnetic waves (electromagnetic radiation) that is converted at electric utilities into electricity by means of solar (photovoltaic) cells or concentrating (focusing) collectors.

Primary Consumption: See **Energy Consumption, End-Use.**

Propane: A normally gaseous straight-chain hydrocarbon (C_3H_8). It is a colorless paraffinic gas that boils at a temperature of -43.67° F. It is extracted from natural gas or refinery gas streams. It includes all products designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial propane and HD-5 propane.

Propylene: An olefinic hydrocarbon (C_3H_6) recovered from refinery or petrochemical processes.

Refiner Acquisition Cost of Crude Oil: The cost of crude oil to the refiner, including transportation and fees. The composite cost is the weighted average of domestic and imported crude oil costs.

Refinery (petroleum): An installation that manufactures finished petroleum products from crude oil, unfinished oils, natural gas liquids, other hydrocarbons, and alcohol.

Renewable Energy: Energy obtained from sources that are essentially inexhaustible (unlike, for example, the fossil fuels, of which there is a finite supply). Renewable sources of energy include wood, waste, photovoltaic, and solar thermal energy.

Reservoir Repressuring: The injection of a pressurized fluid (such as air, gas, or water) into oil and gas reservoir formations to effect greater ultimate recovery.

Residential Sector: The residential sector is considered to consist of all private residences, whether occupied or vacant, owned or rented, including single-family homes, multifamily housing units, and mobile homes. Secondary homes, such as summer homes, are also included. Institutional housing, such as school dormitories, hospitals, and military barracks, generally are not included in the residential sector; they are included in the commercial sector.

Residual Fuel Oil: The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations and that conform to ASTM Specifications D396 and 975. Included are No. 5, a residual fuel oil of medium viscosity; Navy Special, for use in steam-powered vessels in government service and in shore power plants; and No. 6, which includes Bunker C fuel oil and is used for commercial and industrial heating, electricity generation, and to power ships. Imports of residual fuel oil include imported crude oil burned as fuel.

Road Oil: Any heavy petroleum oil, including residual asphaltic oil used as a dust palliative and surface treatment on roads and highways. It is generally produced in six grades, from 0, the most liquid, to 5, the most viscous.

Rotary Rig: A machine used for drilling wells that employs a rotating tube attached to a bit for boring holes through rock.

Short Ton (coal): A unit of weight equal to 2,000 pounds.

SIC: See **Standard Industrial Classification.**

Solar Energy: The radiant energy of the sun, which can be converted into other forms of energy, such as heat or electricity.

Standard Industrial Classification (SIC): A set of codes developed by the Office of Management and Budget which categorizes industries into groups with similar economic activities.

Startup Test Phase of Nuclear Power Plant: A nuclear power plant that has been licensed by the Nuclear Regulatory Commission to operate but is still in the initial testing phase, during which the production of electricity may not be continuous. In general, when the electric utility is satisfied with the plant's performance, it formally accepts the plant from the manufacturer and places it in commercial operation

status. A request is then submitted to the appropriate utility rate commission to include the power plant in the rate base calculation.

Steam-Electric Power Plant: A plant in which the prime mover is a steam turbine. The steam used to drive the turbine is produced in a boiler where fossil fuels are burned.

Strategic Petroleum Reserve (SPR): Petroleum stocks maintained by the Federal Government for use during periods of major supply interruption.

Supplemental Gaseous Fuels: Any gaseous substance that, introduced into or commingled with natural gas, increases the volume available for disposition. Such substances include, but are not limited to, propane-air, refinery gas, coke oven gas, still gas, manufactured gas, biomass gas, or air or inert gases added for Btu stabilization.

Synthetic Natural Gas (SNG): A manufactured product chemically similar in most respects to natural gas, resulting from the conversion or reforming of petroleum hydrocarbons. It may easily be substituted for, or interchanged with, pipeline quality natural gas. Also referred to as substitute natural gas.

Total Consumption: See **Energy Consumption, End-Use.**

Transportation Sector: The transporation sector consists of private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads and railways (including streetcars), aircraft, ships, barges, and natural gas pipelines.

Unaccounted-for Crude Oil: Arithmetic difference between the calculated supply and the calculated disposition of crude oil. The calculated supply is the sum of crude oil production and imports, less changes in crude oil stocks. The calculated disposition of crude oil is the sum of crude oil input to refineries, crude oil exports, crude oil burned as fuel, and crude oil losses.

Underground Storage: The storage of natural gas in underground reservoirs at a different location from which it was produced.

United States: Unless otherwise noted, "United States" in this publication means the 50 States and the District of Columbia. U.S. exports include shipments to U.S. territories, and imports include receipts from U.S. territories.

U.S.S.R.: The Union of Soviet Socialist Republics consisted of 15 constituent republics: Armenia, Azerbaijan, Belorussia, Estonia, Georgia, Kazakhstan, Kirghizia, Latvia, Lithuania, Moldavia, Russia, Tadzhikistan, Turkmenistan, Ukraine, and Uzbekistan. As a political entity, the U.S.S.R. ceased to exist as of December 31, 1991.

Vented Natural Gas: Gas released into the air on the base site or at processing plants.

Wellhead Price: The value of crude oil or natural gas at the mouth of the well.

Well Servicing Unit: Truck-mounted equipment generally used for downhole services after a well is drilled. Services include well completions and recompletions, maintenance, repairs, workovers, and well plugging and abandonments. Jobs range from minor operations, such as pulling the rods and rod pumps out of an oil well, replacing the pump and rerunning the assemblage into the well, to major workovers, such as milling out and repairing collapsed casing. Well depth and characteristics determine the type of equipment used.

Wind Energy (as used at electric utilities): The kinetic energy of wind converted at electric utilities into mechanical energy by wind turbines (i.e., blades rotating from a hub) that drive generators to produce electricity for distribution.

Wood and Waste (as used at electric utilities): Wood energy, garbage, bagasse, sewerage gas, and other industrial, agricultural, and urban refuse used to generate electricity for distribution.

Wood Energy: Wood and wood products used as fuel, including round wood (cord wood), limb wood, wood chips, bark, sawdust, forest residues, charcoal, pulp waste, and spent pulping liquor.

Working Gas: The gas in a reservoir that is in addition to the base (cushion) gas. It may or may not be completely withdrawn during any particular withdrawal season. Conditions permitting, the total working capacity could be used more than once during any given season.

"Demand, Supply, and Price Outlook for Low-Sulfur Diesel Fuel"

by Tancred Lidderdale

Published: August 1993
Energy Information Administration
Single Copies Available Free of Charge

"Demand, Supply, and Price Outlook for Low-Sulfur Diesel Fuel" examines the effects on the refining industry of the sharply lower standard for maximum sulfur content of on-highway diesel fuel required by the 1990 Clean Air Act Amendments as of October 1, 1993. The article reviews patterns of distillate fuel oil demand, refiners' options for meeting the new standard, and the economic factors shaping their decisions. It concludes that the expected rise in demand will probably be met, although at a price premium for low-sulfur diesel fuel of 3 to 4 cents over the price of high-sulfur distillates.

*Readers familiar with the data in the **Monthly Energy Review (MER)** will find many of the same data in the **Annual Energy Review 1992,** where most data are provided annually for 1949 through 1992. The 350-page report also includes annual data for several series not found in the **MER**. For example, energy company financial statistics and international data on natural gas, coal, and hydroelectricity are provided.*

Data Diskettes

Available from GPO and NTIS

- For IBM-PC and compatible microcomputers
- 5 1/4-inch double-sided high-density diskettes
- ASCII comma-delimited format
- Can easily be imported into Lotus® 1-2-3® or dBASE®

This 2-diskette set contains most of the data published in the *Annual Energy Review 1992*. Although the published tables present data in rounded form, the diskettes contain data in the fullest precision available. For prices and more information, contact:
