Energy Information Administration

Ordering Information

This publication and other Energy Information Administration (EIA) publications may be purchased from the Superintendent of Documents, U.S. Government Printing Office.

All telephone orders should be directed to:

U.S. Government Printing Office
McPherson Square Bookstore
1510 H Street, N.W.
Washington, DC 20005
202-653-2050
Fax : 202-376-5055
9 a.m. to 4:30 p.m., eastern time, M-F

Superintendent of Documents
U.S. Government Printing Office
Washington, DC 20402
202-783-3238
Fax: 202-512-2233
8 a.m. to 4 p.m., eastern time, M-F

All mail orders should be directed to:

U.S. Government Printing Office
P.O. Box 371954
Pittsburgh, PA 15250-7954

Complimentary subscriptions and single issues are available to certain groups of subscribers, such as public and academic libraries, Federal, State, local, and foreign governments, EIA survey respondents, and the media. For further information, and for answers to questions on energy statistics, please contact EIA's National Energy Information Center. Address, telephone numbers, and hours are as follows:

National Energy Information Center, EI-231
Energy Information Administration
Forrestal Building, Room 1F-048
Washington, DC 20585
202-586-8800
TTY: For people who are deaf or
hard of hearing: 202-586-1181
9 a.m. to 5 p.m., eastern time, M-F

Electronic Access

Monthly Energy Review (MER) data are also available electronically. Page images of all MER tables are available via modem on the Energy Information Administration Electronic Publication System (202-586-2557) and images of selected tables are available on the U.S. Department of Commerce Electronic Bulletin Board (202-482-3870). The data shown in the tables are also available in database format via modem on the U.S. Government Printing Office (GPO) Federal Bulletin Board (202-512-1524) and on personal computer diskettes by mail from the GPO (202-512-1530) and from the National Technical Information Service (703-487-4650).

The *Monthly Energy Review* (ISSN 0095-7356) is published monthly by the Energy Information Administration, 1000 Independence Avenue, S.W., Washington, DC 20585, and sells for $77.00 per year (price is subject to change without advance notice). Second-class postage rates are paid at Washington, DC 20066-9998, and at additional mailing offices. POSTMASTER: Send address changes to *Monthly Energy Review,* Energy Information Administration, EI-231, 1000 Independence Avenue, S.W., Washington, DC 20585.

Commercial Nuclear Electric Power in the United States: Problems and Prospects

by Mark Gielecki and James G. Hewlett*

For at least a decade, commercial nuclear electric power in the United States has hesitated at a crossroads. While the performance of existing reactors reached record levels in 1992, the number of operating reactors has leveled off. High operating costs, waste disposal difficulties, and other problems have created a climate unsympathetic to the further expansion of nuclear electric power.

This article briefly reviews the origins of commercial nuclear electric power, the efforts to dispose of high-level nuclear waste, the costs of building and operating nuclear electric power plants, and other energy-related developments pertinent to the future of nuclear electric power. It discusses conditions that nuclear electric utilities and vendors believe must be met to encourage new orders for nuclear electric power plants and concludes with Energy Information Administration forecasts of electricity generating capacity through 2010 for nuclear electric power, renewable energy, and fossil fuel-fired plants.

The Origins of Commercial Nuclear Electric Power

British physicist Ernest Rutherford predicted in 1904 that finding a way to control "the rate of disintegration of the radio elements" would enable the capture of enormous energies from tiny amounts of matter. A year later, Albert Einstein wrote his famous equation, $E=mc^2$,** which gave mathematical expression to the relationship between matter and energy.[1] Research during the 1930's on the physics of nuclear fission convinced scientists that a chain reaction was possible,[2] and in 1942 a team led by Enrico Fermi built a primitive nuclear reactor in a room beneath a squash court at the University of Chicago. Fermi's group used uranium housed in an assembly—literally a pile—of stacked graphite blocks. In December 1942, the reactor became the site of the world's first controlled, self-sustaining nuclear chain reaction.[3,4]

Physicists understood that this chain reaction could be the basis for both a source of energy and weaponry. With the Nation at war, control of nuclear research in the United States was assumed by the Federal Government and the effort to develop a nuclear weapon (the Manhattan Project) was given top priority. Immediate responsibility for directing the effort lay with the Army Corps of Engineers.[5]

The urgency of wartime needs had forced the development of nuclear reactors into the background, but the U.S. Congress soon passed the Atomic Energy Act of 1946 to establish the Atomic Energy Commission (AEC). The AEC was granted a monopoly over nuclear materials[6] and given responsibility for the development of civilian nuclear electric power (nuclear power) as well as weapons.[7]

Progress in reactor development continued and, in December 1951, the AEC-sponsored Experimental Breeder Reactor I generated the first electricity from nuclear energy.[8] In parallel, the Government sought ways to speed the commercialization of nuclear power. This led to the Atomic Energy Act of 1954, which allowed private ownership of nuclear materials and reactors. The AEC also launched the Five-Year Program (1953–1958) to develop a number of small experimental reactors and to build the first central station nuclear electric generating plant. That reactor, at Shippingport, Pennsylvania, reached its full design power in December 1957.[9,10] Also in late 1957, Congress passed the Price-Anderson Act to limit the nuclear industry's liability in the event of a catastrophic accident.[11]

It was not obvious in the 1950's which reactor technology was best suited to the task of commercial electric power generation. Heavy investments were made in at least 19

*Mr. Gielecki is a supervisory economist in the Energy Information Administration's (EIA's) Office of Coal, Nuclear, Electric and Alternate Fuels. Mr. Hewlett is a senior economist in EIA's Office of Integrated Analysis and Forecasting. The authors gratefully acknowledge the extensive contribution of Thomas Prugh, an energy writer for EIA's Office of Energy Markets and End Use, to this article. **E denotes energy, m mass, and c the speed of light.

different reactor concepts.[12] Two designs thrived in the United States: the pressurized-water reactor (PWR) and the boiling-water reactor (BWR). Both used light water (H_2O, as distinguished from deuterium oxide, or D_2O, known as heavy water) as the coolant.

The light-water reactor type (LWR) is now the dominant reactor technology worldwide.[13] The design owes much of its success to intensive early development for military use in submarines. Extensive Federal funding for light-water reactor research accelerated the technology's development and enabled it to be the first to be scaled up to sizes suitable for commercial electric power generation. The Shippingport demonstration plant used a light-water reactor similar in design to those used in submarines.[14,15]

Several political and economic factors encouraged the development of commercial nuclear reactors after World War II. Although nuclear power plants tend to be capital-intensive, it was believed from the first studies of the energy-generating potential of nuclear reactors in the late 1940's and early 1950's that they would be economically competitive with coal- and oil-fired generating plants: "[T]his was to be a true energy revolution, in which the share of fuel in the total cost of electricity generation would become [an almost-zero cost]."[16] In addition, both the United States and Western Europe became net importers of crude oil in the early 1950's, and nuclear power was seen as the only long-term means of avoiding energy shortages and dependence on imported crude oil.[17]

Geopolitical considerations may have played a role as well. By the early 1950's, it was clear that nuclear power would become a global technology and the spread of U.S. nuclear hardware and expertise was seen to be in the national interest.[18] In addition, the Atoms for Peace program, announced by President Dwight Eisenhower at the United Nations in December 1953, may have come in response to the successful test of the U.S.S.R.'s first hydrogen bomb. Eisenhower hoped to reduce tensions and the possibility of nuclear confrontation by diverting fissionable materials from weapons stockpiles toward peaceful uses, particularly nuclear power generation.[19]

In response to these developments, the U.S. firms Westinghouse Electric Corporation and General Electric Company, in cooperation with the electric utility industry, built several demonstration plants. (Babcock & Wilcox Company and Combustion Engineering, Inc. later joined the roster of U.S. manufacturers). Westinghouse and General Electric also made commitments to sell a number of new plants at fixed prices. Although the manufacturers incurred substantial unanticipated costs in building the plants, the exercise "transformed nuclear power from a series of costly single demonstration units to a commercially viable industry."[20] An average of 23 generating units per year was ordered between 1965 and 1973.* As with many new technologies, projections of nuclear power's growth were sometimes exaggerated. A 1972 AEC forecast, for example, estimated that nuclear generating capacity in the United States would be between 825 and 1500 gigawatts electric installed by 2000.[21] However, according to Energy Information Administration (EIA) data as of May 1994 (the most recent date for which data are available), U.S. nuclear generating capacity (expressed as summer capability**) was 99 gigawatts electric.[22]

*Many of these plants were later cancelled.

Current Status and Strengths

Nuclear power is a strong presence in the U.S. energy industry. In 1992, the value in nominal dollars of all U.S. nuclear plants (both investor-owned and publicly owned) was about $156 billion, which represents 47 percent of total electricity generating assets.[23,24] According to EIA data,[25] in 1993 the 109 operable nuclear generating units in the United States (about one-quarter of the world total) generated 610 billion kilowatthours of electricity and accounted for 21 percent of U.S. electricity net generation (Figure 1). The two decades prior to 1992 saw a steady increase in the number of operable units as new plants came on line, from 39 in 1973 to 111 in 1991 (Figure 2).

The performance of U.S. nuclear plants improved significantly during the 1980's. The average number of unplanned automatic "scrams" (rapid reactor shutdowns) fell from 7.4 per unit in 1980 to 1.6 per unit in 1990,[26] while the average number of unplanned safety system actuations fell from 1.3 per unit to 0.7 per unit during the period.[27] Data for 1991 and 1992 show generally stable or improving performance.[28] Worker safety indices improved through 1990 as well: the number of injuries involving days away from work dropped sharply from 1.36 per 100 man-years worked in 1980 to 0.22 per 100 man-years worked in 1990.[29] Workers' exposure to radiation during the period declined from 1,230 man-rem per unit to 436 man-rem per unit for BWR's and from 597 man-rem per unit to 294 man-rem per unit for PWR's.[30] The median volumes of low-level solid radioactive waste from both BWR's and PWR's declined substantially after 1980.[31]

**The net summer capability of a nuclear power plant is the steady hourly output the plant's generating equipment is expected to supply to system load, exclusive of auxiliary power, as demonstrated by test at the time of summer peak demand. It is a somewhat more conservative measure than installed capacity.

In addition, the average capacity factor* of all U.S. nuclear plants, which exceeded 60 percent in only 2 years from 1973 through 1987, rose from 57 percent in 1987 to more than 70 percent in 1991 and nearly 71 percent in 1992, a record level (Figure 3). The average capacity factor remained over 70 percent for 1993.[32] After 1980, the fraction of nuclear units with capacity factors at or above 80 percent rose from 10 percent in 1985 to 42 percent in 1993. At the same time, the percentage of units operating at or below 50 percent capacity declined from 21 percent during the 1980–1988 period to 11 percent in 1993.[33]

The improvements in capacity factors were the result of reduced outage rates. (The outage rate is the percentage of time that an operable unit is not generating electricity.) Outages can be routine (e.g., refueling) or unexpected (e.g., equipment problems). U.S. commercial nuclear plants were long plagued by relatively high outage rates, which exceeded 30 percent every year from 1979 through 1989 and averaged 35 percent between 1980 and 1987.[34] The high rates were chiefly the result of three factors:

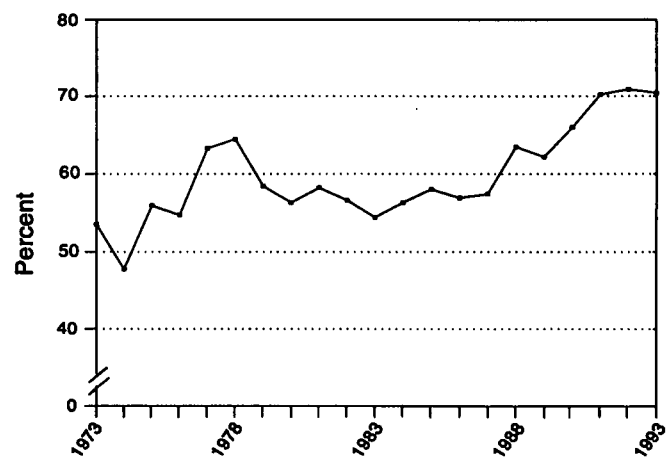
- The Nuclear Regulatory Commission (NRC) enacted new, more stringent safety and regulatory requirements following the accident at Three Mile Island in 1979. Several nuclear power plants were shut down until their electric utility owners could demonstrate that the units could be operated safely in accordance with the new regulations. Other regulations required changes in equipment design and system configurations over the long term, and many units' available operating times were reduced as they were taken out of service to implement the changes.[35]
- Unrelated to the Three Mile Island accident, problems began to emerge in 1970's-vintage units, where damage to major components from corrosion, degradation, and stress fracturing in the harsh nuclear plant environment exceeded expectations. Repairing this damage also required units to be taken out of service temporarily.[36]
- Finally, management problems led to degraded performance at several plants. The NRC detected problems severe enough at the Tennessee Valley Authority (TVA) nuclear program that TVA closed down its Browns Ferry 2 reactor voluntarily in March 1985. (The unit was restarted in May 1991.)[37,38]

*Capacity factor is defined as the ratio of the amount of actual electricity produced in a given period to the amount of electricity that could have been produced if the unit operated at its full rated capacity for 100 percent of the period.

The nuclear power industry's responses to these pressures has left it technically, managerially, and institutionally stronger through formation of electric utility working groups for mutual consultation and sharing of experience by the Institute of Nuclear Power Operations and the Electric Utility Cost Group, among others. The industry also upgraded its physical plant, reduced unplanned outages and the length of refueling outages, and lengthened the average interval between refuelings.[39] The steadily increasing capacity factors of recent years can be attributed, in part, to these improvements.

Changing operating economics contributed as well. Among the economic changes was a trend in the early 1980's toward rising operations and maintenance (O&M) costs and postoperational capital expenditures. Since most operating costs do not vary with the total amount of electricity produced,[40] the increases in O&M costs added an incentive to improve capacity factors and thus lower the O&M costs per unit of electricity generated. Incentives to improve performance were also created when State public utility commissions began, in some cases, to disallow utilities' expenditures on replacement power incurred when their own plants were unable to meet their generating needs. Further incentives were created when utility commissions began implementing incentive rate-of-return programs that rewarded electric utilities with strongly performing plants. Public opposition to poorly performing plants occasionally supplemented these pressures. A 1989 public referendum in California, for example, closed the Rancho Seco nuclear plant due, in part, to low capacity factors.[41]

Figure 3. Average Annual Capacity Factor of Operable Nuclear Power Plants, 1973-1993



Source: Energy Information Administration, *Monthly Energy Review*, August 1994, DOE/EIA-0035(94/08) (Washington, DC, August 1994), p. 121.

Challenges Facing the Industry

Even as existing plants have reached unprecedented levels of performance, changing economic, social, political, and technological circumstances have made prospects for further growth uncertain. The last order for a new nuclear plant in the United States was placed in 1978. No unit ordered after 1973 has been built and construction of a number of partially built plants has been deferred.[42,43] Slower growth in demand for electricity since the mid-1970's has reduced the need for new baseload electric power plants of any kind. O&M costs at existing nuclear plants have been rising (although the rate of cost increases has currently leveled off). These costs have risen to a level sufficiently high that some plants may be uneconomic to operate. Estimates of decommissioning liabilities, many of which may not be adequately funded, are also rising. Although polls sometimes suggest that, in the abstract, the public sees a future for nuclear power, few seem willing to accept local siting of new plants. The problem of safely and permanently disposing of nuclear waste remains unresolved. Regulatory complexity, greater competition in the electric power generation market, and the collapse of the traditional regulatory bargain between State public utility commissions and electric utilities (whereby electric utilities were virtually assured recovery of new-plant construction costs through higher rates) have made electric utilities wary of committing to projects, such as nuclear power plants, with long lead times. The lack of orders has weakened the U.S. industry's manufacturing and engineering capability. (However, the globalization of the market for nuclear power plants and components could still provide the infrastructure to support new orders, should they materialize.)

The more critical of these issues, disposal of high-level nuclear waste and nuclear power economics, are discussed in the two following sections.

Nuclear Waste Disposal

Disposing of the spent fuel (the primary form of high-level radioactive waste)* from nuclear power plants is both a costly problem and a major obstacle to the further development of commercial nuclear power. The U.S. Department of Energy (DOE) estimates the total life-cycle cost of disposing of spent fuel from U.S. reactors to be between $26 billion and $35 billion (in 1988 dollars).[44] The particular solution the United States has chosen is a deep geological repository. By congressional directive, DOE is investigating a single candidate site, at Yucca Mountain, Nevada (Diagram 1).

Of all the waste generated by the operation of nuclear power plants, spent fuel represents less than 1 percent of the volume but more than 99.9 percent of the radioactivity.[45] Most of the waste is being stored at the various reactor sites where it was generated. That was not necessarily planners' intent: when most U.S. reactors were built, it was assumed that spent fuel would be stored only briefly on site and then would be sent to a central facility for reprocessing (removal of fission products and recovery of fissionable elements for reuse). For economic reasons and because of concerns about control of weapons-grade materials, reprocessing has not become an option in the United States and electric utilities have found ways to extend their on-site storage capacity.[46] At the end of 1992, more than 60 nuclear power plants were storing nearly 26 thousand metric tons of spent fuel in cooling pools and dry casks.[47] By 2000, the total will equal an estimated 42 thousand metric tons of spent fuel,**[48] and by 2030, assuming no new nuclear plants are built, the total spent fuel accumulation is projected to be about 85 thousand metric tons.[49]

The deep geological repository must be designed to meet exacting performance requirements set forth in regulations written by the Environmental Protection Agency and the Nuclear Regulatory Commission. Specifically:

- The repository must isolate the high-level waste (HLW) from the biosphere for 10,000 years.***[50]
- Multiple barriers are required, beginning with waste packages that must provide "substantially complete" containment of wastes for 300 to 1,000 years.[51]
- An engineered barrier system must prevent the rate of release from the waste packages from exceeding one part in 100,000 per year.[52]
- The geologic setting must be shown to constrain groundwater movement from the repository disturbed zone to the environment for at least 1,000 years.[53]
- The integrity of the system must be internal, i.e., it must work by virtue of its own properties and not rely on human monitoring or intervention, or even the existence of government.[54]

The decision to pursue geological isolation of HLW was embodied in the passage of the Nuclear Waste Policy Act of 1982 (NWPA). The NWPA set forth the procedure for the selection of two repository sites and assigned responsibility for the project to DOE. In 1987, the Nuclear Waste Policy Amendments Act (NWPAA) directed the Secretary of Energy to "provide for an orderly phase-out of site-specific activities at all candidate sites other than the Yucca Mountain site."[55] Although it is still being studied to determine its geological suitability as a repository, the Yucca Mountain site has become the Nation's only program for the permanent disposal of spent fuel and other HLW.

The target date for opening the permanent repository, originally 1998, has been moved back twice, first to 2003 and

*High-level waste consists mostly of spent fuel from nuclear reactor units. Low-level radioactive waste (LLRW) includes most other used radioactive materials from nuclear power plants, such as contaminated tools, equipment, and uniforms. Its volume is larger than that of high-level waste but, as the name implies, its radioactivity is much lower. Under the terms of the Low-Level Radioactive Waste Policy Act of 1980, responsibility for disposal of LLRW has been assumed by the States, which are entering into interstate compacts to site and finance LLRW respositories. Nine such compacts have been formed. See Clark W. Bullard, "Low-Level Radioactive Waste: Regaining Public Confidence," *Energy Policy* 20, 8 (August 1992), pp. 712-20.

**By 2000, there will also be about 8,000 metric tons of solidified waste from defense programs. See U.S. Department of Energy, "What Is Nuclear Fuel and Waste?" DOE/RW-033P (October 1992), p. 2.

***Title VIII, Section 801 of the Energy Policy Act of 1992 directed the National Academy of Sciences to determine "whether it is possible to make scientifically supportable predictions of the probability that the repository's engineered or geologic barriers will be breached as a result of human intrusion over a period of 10,000 years."

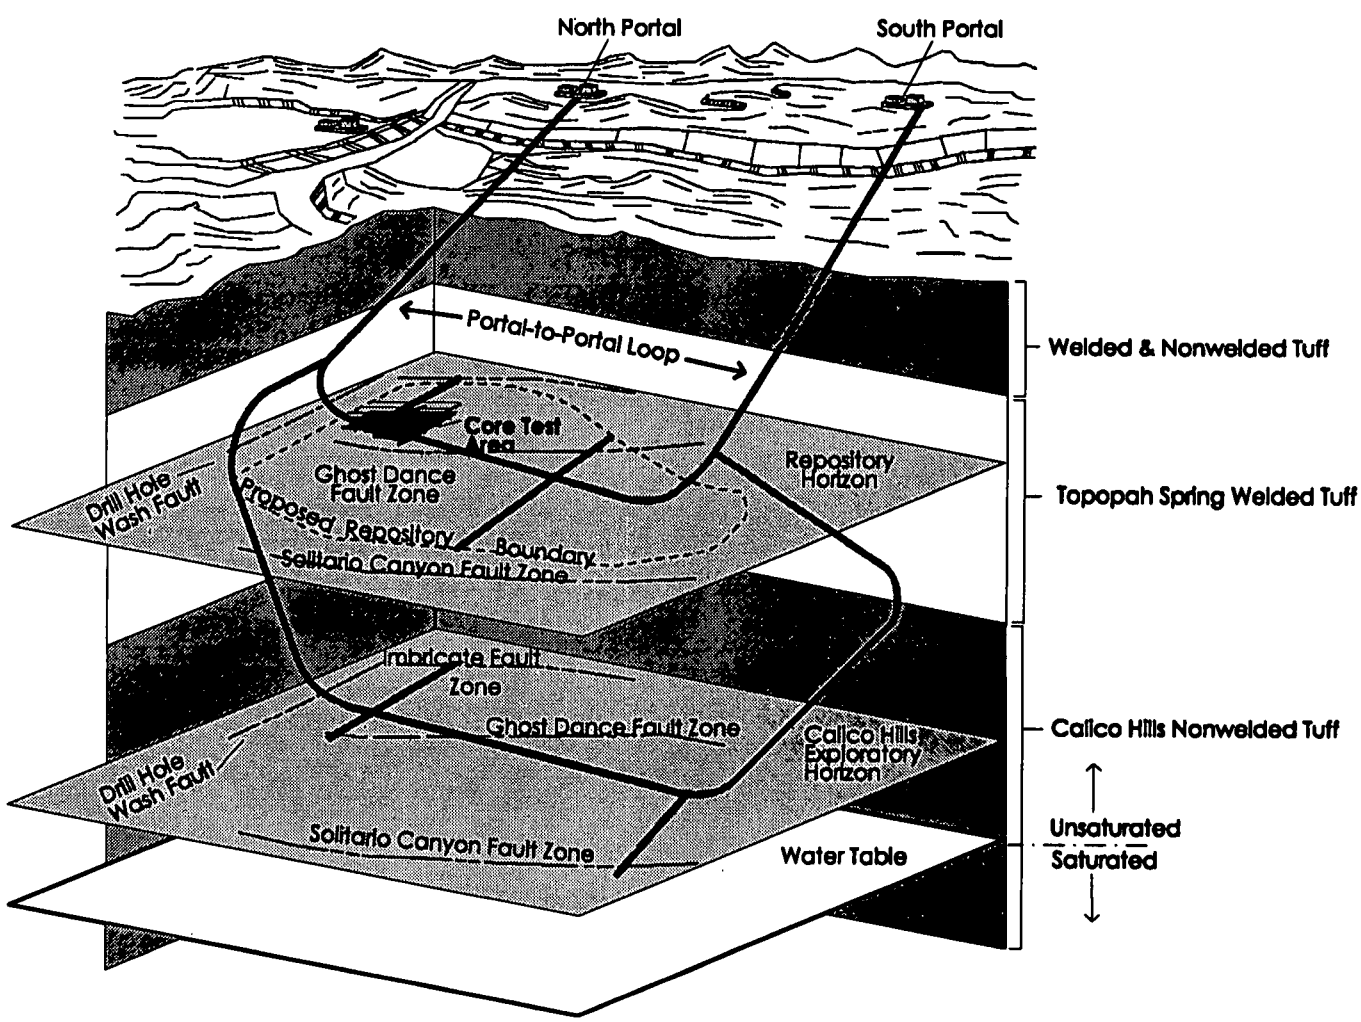
then to 2010. In addition to the repository, DOE has, until recently, been working to find a site for an interim Monitored Retrievable Storage (MRS) facility. In January 1994, however, DOE announced plans to halt design work on the MRS pending progress in identifying a site.*[56] Moreover, the 1987 NWPAA created schedule linkages between the permanent repository and the MRS that prevent the latter from being built until the Nuclear Regulatory Commission has issued a license for the construction for the permanent repository.[57] In May 1994, DOE announced its "preliminary view" that it "does not have a statutory obligation to accept spent nuclear fuel in 1998 in the absence of an operational repository or a suitable storage facility constructed under the Nuclear Waste Policy Act of 1982."[58] The following month, electric utility regulators and attorneys general from 20 States filed suit in Federal court seeking a ruling that DOE must begin to accept spent nuclear fuel from utility-owned nuclear electric power plants by December 31, 1998.[59]

Concern that the interim and permanent repositories will not be available when scheduled has prompted electric utilities to consider other options. Five utilities have received operating licenses for facilities to store spent fuel in aboveground dry casks at their reactor sites and others are planning such facilities.[60] Although technically workable, some States have limited their use. In Minnesota, for example, the State utility commission decided in 1992 to allow one electric utility to build only 7 years of additional dry storage capacity** in order to ensure that the site did not become a de facto permanent repository.[61]

*More than 30 electric utilities are pursuing a private MRS venture, in which DOE is not involved, in cooperation with the Mescalero Apache tribe of New Mexico. See *The Radioactive Exchange*, June 13, 1994, p. 19.

**On May 6, 1994, the Minnesota legislature passed a bill to allow the utility, Northern States Power, to build five dry-cask storage containers immediately and as many as 12 more containers later, contingent upon the utility's agreement to pursue renewable sources of electricity and several other provisions. See *The Energy Daily*, May 10, 1994, p. 4.

Diagram 1. Cutaway Rendering of Yucca Mountain Geologic Block Showing Exploratory Studies Facility Layout and Possible Location of Repository



Notes: • Drawing is not to scale. • Configuration of fault zones at depth is inferred.
Source: Nuclear Waste Technical Review Board, *Underground Exploration and Testing at Yucca Mountain: A Report to Congress and the Secretary of Energy*, October 1993, p. 7.

DOE's permanent repository project faces many conceptual and practical challenges. The Yucca Mountain characterization studies, as originally planned, were estimated to cost $7.2 billion and were intended to lead to an application for licensure to construct the repository in 2005.[62] Should the site prove suitable, the permanent repository will open no earlier than 2010. Although the repository's nominal maximum capacity is set by law at 70 thousand tons of HLW, EIA projects that, if existing nuclear plants are operated through the end of their 40-year nominal lifetimes, total discharges of spent fuel will be 85 thousand tons by 2036.[63] Under current projection assumptions of no new orders for nuclear plants and 40-year lifetimes, total discharges would thus exceed the legal capacity of the repository and require either a relaxation of the mandated limit or the eventual siting and construction of a second repository.[64]

Money for development of the Yucca Mountain repository comes from the Nuclear Waste Fund (NWF), which is supported by a levy of 1 mill (one-tenth of a cent) per kilowatthour of electricity generated and sold by nuclear plants. As of September 30, 1993, about $7.7 billion in fees and investment income had accrued to the NWF, of which about $3.7 billion had been spent.[65] Much of the NWF's current assets are held in U.S. Treasury securities.[66] In June 1992, the Senate Energy and Natural Resources Committee rejected a plan to move the NWF off-budget and thereby allow the release of additional funds.*[67]

The Yucca Mountain project is vast in scope, technically complex, important to many parties with conflicting interests, among the first of its kind, and laden with great expectations. Inevitably, it has been extensively scrutinized by a wide range of official and unofficial analysts. A thorough review of this literature, which has been summarized elsewhere,[68] is not possible in this article. Virtually every aspect of the program—fiscal, managerial, technical, scientific, ecological, and political—has been criticized.

DOE has made substantial efforts to address these concerns. The Office of Civilian Radioactive Waste Management (OCRWM) routinely analyzes and responds publicly in writing to the critiques offered by the Nuclear Waste Technical Review Board, established by Congress as a watchdog for the Nation's high-level waste program. The Yucca Mountain Site Characterization Office was reorganized early in 1994 "to formalize and clarify lines of responsibility and accountability and move the Project Office towards a task-oriented organization focused on the science and technology required to determine the suitability of Yucca Mountain."[69] In July 1994, citing recognition of "... an internal inconsistency between ongoing activities and the expectations for costs, schedules, and progress," OCRWM announced a new organizational structure designed to emphasize "near-term issues of waste acceptance and storage and to ensure overall program integration."[70] The Secretary of Energy commissioned an independent summary of outside critiques of the Yucca Mountain program, which was completed in March 1994. The Secretary also commissioned an independent and potentially wide-ranging review of the financial and managerial performance of the program. That report is expected to be completed early in 1995.[71]

Perhaps the most formidable challenge to the permanent repository is political. The Yucca Mountain project has encountered strong resistance from Nevada residents and officials. In mid-1989, the Nevada legislature enacted a bill (Assembly Bill 222) prohibiting any person or governmental body from storing HLW in the State. The governor ordered State agencies to refuse to process DOE applications for permits to investigate the Yucca Mountain site. (A Federal court ruled against the action in September 1990 and the U.S. Supreme Court let the ruling stand.)[72]

A number of surveys conducted for the State of Nevada's Nuclear Waste Project Office since 1989 suggest that a majority of Nevada residents are uncomfortable with the repository and oppose its siting in Nevada.[73] Although DOE has not surveyed the general public on its attitudes toward HLW and its disposal, survey research compiled or conducted by the nuclear power industry has led the industry to acknowledge that such attitudes tend to be negative. However, the industry believes that public concerns about nuclear waste are based on misperceptions and that correcting them can significantly raise public confidence that HLW can be disposed of safely.[74]

A key related issue is public confidence in DOE and its contractors. In 1991, the Secretary of Energy's Advisory Board (SEAB) established a Task Force on Radioactive Waste Management to "analyze the critical institutional question of how [DOE] might strengthen public trust and confidence in the civilian radioactive waste management program."[75] The task force's final report, released in November 1993, discussed the results of surveys the panel had conducted among State and local officials, environmental groups, and industry representatives, all of whom had interacted with DOE's civilian or military waste management programs. The general level of confidence in DOE headquarters, contractors, and field offices was low: "Although DOE contractors and field offices were viewed overall more positively than DOE headquarters, not only was that difference small but all three elements did quite poorly."[76] On the other hand, the task force also noted that "... DOE has recently reversed what was generally recognized as a continuing and substantial decline in confidence."[77] OCRWM responded that it "agreed with many of the Task Force's ideas and ... planned to implement many of the recommendations ...."[78]

The wide range of difficulties that have attended U.S. efforts to dispose of spent fuel and HLW prompted the National Research Council's Board on Radioactive Waste Management to argue that the current approach should be discarded in favor of one that emphasizes flexibility, ongoing performance assessment, and the ability and will to make changes if new data warrant them.[79] Some observers believe that the preferred course would be to postpone the permanent repository, using dry cask storage at reactor sites in the interim,

*On March 7, 1994, the Secretary of Energy proposed legislation for a new funding approach that would accelerate the availability of NWF funds to the repository program.

until the political climate changes and evolving technologies yield new options.[80]

Economic Issues

Nuclear power plants have always been costly to build, with capital costs typically equaling 60 to 70 percent of per-kilowatthour generating costs.[81] The high costs also seem to have been perennially unexpected. Large engineering projects, especially those involving advanced technologies, frequently suffer from significant underestimation of capital costs.[82] An EIA study of the overnight construction costs (the total cost computed as if all costs, exclusive of finance charges, were incurred at once) of 75 nuclear plants begun during the period 1966 through 1977 shows that the tendency to underestimate final costs resisted experience. Although electric utilities learned to increase their estimates of construction times and total costs, actual costs still exceeded final estimates, made when the plants were 90-percent complete, by about 14 percent (Table 1).[83]

Construction of nuclear plants became more expensive over the years. Plants at which construction began in 1976 and 1977 were 3.4 times costlier (in terms of per-kilowatt constant dollars) than plants begun during 1966 and 1967.[84] The reasons for the increase include the rapid progression to large plants before much experience had been gained with smaller plants,[85] the failure of the expected economies of scale to materialize, and design changes and equipment retrofits, partially as a result of the accident at Three Mile Island. The larger plants in this 75-plant sample tended to have lower costs per unit of generating capacity, but they also took far longer to build, so that increased construction-related costs more than offset scale-related savings.[86] In addition, long construction times and product life cycles made it difficult to quickly incorporate the design experience gained into the construction of new plants. Concern for safety required engineers to be conservative in improving designs. Few cost reductions were obtainable through design standardization because most U.S. reactors were custom-built.[87]

The high capital expense of nuclear power plants has historically been offset by low production costs, i.e., for fuel and for operations and maintenance. Fuel costs remain low, but O&M costs, until recently on the rise, are beginning to eliminate some nuclear plants' operating cost advantage over rival coal-fired plants. Real O&M costs per kilowatt of capacity rose an average of 12 percent per year from 1974 through 1984, 4 percent per year between 1985 and 1989, and about 1 percent per year from 1990 through 1992 (Figure 4).[88] According to a private study, O&M costs for 44 nuclear generating units that began operation prior to 1989 doubled between 1980 and 1990. Although data from the last 2 years suggest that O&M costs have currently leveled off, they are affecting even the best-run plants.[89]

In terms of per-kilowatthour costs, nuclear O&M costs (in 1992 dollars) rose 2.3 percent per year from 1985 through 1992 (from 13.94 mills per kilowatthour to 16.36 mills per kilowatthour), while fossil fuel O&M costs fell 2.0 percent per year (from 6.13 mills per kilowatthour to 5.33 mills per kilowatthour). In addition, while nuclear plant production expenses (O&M plus fuel costs, in 1992 dollars) declined slightly from 23.10 mills per kilowatthour in 1985 to 22.48 mills per kilowatthour in 1992, production costs for fossil fuel plants fell from 36.05 mills per kilowatthour to 22.83 mills per kilowatthour. Thus, by 1992, the costs of operating nuclear and fossil fuel plants had become roughly equal.[90]

One of the most important factors behind rising nuclear electricity generation costs is increased staffing driven by safety-related regulatory requirements. Accidents, especially those at Browns Ferry in 1975 and Three Mile Island in 1979, triggered more extensive regulation by the Nuclear Regulatory Commission. The new regulations increased electric utilities' load of inspections, environmental qualification programs, procedure rewriting, risk assessments, radiation protection measures, and other programs,[91] and often required electric utilities to replace existing systems with new equipment designed to increase safety.[92] Those needs demanded dramatically higher staffing levels. According to a private study of all operating U.S. nuclear plants larger than 400 megawatts of capacity, the average number of employees per plant rose from 150 in 1977 to more than 1,000 in 1990.[93] The number of oversight employees also soared: the average ratio of oversight employees to those directly involved in production at a typical single-unit plant rose from about 1:23 in 1978 to about 1:1.15 in 1990.[94]

Electric utilities and the nuclear industry are keenly aware of the history and significance of rising O&M costs and are working to bring them under control by taking such measures as sharing information concerning operations, fuel-cycle management, and outage scheduling; by coordinating their responses to NRC regulatory initiatives; and by reducing staff sizes. Industry O&M cost-control programs partially explain the leveling off of O&M costs in recent years, and could lead to actual reductions in future costs.

Nevertheless, the future economics of nuclear power plants are clouded by uncertainties, including the possible effects of nuclear plant aging on operating and capital additions costs, the nature and extent of regulatory responses to plant aging, increasing competition in the electric utility industry, and the uncertain costs and complexity of extending nuclear plants' operating lives by renewing their licenses, among others. Citing such factors, a recent report from the congressional Office of Technology Assessment noted that the "[l]ong-term prospects for the Nation's ... operating nuclear power plants are increasingly unclear."[95]

U.S. nuclear plants are growing older. A majority of the 101 operating nuclear units surveyed in a 1992 study were more than 12 years old, and 21 were at least 20 years old.[96] By 1995, 49 plants will be at least 20 years old.[97] As their nuclear plants age, electric utilities must consider a number of factors in assessing the economic prospects of continued operation. Past increases in O&M costs, for example, have helped to make electricity generated by nuclear power plants more expensive and thus vulnerable to competition from other sources. Whether the current easing of O&M cost increases will prove stable is not clear.

Another factor electric utilities must consider is the possibility of premature failure or need for replacement of major nuclear plant components because of unexpected wear or poor design. In some cases, such as steam generators, components designed to last 40 years or more (the nominal licensed lifetime of a nuclear plant) have needed replacement well before expected. Steam generators have already been replaced at 11 U.S. nuclear units, the average age of which was about 11 years, at an average cost of $108 million.[98] Another 17 units either are undergoing steam generator replacement, are slated for replacement within 5 years, or have been designated by electric utility management as possible candidates for replacement.[99] When they occur unexpectedly, such expenses can sharply alter the operating economics of a nuclear plant and even lead to its early retirement.

A third factor complicating electric utilities' economic decisions about their nuclear plants is the effect of aging on costs and performance, particularly because the research evidence is ambiguous or inconclusive. For example, a recent EIA analysis of O&M costs found that the learning effect—the experience gained by reactor operators with each passing year—initially outweighed any aging effects, resulting in cost reductions over the first third of a plant's assumed design life.[100] However, the reverse could be true later on because the learning effects tended to taper off with age. Increases in capital additions costs—those associated with repair or replacement of major components, such as steam generators—more clearly follow increases in age.[101] Finally, some studies suggest that nuclear plant performance declines with age, but other studies find no such relationship and firm conclusions cannot yet be drawn.[102]

A fourth variable is the Federal regulatory response to aging in nuclear power plants. The historical trend toward increasing regulatory stringency was the result of public pressure for greater safety measures (driven particularly by the Three Mile Island accident) as well as the need to resolve engineering and design issues in a complex, still-maturing technology that was pioneered in the United States. The effect of stricter regulation has been to raise costs.[103] The continued aging of nuclear plants could reveal additional problems and lead to additional regulation, thus tending to force costs further upward.

A related complication concerns the NRC's rule, promulgated in 1991, for relicensing nuclear plants when their original operating licenses expire. The implementation procedure, which is still evolving, requires applicant plants to conduct detailed and complex technical and environmental reviews to address the aging of components. None has yet been carried out, but the NRC estimates that such studies would cost about $30 million each. In late 1992, the owners of one nuclear plant indefinitely deferred their license renewal application, citing uncertainty about the number of systems required for review, among other reasons.[104]

The past (and any future) escalation in O&M costs, caused by relicensing or other factors, could result in the premature retirement of some nuclear power plants. Some of these retirements could result in the failure to recover capital costs incurred during the original construction or later capital additions projects.

In addition, electric utilities are generally required to set aside funds for the eventual decommissioning of their nuclear units. The amount of the annual payments, which are made into interest-bearing trust funds, is based on the expectation that reactors will operate for their entire 40-year licensed lives. Since interest accrues exponentially, a plant retired after 30 years of operation would have accumulated only about 50 percent of the total funds needed to decommission the plant. Thus, premature nuclear retirements

would result in underfunding of decommissioning trusts. Such underfunding could lead to substantial rate increases for consumers, or large write-offs if the utility shareholders are forced to bear the costs.

State regulatory commissions almost universally use current costs, rather than future costs, to estimate the total decommissioning costs upon which the annual trust-fund payments are based. Estimates of decommissioning costs ranged from $130 million per unit to $300 million per unit in a 1991 study; a 1992 study by the same analysts found that the range of estimates had risen to $140 million to $500 million per unit. Because these estimates are increasing over time, there is concern that utilities may not be collecting sufficient funds through their current electricity rates to recover the full costs of decommissioning.[105] Further, because no commercial-sized light-water nuclear power plant anywhere in the world has ever been completely decommissioned, these (or any other) decommissioning cost estimates are highly uncertain.

According to current estimates, decommissioning costs will account for only about 1 percent of total generation costs computed over the 40-year life of a nuclear power plant.[106] However, the financial impacts on electric utilities, shareholders, and ratepayers of underfunded decommissioning liabilities could be substantial.[107]

Other Constraining Factors

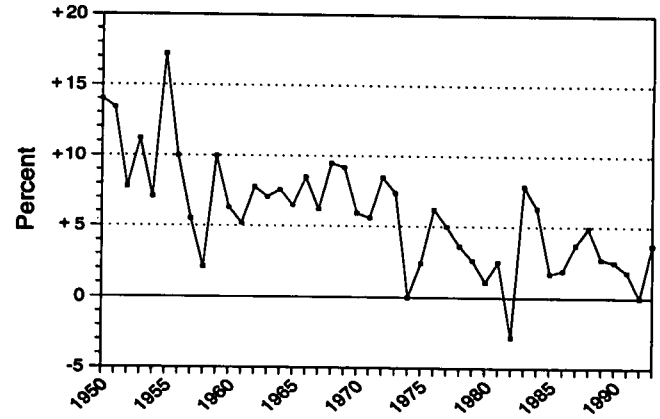
In addition to the waste disposal problem and high costs, commercial nuclear power faces a number of other obstacles to its revitalization:

Slowing electricity demand growth. Growth in the demand for electricity in the United States has slowed since the mid-1970's (Figure 5). That trend can be attributed to improvements in energy efficiency triggered by the oil price shocks, structural economic changes (such as the shift away from energy-intensive heavy industry), slowing growth in the consumer market for electric appliances and gadgets, electric utilities' widening emphasis on managing demand rather than building new capacity, and the recent economic recession. From 1950 through 1973, demand grew at an average annual rate of 8.3 percent, while from 1974 through 1993 it grew only 2.9 percent per year. The period from 1974, when the first oil embargo ended, through 1993 also saw the only 3 years since 1950 in which demand growth was zero or negative. EIA projects that electricity demand will grow about 1.1 percent per year from 1993 through 2010 under expected economic growth conditions.[108] (If the economy grows more rapidly than expected, electricity demand is projected to increase at an annual rate of about 1.5 percent.)[109]

Following in the wake of the earlier overbuilding of generating capacity, the projected decline in demand growth would further soften the market for new nuclear power plants.[110]

The growth of nonutility power production. In 1979, electric utilities generated 97 percent of the electricity produced in the United States. The rest was produced by nonutility power producers (primarily industrial firms) for their own use and,

Figure 5. Change From Previous Year Levels in Electricity Demand Growth, 1950–1993



Source: Energy Information Administration calculation based on data for electricity sales by end-use sector, Table 8.5 in Energy Information Administration, *Annual Energy Review 1993*, DOE/EIA-0384(93) (Washington, DC, July 1994), p. 239.

often, for sale to electric utilities. By 1991, the fraction of U.S. total electricity production accounted for by nonutility power producers had tripled to 9 percent,[111] chiefly because changes in Federal law and the State regulatory climate governing electric power production opened the market to greater competition. Nonutility generation is projected to grow 3.7 percent per year through 2010.[112] Nonutility power producers use primarily natural gas, renewable resources, coal, and waste to generate electricity. Except for Argonne National Laboratory (which operates several small reactors for research purposes and to generate electricity for its own use), no nonutility power producers use nuclear power,[113] nor do any plan to do so, at least in the near term.[114]

Declining U.S. nuclear manufacturing infrastructure. Prior to 1980, U.S. corporations supplied 80 percent of the world's commercial nuclear reactors. Since then, 45 percent of the world's new reactors have been built by European and Japanese vendors.[115] U.S. reactor manufacturers have maintained their interests in nuclear power by building a limited number of reactors for foreign clients (20 since 1980, with 9 currently under construction[116]), servicing and fueling existing U.S. reactors, performing defense-related nuclear work, developing advanced reactor designs, and entering into joint ventures with foreign vendors. However, qualified U.S. suppliers of parts and equipment have fared less well and many have left the industry.[117] If ordering of new plants resumes, it is likely to begin slowly and take years to reach the volumes required for profitable operations among equipment suppliers.[118]

A related problem is the size of the pool of nuclear engineers available to design and operate nuclear power plants. The number of undergraduates enrolled in nuclear engineering programs peaked in 1977 at 2,095 and declined to 1,001 in 1991. In parallel, university nuclear engineering programs dwindled from 80 in 1975 to 38 in 1992, not all of them accredited.[119]

The erosion of the "regulatory bargain." Historically, State public utility commissions (PUC's) generally approved electric utility requests for rate increases to pay for

new generating capacity. However, this relationship changed when, in the early 1980's, a number of electric utilities sought permission to pass on to ratepayers large costs for new power plants and the expended costs of cancelled plants. PUC's began, in some cases, to disallow costs electric utilities had already incurred. Electric utilities are unlikely to make the investment in new nuclear plants without some regulatory assurance that the cost can be recovered through rates charged to electricity customers.[120]

Potential Revitalizing Factors

Not all current circumstances facing the U.S. nuclear power industry are necessarily unfavorable. At least in theory, a number of factors could make the nuclear option more attractive, including:

Global warming. Perhaps the most notable of those factors is the threat of global climate change. Human additions to the earth's natural complement of greenhouse gases appear to be raising the concentrations of those gases and, some scientists believe, thus posing the risk of long-term increases in global average temperatures.[121] Such changes would almost certainly have far-reaching climatic, economic, and geopolitical consequences.

The combustion of fossil fuels for industrial processes, transportation, and electricity generation is the largest single source of anthropogenic greenhouse gases, primarily carbon dioxide.[122] The United States is the world's largest source of energy-related carbon dioxide emissions, accounting for about 22 percent of global emissions in 1990.[123] Nuclear power plants emit no greenhouse gases and could be substituted directly for fossil fuel-fired generating capacity. They could thus be a means of reducing U.S. emissions of greenhouse gases. However, even with confirming evidence of global warming, nuclear power could face strong competition from conservation and efficiency efforts and from the development of renewable energy sources. The costs of generating electricity from renewable sources, such as wind and biomass, are declining and the Electric Power Research Institute projects them to be competitive with the costs of conventional sources, including nuclear power, by the end of the decade.[124]

In April 1994, DOE officials and representatives of electric utility groups signed a memorandum of understanding agreeing to pursue initiatives to help reduce U.S. greenhouse gas emissions.[125] Electric utilities that choose to participate in this program, called Climate Challenge, commit to one or more of several options, including the following:

- Reducing greenhouse gas emissions by "a specified amount" below the utility's 1990 baseline level by 2000
- Reducing greenhouse gas emissions to the utility's 1990 baseline level by 2000
- Reducing greenhouse gas emissions by or to "some other specified level"
- Reducing or limiting the rate of greenhouse gas emissions to "a particular level."[126]

At this writing, the nature and extent of electric utilities' eventual participation in the program, and the possible effect of such participation on commercial nuclear power, are unknown. DOE pledged in the memorandum to "[w]ork to facilitate resolution of issues of nuclear waste storage, nuclear power plant life extension and relicensing policies, and the future use of nuclear power."[127]

Advanced reactor designs. The complexity and high costs that encumber current nuclear plants have driven the search for a new generation of reactors. Work on several advanced designs has been under way for years, funded jointly by the industry and DOE.

Advanced light-water reactors (ALWR's) improve on current light-water designs by incorporating standardized designs, passive safety features, and technological advances. ALWR's are classified into two categories, evolutionary designs of about 1,300-megawatt capacity and advanced mid-size designs of 600 megawatts. The designs must be certified by the NRC before they can be released to the market. NRC granted final design approval, the last step before certification, to two evolutionary designs in July 1994. The earliest any mid-sized design is expected to be certified is September 1997.[128] DOE's financial involvement ends in 1997.

Work is also continuing through fiscal year 1995 on two non-LWR designs, the modular high-temperature gas-cooled reactor (MHTGR) and the advanced liquid metal reactor (ALMR).[129] Both are planned for commercial availability by about 2005.[130] The House of Representatives voted to end the ALMR in June 1993 and the MHTGR was voted down by the Senate the following September. However, both programs were revived in altered form by a House and Senate conference committee during budget deliberations in October 1993.[131]

Vendors have estimated overnight construction costs of the new designs to be significantly lower than actual overnight costs of many existing nuclear power plants.[132] As mentioned earlier, the costs and construction times of large, technologically advanced engineering projects in general tend to be underestimated.[133]

Electric Utilities' Requirements for Nuclear Expansion

In October 1993, Wall Street ratings agency Standard & Poor's Corporation, citing low electricity demand, cost pressures, and nuclear-plant decommissioning liabilities, stiffened its debt-ratings formula for electric utilities, downgraded about 40 electric utility companies, and described the industry as "a sector ... in long-term decline."*[134] The pressures on electric utilities have spurred many to take aggressive cost-cutting measures, which suggests little willingness to undertake large, risky, and capital-intensive projects, such as nuclear power plants, even if

*Power purchases from nonutility power producers can also affect electric utilities' bond ratings, because rating agencies treat the fixed payments required by power-purchase contracts much like they treat a utility's long-term debt. See Energy Information Administration, *Financial Impacts of Nonutility Power Purchases on Investor-Owned Electric Utilities*, DOE/EIA-0580 (Washington, DC, June 1994), p. vii.

electricity demand growth were not sluggish and competition from nonutility power producers were not strong.

The Nuclear Power Oversight Committee (NPOC), an industry group composed of nuclear utilities and vendors, argues that new nuclear power plants will be needed in a few years because of the aging of the U.S. electricity supply system and the need for new baseload generating capacity. NPOC also believes that increased concern about greenhouse gas emissions and other air pollutants will raise the costs of fossil-fuel fired plants, thus renewing interest in building new nuclear plants.[135]

NPOC has identified 14 "significant enabling conditions ... which must be met" to make nuclear power attractive "for the 1990's and beyond."[136] The achievement of a number of these goals, such as maintaining and improving the safety and performance records of existing nuclear plants and ensuring continued supplies of nuclear fuel, seems relatively straightforward. Similarly, important steps toward granting the industry's wish for predictable licensing and design certification processes have been taken with the passage of the Energy Policy Act of 1992 and related regulatory developments.

Other goals, particularly those involving institutional changes, may prove more elusive. NPOC acknowledges the need, among other things, to "achieve progress with the high-level radioactive waste (spent fuel) disposal system that includes a permanent repository and a temporary monitored retrievable storage (MRS) facility"; "achieve broad U.S. public support for nuclear energy"; "positively influence local public attitudes, at potential plant sites, on the need for new plants"; "identify and analyze structures for the financing, ownership, and operation of nuclear plants"; and "achieve support by State regulatory agencies for predictable and stable handling of permitting and financial matters."[137]

In each of these cases, significant difficulties remain. For example, as discussed above, the Nation's program to site and build a permanent HLW facility is beset by problems, including the opposition of many Nevadans, scientific and technical criticisms, distrust of DOE and its contractors, and the restricted availability of much of the money collected through the Nuclear Waste Fund. Work toward the Federal MRS facility has been suspended and the future of the single private MRS venture is uncertain.

Concerning the issue of public support, it has been some time since local public opinion about nuclear power was tested in the United States by the effort to site a new nuclear power plant. The political and popular opposition of many Nevadans to the Yucca Mountain project attests to the strength of the resistance that can arise to nuclear energy-related projects when they are removed from the abstract and proposed for a specific locale. In general, according to a recent industry-sponsored survey, support for the immediate construction of new nuclear plants declined from 24 percent in October 1991 to 14 percent in May 1993. Support for closing the nuclear option declined at the same time, while support for the position that new plants should not be built now, but that the option should be kept open, increased from 48 percent to 64 percent.[138]

The need to "identify and analyze structures for the financing, ownership, and operation of nuclear plants" springs from the economic environment within which nuclear plants operate. That environment is characterized by capital intensity, high (if apparently stabilizing) O&M costs, the risk of underfunded decommissioning liabilities, the uncertain resolution (and thus costs) of the HLW problem, and cost-cutting pressures that may only be made heavier by retail wheeling, should it come to pass (see below). Among the options NPOC has identified to address these problems is "partial government financing" of new nuclear plants.[139]

At the moment, movement appears minimal toward the extensive State regulatory changes required to encourage further nuclear orders. State PUC's have few incentives to make regulatory concessions to electric utilities that show little interest, for the other reasons discussed in this article, in building more nuclear power plants. Several electric utilities with costly nuclear power programs suffered harsh treatment in past prudence reviews by PUC's and subsequently filed for or approached Chapter 11 bankruptcy.[140] At least seven States (California, Connecticut, Kansas, Kentucky, Maine, Oregon, and Wisconsin) have enacted laws that link further construction of nuclear power plants to high-level waste disposal.[141]

Although the recent emergence of retail wheeling as an issue could transform the debate over State regulatory reform, such a transformation may not benefit nuclear power. Retail wheeling, also called direct access, would allow some or all users of electricity to choose from among multiple sources of supply, thus introducing greater competition into electric power markets. PUC's in several States, most notably California, have begun to explore plans for retail wheeling; the California commission has proposed phasing in its plan by 2002.[142]

Greater competition and deregulation could increase pressures on utilities to reduce costs while shrinking or eliminating the regulatory protections that have often allowed recovery of capital expenditures found to be uneconomic after the fact. With greater competition, shareholders (rather than ratepayers) would bear a larger share of the risks associated with large capital investments, such as coal-fired and nuclear plants.[143]

EIA Forecasts of Generating Capacity

The factors discussed in this article form the background against which EIA forecasts a decline of 8 percent in U.S. nuclear power generating capacity from 1992 through 2010, from 99 gigawatts to 91 gigawatts.[144] This forecast assumes that orders for new nuclear plants are unlikely, but that if any are placed, no newly ordered plants will become operational until after 2010. Four units already under construction are assumed to become operational. The forecast further assumes that all existing reactors operate through the end of their licensed lives and that there is no age-related loss of performance. If the assumptions hold true, 20 nuclear units are expected to be retired during the period.[145] Even as

nuclear generating capacity declines, fossil-fuel and renewable generating capacity are projected to increase. EIA forecasts an increase of 31 percent in renewable-fuel capacity, from 84 gigawatts in 1992 to 110 gigawatts in 2010 (out of forecast total generating capacity of 819 gigawatts). Fossil fuel-fired capacity is projected to increase by 19 percent, from 504 gigawatts to 592 gigawatts.[146]

The net loss of nuclear generating capacity and the parallel growth in fossil fuel-fired and renewable capacity lead to a shift in the composition of the U.S. electricity supply. The fraction of total electricity supply generated by nuclear power is projected to decline from 21 percent in 1993 to 17 percent in 2010.[147]

Highlights:

Reducing Home Heating and Cooling Costs

When a central heating-cooling system nears the end of its useful life, homeowners can choose among three general types of central heating-cooling systems: (1) heating oil heat with central air-conditioning, (2) natural gas heat with central air-conditioning, and (3) electric heat pump with central air-conditioning. A recent report by the Energy Information Administration, *Reducing Home Heating and Cooling Costs*, analyzes the relative merits of the three systems. Compiled at congressional request, the report shows that none of the three types of systems has a clear advantage over the others apart from cost, and any cost advantage a particular system may have depends almost entirely on location, because relative energy prices vary from State to State, and even from city to city.

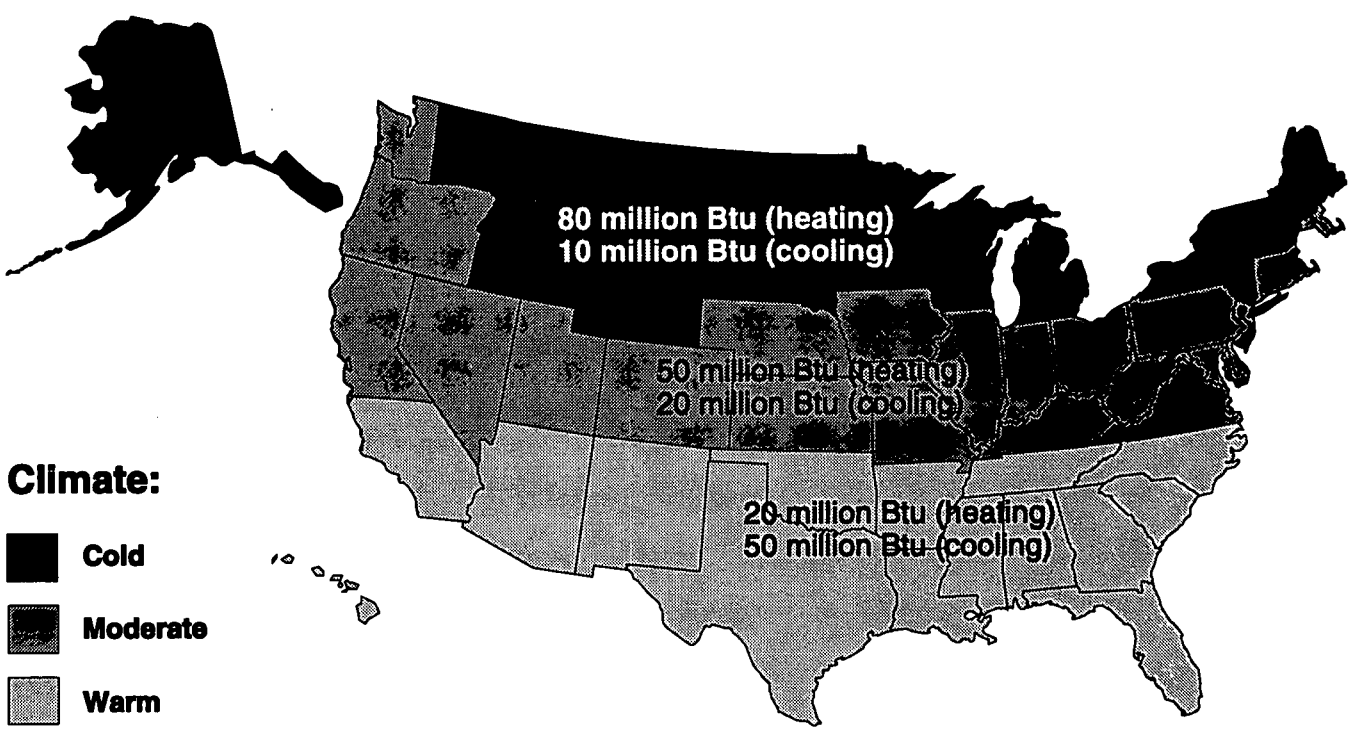
This "Highlights" examines the relative operating costs, safety, and health and environmental impacts of the three major types of heating-cooling systems. The analysis of energy costs is based on hypothetical heating and cooling requirements for a typical home (1,700 square feet) in each of the three major U.S. climate zones. For the purposes of the analysis, heating requirements are assumed to range between 80 million Btu and 20 million Btu per year, with corresponding cooling requirements ranging between 10 million Btu and 50 million Btu per year (Figure 1). The heating and cooling requirements for an actual home will vary, of course, depending on such factors as its size, exposure, and energy efficiency.

Operating Costs

Annual operating costs of heating-cooling systems depend on heating and cooling requirements, system efficiency, and energy costs. To some extent, all three variables are under the control of homeowners, who can weatherize their homes to lower their heating and cooling requirements, buy more efficient systems, and buy systems that use a different energy source.

Weatherization. Although weatherization is most effective at reducing heating requirements in cold and moderate climates, weatherization also reduces cooling requirements in warmer climates. According to a recent Department of Energy (DOE) analysis of its weatherization programs, an average expenditure of about $1,700 for such measures as caulking, weatherstripping, and insulation in cold and moderate climates reduced heating oil bills 17 percent; natural gas heating bills, 25 percent; and electric heating bills, 42 percent. In warmer climates, weatherization programs reduced energy bills 15 percent to 16 percent.

Figure 1. Annual Heating and Cooling Requirements for a Typical Home by Climate Zone



Source: Energy Information Administration, *Reducing Home Heating and Cooling Costs*, SR/EMEU/94–01 (Washington, DC, July 1994), p. 1.

Efficiency. The efficiency of the heating-cooling system also affects operating costs. Older systems generally have higher operating costs because they have lower efficiencies. For example, most older furnaces and boilers have efficiencies of 65 percent or less, which means that they convert only 65 percent or less of the energy they consume into usable heat.

Newer systems, however, have lower operating costs because they are required to meet the efficiency standards DOE set in 1992. Furnaces and boilers on the market today must have an Average Fuel Use Efficiency (AFUE) of 78 percent. Heat pumps must have a standard Heating System Performance Factor (HSPF) of 6.8, which means that they will provide 6,800 Btu of usable heat for each kilowatthour of electricity they consume. Heat pumps and air-conditioners must have a minimum Seasonal Energy Efficiency Ratio (SEER) of 10.0 for cooling, which means that the cooling units will remove 10,000 Btu of heat from a home for each kilowatthour of electricity they use.

Many newer systems have even higher efficiencies: Heating oil furnaces can have an AFUE as high as 85 percent; natural gas furnaces can have an AFUE as high as 96 percent; and electric heat pumps can have an HSPF of 10 or more and a SEER of 16 or more.

Although the more efficient systems cost more to install than standard-efficiency systems, the lower operating costs of the high-efficiency systems in the long term enable homeowners to recoup their initial investments.

Energy Costs. Operating costs also depend heavily on the type of energy source used for heating (heating oil, natural gas, or electricity). (Electricity is by far the predominant energy source used for cooling.) However, energy prices vary around the country. Any of the three major energy sources may be the least expensive in a particular area.

For example, in December 1993, a typical home having a system with a standard efficiency in Washington, DC, would have had lower heating bills with an electric heat pump than with a heating oil or natural gas system. However, the same home in New York State would have had the lowest heating costs with heating oil, while the typical home in Washington State would have had the lowest heating costs with natural gas (Figure 2).

Safety

Properly maintained, all three types of central heating-cooling systems are relatively safe, causing few fires and few injuries or deaths. Fires resulting from all home heating equipment (including central heating-cooling systems, portable space heaters, and fireplaces) account for less than one-fifth of all home fires, and central heating units rank below smoking and arson on the list of principal causes of fires. Of the fires that result from home heating units, most are caused by portable space heaters and chimney fires, not central heating systems.

According to statistics provided by the National Fire Protection Association and the Consumer Product Safety Commission, between 1987 and 1991:

- Heating oil central heating systems caused an average of just under 2 deaths and 5 injuries per million households per year.
- Natural gas central heating systems caused an average of just over 2 deaths and 4 injuries from fires or carbon monoxide poisoning per million households per year.
- Electric central heating systems (both furnaces and heat pumps) caused an average of 1 death and 5 injuries per million households per year.

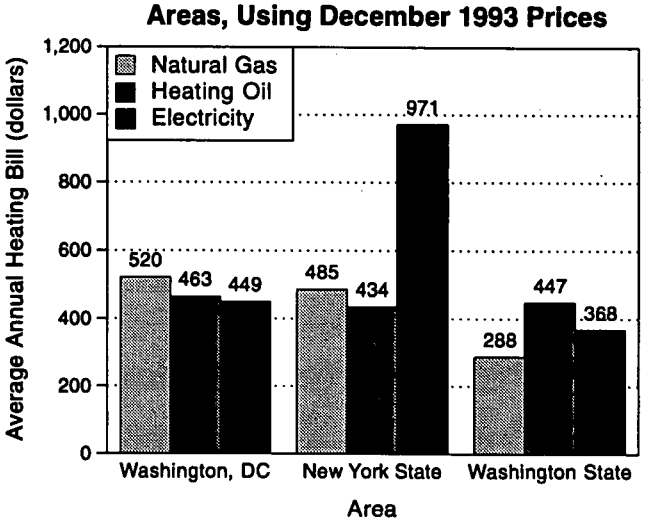
Health and Environmental Impacts

None of the three types of systems has any significant advantage over the others in terms of health and environmental impacts. None of the systems presents a health hazard when properly installed and maintained. The small amounts of toxic gases that heating units produce are vented harmlessly up the chimney.

The three types of systems produce relatively few atmospheric emissions. Both heating oil and natural gas systems produce small amounts of nitrous oxide and carbon monoxide and even smaller amounts of soot, sulfur dioxide, methane, and volatile organic compounds. These two types of systems also produce quantities of carbon dioxide, which is considered a key contributor to global warming.

Electric heating produces no atmospheric emissions at the home, but the generation of electricity by the burning of fossil fuels—the most common source of electricity—produces large quantities of pollutants and carbon dioxide at the generating plant. Of the three types of heating systems, natural gas produces about 30 percent less carbon dioxide than either heating oil or electricity from the average electric utility.

Figure 2. Typical Annual Heating Bills for Three Areas, Using December 1993 Prices



Source: Energy Information Administration, *Reducing Home Heating and Cooling Costs*, SR/EMEU-94/01 (Washington, DC, July 1994), p. 8.

Ranges of Annual Heating Bills by Climate and Heating Unit Efficiency

Heating Oil

For heating oil prices ranging between 70 cents and $1.10 per gallon, corresponding annual heating bills would range between $119 and $976, depending on the heating requirement and central heating unit efficiency (Figure 3a).

Homeowners living in a moderate climate who have a 65-percent efficient oil furnace and an annual heating bill of $610 could save $143 per year by replacing their old furnace with an 85-percent efficient furnace. A new furnace costing $2,500 would pay for itself in about 17 years.

Natural Gas

For natural gas prices ranging between 40 cents and 80 cents per therm, corresponding annual heating bills would range between $84 and $985, depending on the heating requirement and unit efficiency (Figure 3b).

Homeowners living in a moderate climate who have a 65-percent efficient gas furnace and an annual heating bill of $615 could save $194 per year by replacing their old conventional gas furnace with a new 95-percent efficient furnace. A 95-percent efficient furnace costing $2,800 would pay for itself in 14 years.

Electric Heat Pump

For electricity prices ranging between 5 cents and 13 cents per kilowatthour, corresponding annual heating bills for a heat pump would range between $125 and $1,600, depending on the heating requirement and heat pump efficiency (Figure 3c).

Replacing a conventional air-source heat pump with a new high-efficiency model in a moderate climate would save about $187 per year. Since the new heat pump would cost about $2,400—assuming the use of an existing furnace as backup heat and no significant duct work—a heat pump used for heating alone would pay for itself in about 13 years.

However, if the heat pump is also used for air-conditioning, as heat pumps usually are, the additional savings resulting from more efficient air-conditioning would mean a much shorter payback time.

Figure 3a. Range of Heating Oil Heating Bills

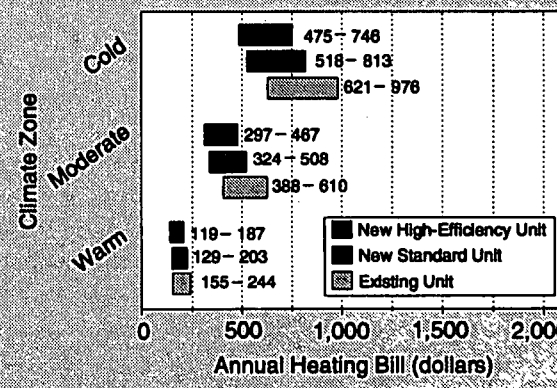


Figure 3b. Range of Natural Gas Heating Bills

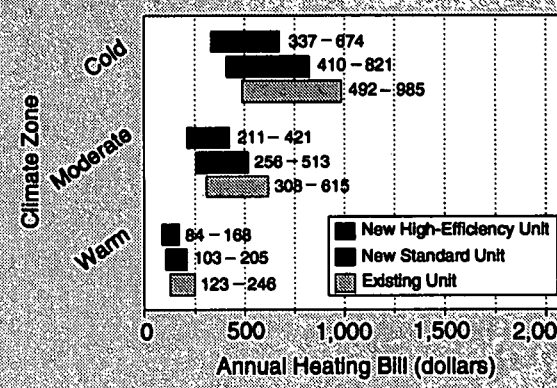

Figure 3c. Range of Electric Heat Pump Heating Bills

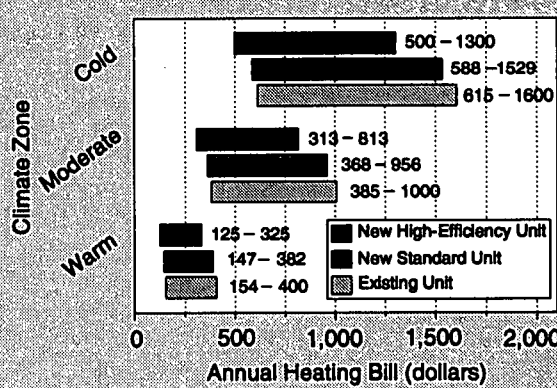


Note: Heating bills for heating oil and natural gas heat were calculated by dividing the heating requirement by the furnace efficiency and multiplying the result by the price of energy in dollars per million Btu. Energy prices in dollars per million Btu were calculated by multiplying the heating oil price in dollars per gallon by 0.1387 or the natural gas price in dollars per therm by 0.1. Heating bills for heat pumps were calculated by dividing the heating requirement by 1,000 times the heat pump efficiency and multiplying the result by the price of electricity in dollars per kilowatthour.

Source: Energy Information Administration, *Reducing Home Heating and Cooling Costs*, SR/EMEU/94-01 (Washington, DC, July 1994), pp. 13, 14, and 16.

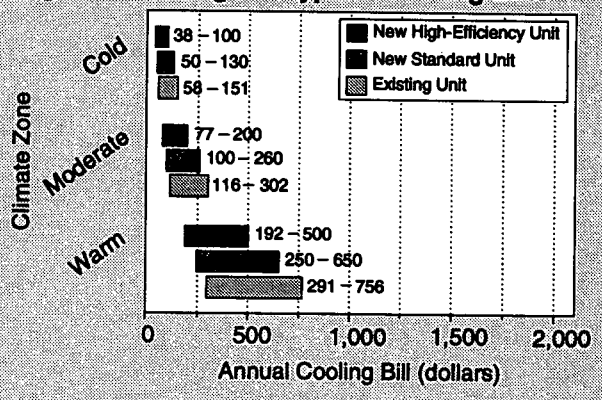
Range of Annual Cooling Bills by Climate and System Efficiency

In 1990, only 25 percent of homeowners in the coldest climate owned central air-conditioning, contrasted with 60 percent of homeowners in the warmest part of the country.

For electricity prices ranging between 5 cents and 13 cents per kilowatthour, corresponding annual cooling bills would range between $38 and $756, depending on the cooling requirement and the efficiency of the air-conditioner. The standard efficiency for new air-conditioners is 10, but many units have efficiencies of 16 or more.

Homeowners in the warmest climates who replace an old air-conditioner with an efficiency of 8.6 with a new air-conditioner having an efficiency of 13 could save about one-third of their cooling bills (Figure 4).

Figure 4. Range of Typical Cooling Bills



Note: Cooling bills were calculated by dividing cooling requirements by 1,000 times the air-conditioner efficiency and multiplying the result by the price of electricity in dollars per kilowatthour.

Source: Energy Information Administration, *Reducing Home Heating and Cooling Costs*, SR/EMEU/94-01 (Washington, DC, July 1994), pp. 13, 14, and 16.

About This Report

Reducing Home Heating and Cooling Costs is a 30-page report aimed at giving homeowners the background information they need when replacing their central heating-cooling systems. Three appendices follow sections on weatherization, the major features of the three energy sources, and heating-cooling systems. The first appendix contains a worksheet to help homeowners compare the installation and operating costs of the various heating-cooling systems on the market. The second appendix contains tables for calculating heating and cooling costs. The third appendix explains how the calculations in the report were made.

Copies of *Reducing Home Heating and Cooling Costs* may be obtained by using the order form in the back of this publication.

Section 1. Energy Overview

Energy production during May 1994 totaled 5.6 quadrillion Btu, a 2.4-percent increase from the level of production during May 1993. Coal production increased 13.3 percent, natural gas production rose 1.7 percent, and petroleum production decreased 2.5 percent. All other forms of energy production combined were down 8.3 percent from the level of production during May 1993.

Energy consumption during May 1994 totaled 6.6 quadrillion Btu, 3.6 percent above the level of consumption during May 1993. Natural gas consumption increased 8.7 percent, coal consumption rose 4.6 percent, and petroleum consumption was up 3.6 percent. Consumption of all other forms of energy combined decreased 5.8 percent from the level 1 year earlier.

Net imports of energy during May 1994 totaled 1.6 quadrillion Btu, 14.3 percent above the level of net imports 1 year earlier. Net imports of petroleum increased 8.4 percent, and net imports of natural gas were up 23.2 percent. Net exports of coal fell 16.8 percent from the level in May 1993.

[a] Based on daily rates prior to rounding.

[b] Due to a lack of consistent historical data, some renewable energy sources are not included. For example, in 1991, 3.3 quadrillion Btu of renewable energy consumed by U.S. electric utilities to generate electricity for distribution is included, but an estimated 3.4 quadrillion Btu of renewable energy used by other sectors is not included.

[c] Includes crude oil, lease condensate, and natural gas plant liquids.

[d] "Other" is hydroelectric and nuclear electric power, and electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

[e] Includes supplemental gaseous fuels.

[f] "Other" is hydroelectric and nuclear electric power; electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy; and net imports of electricity and coal coke.

[g] Minus sign indicates exports are greater than imports.

[h] Includes crude oil, lease condensate, petroleum products, pentanes plus, unfinished oils, gasoline blending components, and imports of crude oil for the Strategic Petroleum Reserve.

[i] "Other" is net imports of electricity and coal coke.

Notes: • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] Due to a lack of consistent historical data, some renewable energy sources are not included. For example, in 1991, 3.3 quadrillion Btu of renewable energy consumed by U.S. electric utilities to generate electricity for distribution is included, but an estimated 3.4 quadrillion Btu of renewable energy used by other sectors is not included.

[b] The sum of domestic energy production and net imports of energy does not equal domestic energy consumption. The difference is attributed to stock changes; losses and gains in conversion, transportation, and distribution; the addition of blending compounds; shipments of anthracite to U.S. Armed Forces in Europe; and adjustments to account for discrepancies between reporting systems.

R=Revised data.

Notes: • For definitions, see Notes 1 through 4 at end of section. • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] Includes supplemental gaseous fuels.

[b] Electric utility and industrial generation and net imports of electricity.

[c] "Other" consumption is net imports of coal coke and electricity generated for distribution from wood, waste, wind, photovoltaic, and solar thermal energy.

[d] Due to a lack of consistent historical data, some renewable energy sources are not included. For example, in 1991, 3.3 quadrillion Btu of renewable energy consumed by U.S. electric utilities to generate electricity for distribution is included, but an estimated 3.4 quadrillion Btu of renewable energy used by other sectors is not included.

R=Revised data.

Notes: • See Note 2 at end of section. • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] Crude oil, lease condensate, and imports of crude oil for the Strategic Petroleum Reserve.

[b] Petroleum products, unfinished oils, pentanes plus, and gasoline blending components.

[c] Assumed to be hydroelectricity and estimated at the average input heat rate for fossil-fuel steam-electric power plant generation, which has ranged from 10.2 thousand Btu to 10.5 thousand Btu per kilowatthour since 1973. Actual heat rates applied in converting kilowatthours to Btu are listed by year in Table A8.

R=Revised data. E=Estimate. (s)=Less than +0.5 trillion Btu and greater than -0.5 trillion Btu.

Notes: • See Notes 3 and 4 at end of section. • Net imports equal imports minus exports. Minus sign indicates exports are greater than imports. • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] Consumer Price Index, All Urban Consumers, All Items, 1982-1984 = 100.0.

NA=Not available.

Notes: • Fuel costs are calculated by using the Urban Consumer Price Index (CPI) developed by the Bureau of Labor Statistics. See Note 6 at end of section. • Annual averages may not equal average of months due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

Sources: • **Annual Data:** Annual prices in Tables 9.4 (All Types), 9.8c, 9.11, and 9.9 (Monthly Series), adjusted by the CPI. • **Monthly Data:** Monthly prices in Tables 9.4 (All Types), 9.8c, 9.11, and 9.9 (Monthly Series), adjusted by the CPI. • **CPI: 1973-1992**—*Economic Report of the President*, February 1994, Table B-59. **1993 forward**—Council of Economic Advisers, *Economic Indicators*, July 1994, "Consumer Prices - All Urban Consumers." • **Conversion Factors:** Tables A1, A4, and A8.

Cost of Fuels to End Users, now Table 1.7 with monthly data, was previously Table 1.9 with quarterly data.

[a] "Net Imports" are imports minus exports. Imports from members of the Organization of Petroleum Exporting Countries (OPEC) exclude indirect imports, which are petroleum products primarily from Caribbean and West European areas and refined from crude oil produced by OPEC.

[b] The Arab members of OPEC are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. Net imports from the Neutral Zone between Kuwait and Saudi Arabia are included in net imports from Arab OPEC.

[c] OPEC currently consists of Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. Ecuador was a member of OPEC from 1973-1992; for this period, net imports from Ecuador are included in net imports from OPEC.

R=Revised data.

Notes: • Beginning in October 1977, Strategic Petroleum Reserves are included. • Annual averages may not equal average of months due to independent rounding. • U.S. geographic coverage is the 50 States and the District of Columbia.

Sources: • **Imports:** Tables 3.3a-3.3h. • **Exports: 1973-1976**—U.S. Department of the Interior, Bureau of Mines, *Mineral Industry Surveys.* **1977-1980**—Energy Information Administration (EIA), *Energy Data Reports,* "Petroleum Statement, Annual." **1981-1993**—EIA, *Petroleum Supply Annual.* **1994**—EIA, *Petroleum Supply Monthly.* • **Petroleum Products Supplied:** Table 3.1a.

Table 1.8 is revised to present monthly data in place of quarterly data.

Mountain					
Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming	13	47	22	(c)	(c)
Pacific[b]					
California, Oregon, Washington	22	42	18	(c)	(c)
U.S. Average[b]	7	14	9	(c)	(c)

[a] "Normal" is based on calculations of data from 1961 through 1990.
[b] Excludes Alaska and Hawaii.
[c] Percent change is not meaningful: normal is less than 100 or ratio is incalculable.

Notes: Degree-days are relative measurements of outdoor air temperature used as an index for heating and cooling energy requirements. Heating degree-days are the number of degrees that the daily average temperature falls below 65° F. Cooling degree-days are the number of degrees that the daily average temperature rises above 65° F. The daily average temperature is the mean of the maximum and minimum temperatures in a 24-hour period. For example, a weather station recording an average daily temperature of 40° F would report 25 heating degree-days for that day (and 0 cooling degree-days). If a weather station recorded an average daily temperature of 78° F, cooling degree-days for that station would be 13 (and 0 heating degree days).

Sources: There are several degree-day databases maintained by the National Oceanic and Atmospheric Administration. The information published here is developed by the National Weather Service Climate Analysis Center, Camp Springs, MD. The data are available weekly with monthly summaries and are based on mean daily temperatures recorded at about 200 major weather stations around the country. The temperature information recorded at those weather stations is used to calculate statewide degree-day averages based on population. The State figures are then aggregated into Census Divisions and into the national average. The population weights currently used represent resident State population data estimated for 1990 by the U.S. Department of Commerce, Bureau of the Census. The data provided here are available sooner than the Historical Climatology Series 5-1 (heating degree-days) and 5-2 (cooling degree-days) developed by the National Climatic Center, Asheville, NC, which compiles data from some 8,000 weather stations.

[b] Excludes Alaska and Hawaii.

Notes: Degree-days are relative measurements of outdoor air temperature used as an index for heating and cooling energy requirements. Cooling degree-days are the number of degrees that the daily average temperature rises above 65° F. Heating degree-days are the number of degrees that the daily average temperature falls below 65° F. The daily average temperature is the mean of the maximum and minimum temperatures in a 24-hour period. For example, if a weather station recorded an average daily temperature of 78° F, cooling degree-days for that station would be 13 (and 0 heating degree-days). A weather station recording an averager daily temperature of 40° F would report 25 heating degree-days for that day (and 0 cooling degree-days).

Sources: There are several degree-day databases maintained by the National Oceanic and Atmospheric Administration. The information published here is developed by the National Weather Service Climate Analysis Center, Camp Springs, MD. The data are available weekly with monthly summaries and are based on mean daily temperatures recorded at about 200 major weather stations around the country. The temperature information recorded at those weather stations is used to calculate statewide degree-day averages based on population. The State figures are then aggregated into Census Divisions and into the national average. The population weights currently used represent resident State population data estimated for 1990 by the U.S. Department of Commerce, Bureau of the Census. The data provided here are available sooner than the Historical Climatology Series 5-1 (heating degree-days) and 5-2 (cooling degree-days) developed by the National Climatic Center, Asheville, NC, which compiles data from some 8,000 weather stations.

Energy Summary Notes

1. Energy Production: Production of energy includes production of coal, crude oil and lease condensate, natural gas plant liquids, natural gas (dry), electric utility and industrial production of hydroelectric power, and electricity generated from nuclear power. Production also includes electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available. Approximate heat contents (Btu values) are derived by using the conversion factors provided in Appendix A.

2. Energy Consumption: Consumption of energy includes consumption of coal, natural gas (including supplemental gaseous fuels), petroleum products supplied, electric utility and industrial production of hydroelectric power, net imports of electricity (assumed to be hydroelectricity), net imports of coal coke, and electricity generated from nuclear power. Consumption also includes electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available. Approximate heat contents (Btu values) are derived by using the conversion factors provided in Appendix A.

3. Energy Imports: Energy imports include imports of coal, crude oil (including crude oil imported for the Strategic Petroleum Reserve), petroleum products, natural gas, electricity (assumed to be hydroelectricity), and coal coke. Approximate heat contents (Btu values) are derived by using the conversion factors provided in Appendix A. For further information on electricity, see "Note for imports and exports of electricity" under Note 8 of the Notes and Sources for the Energy Consumption Section.

4. Energy Exports: Energy exports include coal, crude oil, petroleum products, natural gas, electricity produced from hydroelectric power, and coal coke. Approximate heat contents (Btu values) are derived by using the conversion factors provided in Appendix A. For more information on electricity, see "Note for imports and exports of electricity" under Note 8 of the Notes and Sources for the Energy Consumption Section.

5. Merchandise Trade Value: Import data presented are based on the customs value. That value does not include insurance and freight and is consequently lower than the cost, insurance, and freight (CIF) value, which is also reported by the Bureau of the Census. All export data, and import data prior to 1981, are on a free alongside ship (f.a.s.) basis.

"Balance" is exports minus imports; a positive balance indicates a surplus trade value and a negative balance indicates a deficit trade value. "Energy" includes mineral fuels, lubricants, and related material. "Non-Energy Balance" and "Total Merchandise" include foreign exports (i.e., reexports) and nonmonetary gold and Department of Defense Grant-Aid shipments. The "Non-Energy Balance" is calculated by subtracting the "Energy" from the "Total Merchandise Balance."

"Imports" consist of government and nongovernment shipments of merchandise into the 50 States, the District of Columbia, Puerto Rico, the U.S. Virgin Islands, and the U.S. Foreign Trade Zones. They reflect the total arrival from foreign countries of merchandise that immediately entered consumption channels, warehouses, the Foreign Trade Zones, or the Strategic Petroleum Reserve. They exclude shipments between the United States, Puerto Rico, and U.S. possessions, shipments to U.S. Armed Forces and diplomatic missions abroad for their own use, U.S. goods returned to the United States by its Armed Forces, and in-transit shipments.

Section 2. Energy Consumption

U.S. total energy consumption in May 1994 was 6.6 quadrillion Btu. Petroleum products accounted for 43 percent[1] of the energy consumed in May 1994, while coal accounted for 23 percent and natural gas accounted for 22 percent.

Residential and commercial sector consumption was 2.1 quadrillion Btu in May 1994, up 6 percent from the May 1993 level. The sector accounted for 32 percent of May 1994 total consumption, up 1 percentage point from its 31-percent share in May 1993.

Industrial sector consumption was 2.6 quadrillion Btu in May 1994, up 4 percent from the May 1993 level. The industrial sector accounted for 39 percent of May 1994 total consumption, about the same share as in May 1993.

Transportation sector consumption of energy was 2.0 quadrillion Btu in May 1994, up 1 percent from the May 1993 level. The sector accounted for 30 percent of May 1994 total consumption, about the same share as in May 1993.

Electric utility consumption of energy totaled 2.4 quadrillion Btu in May 1994, up 3 percent from the May 1993 level. Coal contributed 54 percent of the energy consumed by electric utilities in May 1994, while nuclear electric power contributed 21 percent; hydroelectric power 12 percent; natural gas 9 percent; petroleum 3 percent; and geothermal, wood, waste, wind, photovoltaic, and solar thermal energy, less than 1 percent.

Table 2.1 Energy Consumption Summary for May 1994

(Quadrillion Btu)

Energy Source	End-Use Sectors				Electric Utilities	Total
	Residential and Commercial	Industrial	Transportation	Total[a]		
Coal	0.009	0.206	(b)	0.214	1.302	1.516
Natural Gas[c]	.440	.754	.044	1.238	.221	1.459
Petroleum	.150	.709	1.918	2.777	.074	2.850
Nuclear Electric Power	–	–	–	–	.518	.518
Hydroelectric Power[d]	–	.003	–	.003	.283	.286
Geothermal	–	–	–	–	.012	.012
Net Imports of Coal Coke	–	.002	–	.002	–	.002
Other[e]	–	–	–	–	.002	.002
Primary Consumption	**.598**	**1.674**	**1.962**	**4.234**	**2.411**	**6.645**
Electricity	.472	.285	.001	.757	–	–
Net Consumption	**1.070**	**1.958**	**1.963**	**4.991**	–	–
Electrical System Energy Losses	1.030	.621	.002	1.654	–	–
Total Consumption[f]	**2.100**	**2.580**	**1.966**	**6.645**	–	–

[a] Totals for coal and natural gas may not equal sum of sectors due to the use of sector-specific conversion factors.

[b] Small amounts of coal consumed for transportation are reported as industrial sector consumption.

[c] Includes supplemental gaseous fuels. Transportation sector is pipeline fuel only.

[d] Includes net imports of electricity.

[e] "Other" is electricity generated for distribution from wood, waste, wind, photovoltaic, and solar thermal energy.

[f] Due to a lack of consistent historical data, some renewable energy sources are not included. For example, in 1991, 3.3 quadrillion Btu of renewable energy consumed by U.S. electric utilities to generate electricity for distribution is included, but an estimated 3.4 quadrillion Btu of renewable energy used by other sectors is not included.

– =Not applicable.

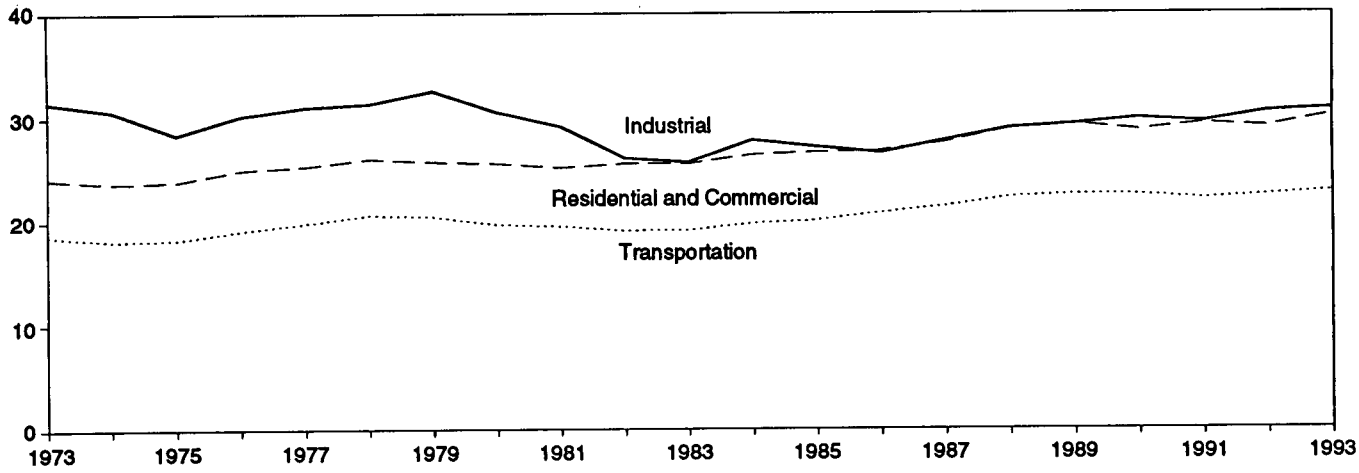
Notes: • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

Additional Notes and Sources: See Tables 2.2-2.6 and end of section.

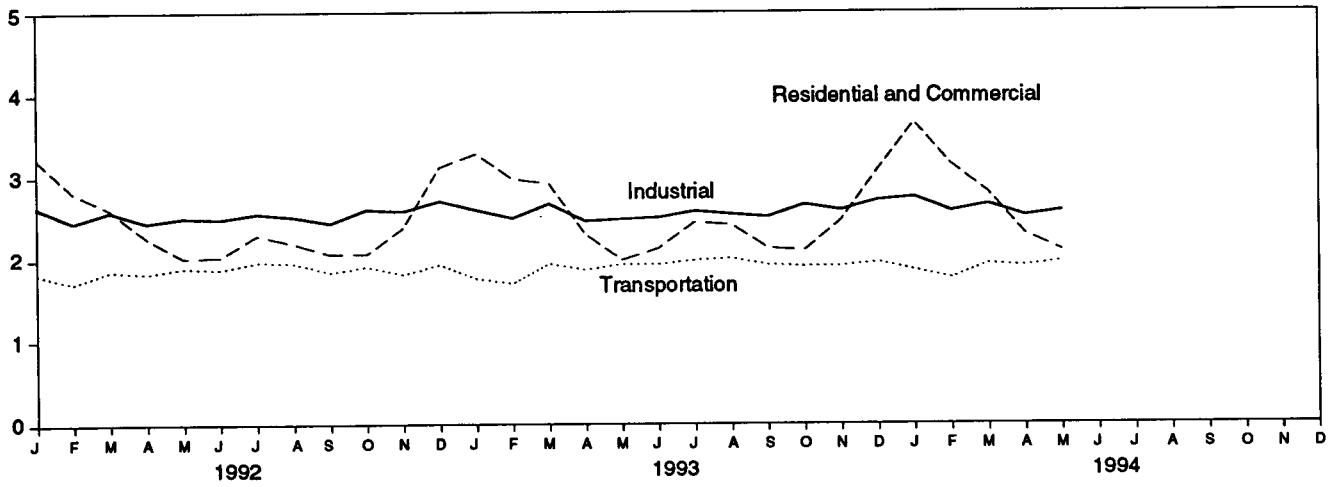
[1] Percentage changes are based on numbers in the following tables.

Figure 2.1 Energy Consumption by End-Use Sector
(Quadrillion Btu)

Consumption by End-Use Sector, 1973-1993



Consumption by End-Use Sector, Monthly



Consumption by End-Use Sector, May

1993 5-Month Total	8.239	13.474	9.921	12.734	9.211	9.222	27.364	35.423
1992 5-Month Total	7.815	12.943	9.842	12.653	9.137	9.149	26.787	34.738

[a] Due to a lack of consistent historical data, some renewable energy sources are not included. For example, in 1991, 3.3 quadrillion Btu of renewable energy consumed by U.S. electric utilities to generate electricity for distribution is included, but an estimated 3.4 quadrillion Btu of renewable energy used by other sectors is not included.

R=Revised data.

Notes: • Totals may not equal sum of components due to independent rounding and the use of sector-specific conversion factors for natural gas and coal. • Geographic coverage is the 50 States and the District of Columbia.

Additional Notes and Sources: See end of section.

[a] Includes supplemental gaseous fuels.

[b] Due to a lack of consistent historical data, some renewable energy sources are not included. For example, in 1991, an estimated 2.7 quadrillion Btu of renewable energy consumed by the U.S. industrial sector (primarily the pulp and paper industry) is not included.

R=Revised data. (s)=Less than +0.5 trillion Btu and greater than -0.5 trillion Btu.

Notes: • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

Additional Notes and Sources: See end of section.

[a] Includes supplemental gaseous fuels.

[b] Includes residual and distillate fuel oils, petroleum coke, and small amounts of kerosene and jet fuel.

[c] Includes net imports of electricity.

[d] "Other" is electricity generated for distribution from wood, waste, wind, photovoltaic, and solar thermal energy.

Notes: • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

Additional Notes and Sources: See end of section.

Energy Consumption Notes and Sources

The data in this section of the *Monthly Energy Review* (*MER*) are obtained initially from a group of energy-related surveys, typically called "supply surveys," conducted by the Energy Information Administration (EIA). Supply surveys are those surveys directed to suppliers and marketers of specific energy sources. They measure the quantities of specific energy sources produced, or the quantities supplied to the market, or both. The data obtained from the EIA's supply surveys are integrated to yield the summary consumption statistics published in this section (and in Section 1) of the *MER*. Users of the EIA's energy consumption statistics should be aware of a second group of energy-related surveys, typically called "consumption surveys." Consumption surveys gather information on the types of energy consumed by end users of energy, along with the characteristics of those end users that can be associated with energy use. For example, the Manufacturing Energy Consumption Survey belongs to the consumption survey group because it collects information directly from end users (the manufacturing establishments). There are important differences between the supply and consumption surveys that need to be taken into account in any analysis that uses both data sources. For information on those differences, see *Energy Consumption by End-Use Sector, A Comparison of Measures by Consumption and Supply Surveys,* DOE/EIA-0533, Energy Information Administration, Washington, DC, April 6, 1990. The numbered notes that follow elaborate on essential information in Section 2.

1. Total Energy Consumed: Total energy consumed includes coal, natural gas (including supplemental gaseous fuels), petroleum products supplied, electric utility and industrial generation of hydroelectric power, net imports of electricity generated from hydroelectric power, and electricity generated from nuclear power. Total energy consumed also includes electricity generated from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy but excludes other energy obtained from those sources because consistent historical data are not available.

2. Economic Sectors: Energy use is assigned to the major economic sectors according to the following guidelines as closely as possible:

- Residential—All private residences, whether occupied or vacant, owned or rented, including single-family homes, multifamily housing units, and mobile homes. Secondary homes, such as summer homes, are also included. Institutional housing, such as school dormitories, hospitals, and military barracks, generally are not included in the residential sector; they are included in the commercial sector.
- Commercial—Business establishments that are not engaged in transportation or in manufacturing or other types of industrial activity (agriculture, mining, or construction). Commercial establishments include hotels, motels, restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; religious and nonprofit organizations; health, social, and educational institutions; and Federal, State, and local governments. Street lights, pumps, bridges, and public services are also included if the establishment operating them is considered commercial.
- Industrial—Manufacturing industries, which make up the largest part of the sector, along with mining, construction, agriculture, fisheries, and forestry. Establishments in this sector range from steel mills to small farms to companies assembling electronic components.
- Transportation—Private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads and railways (including streetcars), aircraft, ships, barges, and natural gas pipelines.
- Electric Utility—Privately and publicly owned establishments that generate, transmit, distribute, and sell electricity primarily for use by the public and meet the definition of an electric utility. Nonutility power producers are not included in the electric utility sector.

Although the end-use allocations are made according to these aggregations as closely as possible, some data are collected by using different classifications. For example, data on agricultural use of natural gas are collected and reported in the commercial sector, rather than in the industrial sector. Since agricultural use of natural gas cannot be identified separately, it is included in the commercial sector in this report. Another example is master-metered condominiums and apartments, and buildings with a combination of residential and commercial units. In many cases, the metering and billing practices cause residential energy usage of electricity, natural gas, or fuel oil to be included in the commercial sector. No adjustments for these discrepancies were made.

3. Conversion Factors: See the conversion factors listed in Appendix A.

4. Coal: Coal is anthracite, bituminous coal (including subbituminous coal), and lignite. Sources:

- 1973-September 1977: U.S. Department of the Interior (DOI), Bureau of Mines (BOM), *Minerals Yearbook* and *Minerals Industry Surveys.*
- Electric Utilities—October 1977 forward: Energy Information Administration (EIA), Form EIA-759 (formerly Form FPC-4), "Monthly Power Plant Report."
- Other Industrial—October 1977-December 1979: EIA, Form EIA-3, "Monthly Coal Consumption Report - Manufacturing Plants"; January 1980 for-

ward: EIA, Form EIA-3, "Quarterly Coal Consumption Report - Manufacturing Plants," and Form EIA-6, "Coal Distribution Report," quarterly.

- Coke Plants—October 1977-December 1980: EIA, Form EIA-5/5A, "Coke and Coal Chemicals - Monthly/Annual"; January 1981-December 1984: EIA, Form EIA-5/5A, "Coke Plant Report - Quarterly/Annual Supplement"; January 1985 forward: EIA, Form EIA-5/5A, "Coke Plant Report - Quarterly."
- Residential and Commercial—October 1977-December 1979: EIA, Form EIA-2, "Monthly Coal Report, Retail Dealers - Upper Lake Docks"; January 1980 forward: EIA, Form EIA-6, "Coal Distribution Report," quarterly.

5. Natural Gas: Natural gas consumption by end use is based on data presented in Table 4.4 of this report. For Section 2 calculations, lease and plant fuel consumption are added to industrial deliveries, and pipeline fuel represents transportation use of natural gas. Values in Btu are derived by using the conversion factors provided in Appendix A. Sources:

- 1973-1975: DOI, BOM, *Minerals Yearbook*, "Natural Gas" chapter.
- 1976-1978: EIA, *Energy Data Reports*, "Natural Gas, Annual."
- 1979: EIA, *Natural Gas Production and Consumption 1979*.
- 1980-1992: EIA, *Natural Gas Annual*.
- 1993: EIA, *Natural Gas Monthly*.
- Electric Utilities—1973-1976: Form FPC-4, "Monthly Power Plant Report"; 1977-1981: Federal Energy Regulatory Commission (FERC), Form FPC-4, "Monthly Power Plant Report"; 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."
- American Gas Association, "Monthly Gas Utility Statistical Report," residential and commercial monthly sales data for 1973-1979, which are used to estimate monthly consumption values from EIA annual consumption values.

6. Petroleum: Petroleum consumption by end use is the sum of all individual petroleum products estimated to be consumed in each end-use sector. First, total consumption by product is determined. Petroleum consumption in this section of the *Monthly Energy Review (MER)* is the series called "petroleum products supplied" in Section 3. Sources for petroleum products supplied by individual products are:

- 1973-1975: DOI, BOM, *Mineral Industry Surveys*, "Petroleum Statement, Annual."
- 1976-1980: EIA, *Energy Data Reports*, "Petroleum Statement, Annual."
- 1981-1992: EIA, *Petroleum Supply Annual*.
- 1993 and 1994: EIA, *Petroleum Supply Monthly*.

Specific petroleum products' end-use allocation procedures follow:

- **Aviation Gasoline**—All product supplied is assigned to the transportation sector.
- **Asphalt**—All product supplied is assigned to the industrial sector.
- **Distillate Fuel**—Product supplied is assigned to electric utilities and non-electric utilities as follows:

Electric Utilities, All Periods.

For 1973-1979, consumption of distillate fuel is assumed to be the amount of petroleum (minus small amounts of kerosene and kerosene-type jet fuel deliveries) consumed in gas turbine and internal combustion plants. For 1980 forward, consumption of distillate fuel is assumed to be the amount of light oil (minus small amounts of kerosene deliveries through 1982) consumed at electric utilities. (See Table 7.3)

Sources: 1973-September 1977: FPC, Form FPC-4, "Monthly Power Plant Report"; October 1977-1981: FERC, Form FPC-4, "Monthly Power Plant Report"; 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."

Sectors Other Than Electric Utilities, Annual Estimates Through 1992.

The aggregate non-electric utility use of distillate fuel is total distillate fuel supplied minus the electric utility consumption. The non-electric utility annual consumption totals are allocated to the individual non-electric utility sectors (residential, commercial, industrial, and transportation) in proportion to the share of "adjusted sales" of each end-use sector, as reported in EIA's *Fuel Oil and Kerosene Sales* report series (DOE/EIA-0535), which is based primarily on data collected by Form EIA-821, previously Form EIA-172. "Adjusted sales" are sales that have been adjusted at the PAD district level to equal EIA volume estimates of petroleum products supplied in the U.S. market. Following are notes on the individual sector groupings:

- Since 1979, the residential sector adjusted sales total is directly from the *Sales* reports. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into residential, commercial, and industrial (including farm) in proportion to the 1979 shares.

- Since 1979, the commercial sector adjusted sales total is directly from the *Sales* reports. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into residential, commercial, and industrial (including farm) in proportion to the 1979 shares.

- Since 1979, the industrial sector adjusted sales total is the sum of the adjusted sales for industrial, farm, oil company, off-highway, diesel, and all other uses. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into residential, commercial, and industrial (including farm) in proportion to the 1979 shares, and this estimated industrial portion is added to oil company, off-highway diesel, and all other uses.

- The transportation sector adjusted sales total is the sum of the adjusted sales for railroad, vessel bunkering, on-highway diesel, and military uses for all years.

Sectors Other Than Electric Utilities, Monthly Estimates Through 1992.

- Residential and commercial monthly consumption is estimated by allocating the annual estimates, which are described above, into the months in proportion to each month's share of the year's sales of No. 2 heating oil. The years' sales totals are from the following sources: for 1973-1980, the Ethyl Corporation, *Monthly Report of Heating Oil Sales;* for 1981 and 1982, the American Petroleum Institute, *Monthly Report of Heating Oil Sales;* and for 1983-1992, EIA, Form EIA-782A, "Refiners'/Gas Plant Operators' Monthly Petroleum Product Sales Report," No. 2 Fuel Oil Sales to End Users and for Resale.

- The transportation highway use portion is allocated into the months in proportion to each month's share of the year's total sales for highway use as reported by the Federal Highway Administration's Table MF-25, "Private and Commercial Highway Use of Special Fuels by Months." The remaining transportation use of distillate fuel (i.e., for railroads, vessel bunkering, and military use) is evenly distributed over the months, adjusted for the number of days per month.

- Industrial monthly estimates are made by subtracting the residential and commercial, transportation, and electric utility sector estimates from each month's total distillate fuel supplied.

Sectors Other Than Electric Utilities, 1993 and 1994

Each month's non-electric utility consumption subtotal is disaggregated into the major end-use sectors in proportion to the shares each sector held of the non-electric utility subtotal in the same month in 1992.

- **Jet Fuel**—Through 1982, small amounts of kerosene-type jet fuel were consumed by electric utilities. Kerosene-type jet fuel deliveries to electric utilities as reported on the Form FERC-423 (formerly Form FPC-423) were used as estimates of this consumption. All remaining jet fuel (kerosene-type and naphtha-type) is consumed by the transportation sector.

- **Kerosene**—Total product supplied monthly is allocated to the major end-use sectors in proportion to annual sales grouped into end-use sectors from EIA's *Fuel Oil and Kerosene Sales* reports (based primarily on data collected by Form EIA-821, previously Form EIA-172), as follows:

  - Residential deliveries are directly from the *Sales* reports for 1979-1992. Sales for 1992 are used as estimates for succeeding periods. Prior to 1979, each year's sales category called "heating" is split into residential, commercial, and industrial in proportion to the 1979 shares.

  - Commercial sales are directly from the *Sales* reports for 1979-1992. Sales for 1992 are used as estimates for succeeding periods. Prior to 1979, each year's sales category called "heating" is split into residential, commercial, and industrial in proportion to the 1979 shares.

  - Industrial sales are directly from the *Sales* reports for 1979-1992. Sales for 1992 are used as estimates for succeeding periods. Prior to 1979, each year's sales category called "heating" is split into residential, commercial and industrial in proportion to the 1979 shares, and this estimated industrial (including farm) portion is added to all other uses.

- **Liquefied Petroleum Gases (LPG)**—The annual shares of LPG's total consumption that are estimated to be consumed by each end-use sector are applied to each month's total LPG consumption (i.e., product supplied) to create monthly end-use consumption estimates. The annual end-use shares are calculated in the following manner:

  - Sales of LPG to the residential and commercial sector are converted from thousand gallons per year to thousand barrels per year and are assumed to be the annual consumption of LPG by the sector.

  - The quantity of LPG sold each year for consumption in internal combustion engines is allocated between the transportation and industrial sectors on the basis of data for special fuels used on highways published by the U.S. Department of Transportation, Federal Highway Administration, in *Highway Statistics*. The allocations of LPG sold for internal combustion engine use to the transportation sector range from a high of 67 percent in 1981 to a low of 37 percent in 1987.

  - LPG consumed annually by the industrial sector is estimated as the difference between LPG total supplied and the estimated consumption of LPG by the sum of the residential and commercial sector and the transportation sector. The industrial sector includes LPG used by chemical plants as raw materials or solvents and used in the production of synthetic rubber; refinery fuel use; use as synthetic

natural gas feedstock and use in secondary recovery projects; all farm use; LPG sold to gas utility companies for distribution through the mains; and a portion of the use of LPG as an internal combustion engine fuel.

The sources of the annual sales data for creating annual end-use shares are:

- 1973-1982: EIA's "Sales of Liquefied Petroleum Gases and Ethane" reports, based primarily on data collected by Form EIA-174.

- 1983: End-use consumption estimates for 1983 are based on 1982 end-use consumption because the collection of data under Form EIA-174 was discontinued after data year 1982.

- 1984-1992: American Petroleum Institute (API), "Sales of Natural Gas Liquids and Liquefied Refinery Gases," which is based on an LPG sales survey jointly sponsored by API, the Gas Processors Association, and the National Liquefied Petroleum Gas Association.

- 1993 and 1994: The 1992 source is used to estimate succeeding periods.

- **Lubricants**—Total product supplied is allocated to the industrial and transportation sectors for all months according to proportions developed from annual sales of lubricants to the two sectors from U.S. Department of Commerce, Bureau of the Census, *Current Industrial Reports*, "Sales of Lubricating and Industrial Oils and Greases." The 1973 shares are applied to 1973 and 1974; the 1975 shares are applied to 1975 and 1976; and the 1977 shares are applied to 1977 forward.
- **Motor Gasoline**—Total product supplied monthly is allocated to the major end-use sectors in proportion to aggregations of annual sales categories created on the basis of the U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics*, Tables MF-21, MF-24, and MF-25, as follows:

  - Commercial sales are the sum of sales for public non-highway use and miscellaneous and unclassified uses.

  - Industrial sales are the sum of sales for agriculture, construction, and industrial and commercial use as classified in the *Highway Statistics*.

  - Transportation sales are the sum of sales for highway use (minus the sales of special fuels, which are primarily diesel fuel and are accounted for in the transportation sector of distillate fuel) and sales for marine use.
- **Petroleum Coke**—The portion consumed by electric utilities is from Form EIA-759, "Monthly Power Plant Report" (formerly Form FPC-4). The remaining petroleum coke is assigned to the industrial sector.
- **Residual Fuel**—Product supplied is assigned to electric utilities and non-electric utilities as follows:

  Electric Utilities, All Periods.

  For 1973-1979, consumption of residual fuel is assumed to be the amount of petroleum consumed in steam-electric power plants. For 1980 forward, consumption of residual fuel is assumed to be the amount of heavy oil consumed at electric utilities. (See Table 7.3)

  Sources: 1973-September 1977: Form FPC-4, "Monthly Power Plant Report"; October 1977-1981: FERC, Form FPC-4, "Monthly Power Plant Report"; 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."

  Sectors Other Than Electric Utilities, Annual Estimates Through 1992.

  The aggregate non-electric utility use of residual fuel is total residual fuel supplied minus the electric utility consumption. The non-electric utility annual totals are allocated into the individual non-electric utility sectors in proportion to the amount of residual fuel sold to end users, grouped into sectors from EIA's *Fuel Oil and Kerosene Sales* reports (based primarily on data collected by Form EIA-821, previously Form EIA-172), as follows:

  - Since 1979, commercial sales data are directly from the *Sales* reports. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into commercial and industrial in proportion to the 1979 shares.

  - Since 1979, industrial sales data are the sum of sales for industrial, oil company, and all other uses. Prior to 1979, each year's sales subtotal of the heating plus industrial category is split into commercial and industrial in proportion to the 1979 shares, and this estimated industrial portion is added to oil company and all other uses.

  - Transportation sales are the sum of sales for railroad, vessel bunkering, and military uses for all years.

  Sectors Other Than Electric Utilities, Monthly Estimates Through 1992.

  - Commercial monthly consumption is estimated by allocating the annual estimates, which are described above, into the months in proportion to each month's share of the year's sales of No. 2 heating oil. The years' sales totals are from the following sources: for 1973-1980, the Ethyl Corporation, *Monthly Report of Heating Oil Sales*; for 1981 and

1982, the American Petroleum Institute, *Monthly Report of Heating Oil Sales;* and for 1983-1992, EIA, Form EIA-782A, "Refiners'/Gas Plant Operators' Monthly Petroleum Product Sales Report," No. 2 Fuel Oil Sales to End Users and for Resale.

- Transportation monthly estimates are made by evenly distributing the annual sector estimate over the months, adjusting for the number of days per month.

- Industrial monthly estimates are made by subtracting the commercial, transportation, and electric utility sector estimates from each month's total residual fuel supplied.

Sectors Other Than Electric Utilities, 1993 and 1994

Each month's non-electric utility consumption subtotal is disaggregated into the major end-use sectors in proportion to the shares each sector held of the non-electric utility subtotal in the same month in 1992.

- **Road Oil**—All product supplied is assigned to the industrial sector.
- **All Other Petroleum Products**—The product supplied of all remaining petroleum products is assigned to the industrial sector.

7. Nuclear Electric Power, Geothermal, and Wood, Waste, Wind, Photovoltaic, and Solar Thermal Energy Sources Connected to Electric Utility Distribution Systems: Sources:

- 1973-1976: FPC, Form FPC-4, "Monthly Power Plant Report."
- 1977-1981: FERC, Form FPC-4, "Monthly Power Plant Report."
- 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."

8. Hydroelectric Power: Includes electricity generated by hydroelectric power at electric utilities, small amounts in the industrial sector, and net imports of electricity, which are assumed to be generated by hydroelectric power and are included in the electric utilities sector.

Sources for electric utilities sector:

- 1973-1976: FPC, Form FPC-4, "Monthly Power Plant Report."
- 1977-1981: FERC, Form FPC-4, "Monthly Power Plant Report."
- 1982 forward: EIA, Form EIA-759, "Monthly Power Plant Report."

Sources for industrial sector:

- 1973-1978: FPC, Form FPC-4, "Monthly Power Plant Report," for plants with generating capacity exceeding 10 megawatts, and FPC, Form FPC-12C, "Industrial Electric Generating Capacity," for all other plants.
- 1979: FPC, Form FPC-4, "Monthly Power Plant Report," for plants with generating capacity exceeding 10 megawatts and EIA estimates for all other plants.
- 1980 forward: Annual generation estimated by EIA as the average generation over the 6-year period of 1974-1979; monthly generation estimated to be in proportion to each month's hydroelectricity generation in the electric utility industry in 1980.

Sources for imports and exports of electricity:

- 1973-September 1977: Unpublished Federal Power Commission data.
- October 1977-1980: Unpublished Economic Regulatory Administration (ERA) data.
- 1981: DOE, Office of Energy Emergency Operations, "Report on Electric Energy Exchanges with Canada and Mexico for Calendar Year 1981," April 1982 (revised June 1982).
- 1982 and 1983: DOE, ERA, *Electricity Exchanges Across International Borders.*
- 1984-1986: DOE, ERA, *Electricity Transactions Across International Borders.*
- 1987 and 1988: DOE, ERA, Form ERA-781R, "Annual Report of International Electrical Export/Import Data."
- 1989-1991: DOE, Assistant Secretary for Fossil Energy, Form FE-781-R, "Annual Report of International Electrical Export/Import Data."
- 1992 forward: EIA estimates based on preliminary data from the National Energy Board of Canada and DOE, Assistant Secretary for Fossil Energy.

9. Net Imports of Coal Coke: Net imports means imports minus exports, and a minus sign indicates that exports are greater than imports. Sources:

- 1973-1975: DOI, BOM, *Minerals Yearbook,* "Coke and Coal Chemicals" chapter.
- 1976-1980: EIA, *Energy Data Report,* "Coke and Coal Chemicals" annual.
- 1981: EIA, *Energy Data Report,* "Coke Plant Report," quarterly.
- 1982 forward: EIA, *Quarterly Coal Report.*

10. Electricity: End-use consumption of electricity is based on Table 7.2 sales data. "Other," which is primarily for use in government buildings, is added to the commercial sector, except for approximately 4 per-

cent used by railroads and railways and attributed to the transportation sector. For 1973-1983 and 1993, "Monthly Series" data are used directly. For 1984-1992, monthly estimates are created by dividing each month's "Monthly Series" value by the "Monthly Series" total for the year and multiplying by the "Annual Series" value for the year. Kilowatthours are converted to Btu at the rate of 3,412 Btu per kilowatthour. See Table 7.2 for sources of the electricity sales data.

11. Electrical System Energy Losses: Electrical system energy losses are calculated as the difference between total energy input at electric utilities and the total energy content of electricity sold to end-use consumers. Most of those losses occur at steam-electric power plants (conventional and nuclear) in the conversion of heat energy into mechanical energy to turn electric generators. The loss is a thermodynamically necessary feature of the steam-electric cycle. Part of the energy input-to-output losses is a result of imputing fossil energy equivalent inputs for hydroelectric and other energy sources, since there is no generally accepted practice for measuring those thermal conversion rates. In addition to conversion losses, other losses include power plant use of electricity, transmission and distribution of electricity from power plants to end-use consumers (also called "line losses"), and unaccounted for electricity. Total losses are allocated to the end-use sectors in proportion to each sector's share of total electricity sales. Overall, approximately 67 percent of total energy input is lost in conversion; of electricity generated, approximately 5 percent is lost in plant use and 9 percent is lost in transmission and distribution. Calculated electrical system energy losses may be less than actual losses, because primary consumption does not include the energy equivalent of utility purchases of electricity from non-electric utilities and from Canada and Mexico, although they are included in electricity sales.

Section 3. Petroleum

Total petroleum imports[2] averaged 9.6 million barrels per day in July 1994, 4 percent[3] higher than the previous month's rate and 5 percent higher than the July 1993 rate.

In July 1994, 17.4 million barrels per day of petroleum products were supplied for domestic use, slightly higher than the July 1993 rate. Motor gasoline accounted for 44 percent of the total; distillate fuel oil, 16 percent; and residual fuel oil, 5 percent.

Motor gasoline supplied during July 1994 averaged 7.7 million barrels per day, 3 percent lower than the previous month's rate and 2 percent lower than the July 1993 rate. Total motor gasoline stocks were 209 million barrels at the end of July 1994, 3 million barrels below the stock level in the previous month and 6 million barrels below the level 1 year earlier.

Distillate fuel oil supplied during July 1994 averaged 2.8 million barrels per day, 9 percent lower than the previous month's rate but 4 percent higher than the July 1993 rate. Distillate fuel oil ending stocks for July 1994 were 133 million barrels, 13 million barrels above the stock level in the previous month and 12 million barrels above the level 1 year earlier.

Residual fuel oil supplied in July 1994 averaged 0.9 million barrels per day, 2 percent lower than the previous month's rate and 20 percent lower than the July 1993 rate. Residual fuel oil stocks measured 37 million barrels at the end of July 1994, 2 million barrels below the stock level in the previous month and 6 million barrels below the stock level 1 year earlier.

Estimates (except of crude production) for the most current month are based on Energy Information Administration (EIA) weekly data and will be revised to conform with data from the EIA Petroleum Reporting System as available. For the most recent month, crude production is an EIA estimate based on historical and provisional data through April 1994.

[2]Total import data include imports into the Strategic Petroleum Reserve.
[3]Percentage changes are based on numbers shown in the following tables.

Table 3.1a Petroleum Overview: Field Production, Stock Change, Petroleum Products Supplied, and Ending Stocks

	Field Production			Stock Change[a]			Ending Stocks[b]
	Total Domestic[c]	Crude Oil	Natural Gas Plant Production	Crude Oil[d]	Petroleum Products	Petroleum Products Supplied	Crude Oil[d] and Petroleum Products
	Thousand Barrels per Day						Million Barrels
1973 Average	10,975	9,208	1,738	-11	146	17,308	1,008
1974 Average	10,498	8,774	1,688	62	117	16,653	[e]1,074
1975 Average	10,045	8,375	1,633	[e]17	[e]15	16,322	1,133
1976 Average	9,774	8,132	[f]1,604	39	-96	17,461	1,112
1977 Average	9,913	8,245	1,618	170	378	18,431	1,312
1978 Average	10,328	8,707	1,567	78	-172	18,847	1,278
1979 Average	10,179	8,552	1,584	148	25	18,513	1,341
1980 Average	10,214	8,597	1,573	98	42	17,056	[e]1,392
1981 Average	10,230	8,572	1,609	[e]290	[e]-130	16,058	1,484
1982 Average	10,252	8,649	1,550	136	-283	15,296	[e]1,430

[a] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[b] Stocks are totals as of end of period.
[c] Includes crude oil, natural gas plant liquids, and other liquids.
[d] Includes stocks located in the Strategic Petroleum Reserve.
[e] See Note 4 at end of section.
[f] See Note 6 at end of section.
[g] Beginning in 1993, includes fuel ethanol blended into finished motor gasoline and oxygenate production from merchant MTBE (methyl tertiary butyl ether) plants.

PE=Preliminary estimate. R=Revised data. NA=Not available. E=Estimate.

Notes: • Crude oil includes lease condensate. • Geographic coverage is the 50 States and the District of Columbia.

[a] Includes crude oil for storage in the Strategic Petroleum Reserve.
[b] Net imports equals imports minus exports.
[c] See Note 6 at end of section.
R=Revised data. E=Estimate.
Notes: • Crude oil includes lease condensate. • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] Strategic Petroleum Reserve.
[b] A balancing item.
[c] Beginning in January 1983, crude oil used directly as fuel is shown as product supplied.
[d] See Note 6 at end of section.
PE=Preliminary estimate. R=Revised data. – =Not applicable. E=Estimate.

Notes: • Crude oil includes lease condensate. • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] Stocks are totals as of end of period.
[b] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[c] Strategic Petroleum Reserve.
[d] Beginning in January 1983, crude oil used directly as fuel is shown as product supplied.
[e] See Note 6 at end of section.
[f] Stocks of Alaskan crude oil in transit are included from January 1981 forward. See Note 5 at end of section.
[g] See Note 4 at end of section.

R=Revised data. – =Not applicable. E=Estimate. (s)=Less than +500 barrels per day and greater than -500 barrels per day.

Notes: • Crude oil includes lease condensate. • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] Excludes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

[b] Imports from the Neutral Zone between Kuwait and Saudi Arabia are included in Saudi Arabia.

(s)=Less than 500 barrels per day.

Notes: • Beginning in October 1977, Strategic Petroleum Reserve imports are included. • U.S. geographic coverage is the 50 States and the District of Columbia.

Sources: • **1973-1980:** Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S3. • **1981 forward:** EIA, *Petroleum Supply Monthly*, August 1994, Table S3.

[a] Excludes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

[b] Ecuador withdrew from OPEC on December 31, 1992. As of January 1993, imports from Ecuador appear on Table 3.3f under "Non-OPEC."

[c] A small amount of Iranian crude oil entered the United States in January 1988 from the Virgin Islands. The oil originated in Iran and was exported to the Virgin Islands prior to the signing of Executive Order 12613 on October 29, 1987.

(s)=Less than 500 barrels per day.

Notes: • Beginning in October 1977, Strategic Petroleum Reserve imports are included. • U.S. geographic coverage is the 50 States and the District of Columbia.

Sources: • **1973-1980:** Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S3. • **1981 forward:** EIA, *Petroleum Supply Monthly*, August 1994, Table S3.

[a] Excludes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

[b] As of January 1993, excludes petroleum imported from Ecuador, which withdrew from OPEC on December 31, 1992.

Notes: • Beginning in October 1977, Strategic Petroleum Reserve imports are included. • Totals may not equal sum of components due to independent rounding. • U.S. geographic coverage is the 50 States and the District of Columbia.

[a] Includes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

[b] Imports from other States in the former U.S.S.R. may be included in imports from Russia for the years 1973 through 1992.

(s)=Less than 500 barrels per day.

Notes: • Beginning in October 1977, Strategic Petroleum Reserve imports are included. • U.S. geographic coverage is the 50 States and the District of Columbia.

Sources: • **1973-1980:** Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S3. • **1981 forward:** EIA, *Petroleum Supply Monthly*, August 1994, Table S3.

[a] Includes petroleum imported into the United States indirectly from members of the Organization of Petroleum Exporting Countries (OPEC), primarily from Caribbean and West European areas, as petroleum products that were refined from crude oil produced by OPEC.

[b] As of January 1993, includes petroleum imported from Ecuador, which withdrew from OPEC on December 31, 1992.

R=Revised data. (s)=Less than 500 barrels per day.

Notes: • Beginning in October 1977, Strategic Petroleum Reserve imports are included. • Totals may not equal sum of components due to independent rounding. • U.S. geographic coverage is the 50 States and the District of Columbia.

[a] Stocks are totals as of end of period.
[b] From 1981 forward, blending components are excluded.
[c] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[d] Includes motor gasoline blending components and gasohol, but excludes oxygenates, which are reported separately.
[e] See Note 4 at end of section.
[f] See Note 2 at end of section.
[g] Beginning in 1993, motor gasoline production and product supplied include blending of fuel ethanol and an adjustment to correct for the imbalance of motor gasoline blending components. See Note 2 at end of section.
[h] See Note 1 at end of section.

R=Revised data. NA=Not available. E=Estimate. (s)=Less than 500 barrels per day.

Note: Geographic coverage is the 50 States and the District of Columbia.

[a] Stocks are totals as of end of period.
[b] Beginning in January 1983, crude oil used directly as distillate fuel oil is reported as crude oil product supplied on Table 3.2b rather than as distillate fuel oil product supplied.
[c] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[d] By weight.
[e] See Note 6 at end of section.
[f] See Note 4 at end of section.
[g] See Note 3 at end of section.
R=Revised data. NA=Not available. – =Not applicable. E=Estimate.
Notes: • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] A negative number indicates a decrease in stocks and a positive number indicates an increase.
[b] Stocks are totals as of end of period.
[c] See Note 4 at end of section.
[d] See Note 6 at end of section.
[e] Beginning in 1993, other petroleum products production, exports, and products supplied include an adjustment to oxygenates and motor gasoline blending components.
(s)=Less than +500 barrels per day and greater than -500 barrels per day.

Notes: • Other petroleum products include pentanes plus, other hydrocarbons and oxygenates, unfinished oils, gasoline blending components, and all finished petroleum products except finished motor gasoline, distillate fuel oil, residual fuel oil, jet fuel, and liquefied petroleum gases. • Geographic coverage is the 50 States and the District of Columbia.
Sources: • **1973-1980:** Energy Information Administration (EIA), *Petroleum Supply Monthly*, February 1993, Table S9. • **1981 forward:** EIA, *Petroleum Supply Monthly*, August 1994, Table S10.

Petroleum Notes

1. The Energy Information Administration (EIA) uses a number of sources and methods to maintain the survey respondent lists. On a regular basis, survey managers review such industry publications as the *Oil and Gas Journal* and *Oil Daily* for information on facilities or companies starting up or closing down operations. Those sources are augmented by articles in newspapers, letters from respondents indicating changes in status, and information received from survey systems.

To supplement routine frames maintenance and to provide more thorough coverage, a comprehensive frames investigation is conducted every 3 years. This investigation results in the reassessment and recompilation of the complete frame for each survey. The effort also includes the evaluation of the impact of potential frame changes on the historical time series of data published from these respondents. The results of this frame study are usually implemented in January to provide a full year under the same frame.

In 1991, the EIA conducted a frame identifier survey of companies that produce, blend, store, or import oxygenates. A summary of the results from the identification survey was published in the *Weekly Petroleum Status Report* dated February 12, 1992, and in the February 1992 issue of the *Petroleum Supply Monthly*. In order to continue to provide relevant information about U.S. and regional gasoline supply, the EIA conducted a second frame identifier survey of those companies during 1992. As a result, numerous respondents were added to the monthly surveys effective in January 1993. See Explanatory Note 7 in the *Petroleum Supply Monthly*.

2. **Motor Gasoline:** Beginning in January 1981, the EIA expanded its universe to include non-refinery blenders and separated blending components from finished motor gasoline as a reporting category. Also, survey forms were modified to describe refinery operations more accurately.

Beginning with the reporting of January 1993 data, the EIA made adjustments to the product supplied series for finished motor gasoline. It was recognized that motor gasoline statistics published by the EIA through 1992 were underreported because the reporting system was (1) not collecting all fuel ethanol blending, and (2) there was a misreporting of motor gasoline blending components that were blended into finished gasoline. The adjustments are incorporated into EIA's data beginning in January 1993. To facilitate data analysis across the 1992-1993 period, EIA has prepared a table of 1992 data adjusted according to the 1993 basis. See *Petroleum Supply Monthly*, March 1993, Table H3.

3. **Distillate and Residual Fuel Oils:** The requirement to report crude oil in pipelines or burned on leases as either distillate or residual fuel oil has been eliminated. Prior to January 1981, the refinery input of unfinished oils typically exceeded the available supply of unfinished oils. That discrepancy was assumed to be due to the redesignation of distillate and residual fuel oils received as such but used as unfinished oil inputs by the receiving refinery. The imbalance between supply and disposition of unfinished oils would then be subtracted from the production of distillate and residual fuel oils. Two-thirds of that difference was subtracted from distillate and one-third from residual. Beginning in January 1981, the EIA modified its survey forms to account for redesignated product and discontinued the above-mentioned adjustment.

Beginning in January 1993, the end-of-month stocks of distillate fuel oil are split into two sulfur categories (0.05 percent sulfur or less and greater than 0.05 percent sulfur) to meet Environmental Protection Agency requirements effective in October 1992. For further details, see the EIA, *Petroleum Supply Monthly*.

4. **New Stock Basis:** In January 1975, 1979, 1981, and 1983, numerous respondents were added to bulk terminal and pipeline surveys, affecting subsequent stocks reported and stock change calculations. Using the expanded coverage (new basis), the end-of-year stocks, in million barrels, would have been:

- Crude Oil: 1982—645 (Total) and 351 (Other Primary).
- Crude Oil and Petroleum Products: 1974—1,121; 1980—1,425; and 1982—1,461.
- Motor Gasoline: 1974—225; 1980—263; 1982—244 (Total) and 202 (Finished).
- Distillate Fuel Oil: 1974—224; 1980—205; and 1982—186.
- Residual Fuel Oil: 1974—75; 1980—91; and 1982—69.
- Jet Fuel: 1974—30 (Total) and 24 (Kerosene Type); 1980—42 (Total) and 36 (Kerosene Type); and 1982—39 (Total) and 32 (Kerosene Type).
- Liquefied Petroleum Gases: 1974—113; 1978—136; 1980—128; and 1982—102.
- Propane and Propylene: 1978—86; 1980—69; and 1982—57.
- Other Petroleum Products: 1974—190; 1980—207; and 1982—219.

Stock change calculations beginning in 1975, 1979, 1981, and 1983 were made by using new basis stock levels.

In January 1984, changes were made in the reporting of natural gas liquids. As a result, unfractionated stream, which was formerly included in the "Other Petroleum Products Supply and Disposition" table, is now reported on a component basis (ethane, propane, normal butane, isobutane, and pentanes plus). Most of these stocks now appear in the "Liquefied Petroleum Gases Supply and

Disposition" table. This change affects stocks reported and stock change calculations in each table. Under the new basis, end-of-year 1983 stocks, in million barrels, would have been:

- Liquefied Petroleum Gases: 1983—108.
- Propane and Propylene: 1983—55.
- Other Petroleum Products: 1983—210.

In January 1993, changes were made in the monthly surveys to begin collecting bulk terminal and pipeline stocks of oxygenates. This change affected stocks reported and stock change calculations. However, a new basis stock level was not calculated for 1992 end-of-year stocks.

5. Stocks of Alaskan Crude Oil: Stocks of Alaskan Crude oil in transit were included for the first time in January 1981. The major impact of this change is on the reporting of stock change calculations. Using the expanded coverage (new basis), 1980 end-of-year stocks, in million barrels, would have been 488 (Total) and 380 (Other Primary).

6. Data Discrepancies: Due to differences internal to EIA data processing systems, some small discrepancies exist between data in the *Monthly Energy Review* (*MER*) and the *Petroleum Supply Annual* (*PSA*) and *Petroleum Supply Monthly* (*PSM*). The data that have discrepancies are footnoted in Section 3 tables and summarized here.

Table	Data Series	Year Average	*MER* Data	*PSA* and *PSM* Data
3.1a	Natural Gas Plant Production	1976	1,604	1,603
3.1b	Exports, Total	1979	471	472

3.2b	Crude Losses	1980	14	15
3.5	Stock Change	1974	10	9
3.5	Stock Change	1975	-41	-40
3.8	Total Production	1982	1,527	1,525
3.10	Products Supplied	1982	1,857	1,856

Section 4. Natural Gas

Total dry natural gas production in the United States during June 1994 was an estimated 1.5 trillion cubic feet, 3 percent[4] higher than production during the previous June. Dry natural gas production during the first half of 1994 was 9.3 trillion cubic feet, 2 percent above production during the first half of 1993.

Consumption of natural and supplemental gas in June 1994 was 1.3 trillion cubic feet, 2 percent above the level in June 1993. Consumption of natural and supplemental gas during the first half of 1994 was 11 trillion cubic feet, 4 percent higher than consumption during the first half of 1993.

Deliveries to residential consumers in May 1994 (latest date for which data are available) were 251 billion cubic feet, 8 percent above the previous May's deliveries. Total deliveries to industrial consumers during May 1994 were 629, 4 percent higher than the previous May's level.

Imports of natural gas in June 1994 were 210 billion cubic feet, 15 percent higher than imports in the previous June. Imports of natural gas during the first half of 1994 were 1.3 trillion cubic feet, 11 percent higher than imports during the first half of 1993.

Stocks of working gas[5] in underground natural gas storage reservoirs at the end of June 1994 totaled 1.9 trillion cubic feet, slightly less than 1 percent below the level of stocks available 1 year earlier. Net injections into storage during June 1994 were 341 billion cubic feet, 9 percent below the amount of injections during the previous June.

[4]Percentage changes are based on unrounded data.
[5]Gas available for withdrawal.

[a] Gas withdrawn from gas and oil wells.

[b] The injection of natural gas into oil and gas formations for pressure maintenance and cycling purposes.

[c] See Note 1 at end of section.

[d] Vented: Natural gas released into the air on the base site or at processing plants. Flared: Natural gas burned in flares on the base site or at gas processing plants.

[e] "Gross Withdrawals" minus "Repressuring," "Nonhydrocarbon Gases Removed," and "Vented and Flared." See Note 2 at end of section.

[f] See Note 3 at end of section.

[g] "Marketed Production (Wet)" minus "Extraction Loss."

[h] May include unknown quantities of nonhydrocarbon gases.

R=Revised data. NA=Not available. E=Estimate.

Notes: • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] Data for 1980-1992 include underground storage and liquefied natural gas storage. All other data include underground storage only. Computation procedures are discussed in Note 8 at end of section.

[b] See Notes at end of section.

[c] See Table 4.3.

[d] Data for 1978 forward do not include in-transit receipts and deliveries.

[e] May include unknown quantities of nonhydrocarbon gases.

[f] See Note 7 at end of section.

R=Revised data. NA=Not available. E=Estimate.

Notes: • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

[a] By pipeline, except for very small amounts of liquefied natural gas imported from Canada in 1973, 1977 and 1981. See Note 5 at end of section.

[b] As liquefied natural gas.

[c] Other imports are from Mexico, except for 1986, when they came from Indonesia.

R=Revised data. (s)=Less than 500 million cubic feet.

Notes: • See Note 5 at end of section. • Totals may not equal sum of components due to independent rounding. • U.S. geographic coverage is the 50 States and the District of Columbia.

Sources: • **1973-1987:** Energy Information Administration (EIA), Form FPC-14, "Annual Report for Importers and Exporters of Natural Gas." • **1988 forward:** EIA, *Natural Gas Monthly*, August 1994, Tables 5 and 6.

Natural Gas Notes

1. Nonhydrocarbon Gases Removed: Annual data on nonhydrocarbon gases removed from marketed production—carbon dioxide, helium, hydrogen sulfide, and nitrogen—are from the Energy Information Administration (EIA) *Natural Gas Annual (NGA) 1991*. Data are not available for periods prior to 1980. Monthly data are reported by three States and computed for six States. Monthly data are preliminary until after publication of the EIA *NGA*. Differences between annual data published in the EIA *NGA* and the sum of the preliminary monthly data (January-December) are allocated proportionally to the months to create final monthly data. For further information on methods of estimating preliminary monthly data, see the EIA *Natural Gas Monthly (NGM)*.

2. Production.

- Annual data: Final annual data are from the EIA *NGA*.
- Estimated monthly data: Data for the two most recent months presented are estimated. Some of the data for earlier months are also estimated or computed. For a discussion of computation and estimation procedures, see the EIA *NGM*.
- Preliminary monthly data: Monthly data are considered preliminary until after publication of the EIA *NGA*. Preliminary monthly data are gathered from reports to the Interstate Oil Compact Commission and the U.S. Minerals Management Service. Volumetric data are converted, as necessary, to a standard 14.73 psi pressure base. Unless there are major changes, data are not revised until after publication of the EIA *NGA*.
- Final monthly data: Differences between annual data in the EIA *NGA* and the sum of preliminary monthly data (January-December) are allocated proportionally to the months to create final monthly data.

3. Extraction Loss: Extraction loss is the reduction in volume of natural gas resulting from the removal of natural gas liquid constituents at natural gas processing plants.

Annual data for extraction loss are from the EIA *NGA*, where they are estimated on the basis of the type and quantity of liquid products extracted from the gas stream and the calculated volume of such products at standard conditions. For a detailed explanation of the calculations used to derive estimated extraction losses, see the EIA *NGA*.

Preliminary monthly data are estimated on the basis of extraction loss as an annual percentage of marketed production. This percentage is applied to each month's marketed production to estimate monthly extraction loss.

Monthly data are revised and considered final after the publication of the EIA *NGA*. Final monthly data are estimated by allocating annual extraction loss data to the months on the basis of total natural gas marketed production data from the EIA *NGA*.

4. Supplemental Gaseous Fuels: Any gaseous substance that, introduced into or commingled with natural gas, increases the volume available for disposition. Such substances include, but are not limited to, propane-air, refinery gas, coke oven gas, still gas, manufactured gas, biomass gas, or air or inert gases added for Btu stabilization.

Annual data beginning with 1980 are from the EIA *NGA*. Unknown quantities of supplemental gaseous fuels are included in consumption data for 1979 and earlier years.

Monthly data are considered preliminary until after the publication of the EIA *NGA*. Monthly estimates are based on the annual ratio of supplemental gaseous fuels to the sum of dry gas production, net imports, and net withdrawals from storage. The ratio is applied to the monthly sum of the three elements to compute a monthly supplemental gaseous fuels figure.

5. Imports and Exports: The United States imports natural gas via pipeline from Canada. Prior to 1985, it also imported natural gas via pipeline from Mexico. Liquefied natural gas (LNG) arrives via tanker from Algeria. One shipment of LNG was received from Indonesia in December 1986. Very small amounts of LNG arrived from Canada in 1973 (667 million cubic feet), 1977 (572 million cubic feet), and 1981 (6 million cubic feet). The United States exports natural gas via pipeline to Canada and Mexico and LNG via tanker to Japan.

Annual and final monthly data are from the annual Form FPC-14, "Annual Report for Importers and Exporters of Natural Gas," which requires data to be reported by month for the calendar year.

Preliminary monthly data are EIA estimates. For a discussion of estimation procedures, see the EIA *NGM*. Preliminary data are revised after the publication of the EIA *U.S. Imports and Exports of Natural Gas*.

6. Consumption: Consumption includes pipeline fuel use, lease and plant fuel use, and deliveries to consuming sectors.

Final data are from the EIA *NGA*. Monthly data are considered preliminary until after publication of the EIA *NGA*. For more detailed information on the methods of

estimating preliminary and final monthly data, see the EIA *NGM*.

7. Balancing Item: The balancing item for natural gas represents the difference between the sum of the components of natural gas supply and the sum of components of natural gas disposition. The differences may be due to quantities lost or to the effects of data reporting problems. Reporting problems include differences due to the net result of conversions of flow data metered at varying temperature and pressure bases and converted to a standard temperature and pressure base; the effect of variations in company accounting and billing practices; differences between billing cycle and calendar period time frames; and imbalances resulting from the merger of data reporting systems which vary in scope, format, definitions, and type of respondents.

The increase of 0.2 trillion cubic feet (Tcf) in the "Balancing Item" category in 1983, followed by a decline of 0.5 Tcf in 1984, reflected unusually large differences resulting from the use of the annual billing cycle (essentially December 15 through the following December 14) consumption data in conjunction with calendar year supply data. Record cold temperatures during the last half of December 1983 resulted in a reported 0.3 Tcf increase in net withdrawals from underground storage for peak shaving as compared with the same period in 1982, but the effect of this cold weather was reflected primarily in 1984 consumption data. For underground storage data, see Table F2 in the May 1985 *NGM*, which was published in July 1985.

8. Natural Gas Storage: Gas in storage at the end of a reporting period may not equal the quantity derived by adding or subtracting net injections or withdrawals from the quantity in storage at the end of the previous period. The difference is due to changes in the quantity of native gas included in the base gas and/or losses in base gas due to migration from storage reservoirs.

Monthly underground storage data are collected from the Forms FERC-8 (interstate data) and EIA-191 (intrastate data). Beginning in January 1991, all data are collected on the revised Form EIA-191. Injection and withdrawal data from the FERC-8/EIA-191 survey are adjusted to correspond to data from Form EIA-176 following publication of the EIA *NGA*.

The final monthly and annual storage and withdrawal data for 1980-1989 include both underground and liquefied natural gas (LNG) storage. Annual data on LNG additions and withdrawals are from Form EIA-176. Monthly data are estimated by computing the ratio of each month's underground storage additions and withdrawals to annual underground storage additions and withdrawals and applying the ratio to the annual LNG data.

Total underground storage capacity at the end of each calendar year since 1975 (first year available), in billion cubic feet, was:

1975	6,280	1985	8,067
1976	6,544	1986	8,145
1977	6,678	1987	8,124
1978	6,890	1988	8,124
1979	6,929	1989	8,124
1980	7,434	1990	8,125

Current capacity is 7,989 billion cubic feet.

Section 5. Oil and Gas Resource Development

A total of 87 seismic exploration crews were active in July 1994, 7 more crews than were active a year earlier. Of the total, 64 were land crews and 23 were aboard marine vessels. The number of land crews decreased by 1 but the number of operating marine vessels increased by 8 vessels from the July 1993 count.

The July 1994 rotary rig count of 771 was 2 percent higher than the count in the previous month and 4 percent higher than the count in July 1993. Of the total number of rigs in operation, 664 were onshore and 107 were offshore. The number of onshore rigs was up 1 percent from the number in July 1993, and the number of offshore rigs was up 26 percent.

Total footage drilled in July 1994 was 9.4 million feet, up 12 percent from footage drilled in June 1994 but down 14 percent from that drilled in July 1993.

The estimated number of exploratory and development oil and gas wells drilled during July 1994 was 1,173, 1 percent higher than the number drilled in June 1994 but 9 percent lower than the number drilled in July 1993. The estimated number of oil wells drilled was 543 and the estimated number of gas wells was 630, 24 percent lower and 10 percent higher, respectively, than their July 1993 levels. The estimated number of dry holes drilled in July 1994 was 524, up 11 percent from the number drilled in June 1994 but 31 percent lower than the number drilled in July 1993.

R=Revised data.

Notes: • Service wells, stratigraphic tests, and core tests are excluded. • Due to the method of estimation, data shown on this page are frequently revised. See end of section. • Geographic coverage is the 50 States and the District of Columbia.

Sources: Energy Information Administration computations, which are based on well reports submitted to the American Petroleum Institute by the Petroleum Information Corporation, Denver, Colorado.

Oil and Gas Resource Development Notes

Three well types are considered in the *Monthly Energy Review (MER)* drilling statistics: "completed for oil," "completed for gas," and "dry hole." Wells that productively encounter both crude oil and natural gas are categorized as "completed for oil." Both development wells and exploratory wells (new field wildcats, new pool tests, and extension tests) are included in the statistics. All other classes of wells drilled in connection with the search for producible hydrocarbons are excluded.

Prior to the March 1985 *MER*, drilling statistics consisted of completion data for the above types and classes of wells as reported to the American Petroleum Institute (API) during a given month. Due to time lags between the date of well completion and the date of completion reporting to the API, as-reported well completions proved to be an inaccurate indicator of drilling activity. During 1982, for example, as-reported well completions rose, while the number of actual completions fell. Consequently, the drilling statistics published since the March 1985 *MER* are Energy Information Administration-generated (EIA) estimates produced by statistically imputing well counts and footage based on the partial data available from the API.

Estimates for a given month are first published in the *MER* for that month. Revisions of the "oil," "gas," and "dry" components are made in the 6th, 12th, and 24th subsequent months, as newly reported data allow refinement of the estimates. Unscheduled revisions may also occur when the latest estimate differs by more than 15 percent during the first 5 months, more than 10 percent during the next 6 months, or more than 2 percent thereafter through 5 years. After 5 years, the reported API data are published in lieu of EIA-generated estimates. Additional information about the EIA estimation methodology may be found in "Estimating Well Completions," the feature article published in the March 1985 *MER*.

Section 6. Coal

Coal production in June 1994 totaled 88 million short tons, 8 percent[6] higher than coal production in June 1993. Coal production for January through June 1994 totaled 514 million short tons, 8 percent higher than the 477 million short tons produced during the comparable period of 1993.

Electric utility coal consumption in May 1994 totaled 63 million short tons, 5 percent higher than the consumption level in May 1993.

Electric utility coal stocks were 120 million short tons at the end of May 1994, down from 151 million short tons at the end of May 1993.

Coal exports in May 1994 totaled 5 million short tons, 12 percent lower than exports in May 1993. Coal imports in May 1994 totaled 550 thousand short tons, 85 percent higher than imports in May 1993.

[6]Percentage changes are based on unrounded data.

[a] Includes Puerto Rico.

[b] Stocks held by electric utilities, coke plants, general industry, and coal producers and distributors at end of period. Excludes stocks held at retail dealers for consumption by the residential and commercial sector.

R=Revised data. NA=Not available. E=Estimate.

Notes: • Data through 1993 are final. Subsequent data are preliminary. • For methodology used to calculate production, consumption, and stocks, see Notes 1, 2, and 3 at end of section. • Totals may not equal sum of components due to independent rounding. • Geographic coverage is the 50 States and the District of Columbia.

Sources: • **Production: 1973-September 1977**—U.S. Department of the Interior, Bureau of Mines, *Minerals Yearbook* and *Minerals Industry Surveys*. **October 1977 forward**—Energy Information Administration, *Weekly Coal Production*. • **Consumption:** Table 6.2. • **Imports and Exports:** U.S. Department of Commerce, Bureau of the Census, Monthly Reports IM-145 (Imports) and EM-545 (Exports). • **Stocks:** Table 6.3.

Coal Notes

1. Production: Preliminary monthly estimates of national coal production are the sum of weekly estimates developed by the Energy Information Administration (EIA) and published in the *Weekly Coal Production* report. When a week extends into a new month, production is allocated on a daily basis and added to the appropriate month. Weekly estimates are based on Association of American Railroads data showing the number of railcars loaded with coal during the week by Class I and certain other railroads. This number is converted into tons of coal by EIA by using the average number of tons of coal per railcar loaded reported in the most recent "Quarterly Freight Commodity Statistics" from the Interstate Commerce Commission. If an average coal tonnage per railcar loaded is not available for a specific railroad, the national average is used. To derive the estimate of total weekly production, the total rail tonnage for the week is divided by the ratio of quarterly production shipped by rail and total quarterly production. Data for the corresponding quarter of previous years are used to derive this ratio. This method insures that the seasonal variations are preserved in the production estimates.

When preliminary quarterly data become available, the monthly and weekly estimates are adjusted to conform to the quarterly figure. The adjustment procedure uses State-level production data and is explained in EIA's *Quarterly Coal Report*. Initial estimates of annual production published in January of the following year are based on preliminary production data covering the first 9 months (three quarters) and weekly/monthly estimates for the fourth quarter. The fourth quarter estimates may or may not be revised when preliminary data become available in March of the following year, depending on the magnitude of the difference between the estimates and the preliminary data. In any event, all quarterly, monthly, and weekly production figures are adjusted to conform to the final annual production data published in the *Monthly Energy Review* in the fall of the following year.

2. Consumption: Coal consumption data are reported by major end-use sector. Estimated data for the most recent months (designated by an "E") are derived from forecasted values shown in the EIA *Short-Term Energy Outlook* (DOE/EIA-0202) table titled "Supply and Disposition of Coal: Mid World Oil Price Case." The monthly estimates are one-third of the quarterly values shown in the then current issue of the publication, regularly released in February, May, August, and November. The estimates are revised quarterly as collected data become available from the data sources. Sector-specific information follows.

- Residential and Commercial—Prior to 1980, monthly consumption estimates for the residential and commercial sector were derived by using reported data to modify baseline figures developed by the Bureau of Mines. From 1980-1987, monthly estimates were derived by proportioning reported quarterly data by using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported on Form EIA-2. During 1981 and 1982, the estimates were also modified to reflect air temperature degree-days. Quarterly consumption data were taken directly from reported data and were defined as distribution to the residential and commercial sector as reported by coal producers and distributors on Form EIA-6. Beginning in January 1988, monthly residential and commercial consumption estimates are derived from reported quarterly data by using monthly national average population weighted heating/cooling degree-days obtained from the National Oceanic and Atmospheric Administration. The monthly ratios are the monthly national sum of heating and cooling degree-days as a proportion of the quarterly national sum. Quarterly consumption data are taken directly from reported data.
- Coke Plants—Prior to 1980, monthly coke plant consumption data were taken directly from reported data. From 1980-1987, coke plant consumption estimates were derived by proportioning reported quarterly data by using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported. Beginning in January 1988, monthly coke plant consumption estimates are derived from the reported quarterly data by using monthly ratios of raw steel production data from the American Iron and Steel Institute. The ratios are the monthly raw steel production from open hearth and basic oxygen process furnaces as a proportion of the quarterly production from those kinds of furnaces.
- Other Industrial—Prior to 1978, monthly consumption data for the other industrial sector (i.e., all industrial users minus coke plants) were derived by using reported data to modify baseline consumption figures from the most recent Bureau of the Census Annual Survey of Manufactures or Census of Manufactures. For 1978 and 1979, monthly estimates were derived from data reported on Forms EIA-3 and EIA-6. From 1980-1987, monthly figures were estimated by proportioning quarterly data by using the ratios of monthly-to-quarterly consumption data in 1979, the last year in which monthly data were reported on Form EIA-3. Quarterly consumption data were derived by adding beginning stocks at manufacturing plants to current receipts and subtracting ending stocks at manufacturing plants. In this calculation, current receipts were the greater of either reported receipts from manufacturing plants (Form EIA-3) or reported shipments to the other industrial sector (Form EIA-6), thereby ensuring that agriculture, forestry, fishing, mining, and construction consumption data were included where appropriate. Starting in January 1988, monthly consumption for the other industrial sector is estimated from reported quarterly data by using

ratios derived from industrial production indices published by the Board of Governors of the Federal Reserve System. Indices for six major industry groups are used as the basis for calculating the ratios: foods, Standard Industrial Classification (SIC) 20; paper and products, SIC 26; chemicals and products, SIC 28; petroleum products, SIC 29; clay, glass, and stone products, SIC 32; and primary metals, SIC 33. The monthly ratios are computed as the monthly sum of the weighted indices as a proportion of the quarterly sum of the weighted indices by using the 1977 proportion as the weights.

- Electric Utilities—Monthly consumption data for electric utility plants are taken directly from reported data.

3. Stocks: Coal stocks data are reported by major end-use sector. Estimated data for the most recent months (designated by an "E") are derived from forecasted values shown in the EIA *Short-Term Energy Outlook* (DOE/EIA-0202) table titled "Supply and Disposition of Coal: Mid World Oil Price Case." The monthly estimates are one-third of the quarterly values shown in the then current issue of the publication, regularly released in February, May, August, and November. The estimates are revised quarterly as collected data become available from the data sources. Sector-specific information follows.

- Coke Plants—Prior to 1980, monthly stocks at coke plants were taken directly from reported data. From 1980 forward, coke plant stocks are estimated by using one-third of the current quarterly change to indicate the monthly change in stocks. Quarterly stocks are directly from data reported on Form EIA-5.
- Other Industrial—Prior to 1978, stocks for the other industrial sector were derived by using reported data to modify baseline figures from a one-time Bureau of Mines survey of consumers. For 1978-1982, monthly estimates were derived by judgmentally proportioning reported quarterly data based on representative seasonal patterns of supply and demand. From 1983 forward, other industrial coal stocks are estimated as indicated above for coke plants. Quarterly stocks are taken directly from data reported on Form EIA-3 and therefore include only manufacturing industries; data for agriculture, forestry, fishing, mining, and construction stocks are not available.
- Electric Utilities—Monthly stocks data at electric utility plants are taken directly from reported data.
- Producers and Distributors—Quarterly stocks at producers and distributors are taken directly from reported data. Monthly data are estimated by using one-third of the current quarterly change to indicate the monthly change in stocks.

4. Imports and Exports: All coal import and export figures are taken directly from data reported monthly by the Bureau of the Census.

5. Additional Information: EIA's *Quarterly Coal Report* provides additional information about coal data and estimation procedures.

Section 7. Electricity

During May 1994, electric utilities generated 228 billion kilowatthours of electricity, 2 percent[7] more than in May 1993. Coal-fired generation totaled 126 billion kilowatthours, 5 percent more than in May 1993. Nuclear generation totaled 49 billion kilowatthours, 4 percent below the level 1 year earlier. Hydroelectric generation totaled 24 billion kilowatthours, 17 percent below the May 1993 level. Natural gas-fired generation was 21 billion kilowatthours, 31 percent higher than the May 1993 level. Petroleum-fired generation totaled 7 billion kilowatthours, 33 percent above the level 1 year earlier.

Sales of electricity to all ultimate consumers in the United States in May 1994 were 222 billion kilowatthours, 3 percent more than sales during May 1993. Sales to industrial consumers totaled 83 billion kilowatthours in May 1994, 2 percent above the level a year ago. Sales to residential consumers during May 1994 were 67 billion kilowatthours, 5 percent above the level of sales during the previous year. Commercial sales were 64 billion kilowatthours, 4 percent higher than the level of commercial sales 1 year earlier. In May 1994, other sales totaled 7 billion kilowatthours, 1 percent lower than the May 1993 level.

Electric utility consumption of coal during May 1994 was 63 million short tons, 5 percent above consumption in May 1993. Petroleum consumption (excluding petroleum coke) during May 1994 was 12 million barrels, 34 percent above the level of consumption in May 1993. During May 1994, electric utilities consumed 216 billion cubic feet of natural gas, 30 percent above the May 1993 consumption level.

On May 31, 1994, electric utility stocks of all types of coal totaled 120 million short tons, 21 percent below the level on May 31, 1993. Stocks of petroleum (excluding petroleum coke) on May 31, 1994, totaled 61 million barrels, 6 percent below the level on May 31, 1993.

[7]Percentage changes are based on numbers shown in the following tables.

[a] Heavy oil includes fuel oil nos. 4, 5, and 6, and residual fuel oils.
[b] Light oil includes fuel oil nos. 1 and 2, kerosene, and jet fuel.
[c] GT/IC = Gas turbine and internal combustion plants.
[d] Includes supplemental gaseous fuels.
NA=Not available.

Section 8. Nuclear Energy

In May 1994, U.S. nuclear generating units produced a total of 49 net terawatthours (billion kilowatthours) of electricity, 4 percent[1] less than in May 1993. Nuclear units generated at an average capacity factor of 65.8 percent, 3 percentage points lower than in May 1993. Nuclear power supplied 21.3 percent of the total electric utility-generated electricity in May 1994, compared with 22.6 percent in May 1993.

No low- or full power licenses for nuclear power plants were issued by the Nuclear Regulatory Commission during May 1994.

On May 31, 1994, there were 109 operable nuclear generating units in the United States, with a collective net summer capability of 99.1 million kilowatts of electricity. Of the 109 operable units, 30 units generated at less than 25 percent of capacity because of maintenance, refueling, or repair outage, and 22 of the 30 units generated no electricity during the month.

Two operable units, Browns Ferry 1 and 3, have been shut down since March 1985. Each unit had a capacity of 1,065 megawatts electric.

As of May 31, 1994, there were 115 domestic nuclear generating units in all stages of construction and operation (construction of the Perry-2 nuclear unit, in North Perry, Ohio, was canceled as of January 4, 1994). The aggregate net design capacity of operable units was 101.1 million kilowatts, and the design capacity of units under construction was 7.3 million kilowatts, for a total design capacity of 108.4 million kilowatts.

[1]Percent changes are based on numbers shown in the following tables.

Nuclear Energy Notes

1. Operable Units: Nuclear generating units that have been issued a full-power license by the Nuclear Regulatory Commission (NRC).

Exceptions: The Shippingport (60 megawatts (MW)) and the Hanford-N (840 MW) nuclear units were included in the operable units until 1982 and 1988, respectively. The Shippingport unit was excluded from the operable category during March 1974-August 1977 due to a major core modification outage. Hanford-N, an unlicensed unit used for defense materiel production, was included in the operable category because power was produced as by-product and sold commercially. Three Mile Island 2 (880 MW) experienced a major accident in 1979 and, although that unit still retains its operating license and site cleanup continues, there is no plan to restart it. Therefore, it has not been included in the operable category since March 1979. Although Shoreham received a full-power license in April 1989, the unit is not currently scheduled to operate and, therefore, has not been included in the operable category. Rancho Seco (873 MW) was shut down by the Sacramento Municipal Utility District (SMUD) in June 1989 following a referendum on its continued operation. Because there are currently no plans to operate it as a nuclear unit, it is no longer included as an operable unit but is identified as a unit shut down for an extended period. As soon as SMUD and the NRC formalize the plant's official retirement, it will be noted as such in this report. The Department of Energy-operated Experimental Breeder Reactor 2 unit is not a commercial reactor and is therefore not included in the operable category.

In addition, nine units have been retired and therefore removed from the operable category. Those units are: Peach Bottom 1 (40 MW) and Indian Point 1 (265 MW), both retired in 1974; Humboldt Bay (65 MW), officially retired in 1976; Dresden 1 (200 MW), retired in August 1979; LaCrosse (51 MW), retired in May 1987; Fort Saint Vrain (217 MW), retired in August 1989; Yankee Rowe 1 (185 MW), retired in February 1992; San Onofre 1 (436 MW), retired in December 1992; and Trojan (1,104 MW), retired in January 1993.

2. In Startup: The period of time between a nuclear generating unit's initial fuel loading date and the issuance of its full-power license. During that period, the unit is undergoing low-power testing and the maximum level of operation is 5 percent of the unit's design thermal rating.

3. Capacity: Nuclear generating units may have more than one type of net capacity rating, including the following:

(a) Net Summer Capability—The steady hourly output that generating equipment is expected to supply to system load, exclusive of auxiliary power, as demonstrated by test at the time of summer peak demand. Auxiliary power of a typical nuclear power plant is about 5 percent of gross generation.

(b) Net Design Capacity or Net Design Electrical Rating (DER)—The nominal net electrical output of a unit, specified by the utility and used for plant design.

4. Monthly Capacity Factors: The monthly capacity factors are computed as the actual monthly generation divided by the maximum possible generation for that month. The maximum possible generation is the number of hours in the month multiplied by the net summer capability at the end of the month. That fraction is then multiplied by 100 to obtain a percentage. Annual capacity factors are averages of the monthly values for that year.

Section 9. Energy Prices

Crude Oil. The average price of domestic crude oil purchased at the wellhead was $14.03 per barrel in May 1994, 12 percent below the level in May 1993. The refiner acquisition cost of imported crude oil in May 1994 was $15.79 per barrel, 12 percent below the May 1993 level. The average cost of domestic crude oil in May 1994 was $15.95, 13 percent less than the May 1993 average.

Motor Gasoline. The national city average retail price of unleaded regular gasoline at all types of stations was $1.11 per gallon in June 1994, 2 percent lower than the price in June 1993. The price of unleaded premium gasoline averaged $1.30 per gallon in June 1994, 2 percent lower than the price in June 1993.

Residual Fuel Oil. The average price, excluding taxes, of residual fuel oil sold to end users in May 1994 was 33 cents per gallon, 6 percent higher than the previous month's price but 10 percent below the May 1993 average. The average resale price, excluding taxes, of residual fuel oil in May 1994 was 30 cents per gallon, 7 percent higher than the April 1994 average but 5 percent lower than the price 1 year earlier.

Aviation Fuel. The average price, excluding taxes, of aviation gasoline sold to end users in May 1994 was 92 cents per gallon, 1 percent higher than the previous month's price but 10 percent lower than the May 1993 price. The average price, excluding taxes, of kerosene-type jet fuel sold to end users in May 1994 was 51 cents per gallon, slightly higher than the previous month's average price but 15 percent lower than the May 1993 average price.

No. 2 Distillate Fuel Oil. The May 1994 national average price, excluding taxes, of heating oil sold to residential customers was 86 cents per gallon, 2 percent lower than the April 1994 price and 6 percent lower than the May 1993 price. The average price of No. 2 fuel oil sold to all end users was 54 cents per gallon in May 1994, 8 percent below the April 1994 price and 11 percent lower than the May 1993 price.

Electricity. The average price of electricity sold to all ultimate consumers in the United States in May 1994 was 6.8 cents per kilowatthour, the same as the May 1993 mean price. The price of electricity sold to residential consumers in May 1994 averaged 8.5 cents per kilowatthour, 1 percent below the May 1993 price. The price of electricity sold to commercial consumers averaged 7.7 cents per kilowatthour in May 1994, the same as the May 1993 price. The price of electricity sold to other consumers was 6.9 cents per kilowatthour, the same as the May 1993 price. The price of electricity sold to industrial users in May 1994 averaged 4.7 cents per kilowatthour, the same as the price 1 year earlier.

Beginning with January 1986, there were new series of national average price estimates based on a statistically derived sample of both publicly and privately owned electric utilities. Previously, average price estimates were derived from selected privately owned electric utilities and were not national averages.

Natural Gas. The estimated average wellhead price of natural gas for May 1994 was $1.83 per thousand cubic feet, 21 percent below the May 1993 price.

The average price of natural gas delivered to electric utility plants was $2.44 per thousand cubic feet in April 1994 (latest date for which data are available), 11 percent below the April 1993 price. The average price of natural gas used by residential consumers in May 1994 was $7.01 per thousand cubic feet, 4 percent above the May 1993 price. The average price of natural gas used by commercial consumers in May 1994 was $5.41 per thousand cubic feet, 4 percent higher than the May 1993 price. The average price of natural gas used by industrial consumers in May 1994 was $3.03 per thousand cubic feet, 7 percent below the May 1993 price.

Notes: • Values for Domestic First Purchase Price and Refiner Acquisition Cost for the current month and for F.O.B. and Landed Costs of Imports for the current 2 months are preliminary. • F.O.B. and landed costs through 1980 reflect the period of reporting; prices after 1980 reflect the period of loading. • Annual averages are the averages of the monthly prices, weighted by volume. • Geographic coverage is the 50 States, the District of Columbia, Puerto Rico, the Virgin Islands, and all U.S. Territories and Possessions.

Sources: • **Domestic First Purchase Price: 1973-1976**—U.S. Department of the Interior (DOI), Bureau of Mines (BOM), *Minerals Yearbook*, "Crude Petroleum and Petroleum Products" chapter. **1977**—Federal Energy Administration (FEA), based on Form FEA-P124, "Domestic Crude Oil Purchaser's Monthly Report." **1978 forward**—Energy Information Administration (EIA), *Petroleum Marketing Monthly*, August 1994, Table 1. • **F.O.B. and Landed Cost of Imports: October 1973-September 1977**—FEA, Form FEA-F701-M-0, "Transfer Pricing Report." **October-December 1977**—EIA, Form FEA-F701-M-0, "Transfer Pricing Report." **1978 forward**—EIA, *Petroleum Marketing Monthly*, August 1994, Table 1. • **Refiner Acquisition Cost: 1973**—EIA estimates. The domestic price was derived by adding estimated transportation costs to the reported domestic first purchase price. The imported price was derived by adding an estimated ocean transport cost to the average "Free Alongside Ship" value published by the U.S. Bureau of the Census. **1974-1976**—DOI, BOM, *Minerals Yearbook*, "Crude Petroleum and Petroleum Products" chapter. **1977—January-September**—FEA, based on Form FEA-P110-M-1, "Refiners' Monthly Cost Allocation Report." **October-December**—EIA, based on Form FEA-P110-M-1, "Refiners' Monthly Cost Allocation Report." **1978 forward**—EIA, *Petroleum Marketing Monthly*, August 1994, Table 1.

[a] Beginning with February 1994, data for Iran are no longer reported in the *Petroleum Marketing Monthly*.

[b] The Arab members of OPEC are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates.

[c] Current members of OPEC are Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. Prior to 1993, Ecuador was also a member. The cost of imports from the Neutral Zone between Kuwait and Saudi Arabia is included in the cost of imports from "Total OPEC."

[d] Based on October, November, and December data only.

[e] No data reported.

R=Revised data. NA=Not available. W=Value withheld to avoid disclosure of individual company data.

Notes: • The Free on Board (F.O.B.) cost at the country of origin excludes all costs related to insurance and transportation. See Note 2 at end of section. • Values for the current 2 months are preliminary. • Prices through 1980 reflect the period of reporting; prices after 1980 reflect the period of loading. • Annual averages are averages of the monthly prices, including prices not published, weighted by volume. • Cargoes that are purchased on a "netback" basis, or under similar contractual arrangements whereby the actual purchase price is not established at the time the crude oil is acquired for importation into the United States, are not included in the published data until the actual prices have been determined and reported. • U.S. geographic coverage is the 50 States and the District of Columbia.

[a] "Other" is public street and highway lighting, other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

[b] Average price for total sales to ultimate consumers.

[c] Annual values are the sum of the monthly revenue divided by the sum of the monthly sales. Data through 1979 cover privately owned electric utilities in Classes A and B. Data for 1980-1985 cover selected privately owned electric utilities in Class A whose electric operating revenue was $100 million or more during the previous year. See Note 7 at end of section.

NA=Not available. – =Not applicable.

Notes: • Prices are calculated by dividing revenue by sales. Revenue may not correspond to sales for a particular month because of electric utility billing and accounting procedures. That lack of correspondence could result in uncharacteristic increases or decreases in the monthly prices. See Note 7 at end of section. • Geographic coverage is the 50 States and the District of Columbia.

[a] Includes supplemental gaseous fuels.

[b] Heavy oil includes fuel oil nos. 4, 5, and 6, and topped crude oil. The weighted averages for petroleum and all fossil fuels include both heavy and light oil (No. 2 fuel oil, kerosene, and jet fuel) prices. Data do not include petroleum coke.

[c] Data for 1973-1982 do not include small quantities of rerefined motor oil, bunker oil, and liquefied petroleum gas.

R=Revised data.

Notes: • See Note 8 at end of section. • Geographic coverage is the 50 States and the District of Columbia.

Energy Prices Notes

1. The average domestic first purchase price represents the average price at which all domestic crude oil is purchased. Prior to February 1976, the price represented an estimate of the average of posted prices; beginning with February 1976, the price represents an average of actual first purchase prices. The data series was previously called "Actual Domestic Wellhead Price."

2. F.O.B. literally means "Free on Board." It denotes a transaction whereby the seller makes the product available with an agreement on a given port at a given price; it is the responsibility of the buyer to arrange for the transportation and insurance.

3. The landed cost of imported crude oil from selected countries does not represent the total cost of all imported crude. Prior to March 1975, imported crude costs to U.S. company-owned refineries in the Caribbean were not included in the landed cost, and costs of crude oil from countries that export only small amounts to the United States were also excluded. Beginning in March 1975, however, coverage was expanded to include U.S. company-owned refineries in the Caribbean. Landed costs do not include supplemental fees.

4. Beginning with January 1981, refiner acquisition costs of crude oil are from data collected on Form EIA-14, "Refiners' Monthly Cost Report." Those costs were previously published from data collected on Form ERA-49, "Domestic Crude Oil Entitlements Program Refiners Monthly Report." Form ERA-49 was discontinued with the decontrol of crude oil on January 28, 1981. Crude oil purchases and costs are defined for Form EIA-14 in accordance with conventions used for Form ERA-49. Also, the respondents for the two forms are essentially the same. However, due to possible different interpretations of the filing requirements and a different method for handling prior period adjustments, care must be taken when comparing the data collected on the two forms.

The refiner acquisition cost of crude oil is the average price paid by refiners for crude oil booked into their refineries in accordance with accounting procedures generally accepted and consistently and historically applied by the refiners concerned. Domestic crude oil is that oil produced in the United States or from the outer continental shelf as defined in 43 USC Section 1331. Imported crude oil is either that oil reported on Form ERA-51, "Transfer Pricing Report," or any crude oil that is not domestic oil. The composite cost is the weighted average of domestic and imported crude oil costs.

Crude oil costs and volumes reported on Form ERA-49 excluded unfinished oils but included the Strategic Petroleum Reserve (SPR). Crude oil costs and volumes reported on Form FEA-P110-M-1, "Refiners' Monthly Cost Allocation Report," included unfinished oils but excluded SPR. Imported averages derived from Form ERA-49 exclude oil purchased for SPR, whereas the composite averages derived from Form ERA-49 include SPR. None of the prices derived from Form EIA-14 include either unfinished oils or SPR.

5. Several different series of motor gasoline prices are published in this section. U.S. City Average Retail Prices of Motor Gasoline are calculated monthly by the Bureau of Labor Statistics during the development of the Consumer Price Index (CPI). These prices include all Federal, State, and local taxes paid at the time of sale. For the period 1974-1977, prices were collected in 56 urban areas. For the period 1978 forward, prices were collected from a new sample of service stations in 85 urban areas selected to represent all urban consumers—about 80 percent of the total U.S. population. The service stations are selected initially, and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full-, mini-, and self-serve).

Refiner prices of finished motor gasoline for resale and to end users are determined by the Energy Information Administration (EIA) in a monthly survey of refiners and gas plant operators (Form EIA-782A). The prices do not include any Federal, State, or local taxes paid at the time of sale. Estimates of prices prior to January 1983 are based on Form FEA-P302-M-1/EIA-460, "Petroleum Industry Monthly Report for Product Prices," and also exclude all Federal, State, or local taxes paid at the time of sale. Sales for resale are those made to purchasers who are other-than-ultimate consumers. Sales to end users are sales made directly to the consumer of the product, including bulk consumers (such as agriculture, industry, and utilities) and residential and commercial consumers.

6. Starting in January 1983, Form EIA-782, "Monthly Petroleum Product Sales Report," replaced 10 previous surveys. Every attempt was made to continue the most important price series. However, prices published through December 1982 and those published since January 1983 do not necessarily form continuous data series due to changes in survey forms, definitions, instructions, populations, samples, processing systems, and statistical procedures. To provide historical data, continuous series were generated for annual data 1978-1982 and for monthly data 1981 and 1982 by estimating the prices that would have been published had Form EIA-782 survey and system been in operation at that time. This form of estimation was performed after detailed adjustment was made for product and sales type matching and for discontinuity due to other factors. An important difference between the previous and present prices is the distinction between wholesale and resale and between retail and end user. The resale category continues to include sales among resellers. However, bulk sales to utility, industrial, and commercial accounts previously included in the wholesale category are now counted as made to end users. The end-user category continues to include retail sales through company owned and operated

outlets but also includes the bulk utility, industrial, and commercial sales. Additional information may be found in Estimated Historic Time Series for the EIA-782, a feature article reprinted from the December 1983 [3] *Petroleum Marketing Monthly*, published by EIA.

7. National average electricity prices are shown in two data series. The "Annual Series" is based on data from more than 3,000 publicly and privately owned electric utilities that report on Form EIA-861, "Annual Electric Utility Report." The "Monthly Series" is based on data from over 400 utilities statistically chosen as a stratified sample of the utilities that report on Form EIA-861. The selected utilities report monthly on Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," formerly the "Electric Utility Company Monthly Statement." Annual values shown for the monthly series are the sum of the monthly revenue divided by the sum of the monthly sales. Prior to January 1986, only privately owned utilities were included in the monthly survey and the sample was chosen by using cut-off, rather than stratification, techniques.

8. Data for 1973-1982 cover all electric generating plants at which the generator nameplate capacity of all steam-electric units combined totaled 25 megawatts or greater. From 1974-1982, peaking units were included in the data and counted towards the 25-megawatt-or-greater total. Data for 1983-1990 cover all electric generating plants at which the generator nameplate capacity of all steam-electric units combined totaled 50 megawatts or greater. Data for 1991 forward cover all electric generating plants at which the generator nameplate capacity of all steam-electric units and combined-cycle units together totaled 50 megawatts or greater.

9. Natural gas prices are intended to include all taxes. Instructions on the data collection forms specifically direct that all Federal, State, and local taxes, surcharges, and/or adjustments billed to consumers are to be included. However, sales and other taxes itemized on consumers' bills are sometimes excluded by the reporting utilities.

Delivered-to-consumers prices for 1987 forward represent natural gas delivered and sold to residential, commercial, industrial, and electric utility consumers. They do not include the price of natural gas delivered to industrial and commercial consumers on behalf of third parties. Volumes of natural gas delivered on behalf of third parties are included in the consumption data shown in Table 4.4. Additional information is available in the EIA *Natural Gas Monthly*, Appendix C.

Section 10. International Energy

Crude Oil Production. World crude oil production during May 1994 was 60 million barrels per day, up 0.2 million barrels per day from the level in the previous month.

Organization of Petroleum Exporting Countries (OPEC) production during May 1994 averaged 26 million barrels per day, up 0.1 million barrels per day from the level during the previous month. Production by the Arab members of OPEC in May 1994 averaged 16 million barrels per day, up slightly from the April 1994 level. During May 1994, production increased in Kuwait by 30 thousand barrels per day and in the United Arab Emirates by 10 thousand barrels per day. Production decreased in Saudi Arabia by 20 thousand barrels per day. Production remained unchanged in Algeria, Iraq, Libya, and Qatar. Among the non-Arab members of OPEC, production during May 1994 increased in Iran by 50 thousand barrels per day, in Nigeria by 30 thousand barrels per day, and in Venezuela by 20 thousand barrels per day. Production remained unchanged in Indonesia.

Among the non-OPEC nations, production during May 1994 increased in the former U.S.S.R. by 110 thousand barrels per day, in the United States by 24 thousand barrels per day, in Canada by 20 thousand barrels per day, and in the United Kingdom by 5 thousand barrels per day. Production remained unchanged in Ecuador, Mexico, and China.

Petroleum Consumption. In March 1994, consumption in all Organization for Economic Cooperation and Development (OECD) countries was 40.3 million barrels per day, less than 1 percent lower than the March 1993 rate. The consumption rate was higher than it was 1 year ago in Germany (+5 percent)[9], the United Kingdom (+3 percent), and Japan (slightly higher). Consumption was lower in France (-8 percent), the United States (-2 percent), and Italy and Canada (both -1 percent), compared with levels 1 year earlier.

Petroleum Stocks. For all OECD countries, petroleum stocks at the end of March 1994 totaled 3.5 billion barrels, 1 percent lower than the ending stock level in March 1993. Stock levels were higher than the levels 1 year ago in France (+10 percent) and Japan (+2 percent). Stocks were lower in the United Kingdom (-7 percent), Italy and Canada (both -5 percent), and Germany and the United States (both -1 percent), compared with levels 1 year earlier.

Nuclear Electricity Generation. Based on *Nucleonics Week* information for May 1994, all reporting countries with nuclear capacity generated 168.2 gross terawatthours[10] of nuclear-generated electricity.

During 1993, nine nuclear units became operable: Comanche Peak-2 in the United States; Darlington-4 in Canada; Guangdong-1 in China; Golfech-2 in France; Shika-1, Hamaoka-4, Genkai-3, and Kashiwazaki Kariwa-4 in Japan; and Balakova-4 in Russia. Three units were permanently shutdown in 1993: Trojan in the United States; and Trawsfynydd-1 and Trawsfynydd-2 in the United Kingdom.

During the first 5 months of 1994, two nuclear units became operable: Guangdong-2 in China during February and Japan's Ikata-3 during March. Two units were permanently shutdown: the United Kingdom's Dounreay during March and France's Bugey-1, a 560-gross megawatt gas-cooled reactor unit, on May 27, 1994.

As of May 31, 1994, there were 430 operable nuclear generating units in the world.

[9] Percentage changes are based on unrounded data.
[10] One terawatthour equals 1 billion kilowatthours.

[a] Includes about one-half of the production in the Kuwait-Saudi Arabia Neutral Zone from 1973 through July 1990 and in June 1991. Kuwaiti Neutral Zone output was discontinued following Iraq's invasion of Kuwait on August 2, 1990, but was resumed in June 1991. In May 1994, Neutral Zone production by both Kuwait and Saudi Arabia totaled about 380 thousand barrels per day.

[b] The Arab members of the Organization of Petroleum Exporting Countries (OPEC) are Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and the United Arab Emirates. Production in the Neutral Zone between Kuwait and Saudi Arabia is included in "Arab OPEC."

R=Revised data.

Notes: • Crude oil includes lease condensate but excludes natural gas plant liquids. • Monthly data are often preliminary figures and may not average to the annual totals because of rounding or because updates to the preliminary monthly data are not available.

[a] "Total OPEC" consists of Algeria, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela. Production from the Neutral Zone between Kuwait and Saudi Arabia is included in "Total OPEC." Although Ecuador belonged to OPEC from November 19, 1973, until December 31, 1992, when it formally withdrew, it is not included in "Total OPEC."

[b] The Persian Gulf Nations are Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and the United Arab Emirates. Production from the Neutral Zone between Kuwait and Saudi Arabia is included in "Persian Gulf Nations."

[c] "Other" is a calculated total derived from the difference between "World" and the sum of production in "Total OPEC," Ecuador, Canada, China, Mexico, the United Kingdom, the United States, and the former U.S.S.R.

R=Revised data. E=Estimate.

Notes: • Crude oil includes lease condensate but excludes natural gas plant liquids. • Monthly data are often preliminary figures and may not average to the annual totals because of rounding or because updates to the preliminary monthly data are not available. • Data for countries may not sum to World totals due to independent rounding. • U.S. geographic coverage is the 50 States and the District of Columbia.

[a] Through December 1990, the data for Germany are for the former West Germany only. Beginning with January 1991, the data for Germany are for the unified Germany, i.e., the former East Germany and West Germany.

[b] "OECD Europe" consists of Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, and the United Kingdom.

[c] "Other OECD" consists of Australia, New Zealand, and the U.S. Territories.

[d] The Organization for Economic Cooperation and Development (OECD) consists of Canada, Japan, and the United States, as well as "OECD Europe" and "Other OECD."

R=Revised data.

Notes: • Data through 1991 are final. Subsequent data are preliminary. • Totals may not equal sum of components due to independent rounding. • U.S. geographic coverage is the 50 States and the District of Columbia.

[a] Through December 1990, the data for Germany are for the former West Germany only. Beginning with January 1991, the data for Germany are for the unified Germany, i.e., the former East Germany and West Germany.

[b] "OECD Europe" consists of Austria, Belgium, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, and the United Kingdom.

[c] "Other OECD" consists of Australia, New Zealand, and the U.S. Territories.

[d] The Organization for Economic Cooperation and Development (OECD) consists of Canada, Japan, and the United States, as well as "OECD Europe" and "Other OECD."

R=Revised data.

Notes: • Petroleum stocks include crude oil (including strategic reserves), unfinished oils, natural gas plant liquids, and refined products. Petroleum stocks include all nonmilitary petroleum held for storage, regardless of ownership, within each country in bulk terminals, refinery tanks, pipeline tankage, intercoastal tankers, tankers in port, and inland ship bunkers. Data exclude oil held in pipelines (except for those in the United States), rail and truck cars, sea-going ships' bunkers, service stations, retail stores, and tankers at sea. • In the United States in January 1975, 1981, and 1983, numerous respondents were added to bulk terminal and pipeline surveys, thereby affecting subsequent stocks reported. New-basis end-of-year U.S. stocks, in million barrels, would have been 1,121 in 1974, 1,425 in 1980, and 1,461 in 1982. • Data through 1991 are final. Subsequent data are preliminary. • Totals may not equal sum of components due to independent rounding. • U.S. geographic coverage is the 50 States and the District of Columbia.

[a] See Table 10.4e for country-specific estimated annual generation in 1992 and 1993, and available monthly generation in 1993, for Eastern Europe.

R=Revised data. NA=Not available. – =Not applicable. E=Estimate.

Notes: • Net figures are generally less than gross figures by about 5 percent, the difference being the energy consumed by the generating plants themselves. • Monthly data may not sum to annual totals due to independent rounding and because precommercial generation is included in some annual totals but not in the monthly data. • Data for regions may not sum to totals due to independent rounding.

[a] Through December 1990, the data for Germany are for the former West Germany only. Beginning with January 1991, the data for Germany are for the unified Germany, i.e., the former East Germany and West Germany.

[b] In 1987, Italy's citizens voted for a nuclear power moratorium, which shut down their nuclear power plants indefinitely.

[c] Monthly data for the United Kingdom are totals for 4- or 5-week reporting periods, not calendar months.

– =Not applicable. E=Estimate. (s)=Less than 0.05 billion kilowatthours.

Notes: • Net figures are generally less than gross figures by about 5 percent, the difference being the energy consumed by the generating plants themselves. • Monthly data may not sum to annual totals due to independent rounding and because precommercial generation is included in some annual totals but not in the monthly data. • Data for countries may not sum to regional totals due to independent rounding.

[a] The total gross generation estimate for 1993 for Czech Republic, Kazakhstan, Lithuania, and Slovakia is calculated as 5 percent more than the annual net nuclear generation reported by the International Atomic Energy Agency (IAEA) and is published in *Nuclear Power Reactors in the World*, April 1994.

[b] Romania has a nuclear generating unit under construction. Its earliest initial operation is projected to be in 1995.

[c] The total gross generation estimate for 1992 for Eastern European countries are calculated as 5 percent more than the annual net nuclear generation reported by the IAEA and published in the Energy Information Administration annual report, *World Nuclear Capacity and Fuel Cycle Requirements 1993*, November 1993, Table 10.

NA=Not available. –=Not applicable. E=Estimate.

Notes: • Armenia has two nuclear generating units under construction. The earliest initial commercial operation for one unit is projected to be in 1995. • Net figures are generally less than gross figures by about 5 percent, the difference being the energy consumed by the generating plants themselves. • Monthly data may not sum to annual totals due to independent rounding and because precommercial generation is included in some annual totals but not in the monthly data. • Data for countries may not sum to regional totals due to independent rounding.

Appendix A. Thermal Conversion Factors

The thermal conversion factors presented in the following eight tables can be used to estimate the heat content in British thermal units (Btu) of a given amount of energy measured in physical units, such as barrels or cubic feet. For example, 10 barrels of asphalt have a heat content of approximately 66.36 million Btu (10 barrels x 6.636 million Btu/barrel = 66.36 million Btu).

Thermal conversion factors for hydrocarbon mixes (Table A1) are weighted averages of the thermal conversion factors for each hydrocarbon included in the mix. For example, in calculating the thermal conversion factor for a 60-40 butane-propane mixture, the thermal conversion factor for butane is weighted 1.5 times more heavily than the thermal conversion factor for propane.

In general, the annual thermal conversion factors presented in Tables A1 through A8 are computed from final annual data. However, if the current year's final data are not available in time for publication, thermal conversion factors for the current year are computed from the best available data and are labeled "preliminary." The source of each factor is described in the section entitled "Thermal Conversion Factor Source Documentation," which follows Table A8 in this appendix.

Table A1. Approximate Heat Content of Petroleum Products

(Million Btu per Barrel)

Petroleum Product	Heat Content	Petroleum Product	Heat Content
Asphalt	6.636	Petrochemical Feedstocks	
Aviation Gasoline	5.048	Naphtha Less Than 401° F	5.248
Butane	4.326	Other Oils Equal to or Greater Than 401° F	5.825
Butane-Propane Mixture[a]	4.130	Still Gas	6.000
Distillate Fuel Oil	5.825	Petroleum Coke	6.024
Ethane	3.082	Plant Condensate	5.418
Ethane-Propane Mixture[b]	3.308	Propane	3.836
Isobutane	3.974	Residual Fuel Oil	6.287
Jet Fuel, Kerosene Type	5.670	Road Oil	6.636
Jet Fuel, Naphtha Type	5.355	Special Naphthas	5.248
Kerosene	5.670	Still Gas	6.000
Lubricants	6.065	Unfinished Oils	5.825
Motor Gasoline	5.253	Unfractionated Stream	5.418
Natural Gasoline and Isopentane	4.620	Waxes	5.537
Pentanes Plus	4.620	Miscellaneous	5.796

[a] 60 percent butane and 40 percent propane.
[b] 70 percent ethane and 30 percent propane.

Thermal Conversion Factor Source Documentation

Approximate Heat Content of Petroleum and Natural Gas Plant Liquids

Asphalt. The Energy Information Administration (EIA) adopted the thermal conversion factor of 6.636 million British thermal units (Btu) per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Aviation Gasoline. EIA adopted the Bureau of Mines thermal conversion factor of 5.048 million Btu per barrel for "Gasoline, Aviation" as published by the Texas Eastern Transmission Corporation in Appendix V of *Competition and Growth in American Energy Markets 1947-1985,* a 1968 release of historical and projected statistics.

Butane. EIA adopted the Bureau of Mines thermal conversion factor of 4.326 million Btu per barrel in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Butane-Propane Mixture. EIA adopted the Bureau of Mines calculation of 4.130 million Btu per barrel based on an assumed mixture of 60 percent butane and 40 percent propane. See **Butane** and **Propane.**

Crude Oil, Exports. Assumed by EIA to be 5.800 million Btu per barrel or equal to the thermal conversion factor for crude oil produced in the United States. See **Crude Oil and Lease Condensate, Production.**

Crude Oil, Imports. Calculated annually by EIA by weighting the thermal conversion factor of each type of crude oil imported by the quantity imported. Thermal conversion factors for each type were calculated on a foreign country basis, by determining the average American Petroleum Institute (API) gravity of crude imported from each foreign country from Form ERA-60 in 1977 and converting average API gravity to average Btu content by using National Bureau of Standards, Miscellaneous Publication No. 97, *Thermal Properties of Petroleum Products,* 1933.

Crude Oil and Lease Condensate, Production. EIA adopted the thermal conversion factor of 5.800 million Btu per barrel as reported in a Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, Adopted January 3, 1950."

Crude Oil and Petroleum Products, Exports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product

exported and crude oil exported weighted by the quantity of each petroleum product and crude oil exported. See **Crude Oil, Exports** and **Petroleum Products, Exports.**

Crude Oil and Petroleum Products, Imports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product and each type of crude oil imported weighted by the quantity of each petroleum product and each type of crude oil imported. See **Crude Oil, Imports** and **Petroleum Products, Imports.**

Distillate Fuel Oil. EIA adopted the Bureau of Mines thermal conversion factor of 5.825 million Btu per barrel as reported in a Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Value of Various Fuels, Adopted January 3, 1950."

Ethane. EIA adopted the Bureau of Mines thermal conversion factor of 3.082 million Btu per barrel in the *California Oil World and Petroleum Industry,* First Issue, April 1942.

Ethane-Propane Mixture. EIA calculated 3.308 million Btu per barrel based on an assumed mixture of 70 percent ethane and 30 percent propane. See **Ethane** and **Propane.**

Isobutane. EIA adopted the Bureau of Mines thermal conversion factor of 3.974 million Btu per barrel in the *California Oil World and Petroleum Industry,* First Issue, April 1942.

Jet Fuel, Kerosene Type. EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel for "Jet Fuel, Commercial" as published by the Texas Eastern Transmission Corporation in Appendix V of *Competition and Growth in American Energy Markets 1947-1985,* a 1968 release of historical and projected statistics.

Jet Fuel, Naphtha Type. EIA adopted the Bureau of Mines thermal conversion factor of 5.355 million Btu per barrel for "Jet Fuel, Military" as published by the Texas Eastern Transmission Corporation in Appendix V of *Competition and Growth in American Energy Markets 1947-1985,* a 1968 release of historical and projected statistics.

Kerosene. EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as reported in a Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, Adopted January 3, 1950."

Liquefied Petroleum Gases (LPG) Consumption. Calculated annually by EIA as the average of the thermal conversion factors of each liquefied petroleum gas consumed, weighted by the quantity of each liquefied petroleum gas consumed.

Lubricants. EIA adopted the thermal conversion factor of 6.065 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Miscellaneous Products. EIA adopted the thermal conversion factor of 5.796 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Motor Gasoline. EIA adopted the Bureau of Mines thermal conversion factor of 5.253 million Btu per barrel for "Gasoline, Motor Fuel" by the Texas Eastern Transmission Corporation in Appendix V of *Competition and Growth in American Energy Markets 1947-1985,* a 1968 release of historical and projected statistics.

Natural Gas Plant Liquids, Production. Calculated annually by EIA as the average of the thermal conversion factors of each natural gas plant liquid produced weighted by the quantity of each natural gas plant liquid produced.

Natural Gasoline. EIA adopted the thermal conversion factor of 4.620 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Pentanes Plus. EIA assumed the thermal conversion factor to be 4.620 million Btu per barrel or equal to that for natural gasoline. See **Natural Gasoline.**

Petrochemical Feedstocks, Naphtha Less Than 401 Degrees Fahrenheit. Assumed by EIA to be 5.248 million Btu per barrel, equal to the thermal conversion factor for special naphthas. See **Special Naphthas.**

Petrochemical Feedstocks, Oils Equal to or Greater Than 401 Degrees Fahrenheit. Assumed by EIA to be 5.825 million Btu per barrel, equal to the thermal conversion factor for distillate fuel oil. See **Distillate Fuel Oil.**

Petrochemical Feedstocks, Still Gas. Assumed by EIA to be 6.000 million Btu per barrel, equal to the thermal conversion factor for still gas. See **Still Gas.**

Petroleum Coke. EIA adopted the thermal conversion factor of 6.024 million Btu per barrel as reported in Btu per short ton in the Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Value of Various Fuels, Adopted January 3, 1950." The Bureau of Mines calculated this factor by dividing 30,120,000 Btu per short ton, as given in the referenced Bureau of Mines internal memorandum, by 5.0 barrels per short ton, as given in the Bureau of Mines Form 6-1300-M and successor EIA forms.

Petroleum Products, Total Consumption. Calculated annually by EIA as the average of the

thermal conversion factors for all petroleum products consumed, weighted by the quantity of each petroleum product consumed.

Petroleum Products, Consumption by Electric Utilities. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed at electric utilities, weighted by the quantity of each petroleum product consumed at electric utilities. The quantity of petroleum consumed is estimated in the State Energy Data System as documented in the *State Energy Data Report.*

Petroleum Products, Consumption by Industrial Users. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed in the industrial sector, weighted by the estimated quantity of each petroleum product consumed in the industrial sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in the *State Energy Data Report.*

Petroleum Products, Consumption by Residential and Commercial Users. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed by the residential and commercial sector, weighted by the estimated quantity of each petroleum product consumed in the residential and commercial sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in the *State Energy Data Report.*

Petroleum Products, Consumption by Transportation Users. Calculated annually by EIA as the average of the thermal conversion factor for all petroleum products consumed in the transportation sector, weighted by the estimated quantity of each petroleum product consumed in the transportation sector. The quantity of petroleum products consumed is estimated in the State Energy Data System as documented in the *State Energy Data Report.*

Petroleum Products, Exports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product, weighted by the quantity of each petroleum product exported.

Petroleum Products, Imports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product imported, weighted by the quantity of each petroleum product imported.

Plant Condensate. Estimated to be 5.418 million Btu per barrel by EIA from data provided by McClanahan Consultants, Inc., Houston, Texas.

Propane. EIA adopted the Bureau of Mines thermal conversion factor of 3.836 million Btu per barrel in the *California Oil World and Petroleum Industry,* First Issue, April 1942.

Residual Fuel Oil. EIA adopted the thermal conversion factor of 6.287 million Btu per barrel as reported in the Bureau of Mines internal memorandum, "Bureau of Mines Standard Average Heating Values of Various Fuels, Adopted January 3, 1950."

Road Oil. EIA adopted the Bureau of Mines thermal conversion factor of 6.636 million Btu per barrel, which was assumed to be equal to that of asphalt (see **Asphalt**) and was first published by the Bureau of Mines in the *Petroleum Statement, Annual, 1970.*

Special Naphthas. EIA adopted the Bureau of Mines thermal conversion factor of 5.248 million Btu per barrel, which was assumed to be equal to that of total gasoline (aviation and motor) factor and was first published in the *Petroleum Statement, Annual, 1970.*

Still Gas. EIA adopted the Bureau of Mines estimated thermal conversion factor of 6.000 million Btu per barrel and first published in the *Petroleum Statement, Annual, 1970.*

Unfinished Oil. EIA assumed the thermal conversion factor to be 5.825 million Btu per barrel or equal to that for distillate fuel oil (see **Distillate Fuel Oil**) and first published in the *Annual Report to Congress, Volume 3, 1977.*

Unfractionated Stream. EIA assumed the thermal conversion factor to be 5.418 million Btu per barrel or equal to that for plant condensate (see **Plant Condensate**) and first published in the *Annual Report to Congress, Volume 2, 1981.*

Waxes. EIA adopted the thermal conversion factor of 5.537 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956.*

Approximate Heat Content of Natural Gas

Natural Gas, Total Consumption. 1973-1979: EIA adopted the thermal conversion factor calculated annually by the American Gas Association (AGA) and published in *Gas Facts,* an AGA annual publication. 1980 forward: Calculated annually by EIA by dividing the total heat content of natural gas consumed by the total quantity of natural gas consumed. The heat content and quantity consumed are from Form EIA-176. Published sources are: 1980-1989: EIA, *Natural Gas Annual 1992, Volume 2,* Table 15. 1990-1992: EIA, *Natural Gas Annual 1992, Volume 2,* Table 16. 1993 forward: 1992 value used as an estimate.

Natural Gas, Consumption by Electric Utilities. Calculated annually by EIA by dividing the total heat content of natural gas received at electric utilities by the total quantity received at electric utilities. The

heat contents and receipts are from Form FERC-423 and predecessor forms.

Natural Gas, Consumption by Sectors Other Than Electric Utilities. Calculated annually by EIA by dividing the heat content of all natural gas consumed less the heat content of natural gas consumed at electric utilities by the quantity of all natural gas consumed less the quantity of natural gas consumed at electric utilities. Data are from Forms EIA-176, FERC-423, EIA-759, and predecessor forms.

Natural Gas, Exports. Calculated annually by EIA by dividing the heat content of exported natural gas by the quantity of natural gas exported, both reported on Form FPC-14.

Natural Gas, Imports. Calculated annually by EIA by dividing the heat content of imported natural gas by the quantity of natural gas imported, both reported on Form FPC-14.

Natural Gas Production, Dry. Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See **Natural Gas Total Consumption.**

Natural Gas Production, Marketed (Wet). Calculated annually by EIA by adding the heat content of dry natural gas production and the total heat content of natural gas plant liquids production and dividing this sum by the total quantity of marketed (wet) natural gas production.

Approximate Heat Content of Coal and Coal Coke

Anthracite, Total Consumption. Calculated annually by EIA by dividing the sum of the heat content of anthracite consumed by electric utilities and all other sectors combined by the total quantity of anthracite consumed.

Anthracite, Consumption by Electric Utilities. Calculated annually by EIA by dividing the heat content of anthracite receipts at electric utilities by the quantity of anthracite received at electric utilities. Heat contents and receipts are from Form FERC-423 and predecessor forms.

Anthracite, Consumption by Sectors Other Than Electric Utilities. Calculated annually by EIA by dividing the heat content of anthracite production less the heat content of the anthracite consumed at electric utilities, net exports, and shipments to U.S. Armed Forces overseas by the quantity of anthracite consumed by sectors other than electric utilities less the quantity of anthracite stock changes, losses, and "unaccounted for."

Anthracite, Imports and Exports. EIA assumed the anthracite imports and exports to be freshly mined anthracite having an estimated heat content of 25.40 million Btu per short ton.

Anthracite, Production. Calculated annually by EIA by dividing the sum of the heat content of freshly mined anthracite (estimated to have an average heat content of 25.400 million Btu per short ton) and the heat content of anthracite recovered from culm banks and river dredging (estimated to have a heat content of 17.500 million Btu per short ton) by the total quantity of anthracite production.

Bituminous Coal and Lignite, Total Consumption. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumed by electric utilities, coal coke plants, other industrial plants, the residential and commercial sector, and the transportation sector by the sum of their respective tonnages.

Bituminous Coal and Lignite, Consumption by Coke Plants. Estimated by EIA to be 26.800 million Btu per short ton on the basis of an input/output analysis of coal carbonization.

Bituminous Coal and Lignite, Consumption by Electric Utilities. Calculated annually by EIA by dividing the total heat content of bituminous coal and lignite received at electric utilities by the total quantity received at electric utilities. Heat contents and receipts are from Form FERC-423 and predecessor forms.

Bituminous Coal and Lignite, Consumption by Other Industrial and Transportation Users. 1973: Calculated by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by other industrial users and that of coal consumed at electric utilities in the 1974-1982 period. 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to other industrial users from each coal-producing area (reported on Form EIA-6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to that of bituminous coal and lignite received at electric utilities from each of the same coal-producing areas (reported on Form FERC-423). The average Btu value of coal by coal-producing area was applied to the volume of deliveries to other industrial users from each coal-producing area, and the sum total of the heat content was divided by the total volume of deliveries. Coal-producing areas are the Bureau of Mines coal-producing districts for 1974 through 1989 and coal-producing States for 1990 forward.

Bituminous Coal and Lignite, Consumption by Residential and Commercial Users. 1973: Calculated by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by residential and commercial users and that of coal consumed by electric utilities

in the 1974-1982 period. 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to residential and commercial users from each coal-producing area (reported on Form EIA-6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to that of bituminous coal and lignite received at electric utilities from each of the same coal-producing areas (reported on Form FERC-423). The average Btu value of coal by coal-producing area was applied to the volume of deliveries to residential and commercial users from each coal-producing area, and the total of the heat value was divided by the total volume of deliveries. Coal-producing areas are the Bureau of Mines coal-producing districts for 1974 through 1989 and coal-producing States for 1990 forward.

Bituminous Coal and Lignite, Exports. Calculated annually by EIA by dividing the sum of the heat content of exported metallurgical coal (estimated to average 27.000 million Btu per short ton) and the heat content of exported steam coal (estimated to have an average thermal content of 25.000 million Btu per short ton) by the total quantity of bituminous coal and lignite exported.

Bituminous Coal and Lignite, Imports. EIA estimated the average thermal conversion factor to be 25.000 million Btu per short ton.

Bituminous Coal and Lignite, Production. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumption, net exports, stock changes, and unaccounted for by the sum of their respective tonnages. Consumers' stock changes by sectors were assumed to have the same conversion factor as that of the consumption sector. Producers' stock changes and unaccounted for were assumed to have the same conversion factor as that for consumption by all users.

Coal, Consumption. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumption by the sum of their respective tonnages.

Coal, Consumption by Electric Utilities. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite received at electric utilities by the sum of their respective tonnages received.

Coal, Consumption by Sectors Other Than Electric Utilities. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumed by sectors other than electric utilities by the sum of their respective tonnages.

Coal, Exports. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite exported by the sum of their respective tonnages.

Coal, Imports. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite imported by the sum of their respective tonnages.

Coal, Production. Calculated annually by EIA by dividing the sum of the total heat content of bituminous coal and lignite and anthracite production by the sum of their respective tonnages.

Coal Coke, Imports and Exports. EIA adopted the Bureau of Mines estimate of 24.800 million Btu per short ton.

Approximate Heat Rates for Electricity

Fossil-Fueled Steam-Electric Plant Generation. There is no generally accepted practice for measuring the thermal conversion rates for power plants that generate electricity from hydroelectric, wood and waste, wind, photovoltaic, or solar thermal energy sources. Therefore, EIA uses data from Form EIA-767 to calculate a rate factor that is equal to the prevailing annual average heat rate factor for fossil-fueled steam-electric power plants in the United States. By using that factor, it is possible to evaluate fossil fuel requirements for replacing those sources during periods of interruption such as droughts. The heat content of a kilowatthour of electricity produced, regardless of the generation process, is 3,412 Btu per kilowatthour. 1973-1991: The weighted annual average heat rate for fossil-fueled steam-electric power plants in the United States, as published by EIA in *Electric Plant Cost and Power Production Expenses 1991*, Table 9. 1992 forward: Unpublished factors calculated on the basis of data from Form EIA-767.

Geothermal Energy Plant Generation. 1973-1981: Calculated annually by EIA by weighting the annual average heat rates of operating geothermal units by the installed nameplate capacities as reported on Form FPC-12. 1982 forward: Estimated annually by EIA on the basis of an informal survey of relevant plants.

Nuclear Steam-Electric Plant Generation. 1973-1991: Calculated annually by EIA by dividing the total heat content consumed in nuclear generating units by the total (net) electricity generated by nuclear generating units. The heat content and electricity generation are reported on Form FERC-1, Form EIA-412, and predecessor forms. The factors, beginning with 1982 data, are published in the following EIA reports—1982: *Historical Plant Cost and Annual Production Expenses for Selected Electric Plants 1982*, page 215. 1983-1991: *Electric Plant Cost and Power Production Expenses 1991*, Table 13. 1992 forward: Calculated annually by EIA by dividing the total heat content of the steam leaving the nuclear generating units to generate electricity by the total (net) electricity generated by nuclear generating units. The heat content and electricity generation data are reported in Nuclear Regulatory Commission, *Licensed Operating Reactors—Status Summary Report.*

Appendix B. Metric and Other Physical Conversion Factors

Data presented in the *Monthly Energy Review* and in other Energy Information Administration publications are expressed predominately in units that historically have been used in the United States, such as British thermal units, barrels, cubic feet, and short tons. However, because U.S. commerce involves other nations, most of which use metric units of measure, the U.S. Government is committed to the transition to the metric system, as stated in the Metric Conversion Act of 1975 (Public Law 94–168), amended by the Omnibus Trade and Competitiveness Act of 1988 (Public Law 100–418), and Executive Order 12770 of July 25, 1991.

The metric conversion factors presented in Table B1 can be used to calculate the metric-unit equivalents of values expressed in U.S. customary units. For example, 500 short tons are the equivalent of 453.6 metric tons (500 short tons x 0.9071847 metric tons/short ton = 453.6 metric tons).

In the metric system of weights and measures, the names of multiples and subdivisions of any unit may be derived by combining the name of the unit with prefixes, such as deka, hecto, and kilo, meaning, respectively, 10, 100, 1,000, and deci, centi, and milli, meaning, respectively, one-tenth, one-hundredth, and one-thousandth. Common metric prefixes can be found in Table B2.

The conversion factors presented in Table B3 can be used to calculate equivalents in various physical units commonly used in energy analyses. For example, 10 barrels are the equivalent of 420 U.S. gallons (10 barrels x 42 gallons/barrel = 420 gallons).

Table B1. Metric Conversion Factors

Type of Unit	U.S. Unit	*multiplied by*	Conversion Factor	*equals*	Metric Unit
Mass	short tons (2,000 lb)	x	0.907 184 7	=	metric tons (t)
	long tons	x	1.016 047	=	metric tons (t)
	pounds (lb)	x	0.453 592 37[a]	=	kilograms (kg)
	pounds uranium oxide (lb U_3O_8)	x	0.384 647[b]	=	kilograms uranium (kgU)
	ounces, avoirdupois (avdp oz)	x	28.349 52	=	grams (g)
Volume	barrels of oil (bbl)	x	0.158 987 3	=	cubic meters (m^3)
	cubic yards (yd^3)	x	0.764 555	=	cubic meters (m^3)
	cubic feet (ft^3)	x	0.028 316 85	=	cubic meters (m^3)
	U.S. gallons (gal)	x	3.785 412	=	liters (L)
	ounces, fluid (fl oz)	x	29.573 53	=	milliliters (mL)
	cubic inches (in^3)	x	16.387 06	=	milliliters (mL)
Length	miles (mi)	x	1.609 344[a]	=	kilometers (km)
	yards (yd)	x	0.914 4[a]	=	meters (m)
	feet (ft)	x	0.304 8[a]	=	meters (m)
	inches (in)	x	2.54[b]	=	centimeters (cm)
Area	acres	x	0.404 69	=	hectares (ha)
	square miles (mi^2)	x	2.589 988	=	square kilometers (km^2)
	square yards (yd^2)	x	0.836 127 4	=	square meters (m^2)
	square feet (ft^2)	x	0.092 903 04[a]	=	square meters (m^2)
	square inches (in^2)	x	6.451 6[b]	=	square centimeters (cm^2)
Temperature	degrees Fahrenheit (°F)	x	5/9 (after subtracting 32)[a,c]	=	degrees Celsius (°C)
Energy	British thermal units (Btu)	x	1, 055.055 852 62 [a,d]	=	joules (J)
	calories (cal)	x	4.186 8[a]	=	joules (J)
	kilowatthours (kWh)	x	3.6[a]	=	megajoules (MJ)

[a]Exact conversion.
[b]Calculated by the Energy Information Administration.
[c]To convert degrees Celsius (°C) to degrees Fahrenheit (°F) exactly, multiply by 9/5, then add 32.
[d]The Btu used in this table is the International Table Btu adopted by the Fifth International Conference on Properties of Steam, London, 1956.

Notes: • Spaces have been inserted after every third digit to the right of the decimal for ease of reading. • Most metric units belong to the International System of Units (SI), and the liter, hectare, and metric ton are accepted for use with the SI units. For more information about the SI units, contact Dr. Barry Taylor at Building 221, Room B610, National Institute of Standards and Technology, Gaithersburg, MD 20899, or on telephone number 301–975–4220.

Appendix C. List of Features

The following is a complete list of features that have appeared in the *Monthly Energy Review* since the first issue was published in October 1974. There are four categories of features on the list. "Articles" cover a wide range of energy-related subjects in depth. "Highlights" summarize the most important information presented in the subject Energy Information Administration (EIA) report. "Energy Previews" provide brief overviews of EIA preliminary energy data on a given topic. "EIA Data News" items present information on recent changes in the scope, design, methodology, and findings of EIA's energy surveys and databases. Questions and comments about features may be directed to Barbara T. Fichman by telephone at 202-586-5737, by fax at 202-586-0018, or by Internet E-Mail at bfichman@eia.doe.gov.

Glossary

Anthracite: A hard, black, lustrous coal containing a high percentage of fixed carbon and a low percentage of volatile matter. Often referred to as hard coal. It conforms to ASTM Specification D388-84 for anthracite, meta-anthracite, and semianthracite.

Asphalt: A dark-brown-to-black cement-like material containing bitumens as the predominant constituents obtained by petroleum processing. The definition includes crude asphalt as well as the following finished products: cements, fluxes, the asphalt content of emulsions (exclusive of water), and petroleum distillates blended with asphalt to make cutback asphalts.

ASTM: The American Society for Testing and Materials.

Aviation Gasoline Blending Components: Naphthas that are used for blending or compounding into finished aviation gasoline (e.g., straight-run gasoline, alkylate, and reformate). Excludes oxygenates (alcohols and ethers), butane, and pentanes plus.

Aviation Gasoline, Finished: All special grades of gasoline for use in aviation reciprocating engines, as given in ASTM Specification D910 and Military Specification MIL-G-5572. Excludes blending components that will be used in blending or compounding into finished aviation gasoline.

Barrel (petroleum): A unit of volume equal to 42 U.S. gallons.

Base (Cushion) Gas: The volume of gas needed as a permanent inventory to maintain adequate underground storage reservoir pressures and deliverability rates throughout the withdrawal season. All native gas is included in the base gas volume.

Bituminous Coal: A dense black coal, often with well-defined bands of bright and dull material, with a moisture content usually less than 20 percent. Often referred to as soft coal. It is the most common coal and is used primarily for generating electricity, making coke, and space heating. It conforms to ASTM Specification D388-84 for bituminous coal. In this report, bituminous coal includes subbituminous coal.

British Thermal Unit (Btu): The quantity of heat needed to raise the temperature of 1 pound of water by 1° F at or near 39.2° F. See **Heat Content of a Quantity of Fuel, Gross** and **Heat Content of a Quantity of Fuel, Net.**

Butane: A normally gaseous straight-chain or branched-chain hydrocarbon (C_4H_{10}). It is extracted from natural gas or refinery gas streams. It includes isobutane and normal butane and is designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial butane.

- *Isobutane:* A normally gaseous branched-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of 10.9° F. It is extracted from natural gas or refinery gas streams.
- *Normal Butane:* A normally gaseous straight-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of 31.1° F. It is extracted from natural gas or refinery gas streams.

Butylene: An olefinic hydrocarbon (C_4H_8) recovered from refinery processes.

Capacity Factor: The ratio of the electrical energy produced by a generating unit for a given period of time to the electrical energy that could have been produced at continuous full-power operation during the same period.

CIF: See **Cost, Insurance, Freight.**

City Gate: A point or measuring station at which a distribution gas utility receives gas from a natural gas pipeline company or transmission system.

Coal: A black or brownish-black solid, combustible substance formed by the partial decomposition of vegetable matter without access to air. The rank of coal, which includes anthracite, bituminous coal, subbituminous coal, and lignite, is based on fixed carbon, volatile matter, and heating value. Coal rank indicates the progressive alteration, or coalification, from lignite to anthracite. Lignite contains approximately 9 to 17 million Btu per ton. The heat contents of subbituminous and bituminous coal range from 16 to 24 million Btu per ton, and from 19 to 30 million Btu per ton, respectively. Anthracite contains approximately 22 to 28 million Btu per ton.

Coal Coke: A hard, porous product made from baking bituminous coal in ovens at temperatures as high as 2,000° F. It is used both as a fuel and as a reducing agent in smelting iron ore in a blast furnace.

Commercial Sector: The commercial sector, as defined economically, consists of business establishments that are not engaged in transportation or in manufacturing or other types of industrial activity (agriculture, mining, or construction). Commercial establishments include hotels, motels,

restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; religious and nonprofit organizations; health, social, and educational institutions; and Federal, State, and local governments. Street lights, pumps, bridges, and public services are also included if the establishment operating them is considered commercial.

Completion: The installation of permanent equipment for the production of oil or gas. If a well is equipped to produce only oil or gas from one zone or reservoir, the definition of a well (classified as an oil well or gas well) and the definition of a completion are identical. However, if a well is equipped to produce oil and/or gas separately from more than one reservoir, a well is not synonymous with a completion.

Conversion Factor: A number that translates units of one system into corresponding values of another system. Conversion factors can be used to translate physical units of measure for various fuels into Btu equivalents.

Cost, Insurance, Freight (CIF): A type of sale in which the buyer of the product agrees to pay a unit price that includes the f.o.b. value of the product at the point of origin plus all costs of insurance and transportation. This type of transaction differs from a "delivered" purchase in that the buyer accepts the quantity as determined at the loading port (as certified by the Bill of Loading and Quality Report) rather than pay on the basis of the quantity and quality ascertained at the unloading port. It is similar to the terms of an f.o.b. sale, except that the seller, as a service for which he is compensated, arranges for transportation and insurance.

Crude Oil f.o.b. Price: The crude oil price actually charged at the oil-producing country's port of loading. Includes deductions for any rebates and discounts or additions of premiums, where applicable. It is the actual price paid with no adjustment for credit terms.

Crude Oil (Including Lease Condensate): A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Included are lease condensate and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale. Drip gases are also included, but topped crude oil (residual oil) and other unfinished oils are excluded. Where identifiable, liquids produced at natural gas processing plants and mixed with crude oil are likewise excluded.

Crude Oil Landed Cost: The price of crude oil at the port of discharge, including charges associated with the purchase, transporting, and insuring of a cargo from the purchase point to the port of discharge. The cost does not include charges incurred at the discharge port (e.g., import tariffs or fees, wharfage charges, and demurrage).

Crude Oil Refinery Input: The total crude oil put into processing units at refineries.

Crude Oil Stocks: Stocks of crude oil and lease condensate held at refineries, in pipelines, at pipeline terminals, and on leases.

Crude Oil Used Directly: Crude oil consumed as fuel by crude oil pipelines and on crude oil leases.

Cubic Foot (natural gas): A unit of volume equal to 1 cubic foot at a pressure base of 14.73 pounds standard per square inch absolute and a temperature base of 60° F.

Degree-Day Normals: Simple arithmetic averages of monthly or annual degree-days over a long period of time (usually the 30-year period 1961-1990). The averages may be simple degree-day normals or population-weighted degree-day normals.

Degree-Days, Cooling (CDD): The number of degrees per day that the daily average temperature is above 65° F. The daily average temperature is the mean of the maximum and minimum temperatures for a 24-hour period.

Degree-Days, Heating (HDD): The number of degrees per day that the daily average temperature is below 65° F. The daily average temperature is the mean of the maximum and minimum temperatures for a 24-hour period.

Degree-Days, Population-Weighted: Heating or cooling degree-days weighted by the population of the area in which the degree-days are recorded. To compute State population-weighted degree-days, each State is divided into from one to nine climatically homogeneous divisions, which are assigned weights based on the ratio of the population of the division to the total population of the State. Degree-day readings for each division are multiplied by the corresponding population weight for each division and those products are then summed to arrive at the State population-weighted degree-day figure. To compute national population-weighted degree-days, the Nation is divided into nine Census regions comprised of from three to eight States, which are assigned weights based on the ratio of the population of the region to the total population of the Nation. Degree-day readings for each region are multiplied by the corresponding population weight for each region and those products are then summed to arrive at the national population-weighted degree-day figure.

Design Electrical Rating, Net: The nominal net electrical output of a nuclear unit as specified by the electric utility for the purpose of plant design.

Development Well: A well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive.

Distillate Fuel Oil: A general classification for one of the petroleum fractions produced in conventional distillation operations. Included are products known as No. 1, No. 2, and No. 4 fuel oils and No. 1, No. 2, and No. 4 diesel fuels. It is used primarily for space heating, on- and off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation.

Dry Hole: An exploratory or development well found to be incapable of producing either oil or gas in sufficient quantities to justify completion as an oil or gas well.

Dry Natural Gas Production (as a decrement from gas reserves): The volume of natural gas withdrawn from reservoirs during the report year less (1) the volume returned to such reservoirs in cycling, repressuring of oil reservoirs, and conservation operations; (2) shrinkage resulting from the removal of lease condensate and plant liquids; and (3) nonhydrocarbon gases, where they occur in sufficient quantity to render the gas unmarketable. Volumes of gas withdrawn from gas storage reservoirs and native gas that has been transferred to the storage category are not considered production. This is not the same as marketed production, since the latter also excludes vented and flared gas but contains liquids.

Dry Natural Gas Production (as an increment to gas supply): Gross withdrawals from production reservoirs less gas used in reservoir repressuring, amounts vented and flared, nonhydrocarbons removed, and various natural gas constituents, such as ethane, propane, and butane, removed at natural gas processing plants. The parameters for measurement are 60° F and 14.73 pounds standard per square inch absolute.

Electrical System Energy Losses: The amount of energy lost during generation, transmission, and distribution of electricity, including plant and unaccounted-for uses.

Electricity Generation: The process of producing electric energy or transforming other forms of energy into electric energy. Also the amount of electric energy produced or expressed in watthours (Wh).

Electricity Generation, Gross: The total amount of electric energy produced by the generating station or stations, measured at the generator terminals.

Electricity Generation, Net: Gross generation less electricity consumed at the generating plant for station use. Electricity required for pumping at pumped-storage plants is regarded as plant use and is deducted from gross generation.

Electricity Production: Net electricity (gross electricity output measured at generator terminals minus power plant use) generated by publicly and privately owned electric utilities. Excludes industrial electricity generation (except autogeneration of hydroelectric power).

Electricity Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. "Other" sales include sales for public street and highway lighting and other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Electric Power Plant: A station containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy.

Electric Utility: A corporation, person, agency, authority, or other legal entity or instrumentality that owns and/or operates facilities for the generation, transmission, distribution, or sale of electric energy, primarily for use by the public, and that files forms listed in the *Code of Federal Regulations*, Title 18, Part 141. Facilities that qualify as cogenerators or small power producers under the Public Utility Regulatory Policies Act are not considered electric utilities.

Electric Utility Sector: The electric utility sector consists of privately and publicly owned establishments that generate, transmit, distribute, or sell electricity primarily for use by the public and that meet the definition of an electric utility. Nonutility power producers are not included in the electric utility sector.

End-Use Sectors: The residential, commercial, industrial, and transportation sectors of the economy.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Energy Consumption: The use of energy as a source of heat or power or as an input in the manufacturing process.

Energy Consumption, End-Use: *Primary end-use energy consumption* is the sum of fossil fuel consumption by the four end-use sectors (residential, commercial, industrial, and transportation) and generation of hydroelectric power by nonelectric utilities. *Net end-use energy consumption* includes

electric utility sales to those sectors but excludes electrical system energy losses. *Total end-use energy consumption* includes both electric utility sales to the four end-use sectors *and* electrical system energy losses.

Energy Consumption, Total: The sum of fossil fuel consumption by the five sectors (residential, commercial, industrial, transportation, and electric utility) plus hydroelectric power, nuclear electric power, net imports of coal coke, and electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

Energy Source: A substance, such as petroleum, natural gas, or coal, that supplies heat or power. In Energy Information Administration reports, electricity and renewable forms of energy, such as biomass, geothermal, wind, and solar, are considered to be energy sources.

Ethane: A normally gaseous straight-chain hydrocarbon (C_2H_6). It is a colorless, paraffinic gas that boils at a temperature of -127.48° F. It is extracted from natural gas and refinery gas streams.

Ethylene: An olefinic hydrocarbon (C_2H_4) recovered from refinery processes or petrochemical processes.

Exploratory Well: A well drilled to find and produce oil or gas in an unproved area, to find a new reservoir in a field previously found to be productive of oil or gas in another reservoir, or to extend the limit of a known oil or gas reservoir.

Exports: Shipments of goods from the 50 States and the District of Columbia to foreign countries and to Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

f.a.s.: See **Free Alongside Ship.**

Federal Energy Regulatory Commission (FERC): The Federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification. FERC is an independent regulatory agency within the Department of Energy and is the successor to the Federal Power Commission.

Federal Power Commission (FPC): The predecessor agency of the Federal Energy Regulatory Commission. The Federal Power Commission was created by an Act of Congress under the Federal Water Power Act on June 10, 1920. It was charged originally with regulating the electric power and natural gas industries. It was abolished on September 30, 1977, when the Department of Energy was created. Its functions were divided between the Department of Energy and the Federal Energy Regulatory Commission, an independent regulatory agency.

First Purchase Price: The marketed first sales price of domestic crude oil, consistent with the removal price defined by the provisions of the Windfall Profits Tax on Domestic Crude Oil (Public Law 96-223, Sec. 4998 (c)).

Flared Natural Gas: Natural gas burned in flares on the base site or at gas processing plants.

f.o.b.: See **Free on Board.**

Footage Drilled: Total footage for wells in various categories, as reported for any specified period, includes (1) the deepest total depth (length of well bores) of all wells drilled from the surface, (2) the total of all bypassed footage drilled in connection with reported wells, and (3) all new footage drilled for directional sidetrack wells. Footage reported for directional sidetrack wells does not include footage in the common bore, which is reported as footage for the original well. In the case of old wells drilled deeper, the reported footage is that which was drilled below the total depth of the old well.

Former U.S.S.R.: See **U.S.S.R.**

Fossil Fuel: Any naturally occurring organic fuel, such as petroleum, coal, and natural gas.

Fossil Fuel Steam-Electric Power Plant: An electricity generation plant in which the prime mover is a turbine rotated by high-pressure steam produced in a boiler by heat from burning fossil fuels.

Free Alongside Ship (f.a.s.): The value of a commodity at the port of exportation, generally including the purchase price, plus all charges incurred in placing the commodity alongside the carrier at the port of exportation.

Free on Board (f.o.b.): A transaction whereby the seller makes the product available within an agreed-on period at a given port at a given price. It is the responsibility of the buyer to arrange for the transportation and insurance.

Fuel Ethanol: An anhydrous, denatured aliphatic alcohol (C_2H_5OH) intended for motor gasoline blending. See **Oxygenates.**

Full-Power Operation: Operation of a nuclear generating unit at 100 percent of its design capacity. Full-power operation precedes commercial operation.

Gasohol: A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol but sometimes methanol) limited to 10 percent by volume

of alcohol. Gasohol is included in finished leaded and unleaded motor gasoline.

Gas-Turbine Electric Power Plant: A plant in which the prime mover is a gas turbine. A gas turbine typically consists of an axial-flow air compressor, one or more combustion chambers where liquid or gaseous fuel is burned and the hot gases expand to drive the generator and then are used to run the compressor.

Gas Well: A well completed for the production of natural gas from one or more gas zones or reservoirs. (Wells producing both crude oil and natural gas are classified as oil wells.)

Geothermal Energy: Energy from the internal heat of the Earth, which may be residual heat, friction heat, or a result of radioactive decay. The heat is found in rocks and fluids at various depths and can be extracted by drilling and/or pumping.

Geothermal Energy (as used at electric utilities): Hot water or steam extracted from geothermal reservoirs in the Earth's crust and supplied to steam turbines at electric utilities that drive generators to produce electricity.

Gross Domestic Product (GDP): The total value of goods and services produced by labor and property located in the United States. As long as the labor and property are located in the United States, the supplier (that is, the workers and, for property, the owners) may be either U.S. residents or residents of foreign countries.

Heat Content of a Quantity of Fuel, Gross: The total amount of heat released when a fuel is burned. Coal, crude oil, and natural gas all include chemical compounds of carbon and hydrogen. When those fuels are burned, the carbon and hydrogen combine with oxygen in the air to produce carbon dioxide and water. Some of the energy released in burning goes into transforming the water into steam and is usually lost. The amount of heat spent in transforming the water into steam is counted as part of gross heat content but is not counted as part of net heat content. Also referred to as the higher heating value. Btu conversion factors typically used in EIA represent gross heat content.

Heat Content of a Quantity of Fuel, Net: The amount of usable heat energy released when a fuel is burned under conditions similar to those in which it is normally used. Also referred to as the lower heating value. Btu conversion factors typically used in EIA represent gross heat content.

Heavy Oil: The fuel oils remaining after the lighter oils have been distilled off during the refining process. Except for start-up and flame stabilization, virtually all petroleum used in steam-electric power plants is heavy oil.

Hydrocarbon: An organic chemical compound of hydrogen and carbon in the gaseous, liquid, or solid phase. The molecular structure of hydrocarbon compounds varies from the simplest (methane, the primary constituent of natural gas) to the very heavy and very complex.

Hydroelectric Power: The production of electricity from the kinetic energy of falling water.

Hydroelectric Power Plant: A plant in which the turbine generators are driven by falling water.

Imports: Receipts of goods into the 50 States and the District of Columbia from foreign countries and from Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Industrial Sector: The industrial sector comprises manufacturing industries, which make up the largest part of the sector, along with mining, construction, agriculture, fisheries, and forestry. Establishments in this sector range from steel mills, to small farms, to companies assembling electronic components.

Internal Combustion Electric Power Plant: A power plant in which the prime mover is an internal combustion engine. Diesel or gas-fired engines are the principal types used in electric power plants. The plant is usually operated during periods of high demand for electricity.

Jet Fuel: The term includes kerosene-type jet fuel and naphtha-type jet fuel. Kerosene-type jet fuel is a kerosene-quality product used primarily for commercial turbojet and turboprop aircraft engines. Naphtha-type jet fuel is a fuel in the heavy naphthas range used primarily for military turbojet and turboprop aircraft engines.

Kerosene: A petroleum distillate that has a maximum distillation temperature of 401° F at the 10-percent recovery point, a final boiling point of 572° F, and a minimum flash point of 100° F. Included are the two grades designated in ASTM D3699 (No. 1-K and No. 2-K) and all grades of kerosene called range or stove oil. Kerosene is used in space heaters, cook stoves, and water heaters; it is suitable for use as an illuminant when burned in wick lamps.

Lease and Plant Fuel: Natural gas used in well, field, and lease operations (such as gas used in drilling operations, heaters, dehydrators, and field compressors), and as fuel in natural gas processing plants.

Lease Condensate: A natural gas liquid recovered from gas well gas (associated and non-associated) in lease separators or natural gas field facilities. Lease condensate consists primarily of pentanes and heavier hydrocarbons.

Light Oil: Lighter fuel oils distilled off during the refining process. Virtually all petroleum used in internal combustion and gas-turbine engines is light oil.

Lignite: A brownish-black coal of low rank with a high content of moisture and volatile matter. Often referred to as brown coal. It is used almost exclusively for electric power generation. It conforms to ASTM Specification D388-84 for lignite.

Liquefied Natural Gas (LNG): Natural gas (primarily methane) that has been liquefied by reducing its temperature to -260° F at atmospheric pressure.

Liquefied Petroleum Gases (LPG): Ethane, ethylene, propane, propylene, normal butane, butylene, and isobutane produced at refineries or natural gas processing plants, including plants that fractionate new natural gas plant liquids.

Low-Power Testing: The period of time between a nuclear generating unit's initial fuel loading date and the issuance of its operating (full-power) license. The maximum level of operation during that period is 5 percent of the unit's design thermal rating.

Lubricants: Substances used to reduce friction between bearing surfaces or as process materials either incorporated into other materials used as processing aids in the manufacturing of other products or as carriers of other materials. Petroleum lubricants may be produced either from distillates or residues. Other substances may be added to impart or improve certain required properties. Excluded are byproducts of lubricating oil refining, such as aromatic extracts derived from solvent extraction or tars derived from deasphalting. Included are all grades of lubricating oils from spindle oil to cylinder oil and those used in greases. Lubricant categories are paraffinic and naphthenic.

Marketed Production: Gross withdrawals less gas used for repressuring, quantities vented and flared, and nonhydrocarbon gases removed in treating or processing operations. Includes all quantities of gas used in field and processing operations.

Methanol: A light, volatile alcohol (CH_3OH) eligible for motor gasoline blending. See **Oxygenates.**

Miscellaneous Petroleum Products: All finished petroleum products not classified elsewhere—for example, petrolatum, lube refining byproducts (aromatic extracts and tars), absorption oils, ram-jet fuel, petroleum rocket fuels, synthetic natural gas feedstocks, and specialty oils.

Motor Gasoline Blending Components: Naphthas that will be used for blending or compounding into finished motor gasoline (e.g., straight-run gasoline, alkylate, reformate, benzene, toluene, and zylene). Excluded are oxygenates (alcohols and ethers), butane, and pentanes plus.

Motor Gasoline, Finished: A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, that has been blended to form a fuel suitable for use in spark-ignition engines. Motor gasoline, as given in ASTM Specification D439 or Federal Specification VV-G-1690B, includes a range in distillation temperatures from 122 to 158° F at the 10-percent recovery point and from 365 to 374° F at the 90-percent recovery point. Motor gasoline includes reformulated motor gasoline, oxygenated motor gasoline, and other finished motor gasoline. Blendstock is excluded until blending has been completed.

- *Reformulated Motor Gasoline*: Motor gasoline, formulated for use in motor vehicles, the composition and properties of which are certified as "reformulated motor gasoline" by the Environmental Protection Agency.
- *Oxygenated Motor Gasoline*: Motor gasoline, formulated for use in motor vehicles, that has an oxygen content of 1.8 percent or higher by weight.
- *Other Finished Motor Gasoline:* Motor gasoline that is not included in the reformulated or oxygenated categories.

Motor Gasoline, Finished Gasohol: A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol, but sometimes methanol) in which 10 percent or more of the product is alcohol.

Motor Gasoline, Finished Leaded: Motor gasoline that contains more than 0.05 gram of lead per gallon or more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating. Includes leaded gasohol. Blendstock is excluded until blending has been completed. Alcohol that is to be used in the blending of gasohol is also excluded.

Motor Gasoline, Finished Leaded Premium: Motor gasoline having an antiknock index, calculated as (R+M)/2, greater than 90 and containing more than 0.05 gram of lead per gallon or more than 0.005 gram of phosphorus per gallon.

Motor Gasoline, Finished Leaded Regular: Motor gasoline having an antiknock index, calculated as (R+M)/2, greater than or equal to 87 and less than or equal to 90 and containing more than 0.05 gram of lead or 0.005 gram of phosphorus per gallon.

Motor Gasoline, Finished Unleaded: Motor gasoline containing not more than 0.05 gram of lead per gallon and not more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating. Includes unleaded gasohol. Blendstock is excluded until blending has

been completed. Alcohol that is to be used in the blending of gasohol is also excluded.

Motor Gasoline, Finished Unleaded Midgrade: Motor gasoline having an antiknock index, calculated as (R+M)/2, greater than or equal to 88 and less than or equal to 90 and containing not more than 0.05 gram of phosphorus per gallon.

Motor Gasoline, Finished Unleaded Premium: Motor gasoline having an antiknock index, calculated as (R+M)/2, greater than 90 and containing not more than 0.05 gram of lead or 0.005 gram of phosphorus per gallon.

Motor Gasoline, Finished Unleaded Regular: Motor gasoline having an antiknock index, calculated as (R+M)/2, of 87 containing not more than 0.05 gram of lead per gallon and not more than 0.005 gram of phosphorus per gallon.

Motor Gasoline Retail Prices: Motor gasoline prices calculated each month by the Bureau of Labor Statistics (BLS) in conjunction with the construction of the Consumer Price Index (CPI). Those prices are collected in 85 urban areas selected to represent all urban consumers—about 80 percent of the total U.S. population. The service stations are selected initially, and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full-, mini-, and self-service).

Motor Gasoline, Total: Includes finished leaded motor gasoline (premium and regular), finished unleaded motor gasoline (premium, midgrade, and regular), motor gasoline blending components, and gasohol.

MTBE (Methyl Tertiary Butyl Ether): An ether, $(CH_3)_3COCH_3$, intended for motor gasoline blending. See **Oxygenates**.

Naphtha: A genetic term applied to a petroleum fraction with an approximate boiling range between 122 and 400° F.

Natural Gas: A mixture of hydrocarbons (principally methane) and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in underground reservoirs.

Natural Gas, Dry: The marketable portion of natural gas production, which is obtained by subtracting extraction losses, including natural gas liquids removed at natural gas processing plants, from total production.

Natural Gas Marketed Production: Gross withdrawals of natural gas from production reservoirs, less gas used for reservoir repressuring; nonhydrocarbon gases removed in treating and processing operations; and quantities vented and flared.

Natural Gas Plant Liquids (NGPL): Natural gas liquids recovered from natural gas in processing plants and, in some situations, from natural gas field facilities, as well as those extracted by fractionators. Natural gas plant liquids are defined according to the published specifications of the Gas Processors Association and the American Society for Testing and Materials as follows: ethane, propane, normal butane, isobutane, pentanes plus, and other products from natural gas processing plants (i.e., products meeting the standards for finished petroleum products produced at natural gas processing plants, such as finished motor gasoline, finished aviation gasoline, special naphthas, kerosene, distillate fuel oil, and miscellaneous products).

Natural Gas Wellhead Price: The wellhead price of natural gas is calculated by dividing the total reported value at the wellhead by the total quantity produced as reported by the appropriate agencies of individual producing States and the U.S. Minerals Management Service. The price includes all costs prior to shipment from the lease, including gathering and compression costs, in addition to State production, severance, and similar charges.

Natural Gas, Wet: Natural gas prior to the extraction of liquids and other miscellaneous products.

Net Consumption: See **Energy Consumption, End-Use.**

Nonhydrocarbon Gases: Typical nonhydrocarbon gases that may be present in reservoir natural gas are carbon dioxide, helium, hydrogen sulfide, and nitrogen.

Nuclear Electric Power: Electricity generated by an electric power plant whose turbines are driven by steam generated in a reactor by heat from the fissioning of nuclear fuel.

Nuclear Electric Power Plant: A single-unit or multiunit facility in which heat produced in one or more reactors by the fissioning of nuclear fuel is used to drive one or more steam turbines.

Nuclear Reactor: An apparatus in which the nuclear fission chain can be initiated, maintained, and controlled so that energy is released at a specific rate. The reactor includes fissionable material (fuel), such as uranium or plutonium; fertile material; moderating material (unless it is a fast reactor); a heavy-walled pressure vessel; shielding to protect personnel; provision for heat removal; and control elements and instrumentation.

Offshore: That geographic area that lies seaward of the coastline. In general, the coastline is the line of ordinary low water along with that portion of the coast that is in direct contact with the open sea or the line marking the seaward limit of inland water.

Oil: See **Crude Oil (Including Lease Condensate).**

Oil Well: A well completed for the production of crude oil from one or more oil zones or reservoirs. Wells producing both crude oil and natural gas are classified as oil wells.

Operable (nuclear): A U.S. nuclear generating unit is considered operable after it completes low-power testing and is issued a full-power operating license by the Nuclear Regulatory Commission. A foreign nuclear generating unit is considered operable once it has generated electricity to the grid.

Organization for Economic Cooperation and Development (OECD): Current members are Australia, Austria, Belgium, Canada, Denmark, Finland, France, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States and its territories (Guam, Puerto Rico, and the Virgin Islands), and Germany.

Organization of Petroleum Exporting Countries (OPEC): Countries that have organized for the purpose of negotiating with oil companies on matters of oil production, prices, and future concession rights. Current members are Algeria, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.

Oxygenated Motor Gasoline: See **Motor Gasoline, Finished.**

Oxygenates: Any substance which, when added to motor gasoline, increases the amount of oxygen in that motor gasoline blend. Through a series of waivers and interpretive rules, the Environmental Protection Agency (EPA) has determined the allowable limits for oxygenates in unleaded gasoline. The "Substantially Similar" Interpretive Rules (56 FR [February 11, 1991]) allows blends of aliphatic alcohols other than methanol and aliphatic ethers, provided the oxygen content does not exceed 2.7 percent by weight. The "Substantially Similar" Interpretive Rules also provide for blends of methanol up to 0.3 percent by volume exclusive of other oxygenates, and butanol or alcohols of a higher molecular weight up to 2.75 percent by weight. Individual waivers pertaining to the use of oxygenates in unleaded motor gasoline have been issued by the EPA. They include:

- *Fuel Ethanol.* Blends of up to 10 percent by volume anhydrous ethanol (200 proof).
- *Methanol.* Blends of methanol and gasoline-grade tertiary butyl alcohol (GTBA) such that the total oxygen content does not exceed 3.5 percent by weight and the ratio of methanol to GTBA is less than or equal to 1. It is also specified that this blended fuel must meet ASTM volatility specifications.
  Blends of up to 5.0 percent by volume methanol with a minimum of 2.5 percent by volume co-solvent alcohols having carbon number of 4 or less (i.e., ethanol, propanol, butanol, and/or GTBA). The total oxygen must not exceed 3.7 percent by weight, and the blend must meet ASTM volatility specifications as well as phase separation and alcohol purity specifications.
- *MTBE (Methyl tertiary butyl ether).* Blends up to 15.0 percent by volume MTBE that must meet the ASTM D4814 specifications. Blenders must take precautions that the blends are not used as base gasolines for other oxygenated blends.

Pentanes Plus: A mixture of hydrocarbons, mostly pentanes and heavier, extracted from natural gas. Includes isopentane, natural gasoline, and plant condensate.

Petrochemical Feedstocks: Chemical feedstocks derived from petroleum principally for the manufacture of chemicals, synthetic rubber, and a variety of plastics.

Petroleum: A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oils, petroleum products, natural gas plant liquids, and nonhydrocarbon compounds blended into finished petroleum products.

Petroleum Coke: A residue that is the final product of the condensation process in cracking. The product is either marketable petroleum coke or catalyst petroleum coke.

Petroleum Coke, Catalyst: The carbonaceous residue that is deposited on and deactivates the catalyst used in many catalytic operations (e.g., catalytic cracking). Carbon is deposited on the catalyst, thus deactivating the catalyst. The catalyst is reactivated by burning off the carbon, which is used as a fuel in the refining process. That carbon or coke is not recoverable in a concentrated form.

Petroleum Coke, Marketable: Those grades of coke produced in delayed or fluid cokers that may be recovered as relatively pure carbon. Marketable petroleum coke may be sold as is or further purified by calcining.

Petroleum Consumption: The sum of all refined petroleum products supplied. For each refined petroleum product, the amount supplied is calculated by adding production and imports, then subtracting changes in primary stocks (net withdrawals are a plus

quantity and net additions are a minus quantity) and exports.

Petroleum Imports: Imports of petroleum into the 50 States and the District of Columbia from foreign countries and from Puerto Rico, the Virgin Islands, and other U.S. territories and possessions. Included are imports for the Strategic Petroleum Reserve and withdrawals from bonded warehouses for onshore consumption, offshore bunker use, and military use. Excluded are receipts of foreign petroleum into bonded warehouses and into U.S. territories and U.S. Foreign Trade Zones.

Petroleum Products: Products obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

Petroleum Products Supplied: See **Petroleum Consumption.**

Petroleum Stocks, Primary: For individual products, quantities that are held at refineries, in pipelines, and at bulk terminals that have a capacity of 50,000 barrels or more, or that are in transit thereto. Stocks held by product retailers and resellers, as well as tertiary stocks held at the point of consumption, are excluded. Stocks of individual products held at gas processing plants are excluded from individual product estimates but are included in other oils estimates and total.

Photovoltaic and Solar Thermal Energy (as used at electric utilities): Energy radiated by the sun as electromagnetic waves (electromagnetic radiation) that is converted at electric utilities into electricity by means of solar (photovoltaic) cells or concentrating (focusing) collectors.

Pipeline Fuel: Gas consumed in the operation of pipelines, primarily in compressors.

Primary Consumption: See **Energy Consumption, End-Use.**

Propane: A normally gaseous straight-chain hydrocarbon (C_3H_8). It is a colorless paraffinic gas that boils at a temperature of -43.67° F. It is extracted from natural gas or refinery gas streams. It includes all products designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial propane and HD-5 propane.

Propylene: An olefinic hydrocarbon (C_3H_6) recovered from refinery or petrochemical processes.

Refiner Acquisition Cost of Crude Oil: The cost of crude oil to the refiner, including transportation and fees. The composite cost is the weighted average of domestic and imported crude oil costs.

Refinery (petroleum): An installation that manufactures finished petroleum products from crude oil, unfinished oils, natural gas liquids, other hydrocarbons, and alcohol.

Renewable Energy: Energy obtained from sources that are essentially inexhaustible (unlike, for example, the fossil fuels, of which there is a finite supply). Renewable sources of energy include wood, waste, photovoltaic, and solar thermal energy.

Repressuring: The injection of a pressurized fluid (such as air, gas, or water) into oil and gas reservoir formations to effect greater ultimate recovery.

Residential Sector: The residential sector is considered to consist of all private residences, whether occupied or vacant, owned or rented, including single-family homes, multifamily housing units, and mobile homes. Secondary homes, such as summer homes, are also included. Institutional housing, such as school dormitories, hospitals, and military barracks, generally are not included in the residential sector; they are included in the commercial sector.

Residual Fuel Oil: The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations and that conform to ASTM Specifications D396 and 975. Included are No. 5, a residual fuel oil of medium viscosity; Navy Special, for use in steam-powered vessels in government service and in shore power plants; and No. 6, which includes Bunker C fuel oil and is used for commercial and industrial heating, electricity generation, and to power ships. Imports of residual fuel oil include imported crude oil burned as fuel.

Road Oil: Any heavy petroleum oil, including residual asphaltic oil used as a dust palliative and surface treatment on roads and highways. It is generally produced in six grades, from 0, the most liquid, to 5, the most viscous.

Rotary Rig: A machine used for drilling wells that employs a rotating tube attached to a bit for boring holes through rock.

Short Ton (coal): A unit of weight equal to 2,000 pounds.

SIC: See **Standard Industrial Classification.**

Solar Energy: The radiant energy of the sun, which can be converted into other forms of energy, such as heat or electricity.

Standard Industrial Classification (SIC): A set of codes developed by the Office of Management and Budget which categorizes industries into groups with similar economic activities.

Startup Test Phase of Nuclear Power Plant: A nuclear power plant that has been licensed by the Nuclear Regulatory Commission to operate but is still in the initial testing phase, during which the production of electricity may not be continuous. In general, when the electric utility is satisfied with the plant's performance, it formally accepts the plant from the manufacturer and places it in commercial operation status. A request is then submitted to the appropriate utility rate commission to include the power plant in the rate base calculation.

Steam-Electric Power Plant: A plant in which the prime mover is a steam turbine. The steam used to drive the turbine is produced in a boiler where fossil fuels are burned.

Strategic Petroleum Reserve (SPR): Petroleum stocks maintained by the Federal Government for use during periods of major supply interruption.

Supplemental Gaseous Fuels: Any gaseous substance that, introduced into or commingled with natural gas, increases the volume available for disposition. Such substances include, but are not limited to, propane-air, refinery gas, coke oven gas, still gas, manufactured gas, biomass gas, or air or inert gases added for Btu stabilization.

Synthetic Natural Gas (SNG): A manufactured product chemically similar in most respects to natural gas, resulting from the conversion or reforming of petroleum hydrocarbons. It may easily be substituted for, or interchanged with, pipeline quality natural gas. Also referred to as substitute natural gas.

Total Consumption: See **Energy Consumption, End-Use.**

Transportation Sector: The transportation sector consists of private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads and railways (including streetcars), aircraft, ships, barges, and natural gas pipelines.

Unaccounted-for Crude Oil: Arithmetic difference between the calculated supply and the calculated disposition of crude oil. The calculated supply is the sum of crude oil production and imports, less changes in crude oil stocks. The calculated disposition of crude oil is the sum of crude oil input to refineries, crude oil exports, crude oil burned as fuel, and crude oil losses.

Underground Storage: The storage of natural gas in underground reservoirs at a different location from which it was produced.

United States: Unless otherwise noted, "United States" in this publication means the 50 States and the District of Columbia. U.S. exports include shipments to U.S. territories, and imports include receipts from U.S. territories.

U.S.S.R.: The Union of Soviet Socialist Republics consisted of 15 constituent republics: Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Russia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan. As a political entity, the U.S.S.R. ceased to exist as of December 31, 1991.

Vented Natural Gas: Gas released into the air on the base site or at processing plants.

Wellhead Price: The value of crude oil or natural gas at the mouth of the well.

Well Servicing Unit: Truck-mounted equipment generally used for downhole services after a well is drilled. Services include well completions and recompletions, maintenance, repairs, workovers, and well plugging and abandonments. Jobs range from minor operations, such as pulling the rods and rod pumps out of an oil well, replacing the pump and rerunning the assemblage into the well, to major workovers, such as milling out and repairing collapsed casing. Well depth and characteristics determine the type of equipment used.

Wind Energy (as used at electric utilities): The kinetic energy of wind converted at electric utilities into mechanical energy by wind turbines (i.e., blades rotating from a hub) that drive generators to produce electricity for distribution.

Wood and Waste (as used at electric utilities): Wood energy, garbage, bagasse, sewerage gas, and other industrial, agricultural, and urban refuse used to generate electricity for distribution.

Wood Energy: Wood and wood products used as fuel, including round wood (cord wood), limb wood, wood chips, bark, sawdust, forest residues, charcoal, pulp waste, and spent pulping liquor.

Working Gas: The gas in a reservoir that is in addition to the base (cushion) gas. It may or may not be completely withdrawn during any particular withdrawal season. Conditions permitting, the total working capacity could be used more than once during any given season.

"Commercial Nuclear Electric Power in the United States: Problems and Prospects"

Published: August 1994
Energy Information Administration
Single Copies Available Free of Charge

Abstract: *For at least a decade, commercial nuclear electric power in the United States has hesitated at a crossroads. While the performance of existing reactors reached record levels in 1992, the number of operating reactors has leveled off. High operating costs, waste disposal difficulties, and other problems have created a climate unsympathetic to the further expansion of nuclear electric power.*

This article briefly reviews the origins of commercial nuclear electric power, the efforts to dispose of high-level nuclear waste, the costs of building and operating nuclear electric power plants, and other energy-related developments pertinent to the future of nuclear electric power. It discusses conditions that nuclear electric utilities and vendors believe must be met to encourage new orders for nuclear electric power plants and concludes with Energy Information Administration forecasts of electricity generating capacity through 2010 for nuclear electric power, renewable energy, and fossil fuel-fired plants.

*The **Historical Monthly Energy Review (HMER)** presents monthly and annual data from 1973 through 1992 for most of the data series found in the **Monthly Energy Review (MER)**. Since the **HMER** presents monthly data for all years from 1973 through 1992 and includes previously unpublished revisions to **MER** data, it is the most convenient and most accurate source of historical **MER** data.*

Please include payment with this order form. Allow a minimum of 4 weeks for domestic delivery and an additional 6 weeks for international delivery.

Quantity _____ x $23.00 = $ _____ (total due). (International customers add 25%.)

Historical Integrated Energy Data Reports from the Energy Information Administration

The ***Monthly Energy Review**** (DOE/EIA–0035) presents current monthly data on production, consumption, stocks, imports, exports, and prices of the principal energy commodities in the United States. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear-powered facilities.

The ***Historical Monthly Energy Review**** (DOE/EIA–0035(73–92)) presents monthly data from January 1973 through December 1992 for most of the series that are published for current months only in the *Monthly Energy Review*.

The ***Annual Energy Review**** (DOE/EIA–0384) presents long-term historical annual energy data. Most series begin in 1949. U.S. energy consumption, production, trade, and prices are included. Major sections of the report are energy overview, consumption indicators, financial indicators, energy resources, petroleum, natural gas, coal, electricity, nuclear energy, renewable energy, and international energy.

The ***State Energy Data Report**** (DOE/EIA–0214) presents estimates of annual energy consumption at the State and national levels by major sector (i.e., residential, commercial, industrial, transportation, and electric utilities) and by principal energy type for selected years. The base year is 1960. The report includes documentation of the consumption estimates for each source of energy, the sources of all data, and a summary of changes made to historical data in the report since its previous release.

The ***State Energy Price and Expenditure Report**** (DOE/EIA–0376) presents annual energy price and expenditure estimates at the State and national levels for selected years. The base year is 1970. The estimates are presented by energy source (e.g., petroleum, natural gas, coal, and electricity) and by major sector (i.e., residential, commercial, industrial, transportation, and electric utilities). The report includes documentation of the price estimates for each type of energy, the sources of all data, and a summary of any changes made to historical data in the report since its previous release.

The ***International Energy Annual*** (DOE/EIA–0219) presents annual data for production, consumption, imports, and exports of primary energy commodities in more than 190 countries, dependencies, and areas of special sovereignty. Also included are prices of crude oil and petroleum products in selected countries. The data presented are derived largely from national publications, international organizations, and other authoritative sources. The data are converted to units of measurement and thermal values familiar to the American public.

The ***International Petroleum Statistics Report*** (DOE/EIA–0520) presents current monthly international petroleum data on production, consumption, imports, and stocks. Included are oil consumption and stocks for specific countries in the Organization for Economic Cooperation and Development (OECD). Also provided are the oil supply-consumption balances for the world in quarterly intervals and oil imports by OECD countries.

*Data for this report are also available on computer diskettes.

*Readers familiar with the data in the **Monthly Energy Review (MER)** will find many of the same data in the **Annual Energy Review 1993**, where most data are provided annually for 1949 through 1993. The 383-page report also includes annual data for several series not found in the MER. For example, energy company financial statistics and international data on natural gas, coal, and hydroelectricity are provided.*
