# Annual Energy Review 1988

Energy Information Administration

**EIA**

# Annual Energy Review

The *Annual Energy Review* presents historical data on production, consumption, stocks, imports, exports, and prices of the principal energy commodities in the United States. Also included are data on international production of crude oil, consumption of petroleum products, petroleum stocks, and production of electricity from nuclear-powered facilities.

Publication of this report is in keeping with responsibilities given the Energy Information Administration (EIA) in Section 57(a)(2) of the Federal Energy Administration Act, Public Law 93-275.

The *Annual Energy Review* is intended for use by Members of Congress, Federal and State agencies, and the general public.

## To Order

Copies of the 1988 edition of the *Annual Energy Review* may be obtained by using the order form in the back of this publication.

## For More Information

Questions on energy statistics and on the availability of other EIA publications may be directed to EIA's National Energy Information Center on 202-586-8800 (TDD 202-586-1181), 8:00 a.m.-5:00 p.m. eastern time, M-F, or at the following address:

National Energy Information Center, EI-231  
Energy Information Administration  
Forrestal Building, Room 1F-048  
Washington, DC 20585

Released for Printing May 23, 1989

# Major Energy Developments, 1988

---

## Economic Growth, Adverse Weather Boost Energy Demand

U.S. total energy consumption<sup>1</sup> in 1988 reached a record level of nearly 80 quadrillion Btu (3)<sup>2</sup> as growth in the economy, adverse weather conditions, and continuing low oil prices combined to increase energy demand.

Real gross national product (GNP) was up by nearly 4 percent compared with 1987 GNP (C1). Increased manufacturing output spurred energy demand in the industrial sector.

Unusually cold weather in the first quarter of the year led to higher consumption of energy for space heating. In the summer, a record-breaking heat wave increased demand for energy, particularly electricity, for cooling. (At the same time, the second consecutive year of drought caused hydroelectric generation to fall to the lowest point in 11 years.)

In real terms,<sup>3</sup> the U.S. refiners' composite cost for a barrel of crude oil fell to \$12.09, \$3.12 below the 1987 level of \$15.21 and \$0.68 below the \$12.77 level in 1986 (65), when excess worldwide production had caused prices to plunge to the lowest level in 13 years. The inability of members of the Organization of Petroleum Exporting Countries (OPEC) to restrain production played a role in the 1988 price decline (105).

The decline in the price of crude oil was severe enough to trigger small declines in the prices of the other fossil fuels, particularly natural gas, which is a more direct competitor. In real terms, the price per million Btu of crude oil fell 21 percent to \$1.78. The real price of natural gas fell 1 percent to \$1.26 and the real price of coal (excluding anthracite) fell 7 percent to \$0.83 (27).

<sup>1</sup>Total (gross) energy consumption includes energy consumed to produce, process, and transport energy.

<sup>2</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

<sup>3</sup>Real prices are expressed in constant 1982 dollars.

As a result of those and other factors, U.S. total energy consumption in 1988 increased 4 percent from the 1987 level. The Energy Information Administration estimates that the adverse weather conditions accounted for about 0.8 percentage points of that increase.<sup>4</sup>

Consumption of petroleum, natural gas, and coal all increased in 1988 (3). Consumption of petroleum products rose 3 percent to over 17 million barrels per day as consumption of all major products increased from 1987 levels (58). Natural gas consumption reached 18 trillion cubic feet, up 5 percent from the 1987 level (68). Coal consumption also registered a 5-percent increase, to 881 million short tons (78).

After 1986, the energy intensity of the U.S. economy moved very slightly upward, by less than 0.1 percent in 1987 and by 0.2 percent in 1988, as growth in energy consumption edged out growth in the economy (8). The adverse weather conditions in 1988 tended to drive up the energy intensity of the economy.

## Exploration and Production: Mixed Results

Lower oil prices continued to depress domestic production of petroleum (crude oil, lease condensate, and natural gas plant liquids), which fell to 20 quadrillion Btu in 1988, down for the third consecutive year (2). Production in the Lower 48 States suffered the effects of a decreasing number of new well completions. Alaskan production of crude oil and lease condensate reached a record high (49) but failed to compensate for the decrease in Lower-48 production.

Exploration for oil and gas is closely tied to market conditions, particularly to the price of crude oil. In 1988, exploration indicators clearly reflected the low price of crude oil. The number of seismic crews totaled 182, up slightly from the number in 1987 but still dramatically below the 681 crews working in 1981 (39) when real crude oil prices

<sup>4</sup>Energy Information Administration, *Short-Term Energy Outlook* January 1989, DOE/EIA-0202(89/1Q) (Washington, DC, February 1989), p. 33.

peaked. Rotary rigs in operation were 936 in 1988 compared with 3,970 in 1981, and completions of exploratory wells totaled 5.9 thousand compared with 17.5 thousand in the peak year of 1981 (40).

In contrast, the domestic refinery industry benefited from market conditions in 1988, when falling crude oil prices and strong product demand tended to increase profit margins in the refining industry. In 1988, the refinery utilization rate—one measure of the health of the refining industry—rose to almost 85 percent, well above its nadir of 69 percent in 1981 (56).

Unlike petroleum production, production of all other major forms of energy except hydroelectricity increased in 1988 (2). Coal production continued at a record pace, totaling 21 quadrillion Btu and surpassing production of petroleum (crude oil, lease condensate, and natural gas plant liquids) for the second consecutive year. Natural gas production rose to 17 quadrillion Btu, up 1 percent from the previous year.

Spurred by extreme temperatures and the resulting increase in energy required for space heating and cooling, demand for electricity remained strong. Net generation rose 5 percent to 2.7 trillion kilowatt-hours (85). Coal-fired generation rose 5 percent to a record 1.5 trillion kilowatt-hours, despite increased competition from cheaply priced heavy oil. Oil-fired generation rose 26 percent but still accounted for a very small share of total generation (less than 6 percent), while coal continued to fuel over half of all generation.

U.S. nuclear-based generation reached an all-time high in 1988 of 527 billion kilowatt-hours and provided nearly 20 percent of total U.S. generation (95). The United States remained the world's largest producer of nuclear-based generation and its share of the total rose to 35 percent (115). Nuclear-based generation in all non-Communist countries combined reached 1.6 trillion kilowatt-hours in 1988.

### **Continued Growth in Energy Net Imports**

Weak oil prices in 1988 tended to suppress domestic production while encouraging consumption, thereby contributing to growth in net energy imports. Net imports of all forms of energy combined rose 5 percent from the 1987 level to almost 13 quadrillion Btu—a level that fueled concerns about U.S. dependence on foreign sources of supply (5).

However, due to the decline in oil prices, the real value of energy net imports fell from \$30.6 billion in 1987 to \$28.1 billion in 1988 (33).

Changes in the trade of all three major energy sources affected the growth in the volume of net imports. On a Btu basis, petroleum net imports rose 7 percent, natural gas net imports rose 30 percent, and coal net exports rose 20 percent (5).

Petroleum continued to account for most of the energy trade. In 1988, petroleum net imports reached 6.4 million barrels per day, the highest level since 1980 but still well below the peak level of 8.6 million barrels per day in 1977 (54). Petroleum net imports from all countries rose to 37 percent of U.S. demand in 1988. OPEC accounted for 3.4 million barrels per day, a 20-percent share of U.S. demand. Net imports from Canada and Mexico rose to 0.9 million barrels per day and 0.7 million barrels per day, respectively.

### **Major Energy Legislation in 1988**

- On August 20, the President signed H.R. 1414 to extend the **Price-Anderson** authority (which provides for insurance for commercial nuclear power plants) for 15 years, to raise the level of compensation to about \$7 billion, and to include a provision for civil and criminal penalties.
- The **Windfall Profit Tax** on domestic oil production was repealed by H.R. 4848, signed August 23. H.R. 4333, repealing the windfall profit tax reporting requirement, was signed November 10.
- On September 28, the President signed H.R. 5090 on the **Canadian Free-Trade Agreement**, which seeks to remove barriers to trade (including the trade of oil and uranium) between the United States and Canada.
- On October 14, the President signed S. 1518, the **Alternative Motor Fuels Act**, which promotes the development of alternate fuels, such as methanol from coal and natural gas, for transportation. The legislation also provides limited Corporate Average Fuel Economy (CAFE) credits for vehicles capable of burning alternate fuels.

---

# 1. Energy Overview

---

## Energy Prices in a Volatile Market

Since the mid-1970's, changes in fossil fuel prices have become more frequent and more pronounced (27).<sup>1</sup> Prior to the Arab oil embargo of 1973-74, the composite real price<sup>2</sup> per million Btu of crude oil, natural gas, and coal had gradually declined from \$1.12 in 1949 to a post-World War II low of \$0.75 in 1969. In 1974, the real price rose to \$1.25, eventually peaking at \$2.92 in 1981 after a second round of crude oil price increases.

Thereafter, overproduction of crude oil began to affect energy prices and, when crude oil prices plunged in 1986, the composite real price of the major fossil fuels fell to \$1.45. In 1987, the composite price declined slightly, to \$1.44, and in 1988 it fell to \$1.26.

Throughout the 40-year period, changes in the real price of oil dominated movements in the composite index. The real price of oil trended downward between 1949 and 1970 and then rose sharply in 1973-74 and again in 1979-81. Thereafter, in the face of shrinking demand and excess production, price trends reversed sharply. The precipitous declines in 1986 and 1988 brought the real price of oil to \$1.78 per million Btu, the lowest level since 1973.

Prices of coal and natural gas were much less volatile than those of oil. Coal markets are generally more competitive than oil markets, where the output and pricing policies of the Organization of Petroleum Exporting Countries (OPEC) were a major influence throughout much of the 1970's and 1980's. Natural gas prices are subject to substantial State and Federal regulation. Throughout the 1970's, regulation dampened the response of natural gas prices relative to oil price movement.

However, the 1986 and 1988 declines in crude oil prices were severe enough to trigger declines in the prices of the other fossil fuels,

<sup>1</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

<sup>2</sup>Real prices are expressed in constant 1982 dollars.

particularly natural gas. In 1988, the real price of crude oil per million Btu was \$1.78, 52 percent below the 1985 price (27). The real price of natural gas fell 38 percent, to \$1.26, during the 4-year period. The decline in the real price of bituminous coal and lignite was smaller—a decrease of 20 percent, to \$0.83, in the 4-year period.

## Production

Historically, three fossil fuels have accounted for the bulk of domestic energy production, which by 1988 totaled 66 quadrillion Btu (2). Coal accounted for the largest share of domestic energy production in 1949-51 and, after a long hiatus, again in 1984-88. In the interim, first crude oil and then natural gas dominated domestic production. In 1988, coal production reached a record 21 quadrillion Btu. Crude oil production and dry natural gas production totaled 17 quadrillion Btu each. Natural gas plant liquids accounted for another 2 quadrillion Btu.

Electricity generation increased throughout 1949-88 (84), registering only one year-to-year decline (during the recession in 1982). Nuclear-based generation increased to the record level of 6 quadrillion Btu in 1988 (2). Since the mid-1970's, coal and nuclear fuels have provided increasing shares of fuel input for power generation, displacing substantial quantities of both petroleum and natural gas (87).

Hydroelectric generation accounted for over 1 quadrillion Btu of electricity in 1949 and from the 1970's through 1987 provided about 3 quadrillion Btu per year (2). In 1988, the second consecutive year of drought, hydroelectric generation totaled only 2.3 quadrillion Btu, the lowest level since 1966.

Other sources of renewable energy still provide only a small part of total domestic energy supplied. Generation of electricity from geothermal energy totaled 0.2 quadrillion Btu in 1988, and generation of electricity from wood, waste, wind, photovoltaic, and solar thermal energy totaled 0.02 quadrillion Btu.

## Consumption by Energy Source

Energy consumption more than doubled during the 1949-73 period, increasing from 30 quadrillion Btu in 1949 to 74 quadrillion Btu in 1973 (3), and the U.S. economy grew at about the same rate. The domestic energy market was dominated by rapid growth in petroleum and natural gas consumption, which more than tripled during the period.

After the 1973 oil price shock, energy consumption fluctuated, rising to a peak of 79 quadrillion Btu in 1979 before returning, in the mid-1980's, to about the same level as in 1973. In contrast, the economy registered a net expansion of about one-third.

The composition of demand after 1973 reflects a shift away from petroleum and natural gas towards electricity generated by other fuels. In 1973, petroleum and natural gas accounted for 77 percent of total energy consumption; by 1988, their share had declined to 66 percent.

### Consumption by Sector: Sharing the Energy Pie

Industrial sector consumption proved to be the most responsive to the turmoil in energy markets during the 1970's and 1980's (4). Consumption fluctuated after 1973, but, in 1986, was considerably below the sector's peak consumption in 1979. Increases in efficiencies in industrial operations and expansion in the service trades were primarily responsible for the decline. In 1988, economic growth spurred demand for energy in the industrial sector, and industrial energy consumption rose 5 percent from the 1987 level to 29 quadrillion Btu.

Growth in electric utility consumption continued during the 1970's and 1980's despite rising energy prices. In 1988, that sector's consumption reached an all-time high of almost 29 quadrillion Btu. However, only 9 quadrillion Btu were sold to consumers; the remainder was used to generate, transmit, and distribute the electricity (87).

The transportation and residential and commercial sectors accounted for most of the growth in energy consumption during the 1949-88 period. Residential and commercial consumption leveled off in response to

higher energy prices, but, following the price declines in 1986 and 1988, grew to a record level of 29 quadrillion Btu. Transportation sector consumption grew more slowly over the 40-year period but also attained a record level (22 quadrillion Btu) in 1988.

### Changing Patterns of Trade

From 1958 forward, the United States consumed more energy than it produced, and the difference was met by energy imports (2, 3, and 5). Net imports of energy (primarily petroleum) grew rapidly through 1973, as demand for cheap foreign oil eroded quotas on petroleum imports. In 1973, net imports of petroleum totaled 13 quadrillion Btu.

The Arab oil embargo of 1973-74, coupled with increases in the price of crude oil, interrupted growth in petroleum net imports, but nevertheless they climbed to a peak of 18 quadrillion Btu in 1977. That year, U.S. dependence on petroleum net imports also peaked, at 47 percent of consumption (54).

A second round of price increases, in 1979-81, suppressed demand for foreign oil. In 1985, petroleum net imports totaled 9 quadrillion Btu, and U.S. dependence fell to 27 percent of consumption. That was the last year in which the ratio of petroleum net imports to petroleum consumption declined. In 1988, as the price of crude oil continued to be repressed, net imports of petroleum rose to over 13 quadrillion Btu, and U.S. dependence on foreign sources of oil reached 37 percent. However, because of the decline in oil prices, the value of crude oil and petroleum product net imports fell from \$37.6 billion in 1987 to \$35.2 billion in 1988 (33).

Natural gas trade was limited to border countries until the advent of shipping natural gas in liquefied form. In 1988, natural gas net imports surpassed 1 quadrillion Btu for only the second time since 1949. Net imports of natural gas were valued at close to \$3 billion.

Throughout the 1949-to-1988 period, the United States was a net exporter of coal (5). In 1988, net exports totaled 2 quadrillion Btu. Net exports of coal (including coal coke) were valued at nearly \$4 billion.

**Diagram 1. Total Energy Flow, 1988**  
(Quadrillion Btu)

\* Total energy consumed with conversion and transmission losses allocated to end-use sectors in proportion to the sectors' use of electricity.  
 Note: Sum of components does not equal total due to independent rounding; the use of preliminary conversion factors; and the exclusion of changes in stocks, miscellaneous supply and disposition, and unaccounted for quantities.

<sup>1</sup> Preliminary.

<sup>2</sup> Dry natural gas.

<sup>3</sup> Includes electricity produced from geothermal, wood, waste, wind, photovoltaic, and solar thermal sources connected to electric utility distribution systems (see Note).

<sup>4</sup> Less than 0.005 quadrillion Btu.

<sup>5</sup> Includes imports of crude oil for the Strategic Petroleum Reserve, which began in 1977.

<sup>6</sup> Includes imports of unfinished oils and natural gas plant liquids.

<sup>7</sup> Includes coal, coal coke, and hydroelectric power.

<sup>8</sup> Includes natural gas, coal coke, and hydroelectric power.

<sup>9</sup> A balancing item. Includes stock changes, losses, gains, miscellaneous blending components, and unaccounted for supply.

<sup>10</sup> Petroleum products supplied includes natural gas plant liquids and crude oil burned as fuel.

<sup>11</sup> Includes industrial generation of hydroelectric power and net electricity imports.

<sup>12</sup> Includes electricity produced from geothermal, wood, waste, wind, photovoltaic, and solar thermal sources connected to electric utility distribution systems (see Note) and net imports of coal coke.

Note: Data do not include the consumption of wood energy (other than that consumed by the electric utility industry) which amounted to an estimated 2.6 quadrillion Btu in 1984 (see Table 97). This table also does not include small quantities of other energy forms for which consistent historical data are not available, such as geothermal, waste, wind, photovoltaic, or solar thermal energy sources except that consumed by electric utilities.

Note: Sum of components may not equal total due to independent rounding.

Sources: Tables 48, 68, 76, 82, 84, and 86, EIA estimates for industrial hydroelectric power, and conversion factors in Appendix A.

<sup>1</sup> Petroleum products supplied including natural gas plant liquids and crude oil burned as fuel.

<sup>2</sup> Electric utility and industrial generation of hydroelectric power and net electricity imports.

<sup>3</sup> Generated by electric utilities.

<sup>4</sup> Includes net imports of coal coke and electricity produced from wood, waste, wind, photovoltaic, and solar thermal sources connected to electric utility distribution systems. Converted to Btu by applying national average heat rates for fossil fuel steam electric plants. Data do not include the consumption of wood energy (other than that consumed by the electric utility industry) which amounted to an estimated 2.6 quadrillion Btu in 1984 (see Table 97). This table also does not include small quantities of energy forms for which consistent historical data are not available, such as geothermal, waste, wind, photovoltaic, or solar thermal energy sources except that consumed by electric utilities.

<sup>5</sup> Percent change from previous year calculated from data prior to rounding.

<sup>6</sup> Less than 0.005 quadrillion Btu.

<sup>7</sup> Preliminary.

Note: Sum of components may not equal total due to independent rounding.

Sources: Tables 48, 68, 76, 82, 84, and 86, EIA estimates for industrial hydroelectric power, and conversion factors in Appendix A.

**Figure 4. Consumption of Energy by End-Use Sector, 1949-1988**

<sup>1</sup> Data do not include consumption of wood energy (other than that consumed by the electric utility industry) which amounted to an estimated 2.6 quadrillion Btu in 1984 (see Table 97). This table also does not include small quantities of other energy forms for which consistent historical data are not available, such as geothermal, waste, wind, photovoltaic, or solar thermal energy sources except that consumed by electric utilities. See Appendix E, Note 2.

<sup>2</sup> Includes only those fossil fuels consumed directly in the sector (see Diagram 1).

<sup>3</sup> Includes those fossil fuels consumed directly in the sector, utility electricity sales to the sector, and energy losses in the conversion and transmission of electricity. Conversion and transmission losses are allocated to sectors in proportion to electricity sales to sectors (see Diagram 1).

<sup>4</sup> Preliminary.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> Production from Naval Petroleum Reserve No. 1 (NPR#1) for 1974 and earlier years is for fiscal years (July through June).

<sup>2</sup> Includes only those quantities for which the royalties were paid based on the value of the natural gas plant liquids produced. Additional quantities of natural gas plant liquids were produced; however, the royalties paid were based on the value of natural gas processed. These latter quantities are included with natural gas.

<sup>3</sup> Includes same quantities of natural gas processed into liquids at natural gas processing plants and fractionators.

<sup>4</sup> Converted to British thermal units (Btu) based on an estimated heat content of coal produced on federally administered lands of 21.0 million Btu per short ton.

<sup>5</sup> Based on physical units.

## 2. Energy Consumption Indicators

---

### Indicators of Energy Intensity

The relationship between total energy consumption and real gross national product (GNP) is a primary indication of the energy intensity of the economy. In 1970, 27 thousand Btu of energy was consumed for each constant 1982 dollar of GNP (8).<sup>1</sup> Higher energy prices in the early 1970's led to increases in energy efficiency and to the development of service industries at the expense of energy-intensive industries. As a result, the energy intensity of the economy as a whole fell to 20 thousand Btu per constant dollar in 1986, a decline of over one-fourth since 1970.

After the oil price collapse in 1986, energy intensity moved very slightly upward, by less than 0.1 percent in 1987 and by 0.2 percent in 1988. Adverse weather conditions in 1988—a colder-than-normal winter and a record-breaking heat wave in summer—tended to drive up the energy intensity of the economy.

A second indicator of energy intensity is per capita consumption. Throughout the 1960's and early 1970's, the growth of end-use energy consumption was greater than the growth of the population (7). Per capita consumption rose from 212 million Btu in 1960 to a peak of 285 million Btu in 1973. Thereafter, per capita consumption trended downward, to as low as 226 million Btu in 1983. In 1988, end-use energy consumption was 244 million Btu per capita.

Energy consumption per household,<sup>2</sup> a third indicator of energy intensity, declined from 138 million Btu in 1978 to 100 million Btu in 1987 (the most recent year for which data are available), with only one small

upward fluctuation, which occurred in 1984. Lower use of distillate fuel oil and kerosene accounted for most of the decline (16).

Households in the South and West consumed the least amount of energy in 1987, an average of 83 million Btu per household in the South and 77 million Btu per household in the West. Energy consumption by households in the North Central Region averaged 123 million Btu per household. Households in the Northeast averaged 124 million Btu per household, surpassing the North Central average for the first time.

### Household Uses of Energy

Energy consumed by households can be attributed to four primary applications: space heating, air conditioning, water heating, and appliance operation (17). In 1987, household energy consumption totaled 9 quadrillion Btu (16). Natural gas was the primary source of energy for space heating and provided the main source of heat in 50 million households (18).

In 1984 (the most recent year for which data are available), space heating was the most prevalent application of energy consumed by households and accounted for 5 quadrillion Btu (17). Nearly 2 quadrillion Btu were used to operate appliances and, as would be expected, electricity was the major source of energy for that application. Refrigerators, color television sets, ovens, and automatic clothes washers were the most common household appliances (19).

Electricity was essentially the only source of energy used for air conditioning. Although air conditioning accounted for only 4 percent of household energy consumption, it accounted for almost 8 percent (\$7.5 billion) of total household energy expenditures of \$97 billion (17).

The cost of energy used to operate appliances totaled \$38 billion in 1984, and the cost for space heating was a close second at \$37 billion. Energy expenses for water heating came to about \$15 billion.

<sup>1</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

<sup>2</sup>Five major energy sources—natural gas, electricity, distillate fuel oil, kerosene, and liquefied petroleum gases—are included in the data.

## Improvements in Motor Vehicle Efficiency

Because motor gasoline consistently accounts for the largest share of all petroleum products supplied (58), demand for motor gasoline can have a significant effect on U.S. dependence on foreign sources of crude oil. In turn, the price and availability of crude oil influence motor gasoline demand.

In 1973, average annual mileage exceeded 10 thousand miles per passenger car (22). The fuel rate of passenger cars, which make up a sizable proportion of the U.S. motor vehicle fleet, was 13.3 miles per gallon. That measure of fuel efficiency had declined for the previous several years.

In 1973-74, however, crude oil supply interruptions and rising prices led to concerns about the continued availability of motor gasoline at desirable prices. Mileage per passenger car immediately declined, to an average of 9.6 thousand in 1974. At the same time, the fuel rate began to creep upward, and continued to increase throughout the remainder of the 1970's and 1980's, reaching 19.2 miles per gallon in 1987 (the most recent year for which data are available). Federal regulations designed to encourage improvements in the efficiency of the fleet played a role in the increases in fuel rates.

During 1987, however, new Federal legislation allowed States to raise the speed limit on some highways, and, by 1988, 41 States had increased speed limits. Because vehicles traveling at speeds above 55 miles per hour are less efficient, higher speed limits tend to increase demand for motor fuel. Other factors, such as relatively low motor gasoline prices and increases in highway travel, also tend to increase demand.

## Energy Consumption at Commercial Buildings

In 1986 (the most recent year for which data are available), there were an estimated 4.0 million commercial buildings with approximately 57 billion square feet of floorspace in the United States (25). The largest number of commercial buildings, 1.6 million, were found in the South and accounted for 38 percent of the U.S. total (24). Space heating, cooling, and water heating were the three most prevalent end uses of energy in commercial buildings.

The four major energy sources at commercial buildings in 1986 were electricity, natural gas, fuel oil (kerosene, distillate fuel oil, and residual

fuel), and district heat (purchased and nonpurchased steam and purchased and nonpurchased hot water). Electricity was found in nearly all commercial buildings and in a much greater percentage of buildings than its nearest competitor, natural gas (25). Fuel oil and district heat were found in relatively few buildings.

Electricity also predominated on a square footage basis. In 1986, 57 billion square feet of commercial space had electricity, compared with 37 billion square feet with natural gas, 11 billion square feet with fuel oil, and 5 billion square feet with district heat.

Energy consumption in commercial buildings in 1986 totaled 5.0 quadrillion Btu. Electricity accounted for 2.4 quadrillion Btu, followed by natural gas (1.7 quadrillion Btu) and fuel oil and district heat (0.4 quadrillion Btu each).

On a Btu basis, electricity was by far the most expensive source of energy consumed at commercial buildings, and as such it accounted for a disproportionate share of energy expenditures. Total energy expenditures of nearly \$61 billion were divided as follows: \$47.2 billion for electricity, \$8.4 billion for natural gas, \$2.1 billion for fuel oil, and \$2.6 billion for district heat.

### Nonfuel Use of Energy Sources

The amount of energy used for nonfuel purposes is small compared with the amount of energy consumed by end users or used in the production, processing, and transportation of energy. In 1988, the 5 quadrillion Btu consumed for nonfuel uses represented a 6-percent share of total energy consumption (13).

The nonfuel use of energy is overwhelmingly the use of petroleum products, primarily asphalt and road oil, liquefied petroleum gases (LPG), and petrochemical feedstocks. Use of petroleum for nonfuel purposes appears to be slightly more in 1988 than in 1980; the apparent increase reflects some combination of actual trends and changes in data collection procedures that resulted from the discontinuation of the Energy Information Administration's survey on LPG sales.

## Consumption of Energy for Manufacturing

The U.S. manufacturing sector consumed an estimated 17.5 quadrillion Btu<sup>3</sup> to produce heat and power and to generate electricity in 1985 (the most recent year for which data are available). Natural gas accounted for 5.2 quadrillion Btu, a 30-percent share of total primary energy consumption (14). Coal accounted for 2.4 quadrillion Btu, a 14-percent share, and electricity<sup>4</sup> consumption for 2.2 quadrillion Btu, a 12-percent share. Fuel oil consumption of about 0.8 quadrillion Btu accounted for the smallest share, 4 percent.

Of all the industries, the petroleum and coal products industry was the largest user of primary energy in 1985, consuming 5.1 quadrillion Btu. At 3.6 quadrillion Btu, the chemicals and allied products industry was the second largest user. Together, the two industries accounted for half of the primary energy consumption in the manufacturing sector.

Because the manufacturing sector accounts for a large share of total U.S. energy consumption, manufacturers' ability to cope with fluctuations in energy supplies and prices by switching to alternative sources of energy plays a significant role in the Nation's energy security. Fuel switching capability<sup>5</sup> in 1985 was determined for five major energy sources: natural gas, purchased electricity, coal and coke, residual fuel oil, and distillate fuel oil (15).

Residual fuel oil registered the largest value (43 percent) for switchable consumption as a percentage of actual consumption, indicating substantial fuel-switching capabilities. Almost 20 percent of distillate fuel oil consumption could have been supplied by other sources. It is estimated that about 92 thousand barrels per day of fuel oil consumption could have been switched to nonpetroleum sources.

<sup>3</sup>The manufacturing sector is composed of establishments that use mechanical or chemical processes to transform raw materials into intermediate or final products. It does not include the remainder of the industrial sector (construction, mining, agricultural, fishing, and forestry establishments) or electric utilities. The 17.5 quadrillion Btu total is *primary energy consumption*; it includes petrochemical feedstocks and raw material inputs but excludes byproduct fuels.

<sup>4</sup>Net electricity, which is obtained by summing purchases, transfers in, and generation from noncombustible renewable resources, minus quantities sold and transferred out. It excludes electricity generated from combustible fuels, which are counted as generating fuels.

<sup>5</sup>The capability of U.S. manufacturers to switch fuels within 30 days, using only existing equipment and keeping production output constant.

Natural gas registered the largest absolute amount of total switchable consumption. Of the 4.7 quadrillion Btu total of natural gas consumption, 2.0 quadrillion Btu (42 percent) could have been switched to other sources. Of the 1.8 quadrillion Btu of coal and coke consumed, 0.5 quadrillion Btu (30 percent) were switchable. Very little of the 2.2 quadrillion Btu of purchased electricity consumed by manufacturers in 1985 could have been switched to other sources—less than 2 percent if manufacturing output were to be maintained.

## Trends in Industrial Energy Consumption

Energy consumption by the industrial sector increased throughout the 1960's and attained an all-time high in 1973 of 26 quadrillion Btu (11). After 1973, increasing energy prices tended to depress industrial sector demand for energy, and the rate of consumption trended downward. By 1986, the annual total was 20 quadrillion Btu. Following the 1986 fall in crude oil prices, industrial energy consumption rose to 22 quadrillion Btu in 1988.

The industrial sector relied on the three major fossil fuels—petroleum, natural gas, and coal—and electricity throughout the 1960-to-1988 period, but the relative contributions of each form of energy changed over time. Coal, which accounted for a 26-percent share in 1960, provided only 13 percent of industrial energy in 1988. Meanwhile, electricity's share rose from 7 percent to 14 percent.

During the 29-year period, the share supplied by petroleum ranged from 33 percent to 41 percent, and the share supplied by natural gas ranged from 33 percent to 42 percent. In 1988, petroleum's share was the largest, 38 percent, followed by natural gas, 35 percent, electricity, 14 percent, and coal, 13 percent.

One measure of energy efficiency in the industrial sector is the ratio of end-use energy consumption to industrial output (measured in thousand Btu per constant 1982 dollar). Throughout the 1960-to-1973 period, when energy was relatively cheap and supplies were assured, energy consumption per dollar of industrial output stayed within a narrow range, with a low of 11.5 in 1968 and a high of 12.4 in 1970 (12). After 1973, the measure began to decline, and by 1985 (the most recent year for which data are available) had fallen to 8.7 thousand Btu per constant dollar of industrial output, 29 percent below the peak in 1970.

1988 <sup>6</sup>	13.15	6.85	20.00	0.2	12.08	2.95	15.03	0.4

<sup>1</sup> In 1982 dollars, calculated using implicit GNP price deflators.

<sup>2</sup> End-use energy consumption is total energy consumption less losses incurred in the generation, transmission, and distribution of electricity, less power plant electricity use and unaccounted for electrical system energy losses. (See Glossary).

<sup>3</sup> Percent change calculated from data prior to rounding.

<sup>4</sup> Total petroleum and natural gas consumption less consumption of these fuels by electric utilities.

<sup>5</sup> Total coal consumption less coal consumed at electric utilities, plus electric utility sales, hydroelectric power generated by non-electric utilities, and net imports of coal coke.

<sup>6</sup> Preliminary.

<sup>1</sup> Preliminary. Energy usage data for Department of Labor, Department of Justice, Department of Defense, and Department of Treasury are estimated.

<sup>2</sup> Includes Department of Commerce, Panama Canal Commission, Tennessee Valley Authority, Department of Labor, National Science Foundation, Department of Treasury, Federal Communications Commission, and Environmental Protection Agency. Environmental Protection Agency and the Department of Treasury data for 1982 are estimated. Department of Treasury data for 1983 are estimated.

Note: Sum of components may not equal total due to independent rounding.

Note: These data include energy consumed at foreign installations and in foreign operations, including aviation and ocean bunkering, primarily by the Department of Defense. U.S. Government energy use for electricity generation and uranium enrichment is excluded. However, other energy used by U.S. agencies that produce electricity or enrich uranium is included.

<sup>1</sup> Those quantities for which payment was made and that were available onsite for consumption.

<sup>2</sup> The amount of fuel actually consumed minus the amount of actual consumption that could have been replaced by other fuels.

<sup>3</sup> The amount of fuel actually consumed plus the amount of additional consumption that could have occurred if all possible switching from other fuels took place.

<sup>4</sup> The amount of actual consumption that could have been replaced by other fuels.

<sup>5</sup> The total estimated quantity of residual and distillate fuel oil combined that is switchable to nonpetroleum alternate fuels is 92 thousand barrels per day.

Note: Consumption includes energy consumed for heat, power, and onsite electricity generation. It excludes energy consumed as petrochemical feedstocks and raw material inputs.

<sup>1</sup> Preliminary.

<sup>2</sup> Degree-day data for 1987 are from individual weather stations. Data for previous years are from clusters of weather stations.

<sup>3</sup> Includes electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

<sup>4</sup> Excludes household use of liquefied petroleum gases for cooking grills or recreation vehicles.

NA = Not available.

Note: No data are available for 1983, 1985, and 1986.

Note: Data for 1978 through 1984 are for April of year shown through March of following year except for household counts and floor space that are for November of year shown; data for 1987 are for calendar year except for household counts and floor space that are for November 1987.

Note: Average consumption per household for each energy source is total average consumption per household and is not limited to space heating and cooling only.

<sup>1</sup> Includes mobile homes and individual housing units in apartment buildings. Housing units with more than one type of heating system are classified according to the principal type of heating system.

<sup>2</sup> Includes coal coke.

<sup>3</sup> Includes nonreporting units in 1950 and 1960 which totaled 997 and 2,000 units, respectively.

<sup>4</sup> Included in distillate fuel oil.

<sup>5</sup> Data for 1982 and 1984 are not available. Since 1981, the *Annual Housing Survey* has been a biennial survey.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

Sources: •1950, 1960, and 1970—Bureau of the Census, *Census of Population and Housing*. •1973 and forward—Bureau of the Census, *Annual Housing Survey*.

1987	137.3	4.9	( <sup>5</sup> )	41.7	183.9	7,359	1,242	8,601
1988 <sup>6</sup>	140.7	4.7	( <sup>5</sup> )	42.8	188.2	7,552	1,290	8,842

<sup>1</sup> Includes only motor fuel taxed at the prevailing tax rates in each State. Excludes motor fuel exempt from tax payment, subject to tax refund, or taxed at rates other than the prevailing tax rate. Experience has shown that the total motor fuel consumption quantity cited here equals more than 99.0 percent of gross reported motor fuel consumption.

<sup>2</sup> Includes motor gasoline, aviation gasoline, and gasohol.

<sup>3</sup> Includes distillate fuel oil (diesel oil), liquefied gases, and kerosene when they are used to operate vehicles on highways. Excludes jet fuel beginning in 1962.

<sup>4</sup> Excludes losses allowed for evaporation, handling, etc.

<sup>5</sup> Included in trucks.

<sup>6</sup> Estimated.

Note: Sum of components may not equal total due to independent rounding.

## 3. Selected Financial Indicators

---

### Fossil Fuel Real Prices Down from Record Levels

From the 1949 level of \$1.12 per million Btu, real prices<sup>1</sup> of fossil fuels<sup>2</sup> trended downward to a low of \$0.75 in 1969 (27).<sup>3</sup> Thereafter, prices began to escalate, sometimes abruptly. In 1974, the composite price of fossil fuels jumped from the 1973 level of \$0.80 to \$1.25, surpassing the 1949 level for the first time and registering the largest year-to-year increase (56 percent) of the 40-year period. The peak of \$2.92 was reached in 1981. However, the price then declined, plunging 36 percent in 1986 alone. By 1988, the composite price of fossil fuels was \$1.26.

Crude oil was the most expensive of the fossil fuels throughout most of the period. Only anthracite was more expensive, and in only 3 years (1975 through 1977). At its peak in 1981, the real price of crude oil reached \$5.83, more than triple the price of natural gas and more than quadruple the price of nonanthracitic coal.

### Energy Expenditures Declined in 1986

The energy expenditure measure is the product of energy consumption and energy prices. In 1986 (the most recent year for which data are available), a slight rise in energy consumption was overwhelmed by a sizable decline in energy prices. Energy expenditures fell dramatically, from \$445 billion in 1985 to \$381 billion in 1986 (29).

End-use expenditures of \$173 billion for petroleum products accounted for the largest share (46 percent) of total energy expenditures. The year-to-year decline in petroleum expenditures was \$51 billion and represented most of the \$64-billion decline in total energy expenditures. Sales of electricity (net of expenditures by electric utilities for most fuels used to generate electricity) totaled \$114 billion; nuclear fuel, wood, and waste used at electric utilities accounted for \$3 billion. Expenditures for natural gas and coal were \$62 billion and \$28 billion, respectively.

<sup>1</sup>Real prices are expressed in constant 1982 dollars.

<sup>2</sup>Crude oil, natural gas, and coal.

<sup>3</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

### Energy Industry Income and Investment

In 1987 (the most recent year for which data are available), the 22 major energy companies included in the Financial Reporting System (FRS)<sup>4</sup> accounted for 57 percent of U.S. crude oil and natural gas liquids production, 44 percent of dry natural gas production, and smaller shares of coal and uranium production (34). They also accounted for over three-fourths of refinery capacity and output in 1987. In 1987, the FRS companies continued to play a significant role in the U.S. economy, accounting for 34 percent of the profits and 26 percent of the assets of *Fortune's* 500 largest U.S. industrial firms.<sup>5</sup>

The FRS companies were involved in a wide range of business activities, but, from 1977 through 1987, petroleum and natural gas production was their primary source of net income (35). However, during 1985 through 1987, sharp swings in oil prices led to fluctuations in the FRS companies' net income and in the share of net income attributable to oil and gas production. When oil prices collapsed in 1986, net income from domestic production fell from \$12 billion in 1985 to \$1 billion in 1986 and net income from foreign production fell from \$8 billion to under \$5 billion (35). In 1987, oil prices partially recovered, and net income from domestic oil and gas production rose to nearly \$5 billion, while net income from foreign production rose to slightly over that amount.

Nevertheless, the FRS companies continued to scale back additions to investment in domestic oil and gas production. In 1987, additions totaled \$11 billion, the lowest level since 1978 (37), and the domestic oil and gas production share of net investment in place fell to 36 percent (36). Additions to investment in foreign production totaled \$7 billion in 1987. The retrenchment in exploration and development is likely to lead to deterioration of the FRS companies' oil and gas reserves in the long term.

<sup>4</sup>The FRS collects financial data from the major energy-producing companies. See Appendix E, note 3.

<sup>1</sup> Includes lease condensate.

<sup>2</sup> Wet natural gas, prior to extraction of natural gas plant liquids.

<sup>3</sup> Derived by multiplying the price per Btu of each fossil fuel by the total Btu content of the production of each fossil fuel and dividing this accumulated value of total fossil fuel production by the accumulated Btu content of total fossil fuel production.

<sup>4</sup> In 1982 dollars, calculated using implicit GNP price deflators.

<sup>5</sup> Preliminary.

Note: All fuel prices taken as close as possible to the point of production.

<sup>1</sup> Includes pentanes plus, petrochemical feedstocks, special naphthas, petroleum coke, still gas, wax, and miscellaneous products.

<sup>2</sup> Less than \$0.05 billion.

<sup>3</sup> In determining total energy expenditures, this is a negative quantity.

<sup>4</sup> These are sales. In determining total energy expenditures, this is a positive quantity.

<sup>5</sup> There are no direct fuel costs for hydroelectric, geothermal, centralized solar, or wind energy. Wood and other biomass fuels are not included, except those consumed at the electric utilities.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> Includes lease condensate.

<sup>2</sup> In 1982 dollars, calculated using implicit GNP price deflators.

<sup>3</sup> Preliminary.

Note: Value is based on fuel prices taken as close as possible to the point of production.

## 4. Energy Resources

---

### Crude Oil and Natural Gas Proved Reserves

Proved reserves of crude oil, natural gas, and natural gas liquids combined increased every year from 1949 until 1968 (44),<sup>1</sup> when, for the first time, production exceeded net additions to proved reserves. Except for the addition of Alaska's North Slope reserves in 1970, proved reserves fell each year through the 1970's before stabilizing at between 69 billion and 70 billion barrels (crude oil equivalent) in the first half of the 1980's. By 1987, proved reserves of crude oil had fallen from a 1970 peak of 39 billion barrels to 27 billion barrels. Proved reserves of natural gas had fallen from a 1967 peak of 293 trillion cubic feet to 187 trillion cubic feet in 1987, and proved reserves of natural gas liquids had declined from 9 billion barrels in 1967 to 8 billion barrels.

### Crude Oil and Natural Gas Resources

The most recent U.S. Geological Survey assessment of U.S. undiscovered, recoverable resources provides mean estimates for 1980 of 83 billion barrels of crude oil and 594 trillion cubic feet of natural gas (38). On a Btu basis, about 46 percent of all onshore resources are located in the Colorado Plateau and Basin and Range and the Gulf Coast. Close to one-third of all resources are estimated to be offshore, primarily near Alaska and in the Gulf of Mexico. In 1984, resources in the Federal offshore area were estimated to be 23 billion barrels of crude oil and 161 trillion cubic feet of natural gas.

### Coal Reserves: An Abundant Supply

The Energy Information Administration has estimated that the demonstrated reserve base of coal contained 475 billion short tons at the beginning of 1988 (45). Although recoverability rates differ from site to site, the rate for the reserve base as a whole is estimated to be at least 50 percent, enough to sustain coal production at current levels for more than 200 years.

<sup>1</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

### Uranium Resources

At the end of 1987, reasonably assured uranium resources with forward costs (those yet to be incurred in production) of up to \$30 per pound totaled 304 million pounds of U<sub>3</sub>O<sub>8</sub>, over half of which was in New Mexico (47). Estimated additional resources and speculative resources in the \$30-per-pound category in 1987 totaled 1.3 billion pounds and 1.0 billion pounds, respectively.

### Exploring for Energy Resources

Exploration for oil and gas is closely tied to market conditions, particularly to the price of crude oil. When the price rose in 1974, the number of seismic crews and rotary rigs also rose (39) and exploratory well completions increased (40). A second price hike sent all three indicators to record levels in 1981: seismic crews working were 681, rotary rigs in operation were 3,970, and completions of exploratory wells totaled 17.5 thousand. Subsequently, prices declined and then collapsed, leading to drastic cutbacks in exploration. In 1987, seismic crews working sank to 176, rotary rigs in operation to 936, and completions of exploratory wells to 6.5 thousand. In 1988, seismic crews working rose a modest 3 percent to 182, the number of rotary rigs in operation was unchanged at 936, and the number of exploratory wells completed fell 9 percent to 5.9 thousand.

Exploration for uranium also reflects changes in energy markets. The number of exploratory and development holes drilled peaked in 1978 at 104 thousand (46). As uranium market conditions deteriorated after 1978, the number plunged to less than 4 thousand in 1985 through 1987—the lowest level in at least three decades.

<sup>1</sup> The low value of the range is the quantity associated with a 95 percent probability (19 in 20 chance) that there is at least this amount. The high value is the quantity with a 5 percent probability (1 in 20 chance) that there is at least this amount. Totals for the low and high values are not obtained by arithmetic summation; they are derived by statistical methods.

<sup>2</sup> The calculated mean from the probability curve using the Monte Carlo technique.

<sup>3</sup> Less than 0.1 trillion cubic feet.

<sup>4</sup> Includes quantities considered recoverable only if technology permits their exploitation beneath Arctic ice — a condition not yet met.

<sup>5</sup> Includes only the area encompassed by the Federally Controlled Outer Continental Shelf.

<sup>6</sup> Includes only economically recoverable quantities and assumes at least one commercial accumulation exists in the area (i.e., these are unrisks economically recoverable volumes).

<sup>7</sup> RMO=risked mean oil, RMG=risked mean gas. The Minerals Management Service methodology computes the marginal probability that economically recoverable hydrocarbons exist in the area. When applied to the mean volume, the methodology adjusts the figure to reflect the probability that the area may be nonproductive.

<sup>1</sup> Data for these years are preliminary. See Appendix E, Note 4.

Note: Sum of components may not equal total due to independent rounding. Average depth may not equal average of components due to independent rounding.

Note: For 1949 through 1959, data represent wells completed in a given year. For 1960 through 1969, data are for well completion reports received by the American Petroleum Institute during the reporting year. For 1970 forward, the data represent wells completed in a given year. See Appendix E, Note 4.

<sup>1</sup> In 1982 dollars, calculated using implicit GNP price deflators. See Appendix C.

Note: Average cost is the arithmetic mean and includes all costs for drilling and equipping wells and for surface producing facilities. Wells drilled include exploratory and development wells; excludes service wells, stratigraphic tests, and core tests.

Note: The information reported for 1965 and prior years is not strictly comparable with the more recent surveys.

<sup>1</sup> Includes measured and indicated resource categories representing 100 percent of the coal in place. Recoverability varies from less than 40 percent to more than 90 percent for individual deposits. About one-half of the demonstrated reserve base of coal in the United States is estimated to be recoverable.

<sup>2</sup> Includes subbituminous coal.

<sup>3</sup> Includes 123.8 million short tons of surface mine reserves, of which 108.3 million tons are in Pennsylvania and 15.5 million tons are in Arkansas.

<sup>4</sup> There are no underground demonstrated coal reserves of lignite.

<sup>5</sup> Includes Georgia, Maryland, North Carolina, and Tennessee.

<sup>6</sup> Includes Arkansas, Kansas, Louisiana, and Michigan.

<sup>7</sup> Less than 0.05 billion short tons.

<sup>8</sup> Includes Arizona, Idaho, Oregon, and South Dakota.

Note: Sum of components may not equal total due to independent rounding.

Total <sup>3</sup> .....	304	1,005	1,592
<b>Undiscovered Resources</b>			
Estimated Additional Resources .....	1,320	2,330	3,740
Speculative Resources .....	1,040	1,960	3,200

<sup>1</sup> Forward costs are all operating and capital costs (in current dollars) still to be incurred in the production of uranium from estimated resources. Excluded are previous expenditures (such as exploration and land acquisitions) taxes, profit, and the cost of money. Generally, forward costs are lower than market prices.

<sup>2</sup> Includes California, Idaho, Montana, Nebraska, Nevada, North Dakota, Oregon, South Dakota, and Washington.

<sup>3</sup> Does not include an estimated 51 million pounds of \$30 per pound reserves from byproduct recovery facilities.

### Fluctuations in the Price of Crude Oil

After successive price hikes had brought the real price<sup>1</sup> of crude oil to a peak in 1981, oil prices began trending downward in 1982, and then plummeted in 1986 (65).<sup>2</sup> The average annual composite refiner acquisition cost of a barrel of crude oil fell from \$24.12 in 1985 to \$12.77 in 1986. In 1987, oil prices recovered somewhat and averaged \$15.21, only to decline to \$12.09 in 1988.

Of the several factors contributing to the unprecedented decline in crude oil prices during the first half of 1986, the most important was excess worldwide production—primarily by members of the Organization of Petroleum Exporting Countries (OPEC) seeking to regain market share. OPEC's expanded use of netback pricing agreements caused uncertainty in world oil markets, prolonging the slump. In 1987, oil prices were higher and more stable, due in part to OPEC's closer adherence to its self-imposed production quotas during the first several months of the year. In 1988, however, OPEC production rose 10 percent (105), contributing to weaker prices for the year.

The swings in crude oil prices often were reflected (though in attenuated form) in changes in the retail prices of petroleum products (67). For example, the average annual price per gallon, in real terms, of unleaded regular motor gasoline declined from \$1.08 in 1985 to \$0.81 in 1986 and 1987. However, crude oil price is not the only component of motor gasoline price; refining and distribution costs and taxation are also major determinants of the retail price. In 1988, the real price per gallon of unleaded regular motor gasoline fell only 3 percent, despite the 21-percent decline in the composite refiner acquisition cost of crude oil.

### Consumption of Petroleum Products

Consumption of petroleum products (petroleum products supplied) increased throughout the 1949-to-1973 period, at an average annual rate of

<sup>1</sup>Real prices are expressed in constant 1982 dollars.

<sup>2</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

4.7 percent, and by 1973, consumption of petroleum products totaled 17 million barrels per day (48). In 1974, however, marked increases in the price of crude oil coupled with a petroleum supply interruption resulted in a consumption decline of 3.8 percent. Although demand recovered during the late 1970's, peaking at 19 million barrels per day in 1978, by 1983 it had declined to 15 million barrels per day. After that, lower crude oil prices tended to promote consumption. In 1988, low oil prices, continued economic growth, and adverse weather conditions combined to boost petroleum consumption to 17 million barrels per day.

### Petroleum Stocks and the Strategic Petroleum Reserve

The U.S. Government established the Strategic Petroleum Reserve (SPR) in response to the oil supply disruptions of the early 1970's. Intended to minimize the effects of any future disruptions, the SPR began storing crude oil in 1977, and by the end of 1988, the Reserve held 560 million barrels (62).

One measure of the Reserve's adequacy is the number of days of petroleum net imports it could provide in the event of an oil supply interruption. Through 1985, that measure of energy security increased every year, due to additions to the Reserve and a decline in the level of net imports. In 1986, however, the measure declined for the first time, from 115 days in 1985 to 94 days in 1986. Due to increasing net imports, by 1988 the measure had fallen to 88 days.

At the end of 1988, SPR stocks plus 331 million barrels of privately held crude oil stocks totaled 891 million barrels (61). Private stocks of crude oil were about equal to the 340-million-barrel level recorded in 1977, when filling of the SPR began, but, at 709 million barrels, private stocks of petroleum products in 1988 remained considerably below the record level of 964 million barrels recorded in 1977.

Motor gasoline consistently accounts for the largest share of all petroleum products supplied (58). From 1949 through 1988, its share was between 38 percent and 43 percent of supply. After peaking in 1978 at 7.4 million barrels per day, consumption declined somewhat and then stabilized at about 6.6 million barrels per day during the early 1980's.

After 1982, declines in motor gasoline prices sparked renewed growth in demand, and demand remained strong throughout 1988. The fuel efficiency of the fleet (22) continued to increase through 1987 (the most recent year for which data are available), tending to depress demand, but other factors more than offset the increase in efficiency. In 1987, increased highway travel, spurred by higher real disposable income, and legislation allowing travel at higher speeds (at which vehicles are less efficient) combined to keep demand strong.

In contrast, consumption of residual fuel oil declined markedly after 1977, accounting for a smaller and smaller share of all products supplied, as major consumers switched to coal and uranium. Residual fuel consumption had reached an all-time high in 1977 of 3.1 million barrels per day, 17 percent of supply (58). After 8 years of decline, consumption had fallen to 1.2 million barrels per day, less than 8 percent of products supplied, in 1985. Sharply lower oil prices in 1986 encouraged demand for residual fuel, and consumption rose to 1.4 million barrels per day. Demand slackened in 1987 and 1988 to about 1.3 million barrels per day, again less than 8 percent of products supplied.

### **Production and Productivity**

During much of the 1950's and 1960's, production capacity exceeded demand to such an extent that mechanisms such as production prorationing and import ceilings were implemented to protect domestic production. By the 1970's, however, petroleum demand had increased and production neared 100 percent of capacity. The average productivity of wells began to decline, and oil production leveled off (49). Increases in Alaskan production at the end of the decade and through 1988 counteracted declines in Lower-48 production. Nevertheless, by 1988 daily domestic production had declined to 8.1 million barrels, down from 9.6 million barrels produced in the peak year of 1970.

Of total U.S. production in 1988, 86 percent came from onshore wells and 14 percent from offshore. The 612 thousand producing wells attained an average productivity of 13 barrels per well per day, down 1 percent from the 1987 level and significantly below peak productivity of over 18 barrels attained in 1972.

### **Imports and Exports**

Despite import quotas, net imports of low-priced petroleum increased throughout most of the 1949-to-1973 period, and in 1973 totaled 6.0 million barrels per day (48). Thereafter, net imports fluctuated, peaking at 8.6 million barrels per day in 1977, then declining to 4.3 million barrels per day in 1985. In 1986, excess world production drove prices down, inhibiting domestic production and boosting demand. Those factors, as well as stockbuilding, resulted in an increase in net imports to 5.4 million barrels per day. Subsequently, with prices significantly below peak levels, daily net imports rose to 5.9 million barrels in 1987 and 6.4 million barrels in 1988.

U.S. dependence on petroleum net imports peaked at 47 percent of consumption in 1977, then fell in 1985 to 27 percent, the lowest level since 1971 (54). By 1988, it had risen to 37 percent, and dependence on net imports from members of OPEC had risen from 12 percent of consumption in 1985 to 20 percent in 1988. Mexico was the major source of U.S. petroleum net imports in 1982 through 1985, but in 1986 through 1988, Saudi Arabia, Canada, and Venezuela each supplied more petroleum to the United States than did Mexico.

From 1973 on, crude oil net imports surpassed petroleum product net imports; in 1988, the ratio was over 3 to 1 (50 and 52). Net imports of residual fuel accounted for 27 percent of all product net imports in 1988.

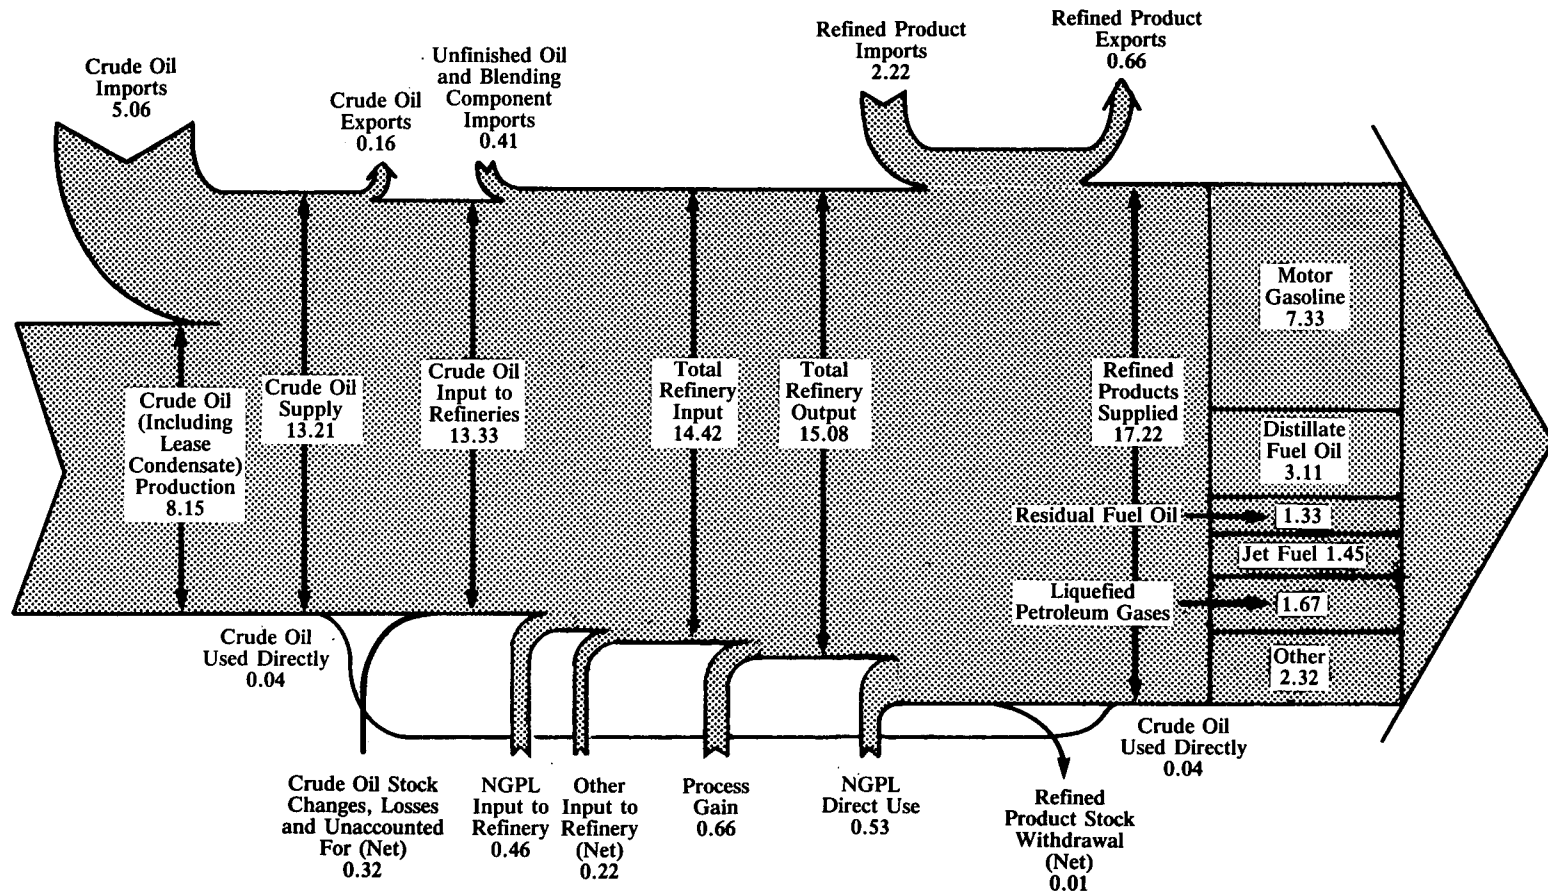

### **The Refining Industry in a Changing Market**

The average daily output from U.S. refineries trended upward from 1949 through 1978, when it peaked at 16 million barrels per day (55). During the next 5 years, output declined, falling to 13 million barrels per day in 1983. As crude oil prices declined in the mid-1980's and the demand for petroleum rose, refinery output began to recover, reaching 15 million barrels per day by 1988.

The rate of refinery utilization fell below 80 percent in 1980 through 1985, but improved thereafter (56). In 1986, the utilization rate was 83 percent, well above its nadir of 69 percent in 1981. Margins guaranteed by netback pricing agreements and decommissioning of less efficient refineries in 1986 both contributed to improvement within the domestic refining industry. In 1988, falling crude oil prices and strong product demand contributed to a utilization rate of 85 percent, an increase of more than 1 percentage point from the 1987 rate.

<sup>1</sup> Includes imports from U.S. possessions and territories.

<sup>2</sup> Includes imports for the Strategic Petroleum Reserve, which began in 1977.

<sup>3</sup> Prior to 1965, imports of kerosene-type jet fuel were included with kerosene, which is listed under "Other Products."

<sup>4</sup> Excludes motor gasoline blending components after 1980. Prior to 1964, motor gasoline data were for total gasoline, including motor gasoline, aviation gasoline, and special naphtha.

<sup>5</sup> Includes aviation gasoline, motor gasoline blending components, aviation gasoline blending components, kerosene, petrochemical feedstocks, special naphthas, lubricants, wax, asphalt, petroleum coke, pentanes plus, and miscellaneous products.

<sup>6</sup> Less than 500 barrels per day.

<sup>7</sup> Preliminary.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> See Glossary for membership.

<sup>2</sup> "Other OPEC" consists of Ecuador, Gabon, Iran, Iraq, Kuwait, Libya, Qatar, and United Arab Emirates. Prior to 1988, imports from the Neutral Zone between Kuwait and Saudi Arabia are included in imports from Saudi Arabia. From 1988 forward, those imports are included in imports from "Other OPEC."

<sup>3</sup> "Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. "Total OPEC" imports exclude petroleum imported into the United States indirectly from OPEC countries, primarily from Caribbean and West European refining areas, as petroleum products that were refined from crude oil produced in OPEC countries.

<sup>4</sup> "Total Arab OPEC" consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and United Arab Emirates. Imports from the Neutral Zone are included in imports from "Total Arab OPEC."

\* Less than 500 barrels per day.

\* Preliminary.

Note: Data include imports for the Strategic Petroleum Reserve, which began in 1977.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> Imports minus exports; negative numbers indicate that exports exceed imports.

<sup>2</sup> "Other OPEC" consists of Algeria, Ecuador, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Qatar, and United Arab Emirates. Prior to 1988, imports from the Neutral Zone between Kuwait and Saudi Arabia are included in imports from Saudi Arabia. From 1988 forward, those imports are included in imports from "Other OPEC."

<sup>3</sup> "Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. "Total OPEC" imports exclude petroleum imported into the United States indirectly from OPEC countries, primarily from Caribbean and West European refining areas, as petroleum products that were refined from crude oil produced in OPEC countries.

<sup>4</sup> "Total Arab OPEC" consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and United Arab Emirates. Imports from the Neutral Zone are included in imports from "Total Arab OPEC."

<sup>5</sup> Calculated by dividing total net petroleum imports by total U.S. petroleum products supplied (consumption).

<sup>6</sup> Calculated by dividing net petroleum imports from OPEC countries by total net petroleum imports.

<sup>7</sup> Calculated by dividing net petroleum imports from OPEC countries by total U.S. petroleum product supplied (consumption).

<sup>8</sup> Less than 500 barrels per day.

<sup>9</sup> Preliminary.

Note: Data include imports for the Strategic Petroleum Reserve which began in 1977.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> Prior to 1981, includes unfinished oils (net), hydrogen, and hydrocarbons not included elsewhere. 1981 forward includes unfinished oils (net), motor gasoline blending components (net), aviation gasoline blending components (net), hydrogen, other hydrocarbons, and alcohol. See Appendix E, Note 5.

<sup>2</sup> Prior to 1964, motor gasoline data were for total gasoline, including motor gasoline, aviation gasoline, and special naphtha. Prior to 1965, kerosene-type jet fuel was included in kerosene.

<sup>3</sup> Includes kerosene, petrochemical feedstocks, lubricants, wax, petroleum coke, asphalt, road oil, still gas, and miscellaneous products. Since 1964, aviation gasoline and special naphthas are included.

<sup>4</sup> Less than 5,000 barrels per day.

<sup>5</sup> Preliminary.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> Prior to 1956, the number of refineries includes only those in operation on January 1. For 1957 and forward, the number of refineries includes all operable refineries on January 1 (see Glossary). <sup>2</sup> Capacity in million barrels per calendar day on January 1. <sup>3</sup> See Appendix E, Note 6. <sup>4</sup> For 1949 through 1980, utilization is derived by dividing gross input to distillation units by one-half of the current year January 1 capacity and the following year January 1 capacity. Percentages were derived from unrounded numbers. For 1981 and forward, utilization is derived by averaging reported monthly utilization. <sup>5</sup> Preliminary. Note: Data are for refineries in the United States, excluding the Hawaiian Foreign Trade Zone. Sources: Operable Refineries: •1949 through 1977—Bureau of Mines, Mineral Industry Surveys, *Petroleum Refineries, Annual*. •1978 through 1981—Energy Information Administration, *Petroleum Supply Annual*. Gross Input to Distillation Units: •1949 through 1966—Bureau of Mines, *Minerals Yearbook*, "Natural Gas Liquids" and "Crude Petroleum and Petroleum Products" chapters. •1967 through 1977—Bureau of Mines, Mineral Industry Surveys, *Petroleum Refineries, Annual*. •1978 through 1980—Energy Information Administration, *Petroleum Refineries in the United States and U.S. Territories*. •1981 through 1987—Energy Information Administration, *Petroleum Supply Annual*. •1988—Energy Information Administration, *Petroleum Supply Monthly*. <sup>1</sup> Reported production of ethane-propane mixtures have been allocated 70 percent ethane and 30 percent propane.

<sup>2</sup> Reported production of butane-propane mixtures have been allocated 60 percent butane and 40 percent propane.

<sup>3</sup> Prior to 1984, this category was reported separately as natural gasoline, isopentane, and plant condensate.

<sup>4</sup> Includes motor gasoline, aviation gasoline, special naphthas, distillate fuel oil, and miscellaneous products.

<sup>5</sup> Preliminary.

Note: Sum of components may not equal total due to independent rounding.

1988 <sup>5</sup>	7.31	1.45	3.10	1.33	1.67	2.31	17.17	3.3

<sup>1</sup> See Appendix E, Notes 5, 7, and 8.

<sup>2</sup> Prior to 1964, motor gasoline data were for total gasoline, including motor gasoline, aviation gasoline, and special naphtha.

<sup>3</sup> Includes kerosene, petrochemical feedstocks, lubricants, wax, petroleum coke, asphalt, road oil, still gas, pentanes plus, and miscellaneous products. Since 1964, aviation gasoline and special naphthas are included. Prior to 1965, kerosene-type jet fuel was included in kerosene. For 1981 and forward, other products include negative barrels per day of distillate and residual fuel oil reclassified as unfinished oils and other products (from both primary and secondary supply) reclassified as gasoline blending components. Beginning in 1983, product supplied also includes crude oil burned as fuel.

<sup>4</sup> Percent change from previous year calculated from data prior to rounding.

<sup>5</sup> Preliminary.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> Includes crude oil stored in the Strategic Petroleum Reserve, which began in 1977.

<sup>2</sup> Prior to 1964, motor gasoline data were for total gasoline which included motor gasoline, aviation gasoline, and special naphthas. For 1981 and forward, includes motor gasoline blending components.

<sup>3</sup> Includes kerosene, petrochemical feedstocks, lubricants, wax, petroleum coke, asphalt, road oil, pentanes plus, and miscellaneous products. Since 1964, aviation gasoline and special naphthas are included. For 1981 and forward, includes aviation gasoline blending components, hydrogen, other hydrocarbons, and alcohol.

<sup>4</sup> Preliminary.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> Stocks do not include imported quantities in transit to Strategic Petroleum Reserve terminals, pipeline fill, and above-ground storage.

<sup>2</sup> Including lease condensate stocks.

<sup>3</sup> Derived by dividing end-of-year strategic petroleum reserve stocks by annual average daily net imports of all petroleum. Calculated prior to rounding.

<sup>4</sup> The quantity of domestic fuel oil which was in storage prior to injection of foreign crude oil.

<sup>5</sup> Less than 0.005 million barrels.

<sup>1</sup> See Glossary for membership.

<sup>2</sup> "Other OPEC" consists of Ecuador, Gabon, Iran, Iraq, Kuwait, Libya, Qatar, and United Arab Emirates. Prior to 1988, imports from the Neutral Zone between Kuwait and Saudi Arabia are included in imports from Saudi Arabia. From 1988 forward, those imports are included in imports from "Other OPEC."

<sup>3</sup> "Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. "Total OPEC" imports exclude petroleum imported into the United States indirectly from OPEC countries, primarily from Caribbean and West European refining areas, as petroleum products that were refined from crude oil produced in OPEC countries.

<sup>4</sup> "Total Arab OPEC" consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and United Arab Emirates. Imports from the Neutral Zone are included in imports from "Total Arab OPEC."

<sup>5</sup> Preliminary.

W = Value withheld to avoid disclosure of individual company data.

NA = Not available, included in "Other Non-Opec."

Note: Data include imports for the Strategic Petroleum Reserve, which began in 1977.

Note: Sum of components may not equal total due to independent rounding.

## 6. Natural Gas

---

### Price Changes in a Regulated Market

Due to different Federal and State rate structures, there are many price categories for natural gas. In addition, prices to consumers vary by region; for example, prices are lower in main producing areas, where transmission costs are lower. Estimated data indicate that the average wellhead price of all categories of natural gas rose from \$1.67 per thousand cubic feet in 1987 to \$1.71 in 1988 (74).<sup>1</sup> In real terms,<sup>2</sup> however, the average wellhead price per thousand cubic feet declined slightly, from \$1.42 to \$1.41.

When wellhead prices change, savings or price increases are passed on to consumers differentially. In 1986 (the most recent year for which complete data are available), the average wellhead price declined 23 percent. The price to industrial consumers fell 18 percent to \$3.06 per thousand cubic feet and the price to electric utilities fell 32 percent to \$2.43 per thousand cubic feet (75). On the other hand, the price to the residential sector, where distribution costs are higher and ratesetting may lag market adjustments, fell only 5 percent, to \$5.83 per thousand cubic feet.

### Sectoral Patterns of Demand

Throughout the 1950's and 1960's, the market for natural gas expanded as low prices encouraged demand (72). Of the many factors affecting natural gas markets during those decades, Federal and State regulatory commissions were the most influential. Below-market rates for certain categories of natural gas coupled with strong demand ultimately resulted in regional shortages during the second half of the 1970's.

In 1972, total consumption of natural gas reached an all-time high of 22 trillion cubic feet. Thereafter, uncertainties about supply and rising

<sup>1</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

<sup>2</sup>Real prices are expressed in constant 1982 dollars. Prices are nominal unless specifically noted as real.

energy prices began to erode demand. By the 1980's, lower demand resulted in a short-term surplus of deliverable gas and production curtailments in many producing areas. In 1986, natural gas consumption totaled 16 trillion cubic feet, the lowest annual total since 1965.

Weakened demand spanned all end-use sectors but was most severe in the industrial and electric utility sectors, where, particularly during the early and mid-1980's, the option of fuel switching proved to be most viable. Lower consumption by the industrial sector accounted for over half of the 6-trillion-cubic-foot reduction from 1972 through 1986, and lower use at electric utilities accounted for close to one-fourth.

### Meeting Peak Demand

Seasonal, and even daily, fluctuations in natural gas demand are met by withdrawals from storage when demand is high and by injections into storage when demand is low compared with available gas flow in transmission lines. Net withdrawals from storage can provide more than half of some companies' peak winter deliveries. During the 1987-88 heating season (October through March), net withdrawals of natural gas from storage supplied nearly 13 percent of total consumption.<sup>3</sup>

Natural gas in storage at the end of the year increased throughout the period of the 1970's when local shortages resulted in curtailments to some consumers (73). Underground storage of working gas—that in excess of the base gas needed to maintain optimum reservoir pressure—equalled 7 percent of annual consumption in 1969 and 16 percent in 1988. At the end of 1988, working gas in storage was 2.9 trillion cubic feet and base gas was 3.8 trillion cubic feet.

<sup>3</sup>Energy Information Administration, *Monthly Energy Review* December 1988, DOE/EIA-0035(88/12) (Washington, DC, March 1989), Tables 4.3 and 4.4.

On a share basis, industrial consumption fell from 44 percent in 1972 to 40 percent in 1986, while the electric utilities' share fell from 18 percent to 16 percent in the same period. In contrast, residential consumption accounted for a larger share of the total in 1986 compared with 1972; its share rose from 23 percent to 27 percent. Similarly, the commercial sector's share rose from 12 percent to 14 percent. The amount of natural gas used as pipeline fuel (transportation use) declined faster than did total consumption of natural gas and, in 1986, accounted for a 3-percent share.

The 1986 low point in natural gas consumption was followed by 2 consecutive years of growth. Consumption in 1987 totaled 17 trillion cubic feet and rose 5 percent in 1988 to 18 trillion cubic feet. Although consumption at electric utilities declined, consumption by all other end-use sectors increased. Severe weather conditions—an unusually cold winter and extremely hot summer—boosted demand in the residential and commercial sectors and growth in manufacturing output was accompanied by an increase in demand by the industrial sector. The industrial sector remained the largest consumer of natural gas and, in 1988, accounted for 42 percent of the U.S. total.

### Natural Gas Production and Productivity

In 1988, gross withdrawals of natural gas rose to 20 trillion cubic feet, up 2 percent from the year before but considerably below the level during the early 1970's, when withdrawals averaged 24 trillion cubic feet per year (69). Texas, Louisiana, and Oklahoma, the largest producers of natural gas, accounted for 69 percent of the U.S. total (71). Most withdrawals came from onshore wells and State offshore wells, but 5 trillion cubic feet (close to one-fourth of the total) were Federal offshore withdrawals.

The 20 trillion cubic feet of gross withdrawals in 1988 yielded 17 trillion cubic feet of marketed production (69). Reservoir repressuring, removal of nonhydrocarbon gases, and venting and flaring accounted for 3 trillion cubic feet.

About 256 thousand gas wells were in operation during 1988 (71). Withdrawals from those wells accounted for almost three-fourths of all

gross withdrawals, while oil wells supplied most of the remainder (69). After peaking at 435 thousand cubic feet per day in 1971 (71), average gas well productivity declined each year except 1984 and 1987 until, by 1988, average productivity had fallen to 161 thousand cubic feet per day.

Small amounts of methane, the main constituent of natural gas, were recovered from coalbeds. In 1987 (the most recent year for which data are available), commercial recovery was estimated at about 26 billion cubic feet.<sup>4</sup> Coalbed methane accounted for a sizable share of production in Alabama.

### Imports and Exports

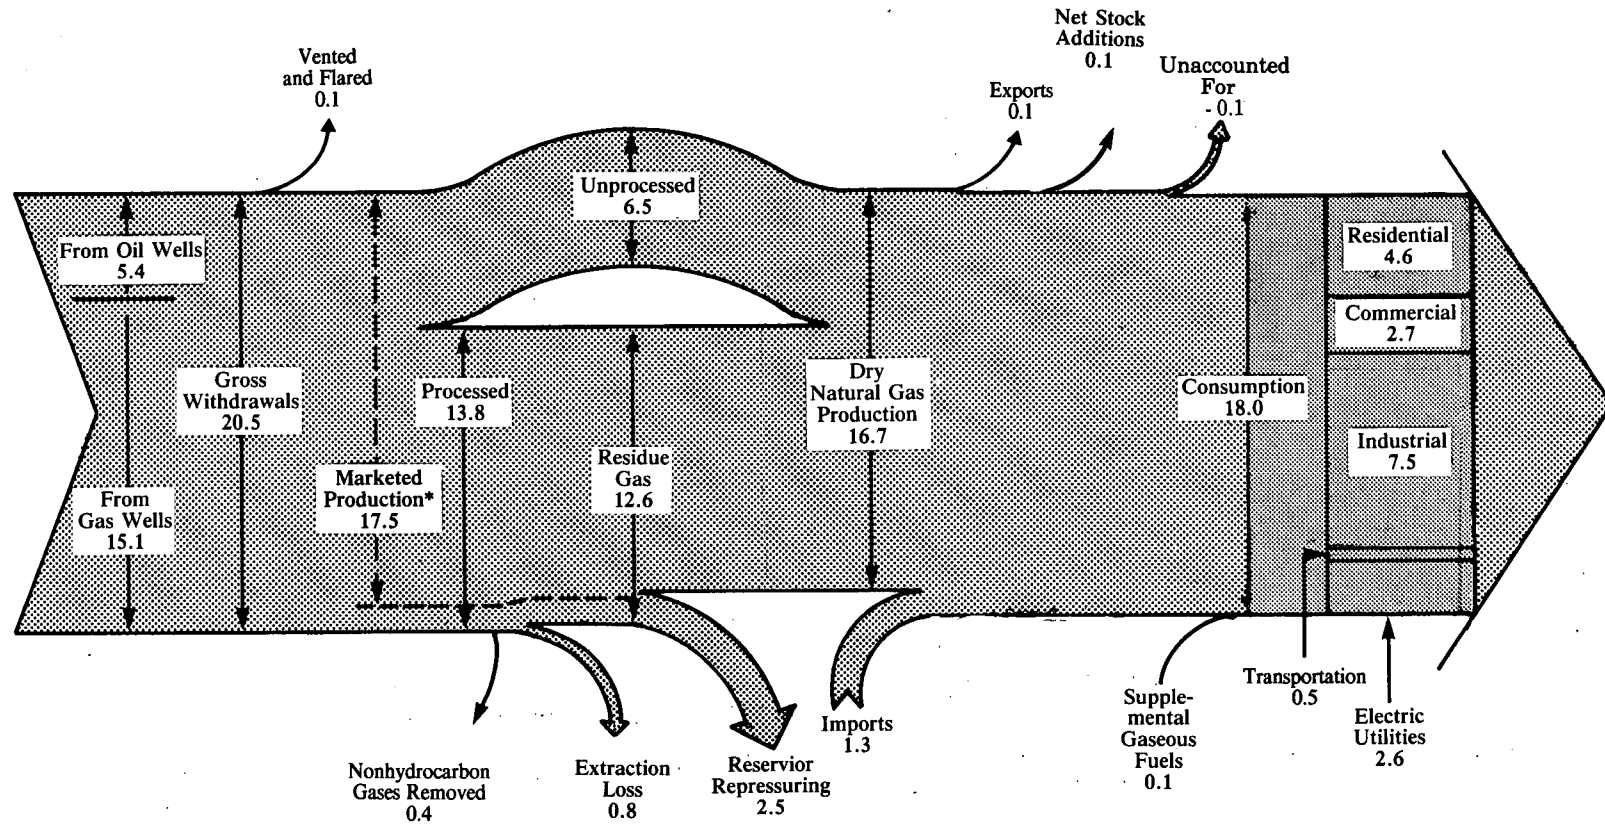

U.S. natural gas trade was limited to the border countries of Mexico and Canada until shipping natural gas in liquefied form emerged as an alternative to pipelines. In 1969, the first shipments of liquefied natural gas (LNG) were sent to Japan, and U.S. imports from Algeria began the following year (70). In 1988, U.S. net imports of natural gas by all routes totaled 1.2 trillion cubic feet, up 31 percent from 1987 net imports and the equivalent of 6.8 percent of domestic consumption, up from 5.5 percent in 1987.

Historically, Canada has been the major supplier of U.S. natural gas imports, with Mexico and, more recently, Algeria supplying smaller amounts. For the 3-year period of 1986 through 1988, however, U.S. net imports from Mexico fell essentially to zero and net imports from Algeria were 17 billion cubic feet. Meanwhile, Canada supplied net imports of 739 billion cubic feet in 1986, 989 billion cubic feet in 1987, and 1.3 trillion cubic feet in 1988.

Since 1969, Japan has displaced both Canada and Mexico to become the primary purchaser of U.S. natural gas. In 1988, shipments of liquefied natural gas from Alaska to Japan totaled 52 billion cubic feet.

<sup>1</sup> Net imports = imports minus exports.

<sup>2</sup> Imports from Algeria and exports to Japan are liquefied natural gas.

\* Less than 0.5 billion cubic feet.

\* Not meaningful because there were net exports during this year.

\* Preliminary.

Note: Sum of components may not equal total due to independent rounding.

# 7. Coal

## Prices

In 1975, the average real price<sup>1</sup> of bituminous coal and lignite at the minemouth peaked at \$32.43 per short ton, and the average real price of anthracite peaked at \$54.40 per short ton (83).<sup>2</sup> After 1975, both prices declined, falling to \$18.08 per short ton of bituminous coal and lignite and to \$34.51 per short ton of anthracite in 1988.

The average real price of coal delivered to electric utilities declined during the 1950's and 1960's (83). However, when prices of other fossil fuels rose rapidly after 1973, coal prices also increased, from \$18.20 per short ton in 1973 to \$28.63 per short ton the following year. (Despite that increase, coal remained the least expensive fossil fuel, on a Btu basis.) The price of coal gradually rose after 1974, peaking at \$34.90 per short ton in 1982, and then declined each year through 1988, by which time the price had fallen to \$25.14.

The average real price of coal coke consumed at blast furnaces also reached its highest level—\$141.70 per short ton—in 1975, and then gradually declined to \$91.22 per short ton in 1985 (the most recent year for which data are available).

## Changing Patterns of Coal Production

Bituminous coal accounts for by far the largest share of all coal production. In 1988, production of all types of coal totaled 959 million short tons, of which 869 million were bituminous and subbituminous coal (77). Lignite and anthracite accounted for the remainder. Despite its superior burning qualities, anthracite, mined in northeastern Pennsylvania, accounts for a diminishing share of total coal production. In 1950,

<sup>1</sup>Real prices are expressed in constant 1982 dollars.

<sup>2</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

anthracite accounted for 8 percent of the total; by 1988, its share had shrunk to less than one-half of 1 percent.

More coal is mined east of the Mississippi than in the West, but the West's share of total production increased almost every year after 1968. That year, production of western coal was 30 million shorts tons, 5 percent of the total. By 1988, western production had increased by more than 12 times, to 368 million short tons—38 percent of the total. The growth in western coal was due in part to environmental concerns that led to increased demand for low-sulfur coal, which is concentrated in the West. In addition, surface mining, with its higher average productivity, is much more prevalent in the West.

## The Peak in Productivity

The average productivity of all types of mines in the United States increased each year after 1949, reaching 2.4 short tons per miner hour in 1969 (81). Productivity during the 1970's and early 1980's was lower, primarily due to the coal industry's compliance with the Federal Coal Mine Health and Safety Act of 1969, as well as to environmental concerns and other factors.

The growing importance of surface coal mining, where productivity is generally higher than for underground mining, led to increases in average productivity during the mid-1980's. In 1987, average productivity reached an all-time high of 3.3 short tons per miner hour. That year, productivity of underground mines (excluding anthracite) was 2.2 short tons per miner hour and productivity of surface mines (excluding anthracite) was 5.1 short tons per miner hour.

## Domestic Markets: Changes in Coal End Use

Electric utilities are the dominant consumers of coal (78). Their consumption grew from 84 million short tons, a 17-percent share, in 1949, to 757 million short tons, an 86-percent share, in 1988.

In contrast, consumption by all other economic sectors in 1988 was lower than it had been in 1949. The most dramatic declines occurred in the transportation sector, where railroads switched to petroleum, and the residential and commercial sector. In 1949, those two sectors accounted for 187 million short tons, 39 percent of total coal consumption. By 1988, their consumption totaled 8 million short tons, less than 1 percent of U.S. consumption.

Consumption by the industrial sector, including coke plants, trended downward after the mid-1960's. From 205 million short tons in 1966, industrial consumption fell to about 112 million short tons in 1986 and 1987. In 1988, growth in manufacturing activity was accompanied by a modest increase in industrial consumption, which rose 4 percent to 117 million short tons for the year.

## Foreign Markets

Since World War II, coal has been the United States' major energy export (5). Throughout most of the 1960's and 1970's, U.S. exports of coal increased, peaking at 113 million short tons in 1981 (79). Increased shipments to Canada and Japan and to European markets contributed to the growth.

The level of U.S. coal exports fluctuated throughout the 1980's, falling as low as 78 million short tons in 1983 but attaining 95 million short tons

in 1988. That year, difficulties experienced by competing countries (particularly China, Australia, and Poland) allowed the United States to recapture some export markets.

Canada, Japan, and Italy remained the three largest markets for U.S. coal and together accounted for 47 percent of total exports in 1988. However, Japan's 1988 purchases were not much more than half those of 1981, and U.S. exports to France, West Germany, Spain, and Denmark also were down markedly compared with 1981 levels.

## Stocks

Although there is little seasonal variation in demand, production of coal can vary considerably due to factors such as coal miners' strikes and bad weather. To compensate for possible supply interruptions, coal producers and distributors, as well as major consumers such as electric utilities and coke plants, generally maintain large stockpiles. For example, in 1980 coal stocks were built up to a year-end total of 228 million short tons (80) and then drawn down to augment supplies during the 1981 miners' strike. Despite stockpiling during the second half of the year, after the strike had ended, 1981 year-end stocks totaled 209 million short tons, 19 million short tons below the level at the end of the previous year.

At the end of 1988, coal stocks totaled 190 million short tons. Electric utilities held over three-fourths of the coal, and coal producers and distributors held most of the remainder. Stocks at coke plants and other industrial sites were relatively small.

<sup>1</sup> Includes subbituminous coal.

<sup>2</sup> Short tons per miner hour. Data for bituminous coal and lignite mines 1949 through 1973 and anthracite mines 1949 through 1978 were originally reported in short tons per miner-day. These data have been converted to short-tons per miner hour by assuming an eight-hour day. All remaining data were calculated by dividing total production by total labor hours worked by all mine employees except office workers.

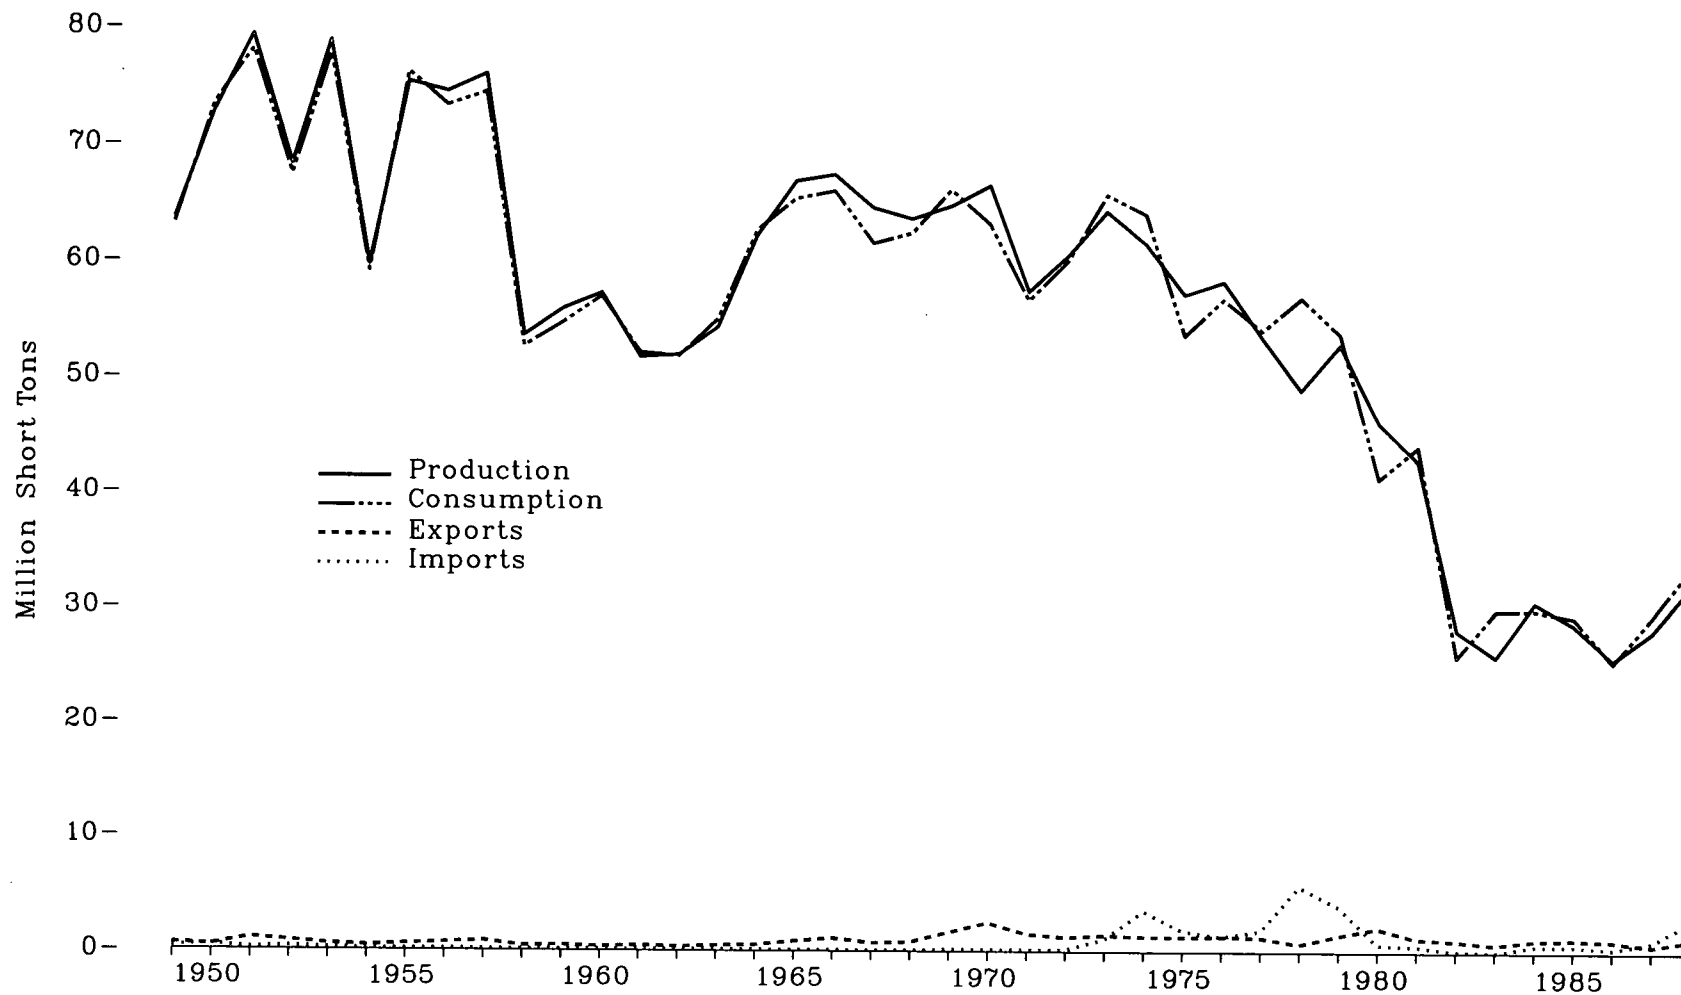

<sup>3</sup> Thousand short tons per day, at end of year.

<sup>4</sup> Percent. Calculated by dividing average daily production by daily productive capacity and multiplying by 100.

NA = Not available.

Sources: Production per Miner Hour: •1949 through 1975—Bureau of Mines, *Minerals Yearbook*, "Coal-Bituminous and Lignite" and "Coal-Pennsylvania Anthracite" chapters. •1976—Energy Information Administration, *Energy Data Report, Coal-Bituminous and Lignite in 1976 and Coal-Pennsylvania Anthracite 1976*. •1977 and 1978—Energy Information Administration, *Energy Data Report, Bituminous Coal and Lignite Production and Mine Operations-1977; ...1978 and Coal-Pennsylvania Anthracite 1977; ...1978*. •1979—Energy Information Administration, *Energy Data Report, Coal Production-1979*. •1980 and forward—Energy Information Administration, *Coal Production* (annual). All Other Data: Energy Information Administration, Form EIA-7A, "Coal Production Report."

## 8. Electricity

---

### Measuring Electricity Generation

Electricity generation is measured and recorded in kilowatt-hours. Theoretically, a 1,000-kilowatt generator operating at maximum capacity for 1 year would produce 8,760,000 kilowatt-hours of electricity (1,000 kilowatts times 24 hours per day times 365 days per year). However, generators require maintenance and therefore cannot operate continuously.

In addition, electricity demand varies both daily and seasonally, so that continuous operation of all generators is not necessary to meet demand. Utilities rely on "baseload" generating plants, usually conventional steam, nuclear, and large hydroelectric plants, to satisfy steady demand. Gas turbine, internal combustion, and other hydroelectric plants are generally used to satisfy peak demand. Those "peaking" plants are used only during relatively short periods of high demand.

### Generating Capacity

Generating capacity is expressed as net summer capability, a measure of the steady hourly output that generating equipment is expected to supply to the system load, exclusive of auxiliary power, as demonstrated by test at the time of summer peak demand. Although data on net summer capability have been collected only since 1984, the Energy Information Administration has estimated values for prior years (90).<sup>1</sup> Estimates indicate that generating capacity during the 1949-to-1988 period increased at an average annual rate of 6.3 percent.

<sup>1</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

Conventional steam plants, fueled by fossil fuels, wood, and waste, were responsible for most of the growth. In 1988, they accounted for almost two-thirds of total generation capacity. Nuclear-powered plants accounted for 14 percent and hydroelectric facilities accounted for 13 percent of the total in 1988. Internal combustion and gas turbine plants, as well as plants powered by emerging sources of energy such as geothermal, accounted for the remainder.

### Generation by Source and Prime Mover

Net generation of electricity by electric utilities in 1988 reached 2.7 trillion kilowatt-hours, up 5 percent from the 1987 level (85). The 1987-to-1988 growth in generation was the largest annual percent gain recorded since the unprecedented drop in net generation in 1982.

Fossil fuels, particularly coal, continued to fuel most of the generation in 1988 (85). Coal accounted for 1,537 billion kilowatt-hours, and natural gas accounted for 253 billion kilowatt-hours. As oil prices declined in 1988, oil-fired generation expanded by 26 percent to a total of 149 billion kilowatt-hours for the year.

Nuclear-based generation surpassed its previous-year level for the eighth consecutive year, reaching an all-time high in 1988 of 527 billion kilowatt-hours. Due to 2 consecutive years of drought, however, hydroelectric generation declined to 223 billion kilowatt-hours in 1988, 23 percent below the level in 1986, prior to the droughts. Geothermal and other alternative energy sources accounted for 12 billion kilowatt-hours.

Fossil-fueled steam generators, consistently the major source of electricity, provided 71 percent of net generation in 1988 (86). Nuclear, hydroelectric, geothermal, and other generators powered by renewables supplied 28 percent. Internal combustion and gas turbine generators, usually reserved for meeting peak demand, supplied less than 1 percent of net generation.

## Fossil Fuel Consumption

During the 1949-to-1988 period, consumption of coal at electric utilities grew at a faster rate than did consumption of natural gas and petroleum (88). On a Btu basis, coal accounted for 67 percent of total fossil fuel consumption in 1949 and 79 percent of the total in 1988.

Electric utility consumption of both petroleum and natural gas increased during most of the 1949-to-1988 period, but growth in the use of both fuels began to slow during the 1970's and, during the first half of the 1980's, consumption actually decreased.

Changes in the consumption of petroleum and natural gas at electric utilities in 1986 through 1988 were particularly illustrative of the utilities' fuel-switching capabilities and their use of them to respond to fluctuations in fuel prices. In 1986, when oil prices fell dramatically, petroleum consumption at electric utilities rose by 0.36 quadrillion Btu, while natural gas consumption fell 0.47 quadrillion Btu. When oil prices recovered somewhat in 1987, electric utilities scaled back consumption of petroleum by 0.19 quadrillion Btu while increasing natural gas consumption by 0.25 quadrillion Btu. In response to the 1988 decline in oil prices, electric utilities increased petroleum consumption by 0.30 quadrillion Btu and consumed 0.22 quadrillion Btu less of natural gas.

## Sales to Consumers

From 1949 through 1985 (the most recent year for which "old series"<sup>2</sup> statistics are available), electricity sales increased at an average annual rate of 6.3 percent (89). Annual sales declined only twice, during the economic recessions of 1974 and 1982. In 1974, the decline in sales spanned all sectors, whereas in 1982, lower sales to the industrial sector alone accounted for the decline.

From 1984 through 1988 (the period for which "new series" statistics are available), electricity sales increased at an average annual rate of 2.9 percent.

<sup>2</sup>See Table 89 footnotes for an explanation of "old series" and "new series" statistics on electricity sales.

Throughout most of the 1949-to-1988 period, sales of electricity to the industrial sector exceeded sales to other sectors, but in 1986 sales to residential customers surpassed industrial sales for the first time. Sales to the commercial sector remained lower than sales to the other two major sectors throughout the period.

In 1988, sales to all sectors combined—and sales to each of the three major end-use sectors—rose 5 percent from the 1987 level to 2,566 billion kilowatthours for the year. Sales to residential customers reached 890 billion kilowatthours. The increase from the 1987 level was partly due to adverse weather conditions that boosted space heating and cooling requirements. Industrial sales increased to 884 billion kilowatthours as economic growth led to increased demand. Due to the unusual weather conditions and the strong economic growth, commercial sales increased to 710 billion kilowatthours.

## Electricity Prices

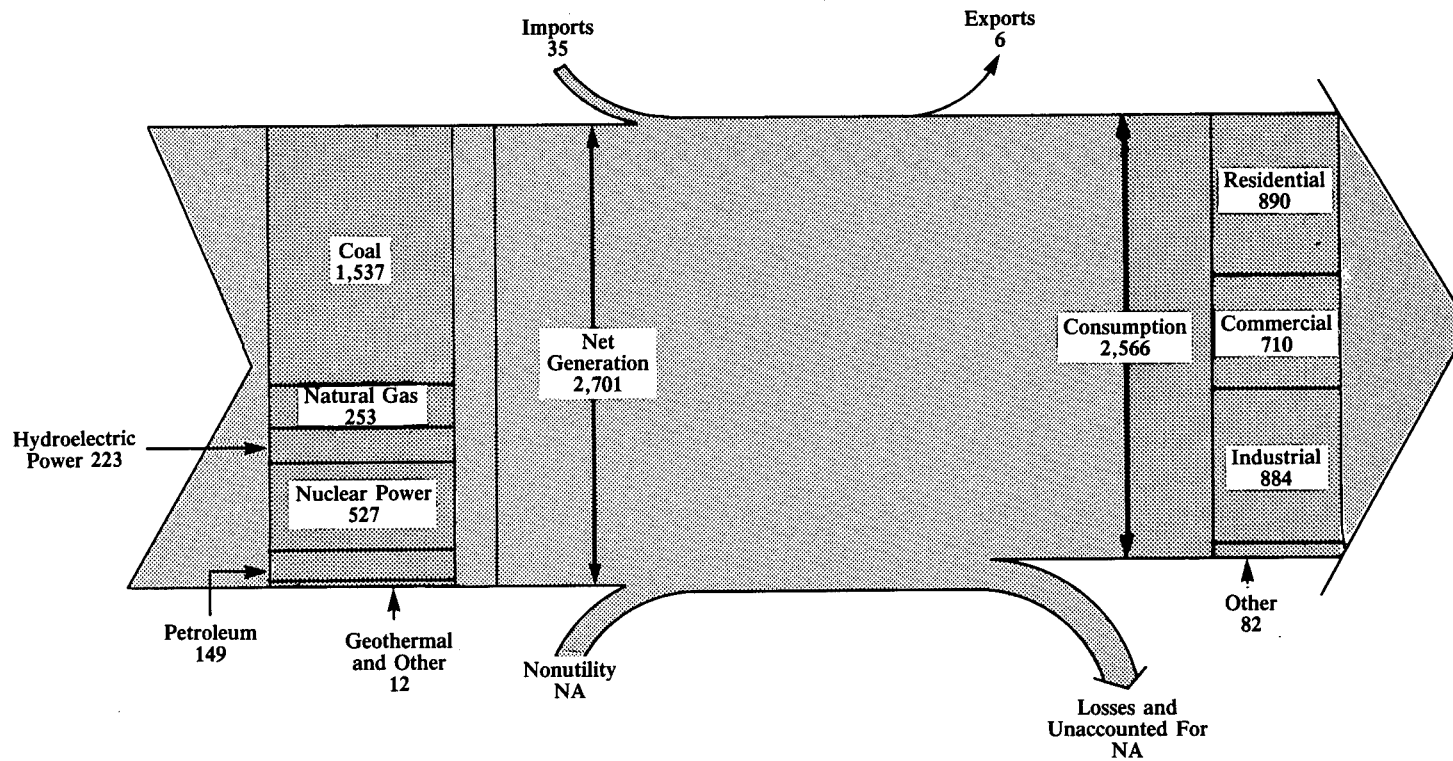

Based on "old series"<sup>3</sup> statistics, the weighted average real price<sup>4</sup> of electricity to all sectors in 1988 was 5.4 cents per kilowatthour, 9 percent below the price in 1960 (92). However, the apparent stability in electricity prices masked fluctuations that occurred throughout the period and variations in prices paid by consumers in different end-use sectors. And although prices of the other major energy sources increased significantly during the 29-year period, electricity remained by far the most expensive source of energy on a Btu basis.

Based on "new series" statistics, the average real price of electricity sold to the residential sector, where prices have usually been the highest, was 6.2 cents per kilowatthour in 1988, 2 percent below the price in 1987. Similarly, the commercial sector experienced a decline, in real terms, of 3 percent, as the price declined to 5.8 cents per kilowatthour in 1988. Meanwhile, industrial customers continued to pay prices favorable compared with prices in other sectors. In 1988, the real price of electricity sold to industrial users was 3.8 cents per kilowatthour.

<sup>3</sup>See Table 92 footnotes for an explanation of "old series" and "new series" statistics on retail prices of electricity.

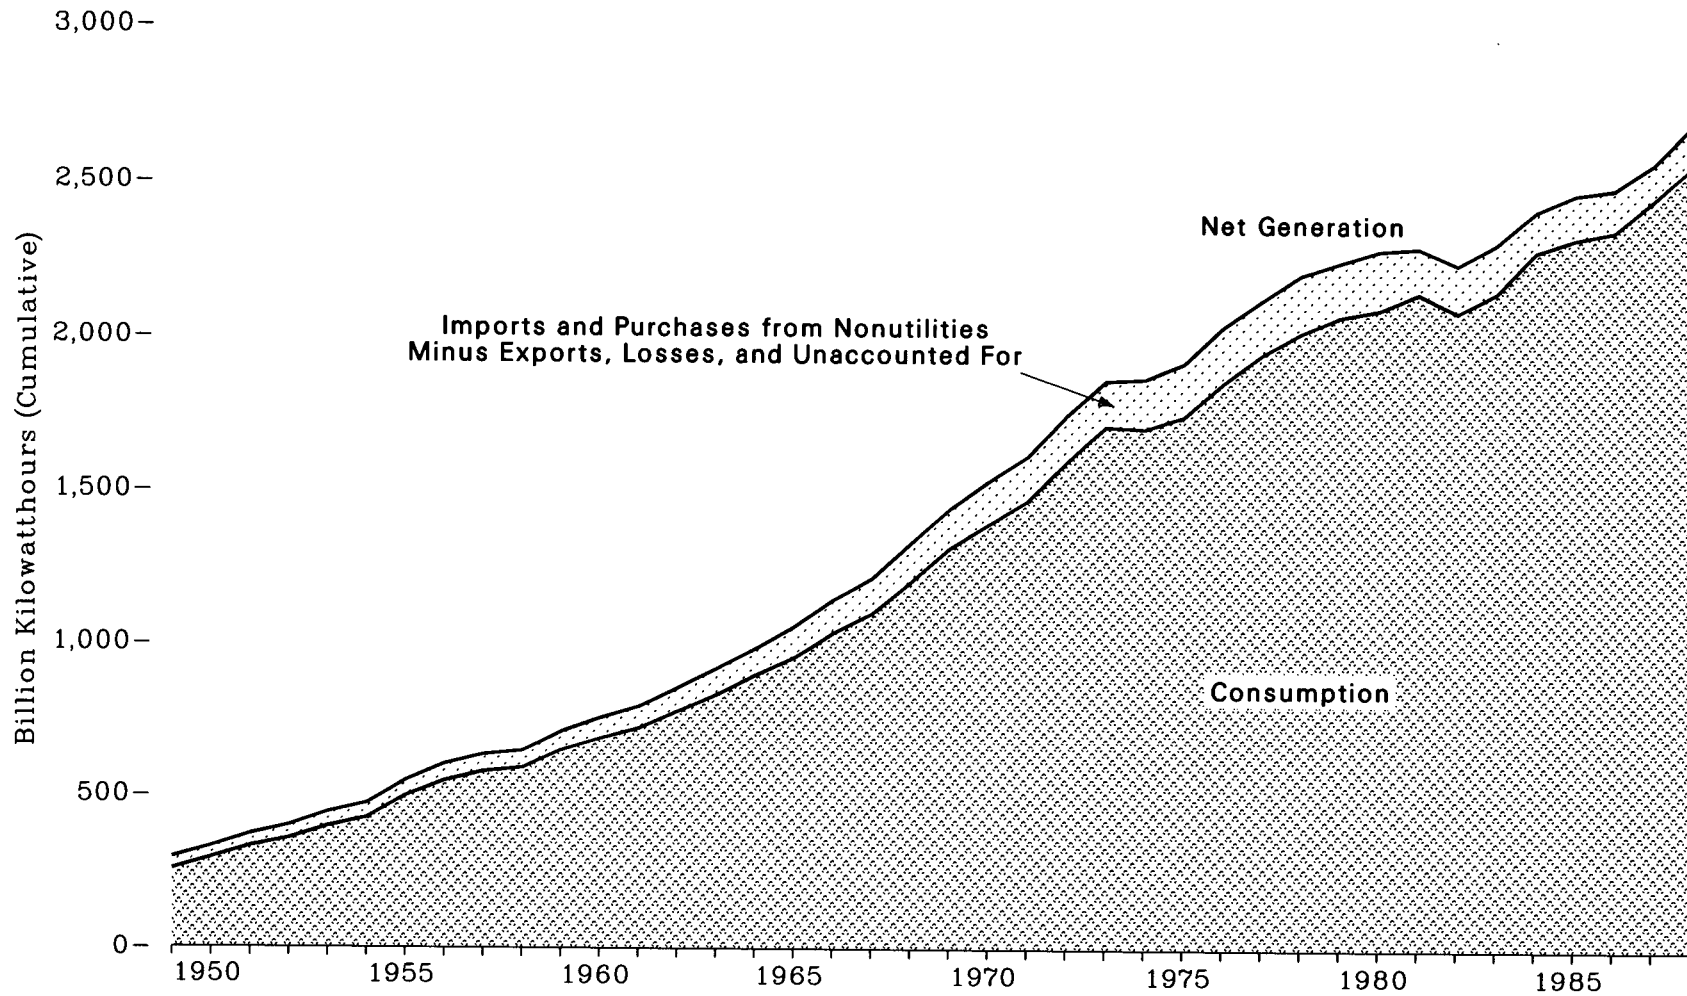

<sup>4</sup>Real prices are expressed in constant 1982 dollars.

<sup>1</sup> See Appendix E, Note 14.

<sup>2</sup> These data are petroleum consumed by electric utilities and do not equate to petroleum supplied to (or delivered to) electric utilities. Included are residual fuel oil (including crude oil burned as fuel), distillate fuel oil, jet fuel, and petroleum coke, which is reported in short tons, and has been converted to barrels at a rate of 5 barrels per short ton.

<sup>3</sup> Preliminary.

Note: Sum of components may not equal total due to independent rounding.

1988 <sup>6</sup>	442.1	4.8	44.9	95.1	89.9	1.7	678.4

<sup>1</sup> See Glossary and Appendix E, Note 17.

<sup>2</sup> See Appendix E, Note 14.

<sup>3</sup> Includes fossil steam, wood, and waste.

<sup>4</sup> Other is wind, photovoltaic, and solar thermal energy.

<sup>5</sup> Less than 0.05 million kilowatts.

<sup>6</sup> Preliminary.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> See Appendix E, Note 14.

<sup>2</sup> Includes anthracite silt stored off-site.

<sup>3</sup> Includes subbituminous coal.

<sup>4</sup> Includes residual fuel oil (including crude oil burned as fuel), distillate fuel oil, and jet fuel.

<sup>5</sup> Petroleum coke, which is reported in short tons, has been converted to barrels at a rate of 5 barrels per short ton.

<sup>6</sup> Preliminary.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> Data 1979 and earlier are for Classes A and B privately owned electric utilities only. Data 1980 forward are for selected Class A utilities whose electric operating revenues were \$100 million or more during the previous year. <sup>2</sup> In 1982 dollars, calculated using implicit GNP price deflators. See Appendix C. <sup>3</sup> Beginning with January 1986, national average price estimates are based on a statistically derived sample of both publicly and privately owned electric utilities. Prior to that time, national average price estimates were based on a sample of only privately owned electric utilities. Respondents to Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," formerly the "Electric Utility Company Monthly Statement," consist of a sample of 201 electric utilities that were statistically chosen using stratification techniques. The respondents were chosen from more than 3,000 electric utilities reporting on Form EIA-861, "Annual Electric Utility Report." In 1988, the sample increased to 225 electric utilities. This scheme differs from the cut-off sample used prior to January 1986. Data are shown for both the old and new series. Publication of both series will continue until sufficient information exists to estimate historical data based on the new series. Data are preliminary. <sup>4</sup> Preliminary. Sources: •1960 through September 1977—Federal Power Commission, Form 5, "Monthly Statement of Electric Operating Revenues and Income." •October 1977 through February 1980—Federal Energy Regulatory Commission, FPC Form 5, "Monthly Statement of Electric Operating Revenues and Income." •March 1980 through 1982—Federal Energy Regulatory Commission, Form 5, "Electric Utility Company Monthly Statement." •1983 through 1986—Energy Information Administration, Form EIA-826, "Electric Utility Company Monthly Statement." •1987 and 1988—Energy Information Administration, Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions."

## 9. Nuclear Energy

---

### Status of Nuclear Generating Units

At the end of 1988, there were 108 operable nuclear generating units in the United States (94).<sup>1</sup> Most of the units were located in the eastern half of the country. In addition, 3 units had reached the startup stage (authorization by the Nuclear Regulatory Commission for fuel loading and low-power testing) and 13 units had received construction permits. There were no units on order.

Although the number of operable units reached an all-time high in 1988, the total of 124 units in all stages of planning, construction, and operation was well below the total of 236 in 1975.<sup>2</sup> After 1975, many planned units were cancelled; after 1978, no orders for new units were announced.

Several factors contributed to the decline in the number of planned nuclear units. Growth in electricity demand was slower than expected. Longer leadtimes for licensing and construction coupled with higher financing expenses increased the cost of nuclear power plants, and rising interest rates and an uncertain economic environment further eroded electric utilities' willingness to commission new plants.

### Contributions to Electricity Generation

Nuclear power's contribution to electricity generation in the United States increased almost every year from the mid-1960's through 1988; the exceptions were 1979 and 1980 (95). In 1988, 527 billion net kilowatthours (20 percent of total U.S. generation) came from nuclear power. Net summer capability, a measure of the steady hourly output that generating equipment is expected to supply to the system, also increased almost every year, reaching 95 million kilowatts by 1988.

<sup>1</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

<sup>2</sup>Energy Information Administration, *Monthly Energy Review* December 1988, DOE/EIA-0035(88/12) (Washington, DC, March 1989), Table 8.2.

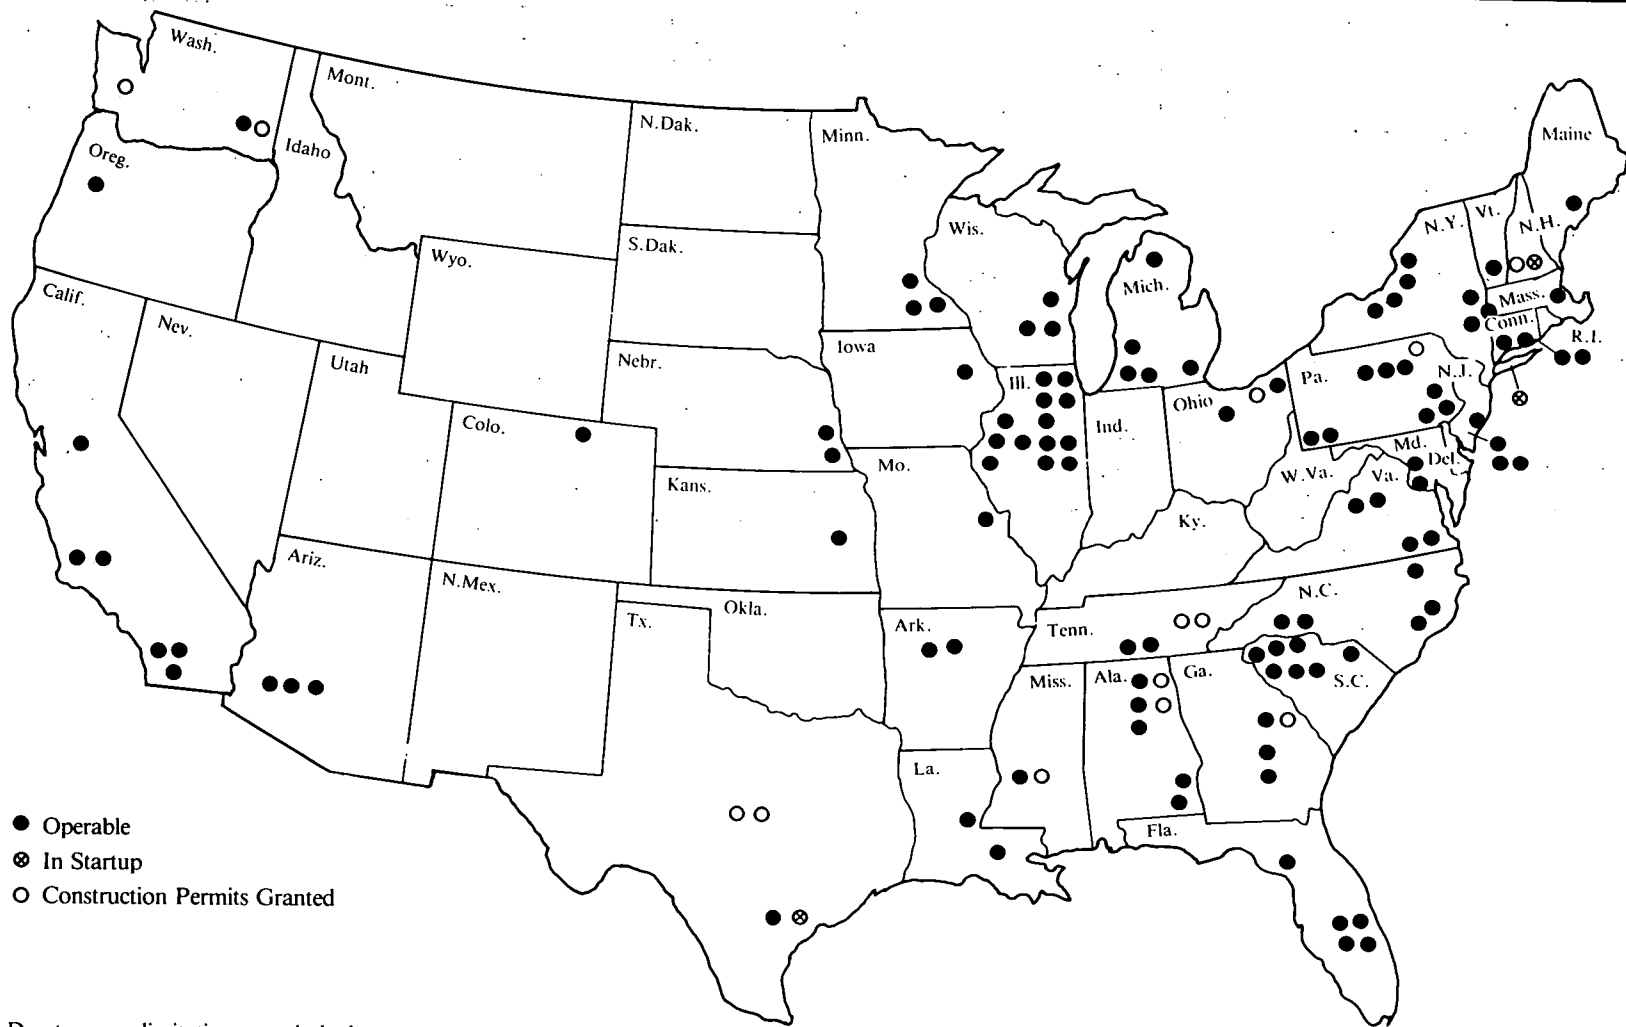

### The Uranium Industry

From 1949 through 1967, the Atomic Energy Commission (AEC) was the major purchaser of uranium. The AEC's demand for uranium for military purposes was strong during the 1950's and domestic production, spurred by AEC incentives, grew from 0.4 million pounds of uranium oxide (U<sub>3</sub>O<sub>8</sub>) in 1949 to 35 million pounds in 1960 (96). As the AEC began to accumulate stockpiles, its purchases declined and U.S. production fell to 21 million pounds in 1965.

From 1966 through 1976, production fluctuated between 21 and 27 million pounds. Subsequently, orders for new nuclear plants led to strong growth, and production peaked at 44 million pounds in 1980. However, plant cancellations and postponements during the late 1970's led to a decline in projected demand and, coupled with buildups of inventories at electric utilities and foreign competition, caused the second major decline in production, which fell to 11 million pounds in 1985. In 1988, production totaled 13 million pounds.

Historically, domestic producers have faced competition from low-cost uranium imports. From 1949 through 1960, net imports actually exceeded domestic production (96). In 1966, the AEC effectively suspended imports by curtailing enrichment services for foreign uranium intended for use in domestic facilities, and no uranium was imported from 1968 through 1974. With the gradual removal of the AEC restrictions during the 1977-to-1983 period, foreign uranium deliveries to the United States increased. Contracts in place as of June 30, 1988, indicated net imports of 12 million pounds of U<sub>3</sub>O<sub>8</sub> in 1988.

1988 <sup>2</sup>			

<sup>1</sup> Import quantities through 1970 are reported for fiscal years. Prior to 1968 the Atomic Energy Commission was the sole purchaser of all imported U<sub>3</sub>O<sub>8</sub>.  
<sup>2</sup> Preliminary.

Note: Import and export data prior to 1982 are for transactions conducted by uranium suppliers only. For 1982 forward, transactions by uranium buyers (consumers) are included. In 1983, buyer imports totalled 3,800 million pounds of U<sub>3</sub>O<sub>8</sub> and buyer exports totalled 1,000 million pounds of U<sub>3</sub>O<sub>8</sub>. Buyer imports and exports prior to 1982 are believed to be small.

# 10. Renewable Energy

## Emerging Sources of Renewable Energy

After World War II, the United States relied on petroleum, natural gas, and coal, which, in addition to having high Btu contents, were inexpensive, readily accessible, and easy to transport. During the early 1970's, however, increases in the prices of petroleum and natural gas, coupled with concerns about the stability of supply, stimulated interest in alternative sources of energy. Since 1973, renewable sources of energy have accounted for small but growing shares of the domestic energy market.

Some sources of renewable energy lend themselves to onsite applications such as the burning of wood for heat and the use of flat-plate solar thermal collectors for domestic hot water. Other sources, such as photovoltaics, can be used to generate electricity for transmission to distant markets. Although other sources with the potential for centralized applications, such as windmills, heliostats, and ocean thermal energy conversion, are not yet widely used, they may eventually contribute significantly to the domestic energy supply.

## Wood and Other Biomass Energy

Energy derived from wood totaled 2.6 quadrillion Btu (97)<sup>1</sup> in 1984. Almost 1.7 quadrillion Btu of wood was consumed by the industrial sector. Industries with ready access to wood and wood byproducts, such as the paper and lumber industries, relied heavily on wood as an energy source. In the residential sector, wood supplied 0.9 quadrillion Btu and over 6 million households relied on wood as the main heating fuel (98).

<sup>1</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

Energy derived from other biomass sources, such as agricultural and solid wastes and alcohol fuels, totaled 0.3 quadrillion Btu in 1984 (97).

## Solar Energy

Solar energy is an inexhaustible, universally available source of energy. Converting solar energy to useful forms, however, requires large collection areas, and therefore the amount that can be harnessed is limited.

Producer shipments of equipment are used as one measure of solar energy consumption. Shipments of low-temperature collectors, used primarily for heating swimming pools, reached 12 million square feet in 1980 and then declined each year thereafter, falling to 3.2 million square feet in 1987 (99). Shipments of medium-temperature, special, and other collectors, used primarily for domestic hot water, peaked at 12 million square feet in 1983, but fell to 1 million square feet in 1987 after the expiration of the Federal energy tax credit in 1985. Shipments of photovoltaic modules increased to 6.9 thousand peak kilowatts in 1987 (101).

## Geothermal Energy

Most of the vast quantity of geothermal energy is inaccessible, trapped below the Earth's crust in layers of molten rock. However, when that energy reaches regions where the crust is thinner, it can be tapped. Hydrothermal reservoirs, the most common sources of geothermal energy, yield hot water or, more rarely, steam. Two other sources, geopressurized reservoirs and hot dry rock, are more difficult to harness.

Geothermal energy may be used directly, for purposes such as space heating, or it may be converted to electricity. In 1960, The Geysers in California became the first U.S. utility to generate electricity from geothermal steam. Subsequently, electricity generation from geothermal sources trended upward, even after 1982, when prices of conventional energy began to decline (102). In 1988, The Geysers and other, smaller plants generated 10 billion kilowatthours of electricity.

## The Rise and Fall of Crude Oil Prices

In the mid-1970's, oil-producing nations became able, for the first time, to exploit the relative inelasticity of petroleum demand in the short term by raising prices substantially. By the 1980's, however, the effects of conservation, fuel switching, and increased efficiency had begun to inhibit demand, even as higher prices stimulated new sources of production. Crude oil prices declined slowly at first and then plunged in 1986, as netback pricing supported excess production. Prices recovered only moderately in 1987 before declining again in 1988.

## Fluctuations in Petroleum Demand

The expanding post-World War II petroleum market reached 56 million barrels per day in 1973 (108).<sup>1</sup> Following the 1973 price hike, demand dipped and then grew slowly to a peak of 65 million barrels per day in 1979. After the 1979-80 price hike, world petroleum consumption began to fall, down to 59 million barrels per day by 1983. At that point, lowered demand and excess production began to erode the price of oil. In 1986, consumption was up to 61 million barrels per day.

U.S. consumption of petroleum products in 1986 accounted for 16 million barrels per day out of the 35 million barrels per day consumed by the Organization for Economic Cooperation and Development (OECD) countries. Japan consumed 4 million barrels per day. Of the non-OECD countries, the U.S.S.R. was the biggest consumer, accounting for 9 million barrels per day.

## Energy Production by Source

World production of crude oil totaled 58 million barrels per day in 1988, up 4 percent from the 1987 level (105). Production gains in Saudi Arabia and Iraq more than offset cut-backs in the United States, the United Kingdom, and Iran. The Organization of Petroleum Exporting Countries

<sup>1</sup>Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

(OPEC) accounted for 35 percent, and the U.S.S.R. and the United States, combined, for 34 percent, of world production.

In 1987, the U.S.S.R. and the United States were the major producers of dry natural gas (110). Together, they accounted for 42 trillion cubic feet out of the world total of 67 trillion cubic feet.

Coal production rose from 3.8 billion short tons in 1977 to 5.1 billion short tons in 1987 (113). China, the leading producer, boosted production to 1.0 billion short tons in 1987. The United States, the second leading producer, mined 917 million short tons.

In 1988, nuclear-based electricity generation by non-Communist countries reached 1.6 trillion kilowatthours (115). The U.S. share of the world total rose to 35 percent. France accounted for 17 percent, Japan for 11 percent, and West Germany for 9 percent of the world total.

## World Leaders in Energy Production

Worldwide energy production of 321 quadrillion Btu in 1987 was 53 quadrillion Btu greater than in 1977 (103). The U.S.S.R. accounted for 19 quadrillion Btu of the world increase and, in 1986, the U.S.S.R.'s production (66 quadrillion Btu) surpassed U.S. production (64 quadrillion Btu) for the first time. China contributed almost 10 quadrillion Btu to the increase in world supply and, in 1982, became the third largest energy producer. Production in the United Kingdom rose from 7 quadrillion Btu in 1977 to 10 quadrillion Btu in 1987.

In contrast, Middle Eastern countries cut back production of energy (primarily petroleum) from 50 quadrillion Btu in 1977 to 26 quadrillion Btu in 1985 in an effort to regain control of world oil markets. Saudi Arabia registered a substantial decline, from 21 quadrillion Btu in 1977 to 9 quadrillion Btu in 1985, before increasing production to 12 quadrillion Btu in its 1986 attempt to regain market share.

<sup>1</sup> Includes lease condensate, excludes natural gas plant liquids.

<sup>2</sup> See Glossary for membership.

<sup>3</sup> Includes about one-half of the production in the Neutral Zone between Kuwait and Saudi Arabia.

<sup>4</sup> Less than 5,000 barrels per day.

<sup>5</sup> Preliminary.

Note: Sum of components may not equal total due to independent rounding.

<sup>1</sup> The data in this column are total imports; they do not equal reported exports because of changes in stocks at sea, exchanges, transshipments, and other statistical discrepancies.

<sup>2</sup> Includes shipments to Puerto Rico and the Virgin Islands.

<sup>3</sup> Less than 500 barrels per day.

<sup>4</sup> Primarily tanker shipments to countries bordering the Indian or Pacific Oceans.

<sup>5</sup> Includes Algeria, Egypt, Libya, Morocco, and Tunisia.

<sup>6</sup> Includes Benin, Cameroon, Equatorial Guinea, Gabon, Ghana, Ivory Coast, Nigeria, and Togo.

<sup>7</sup> Primarily Indonesia, China, Malaysia, and Brunei.

— = Not applicable.

Note: Transshipments are assigned to the country of original lading, if known.

Note: Sum of components may not equal total due to independent rounding.

1989	13.15	12.75	15.40	15.05	15.50	11.40	10.63	15.80

<sup>1</sup> Prices are usually free on board (f.o.b.) at the foreign port of lading. Prices for the period mid-1974 forward are official selling prices.

<sup>2</sup> As of January 1, except in 1987, when prices are as of February 1 (see Note below).

<sup>3</sup> Prices for 1974 and 1975 are for 40 degrees API gravity. Prices for 1980 include \$4.72 in retroactive charges and market premiums.

<sup>4</sup> Prices from 1977 forward include 2 cents per barrel harbor dues.

<sup>5</sup> Mexico does not post official crude oil prices. Prices are formula-determined for each contract. For example, the prices given here are for f.o.b. deliveries to Houston, Texas. They are based on a variety of U.S. domestic crude oil postings and on quotations for fuel oil imports into U.S. Gulf of Mexico ports.

<sup>6</sup> The United Kingdom does not post official crude oil prices. Prices for 1979 through 1984 are estimated long-term contract prices; prices for 1985 and forward are contractual arrangements based on spot market quotations.

<sup>7</sup> Price for 1980 includes \$1.87 market premiums and credit charges.

NA = Not available.

Note: The Organization of Petroleum Exporting Countries (OPEC) adopted major changes in their crude oil pricing system at the beginning of 1986. The primary result of these changes was a switch from official prices to netback arrangements and spot crude oil sales for the January 1986 through January 1987 time period. On February 1, 1987, official contract prices were again being used by OPEC as their primary pricing mechanism. However, subsequently in 1987 all OPEC producers moved to spot crude oil sales as a basis for their crude oil pricing systems. Spot market related pricing continued through 1988 and into 1989.

<sup>1</sup> Primarily Arabian Light Crude Oil, 34 degrees API. Beginning in 1985, data are for Arabian Light Crude Oil, 34 degrees API only.

<sup>2</sup> Primarily Kuwait Heavy Crude Oil, 31 degrees API.

<sup>3</sup> In 1984, Mideast Heavy was redefined and is now primarily Arabian Heavy Crude Oil, 27 degrees API and prices were computed for 1982 and forward. Beginning in 1985, data are for Arabian Heavy, 27 degrees API only.

<sup>4</sup> Primarily Libyan Brega Crude Oil, 40 degrees API during the 1960's. Broadened to include Algeria Saharan Crude Oil, 44 degrees API and Nigerian Bonny, 37 degrees API from 1970 through 1980. Further broadened in 1981 to include United Kingdom-Brent, 38 degrees API and Norway-Ekofisk, 43 degrees API. Beginning in 1985, data are for Nigerian Bonny, 37 degrees API only.

<sup>5</sup> For 1986, this price is the market-related price, see Footnote 8.

<sup>6</sup> Spot price minus official price.

<sup>7</sup> Actual contract prices for Arabian Light Crude -34 degrees API. Although an official Arabian Light Crude -34 degrees API price existed, it applied to only a few direct sales contracts.

<sup>a</sup> For 1986, official prices were replaced by market-related pricing mechanisms, such as the netback prices indicated for 1986. Netback arrangements are crude oil price contracts based on the prices of petroleum products in the final market. For 1987 and before 1986, official sales prices were used as the primary indicator of long-term crude oil contract prices.

# Appendix A. Thermal Conversion Factors

## Using Thermal Conversion Factors

The thermal conversion factors presented in the following seven tables can be used to estimate the heat content in British thermal units<sup>1</sup> (Btu) of a given amount of energy measured in physical units such as barrels or cubic feet. For example, 10 barrels of asphalt has a heat content of approximately 66.36 million Btu (10 barrels X 6.636 million Btu/barrel = 66.36 million Btu).

In general, the annual thermal conversion factors presented in Tables A2 through A7 are computed from final annual data. However, if the current year's final data are not available in time for publication, thermal conversion factors for the current year are computed from the best available data and are labeled "preliminary." The source of each factor is described in a section entitled "Thermal Conversion Factor Source Documentation," which follows Table A7 in this appendix.

Thermal conversion factors for hydrocarbon mixes are weighted averages of the thermal conversion factors for each hydrocarbon included in the mix. For example, in calculating the thermal conversion factor for a 60/40 butane/propane mixture, the thermal conversion factor for butane is weighted 1.5 times more heavily than the thermal conversion factor for propane.

Table A1. Approximate Heat Content of Petroleum Products and Wood

Energy Source	Heat Content
	Million Btu per Barrel
Asphalt .....	6.636
Aviation Gasoline.....	5.048
Butane.....	4.326
Butane-Propane Mixture (60 percent/40 percent) .....	4.130
Distillate Fuel Oil.....	5.825
Ethane.....	3.082
Ethane-Propane Mixture (70 percent/30 percent) .....	3.308
Isobutane .....	3.974
Jet Fuel, Kerosene Type.....	5.670
Jet Fuel, Naphtha Type .....	5.355
Kerosene.....	5.670
Lubricants .....	6.065

# Thermal Conversion Factor Source Documentation

## Petroleum and Natural Gas Plant Liquids

**Asphalt.** • 1949 forward: Energy Information Administration (EIA) adopted the thermal conversion factor of 6.636 million British thermal units (Btu) per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

**Aviation Gasoline.** • 1965 forward: EIA adopted the thermal conversion factor of 5.048 million Btu per barrel as adopted by the Bureau of Mines from the Texas Eastern Transmission Corporation publication *Competition and Growth in American Energy Markets 1947-1985, 1968*.

**Butane.** • 1949 forward: EIA adopted the Bureau of Mines thermal conversion factor of 4.326 million Btu per barrel as published in the *California Oil World and Petroleum Industry, First Issue, April 1942*.

**Butane-Propane Mixture.** • 1949-1983: EIA adopted the Bureau of Mines calculation of 4.130 million Btu per barrel based on an assumed mixture of 60 percent butane and 40 percent propane. See "Butane" and "Propane." EIA use of this term ceased in 1983.

**Crude Oil, Exports.** • 1949 forward: Assumed by EIA to be 5.800 million Btu per barrel or equal to the thermal conversion factor for crude oil produced in the United States. See "Crude Oil and Lease Condensate, Production."

**Crude Oil, Imports.** • 1949 forward: Calculated annually by EIA by weighting the thermal conversion factor of each type of crude oil imported by the quantity imported. Thermal conversion factors for each type were calculated on a foreign country basis, by determining the average American Petroleum Institute (API) gravity of crude imported from each foreign country from Form ERA-60 in 1977 and converting average API gravity to average Btu content using National Bureau of Standards, Miscellaneous Publication No. 97, *Thermal Properties of Petroleum Products, 1933*.

**Crude Oil and Lease Condensate, Production.** • 1949 forward: EIA adopted the thermal conversion factor of 5.800 million Btu per barrel as reported in a Bureau of Mines internal memorandum *Bureau of Mines Standard Average Heating Values of Various Fuels, adopted January 3, 1950*.

**Crude Oil and Petroleum Products, Exports.** • 1949 forward: Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product exported and crude oil exported weighted by the quantity of each petroleum product and crude oil exported. See "Petroleum Products, Exports" and "Crude Oil, Exports."

**Crude Oil and Petroleum Products, Imports.** • 1949 forward: Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product and each crude oil imported weighted by the quantity of each petroleum product and each type of crude oil imported. See "Crude Oil, Imports" and "Petroleum Products, Imports."

**Distillate Fuel Oil.** • 1949 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.825 million Btu per barrel as reported in a Bureau of Mines internal memorandum, *Bureau of Mines Standard Average Heating Value of Various Fuels, adopted January 3, 1950*.

**Ethane.** • 1959 forward: EIA adopted the Bureau of Mines thermal conversion factor of 3.082 million Btu per barrel as published in the *California Oil World and Petroleum Industry, First Issue, April 1942*.

**Ethane-Propane Mixture.** • 1979-1983: EIA calculation of 3.308 million Btu per barrel based on an assumed mixture of 70 percent ethane and 30 percent propane. See "Ethane" and "Propane." EIA use of this term ceased in 1983.

**Isobutane.** • 1949 forward: EIA adopted the Bureau of Mines thermal conversion factor of 3.974 million Btu per barrel as published in the *California Oil World and Petroleum Industry, First Issue, April 1942*.

**Jet Fuel, Kerosene Type.** • 1952 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as published for "Jet Fuel, Commercial" by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985, 1968*.

**Jet Fuel, Naphtha Type.** • 1952 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.355 million Btu per barrel as

published for "Jet Fuel, Military" by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985*, 1968.

**Kerosene.** • 1949 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as reported in a Bureau of Mines internal memorandum, *Bureau of Mines Standard Average Heating Values of Various Fuels*, adopted January 3, 1950.

**Lubricants.** • 1949 forward: EIA adopted the thermal conversion factor of 6.065 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

**Miscellaneous Products.** • 1949 forward: EIA adopted the thermal conversion factor of 5.796 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

**Motor Gasoline.** • 1949 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.253 million Btu per barrel as published for "Gasoline, Motor Fuel" by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985*, 1968.

**Natural Gasoline.** • 1949-1983: EIA adopted the thermal conversion factor of 4.620 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*. EIA use of this term ceased in 1983.

**Natural Gas Plant Liquids, Production.** • 1949 forward: Calculated annually by EIA as the average of the thermal conversion factors of each natural gas plant liquid produced weighted by the quantity of each natural gas plant liquid produced.

**Pentanes Plus.** • 1984 forward: EIA assumed the thermal conversion factor to be 4.620 million Btu or equal to that for natural gasoline. See "Natural Gasoline."

**Petrochemical Feedstocks, Naphtha 400 degrees F or Less.** • 1962 forward: Assumed by EIA to be 5.248 million Btu per barrel, equal to the thermal conversion factor for special naphtha. See "Special Naphtha."

**Petrochemical Feedstock, Over 400 degrees F.** • 1962 forward: Assumed by EIA to be 5.825 million Btu per barrel, equal to the thermal conversion factor for distillate fuel oil. See "Distillate Fuel Oil."

**Petrochemical Feedstock, Still Gas.** • 1962 forward: Assumed by EIA to be 6.000 million Btu per barrel, equal to the thermal conversion factor for still gas. See "Still Gas."

**Petroleum Coke.** • 1949 forward: EIA adopted the thermal conversion factor of 6.024 million Btu per barrel as reported in Btu per short ton in the Bureau of Mines internal memorandum *Bureau of Mines Standard Average Heating Value of Various Fuels*, adopted January 3, 1950. Bureau of Mines calculated this factor by dividing the 30,120,000 Btu per short ton as given in the referenced Bureau of Mines internal memorandum by 5.0 barrels per short ton as given in the Bureau of Mines Form 6-1300-M and successor EIA forms.

**Petroleum Products, Consumption.** • 1949 forward: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed, weighted by the quantity of each petroleum product consumed.

**Petroleum Products, Consumption by Electric Utilities.** • 1949-1959: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed at electric utilities, weighted by the quantity of each petroleum product consumed at electric utilities. • 1960-1987: Calculated from the State Energy Data System as documented in the *State Energy Data Report, Consumption Estimates, 1960-1987*. • 1988: Estimated by EIA.

**Petroleum Products, Consumption by Industrial Users.** • 1949-1959: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed in the industrial sector, weighted by the estimated quantity of each petroleum product consumed in the industrial sector. • 1960-1987: Calculated from the State Energy Data System as documented in the *State Energy Data Report, Consumption Estimates, 1960-1987*. • 1988: Estimated by EIA.

**Petroleum Products, Consumption by Residential and Commercial Users.** • 1949-1959: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed by the residential and commercial sector, weighted by the estimated quantity of each petroleum product consumed in the residential and commercial sector. • 1960-1987: Calculated from the State Energy Data System as documented in the *State Energy Data Report, Consumption Estimates, 1960-1987*. • 1988: Estimated by EIA.

**Petroleum Products, Consumption by Transportation Users.** • 1949-1959: Calculated annually by EIA as the average of the thermal conversion factor for all petroleum products consumed in the transporta-

tion sector, weighted by the estimated quantity of each petroleum product consumed in the transportation sector. • 1960–1987: Calculated from the State Energy Data System as documented in the *State Energy Data Report, Consumption Estimates, 1960–1987*. • 1988: Estimated by EIA.

**Petroleum Products, Exports.** • 1949 forward: Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product weighted by the quantity of each petroleum product exported.

**Petroleum Products, Imports.** • 1949 forward: Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product imported weighted by the quantity of each petroleum product imported.

**Plant Condensate.** • 1949–1983: Estimated to be 5.418 million Btu per barrel by EIA from data provided by McClanahan Consultants, Inc., Houston, Texas. EIA use of this term ceased in 1983.

**Propane.** • 1949 forward: EIA adopted the Bureau of Mines thermal conversion factor of 3.836 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

**Residual Fuel Oil.** • 1949 forward: EIA adopted the thermal conversion factor of 6.287 million Btu per barrel as reported in the Bureau of Mines internal memorandum *Bureau of Mines Standard Average Heating Values of Various Fuels*, adopted January 3, 1950.

**Road Oil.** • 1949 forward: EIA adopted the Bureau of Mines thermal conversion factor of 6.636 million Btu per barrel which was assumed to be equal to that of asphalt (see “Asphalt”) and was first published by the Bureau of Mines in the *Petroleum Statement, Annual, 1970*.

**Special Naphtha.** • 1965 forward: EIA adopted the Bureau of Mines thermal conversion factor of 5.248 million Btu per barrel which was assumed to be equal to that of total gasoline (aviation and motor) factor and was first published in the *Petroleum Statement, Annual, 1970*.

**Still Gas.** • 1949 forward: EIA adopted the Bureau of Mines estimated thermal conversion factor of 6.000 million Btu per barrel and was first published in the *Petroleum Statement, Annual, 1970*.

**Unfinished Oil.** • 1949 forward: EIA assumed the thermal conversion factor to be 5.825 million Btu per barrel or equal to that for distillate fuel oil (see “Distillate Fuel Oil”) and first published in the *Annual Report to Congress, Volume 3, 1977*.

**Unfractionated Stream.** • 1979–1983: EIA assumed the thermal conversion factor to be 5.418 million Btu per barrel or equal to that for plant condensate (see “Plant Condensate”) and first published in the *Annual Report to Congress, Volume 2, 1981*. EIA use of this term ceased in 1983.

**Wax.** • 1949 forward: EIA adopted the thermal conversion factor of 5.537 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

## Natural Gas

**Natural Gas, Consumption.** • 1949–1962: EIA adopted the thermal conversion factor of 1,035 Btu per cubic foot as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*. • 1963–1979: EIA adopted the thermal conversion factor calculated annually by the American Gas Association (AGA) and published in *Gas Facts*, an AGA annual. • 1980–1987: Calculated annually by EIA by dividing the total heat content of natural gas consumed by the total quantity of natural gas consumed. Heat content and quantity consumed are from Form EIA-176. • 1988: Estimated to be the same as 1987.

**Natural Gas, Consumption by Electric Utilities.** • 1949–1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.” • 1973–1987: calcu-

lated annually by EIA by dividing the total heat content of natural gas received at electric utilities by the total quantity received at electric utilities. The heat contents and receipts are from FERC Form 423 and predecessor forms. • 1988: Estimated to be the same as 1987.

**Natural Gas, Consumption by Non-Electric Utility Users.** • 1949–1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.” • 1973–1987: Calculated annually by EIA by subtracting the heat content of natural gas consumed at electric utilities from the heat content of total natural gas consumed and dividing the result by the quantity of non-utility natural gas consumption (total consumption less electric utility consumption). • 1988: Estimated to be the same as 1987.

**Natural Gas, Exports.** • 1949–1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.” • 1973–1987: Calculated annually by EIA by dividing the heat content of exported natural gas by the quantity of natural gas exported, both reported on FPC Form–14. • 1988: Estimated to be the same as 1987.

**Natural Gas, Imports.** • 1949–1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.” • 1973–1987: Calculated annually by EIA by dividing the heat content of imported natural gas by the quantity

of natural gas imported, both reported on FPC Form–14. • 1988: Estimated to be the same as 1987.

**Natural Gas, Production (Dry).** • 1949 forward: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.”

**Natural Gas, Production (Wet).** • 1949–1987: Calculated annually by EIA by adding the heat content of natural gas, dry production and the total heat content of natural gas plant liquids production and dividing this sum by the total quantity of marketed (wet) natural gas production. • 1988: Estimated to be the same as 1987.

## Coal and Coal Coke

**All Coal, Consumption.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumption by the sum of their respective tonnages.

**All Coal, Consumption by Electric Utilities Only.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite received at electric utilities by the sum of their respective tonnages received.

**All Coal, Consumption by Non-Electric Utility Users.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumed by nonelectric utility users by the sum of their respective tonnages.

**All Coal, Exports.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite exported by the sum of their respective tonnages.

**All Coal, Imports.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite imported by the sum of their respective tonnages.

**All Coal, Production.** • 1949 forward: Calculated annually by EIA by dividing the sum of the total heat content of bituminous coal and lignite and anthracite production by the sum of their respective tonnages.

**Anthracite, Consumption.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of anthracite consumed by electric utilities and non-electric utilities by the total quantity of anthracite consumed.

**Anthracite, Consumption by Electric Utilities.** • 1949–1972: Assumed by EIA that all anthracite consumed at electric utilities was recovered from culm banks and river dredging and estimated to have an average heat content of 17.500 million Btu per short ton. • 1973 forward: Calculated annually by EIA by dividing the heat content of anthracite receipts at electric utilities by the quantity of anthracite received at electric utilities, as reported on FERC Form 423 and predecessor forms.

**Anthracite, Consumption by Non-Electric Utility Users.** • 1949 forward: Calculated annually by EIA by dividing the heat content of anthracite production less the heat content of the anthracite consumed at electric utilities, net exports, and shipments to U.S. Armed Forces overseas by the quantity of non-electric utility anthracite consumption less the quantity of anthracite stock changes, losses, and unaccounted for.

**Anthracite, Imports and Exports.** • 1949 forward: EIA assumed the anthracite imports and exports to be freshly mined anthracite having an estimated heat content of 25.400 million Btu per short ton.

**Anthracite, Production.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of freshly mined anthracite (estimated to have an average heat content of 25.400 million Btu per short ton) and the heat content of anthracite recovered from culm banks and river dredging (estimated to have an average heat content of 17.500 million Btu per short ton) by the total quantity of anthracite production.

**Bituminous Coal and Lignite, Consumption.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumed by electric utilities, coal coke plants, other

industrial plants, and by the residential and commercial sector and the transportation sector by the sum of their respective tonnages.

**Bituminous Coal and Lignite, Consumption by Coke Plants.** • 1949 forward: Estimated by EIA to be 26.800 million Btu per short ton based on input-output analysis of coal carbonization.

**Bituminous Coal and Lignite, Consumption by Electric Utilities.** • 1949-1972: EIA adopted the average thermal conversion factor of the Bureau of Mines which used the National Coal Association average thermal conversion factor for electric utilities calculated from FPC Form-1 and published in *Steam Electric Plant Factors*, a National Coal Association annual report. • 1973 forward: Calculated annually by EIA by dividing the total heat content of bituminous coal and lignite received at electric utilities by the total quantity received at electric utilities. Heat contents and receipts are from FERC Form 423 and predecessor forms.

**Bituminous Coal and Lignite, Consumption by Other Industrial Users.** • 1949-1973: Calculated annually by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by other industrial users and that of coal consumed at electric utilities in the 1974-1983 period. • 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to other industrial users from each coal-producing district (reported on EIA Form 6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to bituminous coal and lignite received at electric utilities from each of the same coal-producing districts (reported on FERC Form 423). The average Btu value of coal by coal-producing district was applied to the volume of deliveries to other industrial users from each coal-producing district, and the sum total of the heat content was divided by the total volume of deliveries.

**Bituminous Coal and Lignite, Consumption by Residential and Commercial Users.** • 1949-1973: Calculated annually by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by residential and commercial users and that of coal consumed by electric utilities in the 1974-1983 period. • 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to residential and commercial users from each coal-

producing district (reported on EIA Form 6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to bituminous coal and lignite received at electric utilities from each of the same coal-producing districts (reported on FERC Form 423). The average Btu value of coal by coal-producing district was applied to the volume of deliveries to residential and commercial users from each coal-producing district, and the sum total of the heat value was divided by the total volume of deliveries.

**Bituminous Coal and Lignite, Consumption by Transportation Users.** • 1949 forward: Assumed by EIA to be equal to the Btu conversion factor for "Bituminous Coal and Lignite, Consumption by Other Industrial Users."

**Bituminous Coal and Lignite, Exports.** • 1949-1972: Assumed by EIA to be all metallurgical coal and to have an average thermal content of 27.000 million Btu per short ton. • 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of exported metallurgical coal (estimated to average 27.000 million Btu per short ton) and the heat content of exported steam coal (estimated to have an average thermal content of 25.000 million Btu per short ton) by the total quantity of bituminous coal and lignite exported.

**Bituminous Coal and Lignite, Imports.** • 1949 forward: EIA estimated the average thermal conversion factor to be 25.000 million Btu per short ton.

**Bituminous Coal and Lignite, Production.** • 1949 forward: Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumption, net exports, stock changes, and unaccounted for by the sum of their respective tonnages. Consumers' stock changes by sectors were assumed to have the same conversion factor as the consumption sector. Producers' stock changes and unaccounted for were assumed to have the same conversion factor as consumption by all users.

**Coal Coke, Imports and Exports.** • 1949 forward: EIA adopted the Bureau of Mines estimate of 24.800 million Btu per short ton.

## Electricity

**Fossil Fuel Steam-Electric Power Plant Generation.** There is no generally accepted practice for measuring the thermal conversion rates for power plants that generate electricity from hydroelectric, wood and waste, wind, photovoltaic, or solar thermal energy sources. EIA has selected a rate that is equal to the prevailing annual average heat rate factor for fossil-fueled steam-electric power plants in the United States. By using that factor, it is possible to evaluate fossil fuel requirements for replacing those sources during periods of interruption such as droughts. The heat content of a kilowatthour of electricity produced, regardless of the generation process, is 3,412 Btu per kilowatthour. • 1949–1955: The weighted annual average heat rate for fossil-fueled steam-electric power plants in the United States, as published by EIA in *Thermal-Electric Plant Construction Cost and Annual Production Expenses—1981* and *Steam-Electric Plant Construction Cost and Annual Production Expenses—1978*. • 1956 through 1987: The weighted annual average heat rate for fossil-fueled steam-electric power plants in the United States, as pub-

lished by EIA in *Historical Plant Cost and Annual Production Expenses for Selected Electric Plants*. • 1988: Estimated to be the same as 1987.

**Geothermal Energy Power Plant Generation.** • 1960–1981: Calculated annually by EIA by weighting the annual average heat rates of operating geothermal units by the installed nameplate capacities as reported on FPC Form-12. • 1982 forward: Estimated annually by EIA based on an informal survey of relevant plants.

**Nuclear Generating Units.** • 1957–1987: Calculated annually by EIA by dividing the total heat content consumed in reactors at nuclear generating units by the total (net) electricity generated by nuclear plants as reported on FERC Form-1, EIA-412, and predecessor forms, and, beginning with 1982 data, as published in EIA, *Historical Plant Cost and Annual Production Expenses for Selected Electric Plants*. • 1988: Estimated to be the same as 1987.

# Appendix B. Energy Units in Perspective

## Using Appendix B

The three tables in this appendix are intended to help the nontechnical reader understand the value of the various energy units used in the *Annual Energy Review*. The values (especially the equivalents in Table B3) shown here are approximations intended to convey a general idea of the magnitude of energy units.

The tables can be used to relate a familiar measure of energy, such as gallons, to energy measures used in this report. For example, Table B1 shows that 8 gallons of motor gasoline is equal to roughly one-fifth of a barrel of crude oil.<sup>1</sup> Using information from Table B2, the reader can calculate that the 8 gallons of motor gasoline was, on average, a six-and-a-half-day supply per capita in 1988. Table B3 indicates that 8 gallons of motor gasoline equals about 10 therms of natural gas or approximately 1 million British thermal units (see Glossary).

<sup>1</sup>However, due to the nature of the refining process, one-fifth of a barrel of crude oil would yield less than 8 gallons of motor gasoline.

**Table B1. Physical Conversion Factors for Energy Units**

Type of Unit	Factor
Weight.....	2,000 pounds/short ton
	1.102 short tons/metric ton
	1.120 short tons/long ton
Volume.....	0.028 cubic meters/cubic foot
	35.315 cubic feet/cubic meter
	42 U.S. gallons/U.S. barrel
	128 cubic feet/cord
Weight and Volume.....	0.136 metric tons/U.S. barrel <sup>1</sup>
	0.150 short tons/U.S. barrel <sup>1</sup>
	7.33 U.S. barrels/metric ton <sup>1</sup>
	6.65 U.S. barrels/short ton <sup>1</sup>
	1.25 short tons/cord <sup>2</sup>

<sup>1</sup>For crude oil (average gravity).

<sup>2</sup>For dry hardwood (average).

**Table B2. U.S. Daily Per Capita Consumption of Energy by Type, 1973, 1979, and 1988**

Type of Energy	1973	1979	1988	Percent Change	
				1973-1979	1979-1988
<b>Gallons</b>					
Petroleum Products .....	3.4	3.5	2.9	0.7	-17.1
Motor Gasoline .....	1.3	1.3	1.2	0.0	-7.7
<b>Cubic Feet</b>					
Natural Gas (dry).....	286	247	201	-13.6	-18.6
<b>Pounds</b>					
Coal .....	14.6	16.6	19.6	13.7	18.1
<b>Kilowatthours</b>					
Hydroelectricity .....	3.5	3.4	2.5	-2.9	-26.5
Nuclear Electricity.....	1.1	3.1	5.9	181.8	90.3
Electricity (all) .....	22.0	25.0	29.0	13.6	16.0
<b>Thousand Btu</b>					
Industrial Energy <sup>1</sup> .....	408	398	322	-2.5	-19.1
Total Energy .....	963	963	889	0.0	-7.7

<sup>1</sup>Includes electric losses distributed.

**Table B3. Energy Equivalents**

Energy Unit	Equivalent <sup>1</sup>
1 Btu of Energy.....	1 match tip 250 calories (International Steam Table)
1,000 Btu of Energy.....	0.25 kilocalories (food calories) 2 5-ounce glasses of table wine 250 kilocalories (food calories)
1 Million Btu of Energy.....	0.80 peanut butter and jelly sandwiches 90 pounds of coal 120 pounds of oven-dried hardwood 8 gallons of motor gasoline—enough to move the average U.S. passenger car about 154 miles (1987) 10 therms of dry natural gas 11 gallons of propane 1.2 days of U.S. energy consumption per capita (1984) 2 months of the dietary intake of a laborer
1 Quadrillion <sup>2</sup> Btu of Energy.....	45 million short tons of coal 60 million short tons of oven—dried hardwood 1 trillion cubic feet of dry natural gas 470 thousand barrels of crude oil per day for 1 year 25 days of U.S. petroleum imports 26 days of U.S. motor gasoline use 27 hours of world energy use (1987)
1 Barrel of Crude Oil.....	14 days of U.S. petroleum consumption (1988) 5.6 thousand cubic feet of dry natural gas 0.26 short tons (520 pounds) of coal 1,700 kilowatthours of electricity
1 Short Ton of Coal.....	106 days of U.S. coal consumption per capita (1988) 3.8 barrels of crude oil 21 thousand cubic feet of dry natural gas 6,500 kilowatthours of electricity
1,000 Cubic Feet of Natural Gas.....	4.9 days of natural gas use per capita (1988) 0.18 barrels (7.4 gallons) of crude oil 0.047 short tons (93 pounds) of coal 300 kilowatthours of electricity
1,000 Kilowatthours (kWh) of Electricity.....	35 days of U.S. electricity use per capita 0.59 barrels of crude oil <sup>3</sup> 0.15 short tons (310 pounds) of coal <sup>3</sup> 3,300 cubic feet of dry natural gas <sup>3</sup>

<sup>1</sup>Equivalents are approximate.

<sup>2</sup>One quadrillion equals 1,000,000,000,000,000.

<sup>3</sup>However, because of net energy losses associated with the generation of electricity, about three times as much fossil fuel is required to generate 1,000 kWh: 1.8 barrels of oil, 0.47 short tons of coal, or 10,000 cubic feet of natural gas.

Note: •One million Btu of fossil fuels burned at electric utilities can generate about 100 kilowatthours of electricity, while it takes about 300 kilowatthours of electricity generated at electric utilities to produce 1 million Btu of heat. •Calculations are based on 1988 data where applicable, unless otherwise noted.

# Appendix C. GNP Dollars and Deflators

**Table C1. GNP<sup>1</sup> Dollars and Implicit Price Deflators, 1949–1988**

Years 1949–1969	GNP (billion 1982 dollars)	Deflator (1982=100)	Years 1970–1988	GNP (billion 1982 dollars)	Deflator (1982=100)
1949	1,109.0	23.5			
1950	1,203.7	23.9	1970	2,416.2	42.0
1951	1,328.2	25.1	1971	2,484.8	44.4
1952	1,380.0	25.5	1972	2,608.5	46.5
1953	1,435.3	25.9	1973	2,744.1	49.5
1954	1,416.2	26.3	1974	2,729.3	54.0
1955	1,494.9	27.2	1975	2,695.0	59.3
1956	1,525.6	28.1	1976	2,826.7	63.1
1957	1,551.1	29.1	1977	2,958.6	67.3
1958	1,539.2	29.7	1978	3,115.2	72.2
1959	1,629.1	30.4	1979	3,192.4	78.6
1960	1,665.3	30.9	1980	3,187.1	85.7
1961	1,708.7	31.2	1981	3,248.8	94.0
1962	1,799.4	31.9	1982	3,166.0	100.0
1963	1,873.3	32.4	1983	3,279.1	103.9
1964	1,973.3	32.9	1984	3,501.4	107.7
1965	2,087.6	33.8	1985	3,618.7	110.9
1966	2,208.3	35.0	1986	3,721.7	113.9
1967	2,271.4	35.9	1987	3,847.0	117.7
1968	2,365.6	37.7	1988	3,996.1	121.7
1969	2,423.3	39.8			

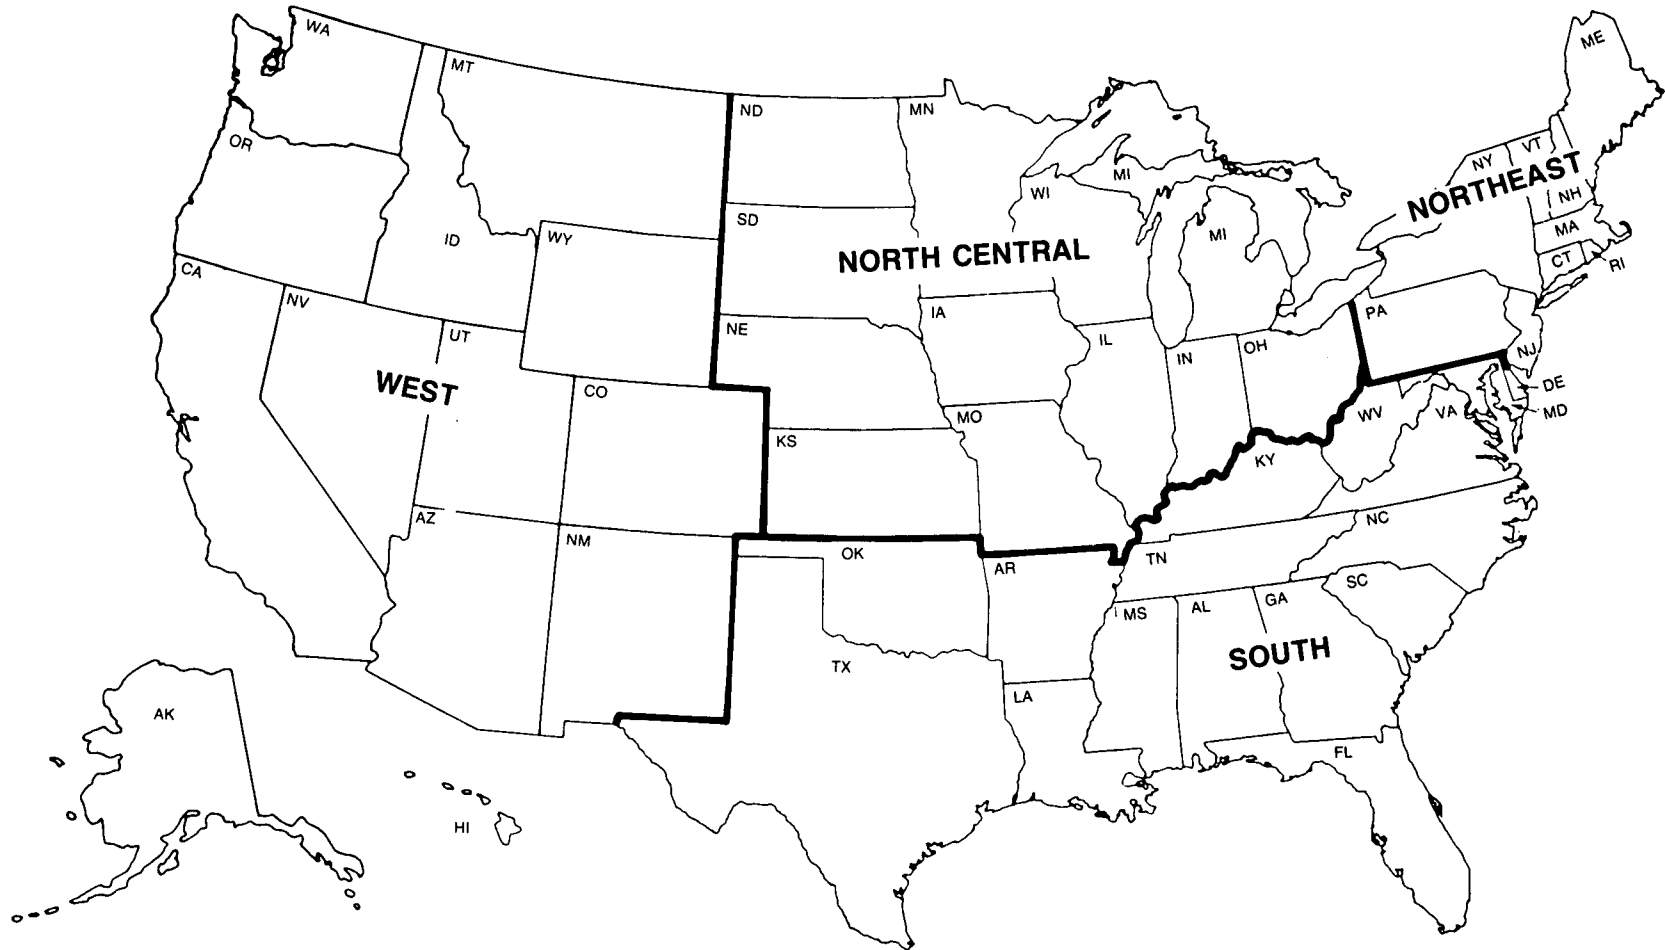

<sup>1</sup>GNP=Gross national product (see Glossary).

Sources: **GNP in 1982 Dollars:** • 1949 through 1987—*Economic Report of the President*, January 1989, Table B-2. • 1988—Bureau of Economic Analysis, *United States Department of Commerce News*, March 23, 1989, Table 3.

# Appendix D. U.S. Census Region Map

Source: Department of Commerce, Bureau of the Census.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that proper record-keeping is essential for ensuring transparency and accountability in financial operations. This section also highlights the role of internal controls in preventing errors and fraud.

2. The second part of the document focuses on the implementation of effective risk management strategies. It outlines various risk assessment techniques and provides guidance on how to identify, measure, and mitigate potential risks. The text stresses the need for a proactive approach to risk management to protect the organization's assets and reputation.

3. The third part of the document addresses the importance of regular communication and reporting. It discusses the benefits of clear and concise communication in conveying financial information to stakeholders. This section also provides guidelines for developing comprehensive reports that provide a clear overview of the organization's financial performance and position.

4. The fourth part of the document discusses the role of technology in modern financial management. It explores various software solutions and tools that can streamline financial processes, improve data accuracy, and enhance decision-making capabilities. The text emphasizes the need for organizations to stay up-to-date with the latest technological advancements in the field.

5. The fifth and final part of the document provides a summary of the key points discussed throughout the document. It reiterates the importance of maintaining accurate records, implementing effective risk management strategies, and ensuring regular communication and reporting. The text concludes by encouraging organizations to adopt a holistic approach to financial management to achieve long-term success and growth.

---

## Appendix E. Explanatory Notes

---

**1. Electricity Generation.** Data on the generation of electricity in the United States represents gross electricity output measured at the generator terminals, minus power plant use (net electricity generated). Nuclear electricity generation data identified by individual countries in this report are gross electricity output. See Tables 2, 84, 85, 86, 114, and 115.

**2. Consumption of Primary Energy by End-Use Sector.** Sector data are derived from the end-use sector table of each energy commodity. The "Other" sector in the Electric Utility Sales table is allocated to the Residential and Commercial Sector, except for the railways' portion of "Other," which is allocated to the Transportation Sector. See Table 4.

**3. Financial Reporting System (FRS) Companies.** The FRS data system is designed to permit review of the financial performance of energy companies. Data are disaggregated both by line of business and by geographic area of operation. Domestic operations include Puerto Rico and the Virgin Islands; foreign operations exclude those areas.

The 22 companies included in the FRS for the 1987 reporting year are the following:

Amerada Hess Corporation  
American Petrofina Incorporated  
Amoco Corporation  
Ashland Oil Inc.  
Atlantic Richfield Company  
BP America Inc.  
Burlington Northern Inc.  
Chevron Corporation (formerly Standard Oil Company of California)  
Coastal Corporation  
E.I. du Pont de Nemours and Company (Du Pont)  
Exxon Corporation  
Kerr-McGee Corporation  
Mobil Corporation  
Occidental Petroleum Corporation  
Phillips Petroleum Company

Shell Oil Company  
Sun Company  
Tenneco Inc.  
Texaco Inc.  
Unocal Corporation (formerly Union Oil Company of California)  
Union Pacific Corporation  
USX Corporation (formerly United States Steel Corporation)

Prior to 1983, the reporting group included 26 companies. Conoco and Marathon were replaced by Du Pont and the United States Steel Corporation, due to the merger of the former companies with the latter companies, respectively, beginning in 1982. Although Occidental acquired Cities Service in 1982, separate financial reports were available for 1982, so each company continued to be treated as a separate FRS company until 1983. In 1984 three more intragroup mergers occurred: (1) Chevron acquired Gulf Oil, (2) Mobil acquired Superior Oil, and (3) Texaco acquired Getty Oil. Since financial reports for 1984 were available for the three acquired companies, they are treated as separate companies through 1984. See Tables 34 through 37 and 43.

**4. Well Completions.** For the years 1970 forward, annual well completions are estimated by the Energy Information Administration (EIA) using the American Petroleum Institute's drilling data files. For more recent years, these files are not complete, due to delays in the reporting of wells drilled. Based on statistical analysis, EIA employs an adjustment process to impute missing data to show total well completions and footages for current years. See Tables 40 and 41.

**5. Reclassified.** Accurate calculation of the quantity of petroleum products supplied to the domestic market is complicated by the recycling of products at the refinery, the renaming of products involved in a transfer, and the receipt of products from outside of the primary supply system. Beginning in 1981, a single adjustment (always a negative quantity) is made to total product supplied to correct this accounting problem. The calculation of this adjustment, called "reclassified," involves only unfinished oils and gasoline blending components. It is the sum of their net

changes in primary stocks (net withdrawals is a plus quantity, net additions is a minus quantity) plus imports minus net input to refineries. See Tables 55, 58, and 60.

**6. Gross Input to Distillation Units (GIDU).** The methods for deriving GIDU in this report are as follows: 1949 through 1966 GIDU is estimated by summing annual crude oil runs to stills, net unfinished oil reruns at refineries and shipments of natural gasoline and plant condensate from natural gas processing plants to refineries. 1967 through 1973 GIDU is estimated by summing annual crude oil runs to stills, net unfinished oil reruns, and refinery input of natural gasoline and plant condensate. 1974 through 1980 GIDU is published annual data. 1981 and forward GIDU is the sum of reported monthly data. See Table 56.

**7. Petroleum Products Supplied.** Total petroleum products supplied is the sum of the product supplied for each petroleum product, crude oil, unfinished oils, and gasoline blending components. For each of these, except crude oil, product supplied is calculated by adding refinery production, natural gas plant liquids production, new supply of other liquids, imports, stock withdrawals, and subtracting stock additions, refinery inputs, and exports. Crude oil product supplied is the sum of crude oil burned on leases and at pipeline pump stations as reported on Form EIA-813. Prior to 1983, crude oil burned on leases and at pipeline pump stations was reported as either distillate or residual fuel oil and was included as product supplied for these products. Petroleum product supplied is an approximation of petroleum consumption and is synonymous with the term "Petroleum Consumption" in Section 1. End-use sector data for petroleum products used in more than one sector are derived from surveys of sales to ultimate consumers by refiners, marketers, distributors, and dealers and from receipts at electric utilities. See Explanatory Notes 5 and 8 and Tables 58, 59, and 60.

**8. Joint Petroleum Reporting System.** Beginning in January 1981, several Energy Information Administration survey forms and calculation methodologies were changed to reflect new developments in refinery and blending plant practices and to improve data integrity. These changes affect production and product supplied statistics for motor gasoline, distillate fuel oil, and residual fuel oil, and stocks of motor gasoline. On the new basis, motor gasoline production during the last half of 1980 would have averaged 289,000 barrels per day higher than that which was published on the old basis. Distillate and residual fuel oil production and product supplied for all of 1980 would have averaged, respectively, 105,000 and 54,000 barrels per day higher than the numbers that were published. See Tables 55, 58, and 60.

**9. Crude Oil Wellhead Prices.** Derived as follows: 1949 through 1973—weighted average wellhead values as reported by State agencies and calculated by the Bureau of Mines; 1974 and 1975—weighted averages of a sample survey of major first purchasers' purchases; 1976 and forward—weighted averages of all first purchasers' purchases. See Table 63.

**10. Refiner Acquisition Cost of Crude Oil.** This cost was estimated for 1968 through 1973. The cost of domestic crude oil was derived by adding estimated transportation costs to the reported average wellhead value. The cost of imported crude oils was derived by adding an estimated ocean transport cost based on the published "Average Freight Rate Assessment" to the average "Free Alongside Ship" value published by the U.S. Bureau of the Census. The composite cost was derived by weighting domestic costs and imported costs based on quantities produced and imported. See Tables 65 and 117.

**11. Natural Gas Consumption.** Natural gas consumption statistics are compiled from a survey of natural gas production, transmission, and distribution companies and electric utility companies. Consumption by end-use sector from these surveys is compiled on a national and individual State basis and then balanced with national and individual State supply data. Included in end-use data are the following: Commercial Sector—consumption by nonmanufacturing establishments, by municipalities for institutional heating and lighting, and those engaged in agriculture, forestry, and fishing; Electric Utility Sector—consumption by electric utilities for the generation of electric power; Industrial Sector—consumption by establishments engaged primarily in processing unfinished materials into another form of product (includes mining, petroleum refining, manufacturing, and natural gas industry use for lease and plant fuel); Residential Sector—consumption by private households for space heating, cooking, and other household uses; Transportation Sector—natural gas transmission (pipeline) fuel. See Tables 72 and 75.

**12. Natural Gas Prices by National Gas Policy Act of 1978 (NGPA) Categories.** **Old Gas.** Includes natural gas dedicated to interstate commerce and natural gas purchased under existing interstate or rollover contracts (Section NGPA 104, 105, and 106). **New Gas.** Includes new natural gas and certain natural gas produced from the Outer Continental Shelf, stripper well gas, and other new gas categories (Section NGPA 102, 103, 108, and 109). **High-Cost Gas.** Includes natural gas from deep wells and low permeability (tight) reservoirs and unregulated gas (NGPA Section 107). See Table 74.

**13. Coal Consumption.** Data in this report on the consumption of bituminous coal (including subbituminous coal), lignite, and anthracite are generated primarily from consumption data reported in surveys. Included are data reported by all electric utility companies and coke plant companies. Data on coal consumption by all industrial and manufacturing establishments and by the residential and commercial sector are based on distribution data obtained quarterly from coal companies. Included in end-use sector data are the following: Electric Utility Sector—consumption by privately and publicly owned establishments engaged in the generation and/or distribution of electric power primarily for sale or resale; Industrial and Miscellaneous Sector—consumption at manufacturing plants, large commercial establishments, coking plants, and by agriculture, mining (other than coal mining) and construction industries; Transportation Sector—sales to railroads and vessel bunker fuel; Residential and Commercial Sector—retail dealer sales to households and small commercial establishments. See Table 78.

**14. Electricity Statistics.** Prior to 1985, electricity supply and distribution statistics included data reported by institutions (such as universities) and military facilities that generated electricity primarily for their own use. Beginning in 1985, electricity statistics exclude data for these facilities and include only data for those organizations that generate electricity primarily for public use. See Tables 84 through 91.

**15. Electrical System Energy Losses.** Electrical system energy losses are calculated as the difference between total energy input at electric utilities and the total energy content of electricity sold to end-use consumers. Most of these losses occur at steam electric power plants (conventional and nuclear) in the conversion of heat energy into mechanical energy to turn electric generators. This loss is a thermodynamically necessary feature of the steam electric cycle. Part of the energy input to output losses are a result of imputing fossil energy equivalent inputs for hydroelectric and other energy sources, since there is no generally accepted practice for measuring these thermal conversion rates. In addition to conversion losses, other losses include power plant use of electricity, transmission and distribution of electricity from power plants to end-use consumers (also called “line-losses”), and unaccounted for electricity. Total losses are allocated to the end-use sectors in proportion to each sector’s share of total electricity sales. Overall, approximately 67 percent of total energy input is lost in conversion; of electricity generated, approximately 5 percent is lost in plant use and 9 percent in transmission and distribution. Calculated electrical energy system losses may be less than actual losses, because primary consumption does not include the energy equivalent of utility purchases of electricity from nonutilities and from Canada and Mexico, although they are included in electricity sales. See Table 87.

**16. Electricity Sales.** Data on the sales of electric utility electricity represent gross electricity output measured at the generator terminals, minus power plant use and transmission and distribution losses. Included in each end-use sector are the following: Commercial Sector—sales of electricity to businesses that generally require less than 1,000 kilowatts of service; Industrial Sector—sales of electricity to businesses that generally require more than 1,000 kilowatts of service; Residential Sector—sales of electricity to residences for household purposes; “Other” Sector—sales of electricity to Government, railways, street lighting authorities, and sales not elsewhere included. See Table 89.

**17. Net Summer Capability.** Net summer capabilities were first collected on Form EIA-860 for the 1984 data year. Units not assigned a net summer capability rating by the utility were given an estimated rating using a statistical relationship between installed nameplate capacity and net summer capability for each prime mover. To estimate net summer capability from 1949 through 1984, two methods were used. For each prime mover except nuclear and “other,” net summer capability estimates were calculated in two steps. First, the unit capacity values reported on Form EIA-860 and the unit start dates contained in the 1984 Generating Unit Reference File (GURF) were used to compute preliminary aggregate estimates of annual net summer capability and installed nameplate capacity. These preliminary estimates were obtained by aggregating unit capacity values for all units in service during a given year. Next, the ratio of the preliminary capability to nameplate estimate was computed for each year and multiplied by the previously published installed nameplate capacity values to produce the final estimates of net summer capability.

The net summer capability data for nuclear and “other” units were used directly from the 1984 GURF for all years. Historical aggregates were then developed using the unit start dates on the GURF.

Historical capacity has also been modified to estimate capability based upon the operable definition. This was accomplished by assuming that nonnuclear generating units became operable between 1 and 4 months prior to their commercial operation dates, depending upon the prime mover and time period. The actual operable dates for nuclear units were used. See Tables 90 and 95.

**18. Operable Units.** Prior to 1973, the number of “Operable Units at End of Year” includes units that were in commercial operation by December 31 of the stated year. Units decommissioned or inoperative for extended periods were generally included. Also included are two U.S. Department of Energy (DOE)-operated plants that supply electricity to the

commercial grid. A third DOE plant, which does not distribute electricity to the grid, is excluded. For 1973 and forward, the number of units includes units issued full-power or operating licenses and generally does not include units in long-term shutdown status. See Table 95.

**19. World Primary Energy Production.** Includes only crude oil and lease condensate, natural gas plant liquids, dry natural gas, coal, and electricity from hydroelectric power and nuclear power. Crude oil production is measured at the wellhead and includes lease condensate. Natural gas plant liquids are products obtained from processing natural gas at natural gas processing plants, including natural gas plants, cycling plants, and fractionators. Dry natural gas production is that amount of natural gas production that is available to be marketed and consumed as a gas. Coal (anthracite, subanthracite, bituminous, subbituminous, lignite, and brown coal) production is the sum of sales, mine consumption, issues to miners, and issues to coking, briquetting, and other ancillary plants at mines. Coal production data include quantities extracted from surface and underground workings and normally exclude wastes removed at mines or associated preparation plants. The production of electricity from hydroelectric power and nuclear power includes both electric utility and

industrial production reported on a net basis, thus excluding electricity that is generally used by the electric power plant for its own operating purposes or electricity losses in the transformers that are considered integral parts of the station. See Tables 103 and 104.

**20. Primary Stocks of Petroleum—OECD.** Petroleum stocks reported by the Organization for Economic Cooperation and Development (OECD) include those held at (or in) the following locations or facilities: leases, refineries, natural gas processing plants, bulk terminals, tanks associated with pipelines, barges, intercoastal tankers, ocean tankers in port, inland ship bunkers, major final consumers, and the strategic storage reserve. For an individual country, stocks include those held for the account of that country but located in another country. U.S. stocks include those held in the 50 States and the District of Columbia. "Other OECD" includes stocks held in Puerto Rico and the Virgin Islands. The OECD definition of petroleum stocks excludes petroleum in pipelines, rail tank cars, tank trucks, oceangoing ship bunkers, service stations, retail stores, and tankers at sea. An exception is U.S. stocks which include petroleum in pipelines. See Table 109.

---

# Glossary

---

**Additions to Property:** The current year's expenditures on property, plant, and equipment. The amount is predicated upon each reporting company's accounting practices. That is, accounting practices with regard to capitalization of certain items may differ across companies, and therefore this figure is a function of each reporting company's policy.

**Alcohol:** The family name of a group of organic chemical compounds composed of carbon, hydrogen, and oxygen. The molecules in the series vary in chain length and are composed of a hydrocarbon plus a hydroxyl group ( $\text{CH}_3-(\text{CH}_2)_n-\text{OH}$ ). Alcohol includes methanol and ethanol.

**Anthracite:** A hard, black, lustrous coal containing a high percentage of fixed carbon and a low percentage of volatile matter. It is often referred to as hard coal. It includes meta-anthracite and semianthracite and conforms to ASTM Specification D388 for anthracite.

**API:** The trade association American Petroleum Institute.

**API Gravity:** An arbitrary scale expressing the gravity or density of liquid petroleum products. The measuring scale is calibrated in terms of degrees API. A low API gravity means a heavy, more dense product.

**Apparent Consumption, Natural Gas (international):** The total of an individual nation's marketed natural gas production plus imports less exports.

**Asphalt:** A dark-brown-to-black cement-like material containing bitumens as the predominant constituents, obtained by petroleum processing. The definition includes crude asphalt as well as the following finished products: cements, fluxes, the asphalt content of emulsions (exclusive of water), and petroleum distillates blended with asphalt to make cutback asphalts.

**ASTM:** The acronym for the American Society for Testing and Materials.

**Aviation Gasoline Blending Components:** Finished components<sup>a</sup> in the gasoline range that will be used for blending or compounding into finished aviation gasoline.

**Aviation Gasoline, Finished:** All special grades of gasoline for use in aviation reciprocating engines, as given in ASTM Specification D910. Excludes blending components that will be used in blending or compounding into finished aviation gasoline.

**Base Gas:** The volume of gas needed as a permanent inventory to maintain adequate underground storage reservoir pressures and deliverability rates throughout the withdrawal season. All native gas is included in the base gas volume.

**Bituminous Coal:** A coal that is high in carbonaceous matter having a volatility greater than anthracite and a calorific value greater than subbituminous coal. In the United States, it is often referred to as soft coal. It conforms to ASTM Specification D388 for bituminous coal and is used primarily for electricity generation, coke production, and space heating.

**British Thermal Unit (Btu):** The amount of energy required to raise the temperature of 1 pound of water 1 °F at or near 39.2 °F. One Btu is equivalent to about 252 International Steam Table calories. An average Btu content of fuel is a heat value per unit quantity of fuel as determined from tests of fuel samples.

**Butane:** A normally gaseous, paraffinic hydrocarbon ( $\text{C}_4\text{H}_{10}$ ) extracted from natural gas or refinery gas streams. It includes isobutane (branch-chain) and normal butane (straight-chain) and is covered by ASTM Specification 1835 and Natural Gas Processors Specifications for commercial butane. It is used primarily for blending into high-octane gasoline, for residential and commercial heating, and for industrial purposes, especially the manufacture of chemicals and synthetic rubber.

**Butylene:** A normally gaseous, olefinic hydrocarbon ( $\text{C}_4\text{H}_8$ ) recovered from refinery processes. Quantities are included with "normal butane" data.

**Capacity Factors at Electric Utilities:** Annual capacity factors are averages of the monthly values for that year. The monthly capacity factors are computed as the actual monthly generation divided by the maximum possible generation for that month. The maximum possible generation is the number of hours in the month multiplied by the net monthly maximum dependable capacity. This fraction is then multiplied by 100 to obtain a percentage.

**Class A Electric Utility:** An electric utility having annual electric operating revenues of \$2.5 million or more during the previous calendar year. Through 1979, electric utility data are for all Class A electric utilities. From 1980 through 1983, electric utility data are for selected Class A electric utilities (those having annual electric operating revenues of \$100 million or more during the previous calendar year).

**Class B Electric Utility:** A utility having annual electric operating revenues of \$1.0 million or more but less than \$2.5 million. (Class B utilities are not included in data for 1980 through 1983.)

**Coal:** Includes all ranks of coal—anthracite, bituminous coal, subbituminous coal, and lignite—conforming to ASTM Specification D388.

**Coal Coke:** The strong, porous residue, consisting of carbon and mineral ash, that is formed when the volatile constituents of bituminous coal are driven off by heat in the absence of or in a limited supply of air. It is used primarily in blast furnaces for smelting ores, especially iron ore.

**Cogenerators:** Generally, industrial, commercial, or other manufactures that use steam, heat, or resultant energy for the dual use of processing materials and generating electricity.

**Commercial Building:** A structure that is totally enclosed by walls that extend from the foundation to the roof and that is used solely or, if residential, used partially for commercial purposes. Also included are buildings used for both commercial and industrial purposes or both commercial and agricultural purposes if the major activity is commercial. Excluded are buildings used solely for residential purposes, buildings used primarily for industrial or agricultural activity, and U.S. government buildings on military bases or reservation. In addition to retail stores and office buildings, commercial buildings include, but are not limited to, schools, churches, gymnasiums, libraries, museums, hospitals, clinics, warehouses, restaurants, lodgings, and jails.

**Commercial Sector:** Nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; health, social, and educational institutions; and Federal, State, and local governments. Street lights, pumps, bridges, and public services are also included. (For allocation of individual fuels to end-use sectors, see the Explanatory Notes.)

**Constant Dollars:** A price, expenditure, or value that has been adjusted to account for inflation. Amounts expressed in constant dollars reflect buying power relative to a base year.

**Cost, Insurance, and Freight (C.I.F.):** A term used in sales price contracts for both domestic and export sales. In general, the sales price includes the cost of the goods, the freight charges to a named destination, and the insurance charges on the goods shipped. The seller may waive insurance and choose to assume responsibility for any loss or damage. Regarding domestic coal sales, the sales price includes all charges for delivering the coal to the electric power utility excluding demurrage at the plant and unloading charges. Federal Power Commission Form 423, on which these data are collected, refers to this price as "f.o.b. plant" price.

**Crude Oil Average Domestic First Purchase Price:** The average price at which all domestic crude oil is purchased. Prior to February 1976, the price represented an estimate of the average of posted prices; after February 1976, the price represents an average of actual first purchase prices. This price is frequently called the wellhead price.

**Crude Oil (including lease condensate):** A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Included are lease condensate and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale. Drip gases are also included, but topped crude oil (residual oil) and other unfinished oils are excluded. Liquids produced at natural gas processing plants and mixed with crude oil are excluded where identifiable.

**Crude Oil Refinery Input:** Total crude oil (including lease condensate) input to crude oil distillation units and other processing units.

**Crude Oil Stocks:** Stocks of crude oil and lease condensate held at refineries, in pipelines, at pipeline terminals, and on leases.

**Current Dollars:** A price, expenditure, or value that represents the price actually paid for a product or service at the time of the transaction.

**Demonstrated Reserve Base of Coal:** Known in-place coals of all rank that are technically and economically minable at the time of evaluation. It includes measured and indicated coal resources. It is estimated that at least one-half of the in-place coals can be recovered. (See **Indicated Resources, Coal** and **Measured Resources, Coal**.)

**Development Well:** A well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive.

**Distillate Fuel Oil:** Light fuel oils distilled during the refining process and used primarily for space heating, on- and off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation. Included are products known as No. 1, No. 2, and No. 4 fuel oils, and No. 1, No. 2, and No. 4 diesel fuels, conforming to ASTM Specifications D396 or D975, respectively. No. 1 fuel oil is a light distillate fuel oil used in vaporizing pot-type burners. No. 2 fuel oil is used in atomizing-type burners for domestic heating or for moderate capacity commercial-industrial burner units. No. 4 fuel oil is a blend of distillate fuel oil and residual fuel oil that is used in commercial burner installations not equipped with preheating facilities; it is used extensively in industrial plants. Diesel fuel oils are used in compression-ignition engines.

**Distillation Unit, Atmospheric:** The primary distillation unit that processes crude oil (including mixtures of other hydrocarbons) at approximately atmospheric conditions. It includes a pipe still for vaporizing the crude oil and a fractionation tower for separating the vaporized hydrocarbon elements in the crude oil into fractions with different boiling ranges. Fractionation consists of continuously vaporizing and condensing the components to separate higher boiling point material from lower boiling point material. The selected boiling ranges are set by the processing scheme, the properties of the crude oil, and the product specifications.

**Dry Hole:** An exploratory or development well found to be incapable of producing either oil or gas in sufficient quantities to justify completion as an oil or gas well.

**Electric Utility:** A corporation, person, agency, authority, or other entity that owns or operates facilities for the generation, transmission, distribution, or sale of electricity, primarily for use by the public.

**Electric Utility Sector:** Privately and publicly owned establishments that generate electricity primarily for use by the public.

**Eliminations:** Revenues and expenses resulting from transactions between segments. Consolidated company accounts do not include intersegment revenues and expenses. Therefore, such intersegment transactions must be eliminated.

**End-Use Energy Consumption:** Total energy consumption less losses incurred in the generation, transmission, and distribution of electricity, less power plant electricity use and unaccounted for electrical system energy losses. It is also the sum of fossil fuel consumption in the residential, commercial, industrial, and transportation end-use sectors plus electric utility sales to these sectors and generation of hydroelectric power by non-electric utilities.

**Energy-Weighted Industrial Output:** The weighted sum of real output for all two-digit Standard Industrial Classification (S.I.C.) manufacturing industries plus agriculture, construction, and mining. The weight for each industry is the ratio between the quantity of end-use energy consumption and the value of real output. The base year for these weights is either 1981 or 1982, depending on data availability.

**Ethane:** A normally gaseous, paraffinic hydrocarbon ( $C_2H_6$ ) extracted from natural gas or refinery gas streams. It is used primarily as petrochemical feedstock for production of chemicals and plastic materials.

**Ethylene:** A normally gaseous, olefinic hydrocarbon ( $C_2H_4$ ) recovered from refinery processes. Quantities are included with "ethane" data.

**Exploratory Well:** A well drilled to find and produce oil or gas in an unproved area; to find a new reservoir in a field previously found to be productive of oil or gas in another reservoir; or to extend the limit of a known oil or gas reservoir.

**Exports:** Shipments of goods from the 50 States and the District of Columbia to foreign countries, Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

**Extraction Loss:** The reduction in volume of natural gas due to the removal of natural gas constituents, such as ethane, propane, and butane, at natural gas processing plants.

**F.a.s. (free alongside ship):** The f.a.s. price is based on the purchase price (the actual transaction value of merchandise at the foreign port of export) and generally includes all charges incurred in placing the merchandise alongside the carrier at the foreign port.

**Federally Administered Lands:** Includes all public lands (Federal), Indian lands, Naval Petroleum Reserve, National Petroleum Reserve (Alaska), Outer Continental Shelf, and acquired lands (lands formerly held by the Department of Agriculture and now under the jurisdiction of the Department of the Interior). Beginning on October 1, 1984, the National Petroleum Reserve was transferred to Alaskan Natives.

**F.o.b. (free on board):** The f.o.b. price includes all charges incurred in delivering merchandise and placing it on board the carrier. In general, the seller assumes responsibility and all costs up to the specific point of delivery; the buyer assumes responsibility and costs thereafter.

**Forward Costs:** All operating and capital costs (in current dollars) still to be incurred in the production of uranium from estimated resources. Excluded are previous expenditures (such as property and mill acquisition), taxes, profit, and the cost of money. Experience has shown that forward costs are generally lower than market prices.

**Fossil Fuel Steam-Electric Power Plant:** An electricity generation plant in which the prime mover is a turbine rotated by high-pressure steam produced in a boiler by heat from burning fossil fuels.

**Gasohol:** A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol but sometimes methanol) in which 10 percent or more of the product is alcohol.

**Gas Well:** A well completed for the production of natural gas from one or more gas zones or reservoirs. (Wells producing both crude oil and natural gas are classified as oil wells.)

**Gas Well Productivity:** Derived annually by dividing gross natural gas withdrawals from gas wells by the number of producing gas wells on December 31 and then dividing the quotient by the number of days in the year.

**Geothermal Energy (as used at electric utilities):** Hot water or steam, extracted from geothermal reservoirs in the earth's crust, which is supplied to steam turbines at electric utilities that drive generators to produce electricity.

**Gross Input to Distillation Units:** The volume of crude oil, lease condensate, natural gas plant liquids, unfinished oils, liquefied refinery gases, slop oils, and other liquid hydrocarbons that are processed through crude oil distillation units.

**Gross National Product (GNP):** The total value of goods and services produced by the Nation's economy, before deduction of depreciation charges and other allowances for capital consumption. It includes the total purchases of goods and services by private consumers and government, gross private domestic capital investment, and net foreign trade.

**Gross National Product (GNP) Implicit Price Deflator:** The implicit price deflator, published by the Department of Commerce, Bureau of Economic Analysis, is used to convert current-dollars figures to constant-dollar figures.

**Household:** A group of 12 or fewer persons who occupy the same housing unit (see **Housing Unit**) as their usual or permanent place of residence. Persons include babies, lodgers, boarders, and persons who live in the housing unit but are traveling or in a hospital. Excluded are persons who are away from home as college students or members of the Armed Services.

**Housing Unit:** A structure or part of a structure in which a household (see **Household**) lives or could live, with access to the outside of the building either directly or through a common hall. Housing units do not include group quarters, such as prisons, hospitals, dormitories, nursing homes, fraternity/sorority houses, or convents, in which 10 or more unrelated persons live. Hotel and motel rooms, mobile homes, and trailers are considered housing units if permanently occupied by a household.

**Hydroelectric Power:** Electricity generated by an electric power plant whose turbines are driven by falling water.

**Imports:** Receipts of goods into the 50 States and the District of Columbia from foreign countries, Puerto Rico, the Virgin Islands, and other U.S. possessions and territories. (See **Petroleum Imports**.)

**Indicated Resources, Coal:** Coal resources for which estimates for the rank, quality, and quantity have been computed partly from sample analyses and measurements and partly from reasonable geologic projections. (See **Demonstrated Reserve Base of Coal**.)

**Industrial Sector:** Manufacturing, construction, mining, agriculture, fishing, and forestry establishments. (For allocation of individual fuels to end-use sectors, see the Explanatory Notes.)

**International Bunkers:** Fuel loaded on vessels and aircraft engaged in international commerce for use as fuel by the vessel or aircraft.

**Isobutane:** See **Butane**.

**Jet Fuel:** Includes both naphtha-type and kerosene-type jet fuel meeting standards for use in aircraft turbine engines or meeting ASTM Specification D1655. Although most jet fuel is used in aircraft, some is used for other purposes, such as fuel for turbines to produce electricity.

**Kerosene:** A petroleum middle distillate having burning properties suitable for use as an illuminant when burned in wick lamps. Included are No. 1-K and No. 2-K recognized in ASTM Specification D3699 and grades of kerosene called range oil having properties similar to No. 1 fuel oil. Kerosene is used primarily in space heaters, cooking stoves, and water heaters.

**Landed Cost of Crude Oil Imports:** The price of imported crude oil at the port of discharge. It includes the purchase price at the foreign port plus charges for transporting and insuring the crude oil from the purchase point to the port of discharge. It does not include import tariffs or fees, wharfage charges, or demurrage costs. Coverage includes the United States and its territories.

**Lease and Plant Fuel:** Natural gas used in lease operations, as gas processing plant fuel, and as net used for gas lift.

**Lease Condensate:** A natural gas liquid recovered from gas-well gas (associated and nonassociated) in lease separators or natural gas field facilities. Lease condensate consists primarily of pentanes and heavier hydrocarbons. Generally, it is blended with crude oil for refining.

**Lignite:** A brownish-black coal of low rank with high inherent moisture and volatile matter. It is also referred to as brown coal. It conforms to ASTM Specification D388 for lignite and is used almost exclusively for electric power generation.

**Line-Miles of Seismic Exploration:** The distance along the Earth's surface that is covered by seismic surveying.

**Liquefied Natural Gas (LNG):** Natural gas (primarily methane) that has been liquefied by reducing its temperature to minus 260 °F at atmospheric pressure.

**Liquefied Petroleum Gases (LPG):** Ethane, propane, normal butane, ethane-propane mixtures, propane-butane mixtures, and isobutane produced at natural gas processing plants, including plants that fractionate raw natural gas plant liquids. LPG also includes liquefied refinery gases (ethylene, propylene, butylene, and isobutylene produced from crude oil at refineries).

**Liquefied Refinery Gases (LRG):** Ethylene, propylene, butylene, and isobutylene produced from crude oil at refineries. (See **Liquefied Petroleum Gases**.)

**Low-Temperature Solar Collector:** A collector that generally operates in the temperature range below 110 °F. Typically, it has no glazing or insulation and is made of plastic or rubber, although some are made of metal. (See **Solar Thermal Collector**.)

**Lubricants:** Substances used to reduce friction between bearing surfaces. Petroleum lubricants may be produced either from distillates or residues. Other substances may be added to impart or improve certain required properties. Lubricants include all grades of lubricating oils from spindle oil to cylinder oil and those used in greases. The three categories include bright stock lubricants, neutral lubricants, and other lubricants (lubricating oil base stock used in finished lubricating oils and greases, including black, coastal, and red oils).

**Major Electric Utility:** A utility that, in the last three consecutive calendar years, had sales or transmission services exceeding one of the following: (1) 1 million megawatthours of total annual sales; (2) 100 megawatthours of annual sales for resale; (3) 500 megawatthours of annual gross interchange out; or (4) 500 megawatthours of wheeling (deliveries plus losses) for others.

**Measured Resources, Coal:** Coal resources for which estimates of the quality and quantity have been computed within a margin of error of less than 20 percent, by analyzing measurements taken from closely spaced, geologically well-known sample sites. (See **Demonstrated Reserve Base of Coal**.)

**Medium-Temperature Solar Collector:** A collector that generally operates in the temperature range of 140 °F to 180 °F but may operate at temperatures as low as 110 °F. Typically, it has one or two glazings, a metal frame, a metal absorption panel with integral flow channels or attached tubing (liquid collector) or with integral ducting (air collector), and insulation on the sides and back of the panel. (See **Solar Thermal Collector**.)

**Metallurgical Coal:** A high-quality bituminous coal suitable for making coal coke.

**Metropolitan Area:** A group of households located within a Metropolitan Statistical Area (MSA) as defined in the 1980 Census. Except in New England, an MSA is a county or group of contiguous counties that

contain at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. The contiguous counties are included in an MSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, MSA's consist of towns and cities, rather than counties.

**Miscellaneous Petroleum Products:** Includes all finished petroleum products not classified elsewhere, e.g., petrolatum, absorption oils, ram-jet fuel, petroleum rocket fuels, synthetic natural gas feedstocks, specialty oils, and medicinal oils.

**Motor Gasoline Blending Components:** Finished components in the gasoline range that will be used for blending or compounding into finished motor gasoline. Pool gasoline (gasoline needing no processing other than blending) is included in this category.

**Motor Gasoline, Finished:** A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, that have been blended to form a fuel suitable for use in spark-ignition engines and conforming to ASTM Specification D439. Included are finished leaded gasoline, finished unleaded gasoline, and gasohol. Excluded are blendstock that has not been blended into finished motor gasoline and alcohol that has not been blended into gasohol.

**Motor Gasoline, Leaded Premium:** A gasoline having an antiknock index of 93 with the use of lead additives or which contains more than 0.05 grams of lead per gallon or more than 0.005 grams of phosphorus per gallon. Includes gasohol.

**Motor Gasoline, Leaded Regular:** A gasoline having an antiknock index of 89 with the use of lead additives or which contains more than 0.05 grams of lead per gallon or more than 0.005 grams of phosphorus per gallon.

**Motor Gasoline, Total:** Includes finished leaded motor gasoline (premium and regular), finished unleaded motor gasoline (premium and regular), motor gasoline blending components, and gasohol.

**Motor Gasoline, Unleaded Premium:** A gasoline having an antiknock index of 90 containing not more than 0.05 grams of lead per gallon and not more than 0.005 grams of phosphorus per gallon. Includes gasohol.

**Motor Gasoline, Unleaded Regular:** A gasoline having an antiknock index of 87 containing not more than 0.05 grams of lead per gallon and not more than 0.005 grams of phosphorus per gallon.

**Naphtha:** A generic term applied to a petroleum fraction with an approximate boiling range of between 122 °F and 400 °F.

**Native Gas:** Gas in place at the time that a reservoir was converted to use as an underground storage reservoir. Excludes quantities of gas added or injected.

**Natural Gas:** A mixture of hydrocarbons (principally methane) and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in underground reservoirs.

**Natural Gas, Dry Production:** Derived by subtracting extraction loss from "marketed production." It represents the amount of domestic gas production that is available to be marketed and consumed as a gas.

**Natural Gas, End-Use Average Price:** Average price per specified unit, including all taxes, at the point of consumption.

**Natural Gas Gross Withdrawals:** Full well stream volume of produced natural gas excluding condensate separated at the lease.

**Natural Gas Liquids (NGL):** Those hydrocarbons in natural gas that are separated as liquids from the gas. Natural gas liquids include natural gas plant liquids (primarily ethane, propane, butane, and isobutane produced at natural gas processing plants) and lease condensate (primarily pentanes plus produced from natural gas at lease separators and field facilities). (See **Natural Gas Plant Liquids and Lease Condensate**.)

**Natural Gas, Marketed Production:** This quantity is derived. It is gross withdrawals of natural gas from production reservoirs, less gas used for reservoir repressuring, quantities vented and flared, and nonhydrocarbon gases removed in treating and processing operations.

**Natural Gas Plant Liquids (NGPL):** Those natural gas liquids that are recovered from natural gas processing plants, and in some situations, from natural gas field facilities, as well as those that are extracted by fractionators. Natural gas plant liquids are defined according to the published specifications of the ASTM and the Gas Processors Association and are classified as follows: ethane, propane, normal butane, isobutane, pentanes plus, and other products from natural gas processing plants (i.e., products meeting the standards for finished petroleum products produced at natural gas processing plants, such as finished motor gasoline, finished aviation gasoline, special naphthas, kerosene, distillate fuel oil, and miscellaneous products).

**Natural Gas Wellhead Price:** The annual wellhead price of natural gas is calculated by dividing the total reported value at the wellhead by the total quantity produced as reported by the appropriate agencies of individual producing States, as well as by the U.S. Geological Survey (through 1981) and the U.S. Minerals Management Service (from 1982 forward). The price includes all costs prior to shipment from the lease including gathering and compression costs in addition to State production, severance, and similar charges.

**Natural Gas, Wet:** Natural gas prior to the extraction of liquids and other miscellaneous products.

**Net Electricity Generation:** Gross generation less electricity consumed at the generating plant for station use. Electricity required for pumping at pumped-storage plants is regarded as plant use and is deducted from gross generation.

**Net Income:** Operating income plus earnings from unconsolidated affiliates; gains from disposition of property, plant, and equipment; minority interest income; and foreign currency translation effects less income taxes, extraordinary items, and the cumulative effect of accounting changes.

**Net Ownership Interest:** The sum of net working interest and royalty interest (see **Net Working Interest** and **Royalty Interest**). Net ownership interest applies to both production and reserves.

**Net Property Investment:** The original cost of property, plant, and equipment (PP&E), less accumulated depreciation.

**Net Summer Capability:** The steady hourly output that generating equipment is expected to supply to system load, exclusive of auxiliary power, as demonstrated by test at the time of summer peak demand.

**Net Working Interest:** A company's working interest, not including any basic royalty or overriding royalty interests. (See **Working Interest**.)

**Nonhydrocarbon Gases:** Typical nonhydrocarbon gases which may be present in reservoir natural gas are carbon dioxide, helium, hydrogen sulfide, and nitrogen.

**Nonmetropolitan Area:** Households not located within Metropolitan Statistical Areas as defined in the 1980 Census.

**Nontraceables:** Those revenues, costs, assets, and liabilities that cannot be directly attributed to a type of business or that cannot be assigned to

a type of business by use of a reasonable allocation method developed on the basis of operating-level realities.

**Normal Butane:** See **Butane**.

**Nuclear Energy:** Electricity generated by an electric power plant whose turbines are driven by steam generated in a reactor by heat from the fissioning of nuclear fuel.

**Oil Well:** A well completed for the production of crude oil from one or more oil zones or reservoirs. Wells producing both crude oil and natural gas are classified as oil wells.

**Operable Refineries:** Operable refineries include those that were in one of the following three categories at the beginning of the year: (1) in operation; (2) not in operation and not under active repair but capable of being placed into operation within 30 days; or (3) not in operation but under active repair that can be completed within 90 days.

**Operating Income:** Operating revenues less operating expenses. Excludes items of other revenue and expense such as equity in earnings of unconsolidated affiliates, dividends, interest income and expense, income taxes, extraordinary items, and cumulative effect of accounting changes.

**Organization for Economic Cooperation and Development (OECD):** Current members: Australia, Austria, Belgium, Canada, Denmark, Finland, France, West Germany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom, and the United States and its territories (Guam, Puerto Rico, and the Virgin Islands).

**Organization of the Petroleum Exporting Countries (OPEC):** Current members: Algeria, Ecuador, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, United Arab Emirates, and Venezuela.

**Other Hydrocarbons (petroleum data):** Other materials processed at refineries. Includes coal tar derivatives, hydrogen, gilsonite, and natural gas received by the refinery for reforming into hydrogen.

**Pentanes Plus:** A mixture of hydrocarbons, mostly pentanes and heavier, extracted from natural gas. This product includes isopentane, natural gasoline, and plant condensate.

**Petrochemical Feedstocks:** Chemical feedstocks derived from petroleum, principally for the manufacture of chemicals, synthetic rubber, and

a variety of plastics. The categories reported are "naphtha less than 400 °F end-point" and "other oils over 400 °F end-point."

**Petroleum:** A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oils, petroleum products, natural gas plant liquids, and nonhydrocarbon compounds blended into finished petroleum products.

**Petroleum Coke:** A solid residue that is the final product of the condensation process in cracking. It consists of aromatic hydrocarbons very poor in hydrogen. Calcination of petroleum coke can yield almost pure carbon or artificial graphite suitable for production of carbon or graphite electrodes, structural graphite, motor brushes, dry cells, and similar products. This product is reported as marketable or catalyst coke.

**Petroleum Imports:** Imports of petroleum into the 50 States and the District of Columbia from foreign countries, Puerto Rico, the Virgin Islands, and other U.S. territories and possessions. Included are imports for the Strategic Petroleum Reserve and withdrawals from bonded warehouses for onshore consumption, offshore bunker use, and military use. Excluded are receipts of foreign petroleum into bonded warehouses and into U.S. territories and U.S. Foreign Trade Zones.

**Petroleum Products:** Petroleum products are obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, naphtha less than 400 °F end-point, other oils over 400 °F end-point, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

**Petroleum Products Supplied:** See Explanatory Note 5.

**Petroleum Stocks, Primary:** Stocks of crude oil or petroleum products held in storage at (or in) leases, refineries, natural gas processing plants, pipelines, tankfarms, and bulk terminals that can store at least 50,000 barrels of petroleum products or that can receive petroleum products by tanker, barge, or pipeline. Crude oil that is in transit from Alaska, or that is stored on Federal leases or in the Strategic Petroleum Reserve, is included. Excluded are stocks of foreign origin that are held in bonded warehouse storage.

**Photovoltaic and Solar Thermal Energy (as used at electric utilities):** Energy radiated by the sun as electromagnetic waves (electromagnetic radiation) that is converted at electric utilities into electricity by means of solar (photovoltaic) cells or concentrating (focusing) collectors.

**Photovoltaic Module:** A group of photovoltaic cells. (Cells are solid-state devices that produce electricity when exposed to sunlight.) The electricity is used primarily in applications requiring remote power, such as radio communication, cathodic protection, and navigational aids.

**Plant Condensate:** One of the natural gas plant liquids, mostly pentanes and heavier hydrocarbons, recovered and separated as liquids at gas inlet separators or scrubbers in processing plants. Plant condensate is not suitable for blending into finished motor gasoline. It is usually blended with crude oil for distilling or processed at other refinery units.

**Primary Energy Consumption Expenditures:** Expenditures for energy consumed in each of the four major end-use sectors, excluding energy in the form of electricity, plus expenditures by the electric utilities sector for energy used to generate electricity. There are no fuel-associated expenditures for hydroelectric power, geothermal energy, photovoltaic and solar energy, or wind energy. Also excluded are the quantifiable consumption expenditures that are an integral part of process fuel consumption. (See **Process Fuel**.)

**Process Fuel:** All energy consumed in the acquisition, processing, and transportation of energy. Quantifiable process fuel includes three categories: natural gas lease and plant operations, natural gas pipeline operations, and oil refinery operations.

**Processing Gain:** The amount by which the total volume of refinery output is greater than the volume of input for a given period of time. The processing gain arises when crude oil and other hydrocarbons are processed into products that are, on average, less dense than the input.

**Processing Loss:** The amount by which the total volume of refinery output is less than the volume of input for a given period of time. The processing loss arises when crude oil and other hydrocarbons are processed into products that are, on average, more dense than the input.

**Propane:** A normally gaseous, paraffinic hydrocarbon (C<sub>3</sub>H<sub>8</sub>). It is extracted from natural gas or refinery gas streams, and includes all products covered by Gas Processors Association Specifications for commercial propane and HD-5 propane and ASTM Specification D1835. Propane is used primarily for residential and commercial heating

and cooling, and also as a fuel for transportation. Industrial uses of propane include use as a petrochemical feedstock.

**Propylene:** A normally gaseous, olefinic hydrocarbon ( $C_3H_6$ ) recovered from refinery processes. Quantities are included with "propane" data.

**Proved Reserves, Crude Oil:** The estimated quantities of all liquids statistically defined as crude oil that geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.

**Proved Reserves, Natural Gas:** The estimated quantities of natural gas that analysis of geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known crude oil and natural gas reservoirs under existing economic and operating conditions.

**Proved Reserves, Natural Gas Liquids:** Estimates include: (1) reserves of liquids that are expected to be recovered from associated and nonassociated gas produced from gas wells and processed through lease separators, and (2) reserves of liquids expected to be recovered from associated-dissolved and nonassociated gas when processed in field facilities or gas processing plants. Estimates of proved reserves of natural gas liquids are based on (1) proved reserves of natural gas at the time of estimation, and (2) rates at which liquids can be recovered from natural gas by using processing equipment of the type currently installed or planned at the time of estimation.

**Refiner Acquisition Cost of Crude Oil:** The average price paid by refiners for crude oil booked into their refineries in accordance with accounting procedures generally accepted and consistently and historically applied by the refiners concerned. (Also see Explanatory Note 8.)

**Refinery Input:** The total amount of crude oil and lease condensate input to crude oil distillation units and other refinery processing units.

**Refinery Output:** The total amount of petroleum products produced at a refinery. Includes petroleum consumed by the refinery.

**Renewable Energy:** Energy obtained from sources that are essentially inexhaustible (unlike, for example, the fossil fuels, of which there is a finite supply). Renewable sources of energy include wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

**Reservoir Repressuring:** The injection of natural gas into oil and gas reservoir formations for pressure maintenance and cycling.

**Residential Sector:** Private household establishments, which consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. (For allocation of individual fuels to end-use sectors, see the Explanatory Notes.)

**Residual Fuel Oil:** The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations and that conform to ASTM Specifications D396 and 975. Included are No. 5, a residual fuel oil of medium viscosity; Navy Special, for use in steam-powered vessels in government service and in shore power plants; and No. 6, which includes Bunker C fuel oil, and is used for commercial and industrial heating and electricity generation. Imports of residual fuel oil include imported crude oil burned as fuel.

**Residue Gas:** Natural gas from which natural gas processing plant liquid products and, in some cases, nonhydrocarbon components have been extracted.

**Road Oil:** Any heavy petroleum oil, including residual asphaltic oil used as a dust palliative and surface treatment on roads and highways. It is generally produced in six grades from 0, the most liquid, to 5, the most viscous.

**Rotary Rig:** A machine, used for drilling wells, that employs a rotating tube attached to a bit for boring holes through rock.

**Royalty Interest:** An interest in a mineral property provided through a contractual arrangement that gives the owner of the interest the right to a fractional share of production, or proceeds therefrom, that does not contain rights and obligations of operating a mineral property, and that is normally free and clear of exploration, development, and operating costs, except production taxes.

**Rural Area:** A place that had a population of less than 2,500 as of the 1970 Census.

**Solar Thermal Collector:** A device designed to receive solar radiation and convert it into thermal energy. Normally, a solar thermal collector includes a frame, glazing, and an absorber together with appropriate insulation. The heat collected by the solar thermal collector may be used immediately or stored for later use.

**Special Naphthas:** All finished products within the gasoline range, specially refined to a specified flash point and boiling range, for use as paint thinners, cleaners, and solvents, including commercial hexane conforming with ASTM Specification D1836, and cleaning solvent

conforming to ASTM Specification D484. Excluded are naphthas to be blended or marketed as motor gasoline or aviation gasoline, or to be used as petrochemical and synthetic natural gas (SNG) feedstock.

**Special Solar Collector:** An evacuated tube collector or a concentrating (focusing) collector. Special collectors operate in the temperature range from just above ambient temperature (low concentration for pool heating) to several hundred degrees Fahrenheit (high concentration for air conditioning and specialized industrial processes). (See **Solar Thermal Collector**.)

**Spot Price:** A transaction price concluded "on the spot," that is, on a one-time, prompt basis; usually the transaction involves only one specific quantity of product. This contrasts with a term contract sale price, which obligates the seller to deliver a product at an agreed frequency and price over an extended period.

**Startup Test Phase of Nuclear Power Plant:** A nuclear power plant that has been licensed by the Nuclear Regulatory Commission to operate, but is in the initial testing phase during which production of electricity may not be continuous. In general, when the electric utility is satisfied with the plant's performance, it formally accepts the plant from the manufacturer, and places it in "commercial operation" status. A request is then submitted to the appropriate utility rate commission to include the power plant in the rate base calculation.

**Still Gas (refinery gas):** Any form or mixture of gas produced in refineries by distillation, cracking, reforming, and other processes. The principal constituents are methane, ethane, ethylene, normal butane, butylene, propane, and propylene. It is used primarily as refinery fuel and petrochemical feedstock.

**Strategic Petroleum Reserve (SPR):** Petroleum stocks maintained by the Federal Government for use during periods of major supply interruption.

**Stripper Well Property:** A property whose average daily production of crude oil per well (excluding condensate recovered in nonassociated natural gas production) did not exceed an average of 10 barrels per day during any preceding consecutive 12-month period beginning after December 31, 1972.

**Subbituminous Coal:** A dull black coal of rank intermediate between lignite and bituminous coal. It conforms to ASTM Specification D388 for subbituminous coal, and is used almost exclusively for electric power generation.

**Supplemental Gaseous Fuels:** Consist primarily of synthetic natural gas, propane-air, and refinery (still) gas. May also include coke oven gas, biomass gas, manufactured gas, and air injected for Btu stabilization.

**Synthetic Natural Gas (SNG):** A product resulting from the manufacture, conversion, or reforming of hydrocarbons that may be easily substituted for, or interchanged with, pipeline-quality natural gas.

**Transportation Sector:** Private and public vehicles that move people and commodities. Included are automobiles, trucks, buses, motorcycles, railroads and railways (including streetcars), aircraft, ships, barges, and natural gas pipelines.

**Unaccounted for Crude Oil:** Represents the arithmetic difference between the indicated demand for crude oil and the total disposition of crude oil. Indicated demand is the sum of crude oil production and imports less changes in crude oil stocks. Total disposition of crude oil is the sum of crude oil input to refineries, crude oil exports, crude oil burned as fuel, and crude oil losses.

**Undiscovered Recoverable Resources (crude oil and natural gas):** Those economic resources of crude oil and natural gas, yet undiscovered, that are estimated to exist in favorable geologic settings.

**Unfinished Oils:** Includes all oils requiring further refinery processing, except those requiring only mechanical blending.

**Unfractionated Streams:** Mixtures of unsegregated natural gas liquid components, excluding those in plant condensate. This product is extracted from natural gas.

**United States:** Unless otherwise noted, "United States" in this publication means the 50 States and the District of Columbia. U.S. exports include shipments to U.S. Territories, and imports include receipts from U.S. Territories.

**Uranium Resources:** Uranium resource estimates are divided into three separate categories reflecting different levels of confidence in the quantities estimated. They are reasonably assured resources, estimated additional resources, and speculative resources. Reasonably assured resources refers to uranium in known mineral deposits of such size, grade, and configuration that it could be recovered within the given cost ranges, with currently proven mining and processing technology. Estimated additional resources refers to uranium in addition to reasonably assured resources that is expected to occur, mostly on the basis of direct geological evidence, in extensions of well-explored deposits, in deposits

in which geological continuity has been well established, as well as deposits believed to exist in well-defined geological trends or areas of mineralization with known deposits. Such deposits in this category can be discovered and delineated and the uranium subsequently recovered, all within a given cost range. Speculative resources refers to uranium in addition to estimated additional resources that is thought to exist, mostly on the basis of indirect evidence and geological extrapolations.

**Urban Area:** A place that had a population of 2,500 or more as of the 1970 Census.

**Vented and Flared:** Vented natural gas is gas that is released into the air; flared natural gas is gas that is burned in flares.

**Waxes:** Solid or semi-solid materials derived from petroleum distillates or residues. Waxes are light-colored, more or less translucent crystalline masses, slightly greasy to the touch, consisting of a mixture of solid hydrocarbons in which the paraffin series predominates. Includes all marketable waxes, whether crude scale or fully refined. Waxes are used primarily as industrial coatings for surface protection.

**Well:** A hole drilled for the purpose of finding or producing crude oil or natural gas or providing services related to the production of crude

oil or natural gas. Wells are classified as oil wells, gas wells, dry holes, stratigraphic or core tests, or service wells.

**Wind Energy (as used at electric utilities):** The kinetic energy of wind converted at electric utilities into mechanical energy by wind turbines (i.e., blades rotating from a hub) that drive generators to produce electricity for distribution.

**Wood and Waste (as used at electric utilities):** Wood energy (see **Wood Energy**), garbage, bagasse, sewerage gas and other industrial, agricultural, and urban refuse used to generate electricity for distribution.

**Wood Energy:** Wood and wood products used as fuel. Included are round wood (cord wood), limb wood, wood chips, bark, sawdust, forest residues, charcoal, pulp waste, and spent pulping liquor.

**Working Gas:** The volume of gas in an underground storage reservoir above the designed level of the base. It may or may not be completely withdrawn during any particular withdrawal season. Conditions permitting, the total working capacity could be used more than once during any season.

**Working Interest:** An interest in a mineral property that entitles the owner of that interest to all or a share of mineral production from the property, usually subject to a royalty.

# Order Form for *Annual Energy Review 1988*

Published: May 1989  
Energy Information Administration  
DOE/EIA-0384(88)  
Price per copy: \$16.00\*

Company or Personal Name: \_\_\_\_\_  
Additional Address/Attention Line: \_\_\_\_\_  
Street Address: \_\_\_\_\_  
City, State, Zip Code: \_\_\_\_\_  
Daytime Phone Number (area code first): \_\_\_\_\_

**Please include payment with this order form.  
Allow 2 weeks for delivery.**

Number of copies \_\_\_\_\_ x \$16.00\* = total due: \_\_\_\_\_ . (Foreign orders add 25%.)

\*Price is subject to change without advance notice.

- Check payable to Superintendent of Documents  
 Money order payable to Superintendent of Documents  
 Charge to Deposit Account No. \_\_\_\_\_ Order No. \_\_\_\_\_  
 Charge to:  VISA  MasterCard  Choice Number \_\_\_\_\_

Signature \_\_\_\_\_ Expiration Date (Month/Year) \_\_\_\_\_
