Annual Energy Review

The *Annual Energy Review* presents long-term historical energy data. U.S. energy consumption, production, trade, and prices are included. Also covered are consumption indicators, energy resources, petroleum, natural gas, coal, electricity, nuclear energy, renewable energy, and international energy.

Publication of this report is in keeping with responsibilities given the Energy Information Administration (EIA) in Section 57(a)(2) of the Federal Energy Administration Act, Public Law 93-275.

The *Annual Energy Review* is intended for use by Members of Congress, Federal and State agencies, and the general public.

To Order

Copies of the 1990 edition of the *Annual Energy Review* may be obtained by using the order form in the back of this publication.

For More Information

Questions on energy statistics and on the availability of other EIA publications may be directed to EIA's National Energy Information Center on 202-586-8800 (TDD 202-586-1181), 8 a.m.-5 p.m. eastern time, M-F, or at the following address:

National Energy Information Center

Annual Energy Review 1990

Annual Energy Review 1990

This report presents long-term historical energy data. Included are U.S. energy consumption, production, trade, and prices. Also covered are consumption patterns, energy resources, petroleum, natural gas, electricity, nuclear energy, renewable energy, and international energy data affecting energy markets.

Major Energy Developments, 1990

Energy Consumption Levelled Off

The most dramatic energy-related event of 1990 was the Iraqi invasion of Kuwait on August 2, which resulted in higher energy prices and heightened concern about the future availability of crude oil. Higher energy prices, combined with other factors such as mild weather early in the year and slow economic growth, restrained energy demand. U.S. total energy consumption¹ in 1990 remained at the 1989 level of 81 quadrillion Btu (3).²

A modest increase in energy efficiency also helped to hold energy consumption down. The ratio of energy consumption to gross national product (GNP) is a primary indication of the energy efficiency of the economy. In 1990, that ratio was 19.59 thousand Btu of energy per 1982 dollar of GNP, down from 19.76 in 1989 (8).

Although 1990 consumption of all energy sources combined remained at the 1989 level, consumption of individual sources of energy changed (1). Petroleum consumption declined 2 percent. That decline was offset by increases of 0.6 percent in coal consumption, 0.2 percent in natural gas consumption, and 9 percent and 2 percent, respectively, in nuclear and hydroelectric power used by electric utilities to generate electricity.

Similarly, energy consumption by individual consuming sectors changed (4). The industrial sector used 2 percent more energy in 1990 than it had in 1989, and electric utilities consumed 1 percent more. Those increases were offset by 1-percent declines in both the residential and commercial sector and in the transportation sector.

Exploration and Production: Mixed Results

Domestic production of crude oil (including lease condensate) continued to suffer from the effects of years of low oil prices and from the

expectation (prior to the Iraqi invasion of Kuwait) that prices would remain low. In 1990, production in the Lower 48 States declined to 5.5 million barrels per day, and even Alaskan production declined for the second consecutive year (52).

In 1990, two key indicators of oil and gas exploration fell to their lowest levels in at least 42 years. The number of seismic crews fell to 125, down 5 percent from the number in 1989 (42). Completions of exploratory wells totaled 4.9 thousand, also down 5 percent (43). In contrast, rotary rigs in operation rose 16 percent to 1,010 (42).

Unlike petroleum production, production of other major forms of energy increased in 1990 (2). Coal production exceeded 1 billion short tons for the first time (81). Natural gas production rose to 18 trillion cubic feet, up 2 percent from the previous year (73).

Electricity sales totaled 2.7 trillion kilowatthours, an increase of 2 percent from the 1989 level (94). Mild weather early in 1990 led to decreased demand for electricity for space heating, and the economic slowdown tended to restrain industrial demand for electricity.

Coal-fired generation rose only 0.2 percent in 1990 but attained the record level of 1.6 trillion kilowatthours (90). Both nuclear-based and hydroelectric generation registered sizable increases (9 percent and 6 percent, respectively), and nuclear-based generation reached a high of 577 billion kilowatthours. In contrast, oil-fired generation declined dramatically, falling 26 percent from the 1989 level. High petroleum prices and the ability to use more nuclear and hydroelectric power played a role in the decline. Natural gas-fired generation also declined in 1990, although by much less (1.5 percent).

Energy Net Imports Declined

U.S. net imports of all forms of energy combined decreased 2 percent in 1990 compared with the level in 1989 (5). The 0.4-quadrillion-Btu decline brought energy net imports down to 13.8 quadrillion Btu. Lower net imports of petroleum accounted for 0.2 quadrillion Btu of the

¹Total (gross) energy consumption includes energy consumed to produce, process, and transport energy.

²Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

decline. A 0.1-quadrillion-Btu increase in natural gas net imports offset an equal increase in coal net exports. Net imports of coal coke and electricity accounted for a small percentage of the total but nevertheless affected the trade balance because they registered a 0.1-quadrillion-Btu decline.

Although the volume of energy net imports declined, higher crude oil prices contributed to an increase in the real value of energy net imports, which rose \$6.5 billion from \$35.1 billion in 1989 to \$41.6 billion in 1990 (35). Crude oil and petroleum product net imports accounted for \$6.3 billion of the increase.

Petroleum continued to account for most of the energy trade. In 1990, petroleum net imports totaled 7.1 million barrels per day, down 0.1 million barrels per day from the 1989 level (57). Because petroleum consumption declined at a somewhat faster rate, U.S. dependence on oil imports, measured as petroleum net imports' share of petroleum consumption, rose 0.3 percentage points to 42 percent.

The Organization of Petroleum Exporting Countries (OPEC) supplied 4.3 million barrels per day of petroleum to the United States (57). Within OPEC, Saudi Arabia, Venezuela, and Nigeria were the primary U.S. suppliers. Non-OPEC countries supplied 2.8 million barrels per day, down from 3.1 million barrels per day in 1989. Petroleum net imports from both Canada and Mexico declined.

Most Energy Prices Increased

Crude oil prices fluctuated widely during 1990. The composite refiner acquisition cost of crude oil fell from \$20.64 per barrel³ in January to \$14.98 in June, due to mild weather and high OPEC production. The crisis in the Persian Gulf led to even wider fluctuations in the second half of the year, and the cost fell from the annual high of \$33.18 per barrel in October to \$26.38 per barrel in December. For 1990, the composite cost of crude oil averaged \$22.24 per barrel (70), 24 percent above the average in 1989.

³Energy Information Administration, *Monthly Energy Review* March 1991, DOE/EIA-0035(91/03) (Washington, DC, March 1991), Table 9.1.

End-use prices (excluding taxes) of petroleum products reflected the higher crude oil prices (71). The average price of all types of motor gasoline rose from 76 cents per gallon in 1989 to 88 cents per gallon in 1990, a 17-percent increase. The price of residual fuel oil rose 15 percent to 44 cents per gallon. Other petroleum products registered even more dramatic increases. The price of No. 2 distillate fuel oil rose 24 percent to 73 cents per gallon, and the price of kerosene-type jet fuel rose 30 percent to 77 cents per gallon. None of the major petroleum products registered a price decline.

Other energy end-use prices also increased in 1990 compared with 1989. The price of coal sold to electric utilities rose 1 percent to \$30.43 per short ton (88), and the price of electricity sold to all types of end users increased by an average of 2 percent (94). The price per thousand cubic feet of natural gas sold to residential consumers rose 2 percent to \$5.77 (80). The price to commercial consumers totaled \$4.83, also 2 percent above the 1989 price. In contrast, the price of natural gas sold to industrial consumers fell 2 percent to \$2.92 per thousand cubic feet (80).

Major Energy Legislation in 1990

- On November 5, the President signed the Omnibus Budget Reconciliation Act of 1990 (Public Law 101-508), which raised the **Federal tax on motor fuels** (by 5 cents per gallon on December 1, 1990) and on other transportation fuels. The law also provides tax incentives for oil and gas production and for some ethanol production.
- The **Clean Air Act Amendments of 1990** were signed into law (Public Law 101-549) on November 15. The law addresses nonattainment of air quality standards, automobile emissions, industrial emissions of airborne toxic substances, acid rain, ozone depletion, and other issues.
- **Amendments to the Public Utility Regulatory Policy Act of 1978 (PURPA)** also were signed into law (Public Law 101-575) on November 15. The law removes the 80-megawatt size limit (set by PURPA) on solar, wind, waste, and geothermal production facilities.

1. Energy Overview

Energy Prices in a Volatile Market

Since the mid-1970's, changes in fossil fuel prices have become more frequent and more pronounced (29).¹ Prior to the Arab oil embargo of 1973–1974, the composite real price² per million Btu of crude oil, natural gas, and coal had gradually declined from \$1.12 in 1949 to a post-World War II low of \$0.75 in 1969. In 1974, the real price rose to \$1.25, eventually peaking at \$2.92 in 1981 after a second round of crude oil price increases.

Thereafter, overproduction of crude oil began to affect energy prices and, when crude oil prices plunged in 1986, the composite real price of the major fossil fuels fell to \$1.45. By 1988, the composite price had declined to \$1.26, but in 1989 it rose to \$1.32, and in 1990 it rose to \$1.40.

Throughout the 42-year period, changes in the real price of oil dominated movements in the composite index. The real price of oil trended downward between 1949 and 1970 and then rose sharply in 1974 and again in 1980–1981. Thereafter, in the face of shrinking demand and excess production, price trends reversed sharply. The precipitous declines in 1986 and 1988 brought the real price of crude oil to \$1.79 per million Btu, the lowest level since 1973. In 1989, the price rose to \$2.17. In 1990, the Iraqi invasion of Kuwait contributed to an increase in crude oil prices, which averaged \$2.63 per million Btu, up 21 percent from the 1989 level.

Prices of coal and natural gas were much less volatile than those of oil. Coal markets are generally more competitive than oil markets, where the output and pricing policies of the Organization of Petroleum Exporting Countries (OPEC) were a major influence throughout much of the 1970's and 1980's. Natural gas prices were subject to substantial State and Federal regulation. Throughout the 1970's, regulation dampened the response of natural gas prices relative to oil price movement.

¹Numbers in parentheses indicate related tables. Annual data are the most recent available and frequently are preliminary.

²Real prices are expressed in 1982 dollars.

However, the weakening of crude oil prices during the last half of the 1980's was severe enough to trigger declines in the prices of the other fossil fuels, particularly natural gas. Despite the price recovery in 1989 and 1990, the 1990 real price of crude oil per million Btu was \$2.63, 30 percent below the 1985 price (29). The real price of natural gas fell 42 percent, to \$1.18, during the 6-year period. The decline in the real price of bituminous coal and lignite was smaller—a decrease of 26 percent, to \$0.77, in the 6-year period.

Production

Historically, three fossil fuels have accounted for the bulk of domestic energy production, which by 1990 totaled 68 quadrillion Btu (2). Coal accounted for the largest share of domestic energy production in 1949–1951 and, after a long hiatus, again in 1982 and in 1984–1990. In the interim, first crude oil and then natural gas dominated domestic production. In 1990, coal production reached a record 23 quadrillion Btu. Dry natural gas production totaled 18 quadrillion Btu and crude oil production totaled 15 quadrillion Btu. Natural gas plant liquids accounted for another 2 quadrillion Btu.

Electricity generation increased throughout 1949–1990 (89), registering only one year-to-year decline (during the recession in 1982). Nuclear-based generation increased to the record level of 6 quadrillion Btu in 1990 (2). Since the mid-1970's, coal and nuclear fuels have provided increasing shares of fuel input for power generation, displacing substantial quantities of both petroleum and natural gas (92).

Hydroelectric generation accounted for over 1 quadrillion Btu of electricity in 1949 and from the 1970's through 1987 provided about 3 quadrillion Btu per year (2). In 1988, the second consecutive year of drought, hydroelectric generation totaled only 2.3 quadrillion Btu, the lowest level since 1966. In 1989, improved watershed conditions resulted in an increase in generation, which totaled 2.8 quadrillion Btu for the year. In 1990, hydroelectric generation totaled 2.9 quadrillion Btu.

Other sources of renewable energy still provide only a small part of total domestic energy supplied. Generation of electricity from geothermal energy in 1990 totaled 0.2 quadrillion Btu (down for the third consecutive year), and generation of electricity from wood, waste, wind, photovoltaic, and solar thermal energy totaled 0.02 quadrillion Btu.

Consumption by Energy Source

Energy consumption more than doubled during the 1949–1973 period, increasing from 30 quadrillion Btu in 1949 to 74 quadrillion Btu in 1973 (3), and the U.S. economy grew at about the same rate. The domestic energy market was dominated by rapid growth in petroleum and natural gas consumption, which more than tripled during the period.

After the 1973 oil price shock, energy consumption fluctuated, rising to 79 quadrillion Btu in 1979 before returning, in 1984 through 1986, to about the same level as in 1973. In contrast, the economy registered a net expansion of about one-third. Following the plunge in crude oil prices in 1986, energy consumption increased each year and reached an all-time high of 81 quadrillion Btu in 1989 and 1990. The composition of demand after 1973 reflects a shift away from petroleum and natural gas towards electricity generated by other fuels. In 1973, petroleum and natural gas accounted for 77 percent of total energy consumption; by 1990, their share had declined to 65 percent.

Consumption by Sector: Sharing the Energy Pie

Industrial sector consumption proved to be the most responsive to the turmoil in energy markets after the 1973–1974 embargo (4). In 1979, it peaked at almost 33 quadrillion Btu. In the early 1980's, a stagnant economy, increases in industrial operations, and expansion in the service trades all combined to restrain industrial consumption, which declined to a 16-year low of 26 quadrillion Btu in 1983. In 1988 and 1989, economic growth spurred demand for energy in the industrial sector, and industrial energy consumption in 1989 rose to 29 quadrillion Btu. Despite slower economic growth in 1990, industrial energy consumption rose to 30 quadrillion Btu.

Growth in electric utility consumption continued during the 1970's and 1980's despite rising energy prices, and, in 1990, that sector's consumption reached an all-time high of nearly 30 quadrillion Btu. However, only 9 quadrillion Btu were sold to consumers; the remainder was used to generate, transmit, and distribute the electricity (92).

Much of the growth in energy consumption during the 1949–1989 period occurred in the residential and commercial sector and in the transportation sector (4). Residential and commercial consumption leveled off in response to higher energy prices, but, following the price declines in 1986 and 1988, grew to a record level of nearly 30 quadrillion Btu in 1989. Higher energy prices in 1990 were reflected in a small decline (1 percent) in residential and commercial consumption. Transportation sector consumption grew more slowly over the 42-year period. Energy consumption in the transportation sector also reached a record level (22 quadrillion Btu) in 1989 and then declined 1 percent in 1990.

Changing Patterns of Trade

From 1958 forward, the United States consumed more energy than it produced, and the difference was met by energy imports (2, 3, and 5). Net imports of energy (primarily petroleum) grew rapidly through 1973, as demand for cheap foreign oil eroded quotas on petroleum imports. In 1973, net imports of petroleum totaled 13 quadrillion Btu.

The Arab oil embargo of 1973–1974, coupled with increases in the price of crude oil, interrupted growth in petroleum net imports, but nevertheless they climbed to a peak of 18 quadrillion Btu in 1977 (5). That year, U.S. dependence on petroleum net imports also peaked, at 47 percent of consumption (57).

A second round of price increases, in 1979–1981, suppressed demand for foreign oil. In 1985, petroleum net imports totaled 9 quadrillion Btu, and U.S. dependence fell to 27 percent of consumption (5 and 57). That was the last year in which the ratio of petroleum net imports to petroleum consumption declined. Subsequently, petroleum net imports increased every year through 1989. In 1990, petroleum net imports declined 1.5 percent from the 1989 level but petroleum consumption declined more (1.7 percent), and U.S. dependence on foreign sources of crude oil reached 42 percent of consumption. The real value of crude oil and petroleum product net imports in 1990 was \$42.8 billion, 17 percent above the 1989 real value (35).

Natural gas trade was limited to border countries until the advent of shipping natural gas in liquefied form. In 1990, natural gas net imports surpassed 1 quadrillion Btu for the third consecutive year (5). Net imports of natural gas were valued, in real terms, at \$2 billion (35).

Throughout the 1949-to-1990 period, the United States was a net exporter of coal (5). In 1990, net exports totaled 3 quadrillion Btu. Net exports of coal (including coal coke) were valued, in real terms, at over \$3 billion (35).

**Diagram 1. Total Energy Flow, 1990
(Quadrillion Btu)**

*Total energy consumed with conversion and transmission losses allocated to end-use sectors in proportion to the sectors' use of electricity.

Note: Data are preliminary.

Note: Sum of components may not equal totals due to independent rounding; the use of preliminary conversion factors; and the exclusion of changes in stocks, miscellaneous supply and disposition, and unaccounted for quantities.

¹ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

² Dry natural gas.

³ Includes electricity produced from geothermal, wood, waste, wind, photovoltaic, and solar thermal sources connected to electric utility distribution systems (see Note).

⁴ Less than 0.005 quadrillion Btu.

⁵ Includes imports of crude oil for the Strategic Petroleum Reserve, which began in 1977.

⁶ Includes imports of unfinished oils and natural gas plant liquids.

⁷ Includes coal, coal coke, and hydroelectric power.

⁸ Includes natural gas, coal coke, and hydroelectric power.

⁹ A balancing item. Includes stock changes, losses, gains, miscellaneous blending components, and unaccounted for supply.

¹⁰ Petroleum products supplied includes natural gas plant liquids and crude oil burned as fuel.

¹¹ Includes industrial generation of hydroelectric power and net electricity imports.

¹² Includes electricity produced from geothermal, wood, waste, wind, photovoltaic, and solar thermal sources connected to electric utility distribution systems (see Note) and net imports of coal coke.

Note: Data do not include the consumption of wood energy (other than that consumed by the electric utility industry) which amounted to an estimated 2.4 quadrillion Btu in 1987 (see Table 105). This table also does not include small quantities of other energy forms for which consistent historical data are not available, such as geothermal, waste, wind, photovoltaic, or solar thermal energy sources except that consumed by electric utilities.

Note: Sum of components may not equal total due to independent rounding.

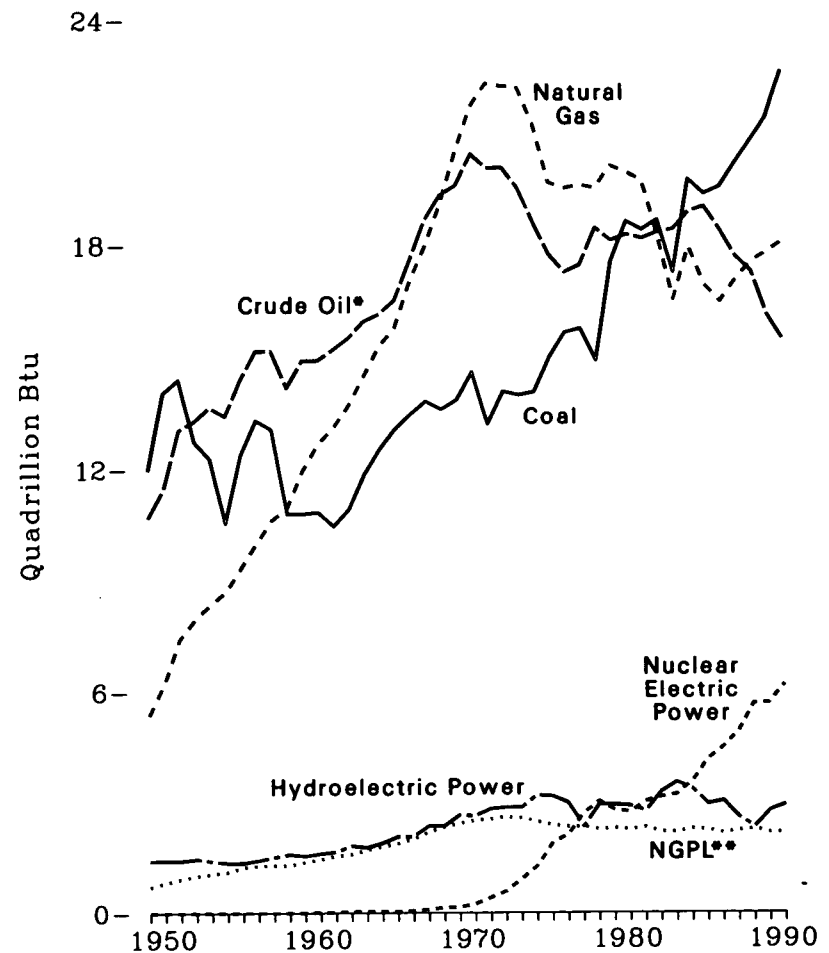

Sources: Tables 51, 73, 81, 87, 89, and 91, EIA estimates for industrial hydroelectric power, and conversion factors in Appendix A.

¹ Dry natural gas.

² Includes lease condensate.

³ Generated by electric utilities, see Explanatory Note 1.

⁴ Electric utility and industrial generation of hydroelectric power, see Appendix E, Note 1.

⁵ Includes electricity produced from wood, waste, wind, photovoltaic, and solar thermal sources connected to electric utility distribution systems. Converted to Btu by applying national average heat rates for fossil fuel steam electric plants. Data do not include the consumption of wood energy (other than that consumed by the electric utility industry) which amounted to an estimated 2.4 quadrillion Btu in 1987 (see Table 105). This table also does not include small quantities of energy forms for which consistent historical data are not available, such as geothermal, waste, wind, photovoltaic, or solar thermal energy sources except that consumed by electric utilities.

⁶ Percent change from previous year calculated from data prior to rounding.

⁷ Less than 0.005 quadrillion Btu.

* Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

— = Not applicable.

Note: Sum of components may not equal total due to independent rounding.

¹ Petroleum products supplied including natural gas plant liquids and crude oil burned as fuel.

² Generated by electric utilities.

³ Electric utility and industrial generation of hydroelectric power and net electricity imports.

⁴ Includes net imports of coal coke and electricity produced from wood, waste, wind, photovoltaic, and solar thermal sources connected to electric utility distribution systems. Converted to Btu by applying national average heat rates for fossil fuel steam electric plants. Data do not include the consumption of wood energy (other than that consumed by the electric utility industry) which amounted to an estimated 2.4 quadrillion Btu in 1987 (see Table 105). This table also does not include small quantities of energy forms for which consistent historical data are not available, such as geothermal, waste, wind, photovoltaic, or solar thermal energy sources except that consumed by electric utilities.

⁵ Percent change from previous year calculated from data prior to rounding.

⁶ Less than 0.005 quadrillion Btu.

⁷ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

— = Not applicable.

Note: Sum of components may not equal total due to independent rounding.

2. Energy Consumption Indicators

Indicators of Energy Intensity

The relationship between total energy consumption and real gross national product (GNP) is a primary indication of the energy intensity of the economy. In 1970, 27 thousand Btu of energy was consumed for each 1982 dollar of GNP (8).¹ Higher energy prices in the early 1970's corresponded with increases in energy efficiency, and the energy intensity of the economy as a whole fell to 20 thousand Btu per 1982 dollar in 1986, a decline of over one-fourth since 1970.

After the oil price collapse in 1986, the rate of decline slowed. In fact, in 1987, the energy intensity of the economy rose slightly (0.1 percent). Thereafter, it declined slowly, at the average annual rate of 0.6 percent.

A second indicator of energy intensity is per capita consumption. Throughout the 1960's and early 1970's, the growth of end-use energy consumption was greater than the growth of the population (7). Per capita consumption rose from 212 million Btu in 1960 to a peak of 285 million Btu in 1973. Thereafter, per capita consumption trended downward, to as low as 226 million Btu in 1983. In 1990, end-use energy consumption was 246 million Btu per capita, the same level as in the previous 2 years.

Energy consumption per household,² a third indicator of energy intensity, declined from 138 million Btu in 1978 to 101 million Btu in 1987 (the most recent year for which data are available), with only one small upward fluctuation, which occurred in 1984 (16). Lower use of distillate fuel oil and kerosene accounted for most of the decline.

¹Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

²Five major energy sources—natural gas, electricity, distillate fuel oil, kerosene, and liquefied petroleum gases—are included in the data.

Households in the South and West consumed the least amount of energy in 1987, an average of 84 million Btu per household in the South and 78 million Btu per household in the West. Energy consumption by households in the Midwest averaged 123 million Btu per household. Households in the Northeast averaged 124 million Btu per household in 1987, surpassing the Midwest average for the first time.

Household Uses of Energy

Energy consumed by households can be attributed to four primary applications: space heating, air conditioning, water heating, and appliance operation (17). In 1987, household energy consumption totaled 9 quadrillion Btu. Natural gas was the primary source of energy for space heating and provided the main source of heat in 50 million households (18).

In 1987 (the most recent year for which data are available), space heating was the most prevalent application of energy consumed by households and accounted for 5 quadrillion Btu (17). Over 2 quadrillion Btu were used to operate appliances and, as would be expected, electricity was the major source of energy for that application. Refrigerators, color television sets, ovens (regular and microwave), and automatic clothes washers were the most common household appliances (19).

Electricity was essentially the only source of energy used for air conditioning. Although air conditioning accounted for only 5 percent of household energy consumption, it accounted for 10 percent (\$9.8 billion) of total household energy expenditures of \$98 billion (17).

The cost of energy used to operate appliances totaled \$42 billion in 1987, and the cost for space heating was \$32 billion. Energy expenses for water heating came to about \$14 billion.

Improvements in Motor Vehicle Efficiency

Because motor gasoline consistently accounts for the largest share of all petroleum products supplied (61), demand for motor gasoline can have a significant effect on U.S. dependence on foreign sources of crude oil. In turn, the price and availability of crude oil influence motor gasoline demand.

In 1973, average annual mileage exceeded 10 thousand miles per passenger car (22). The average fuel rate of passenger cars, which make up a sizable proportion of the U.S. motor vehicle fleet, was 13 miles per gallon. That measure of fuel efficiency had declined for the previous several years.

In 1973–1974, however, crude oil supply interruptions and rising prices led to concerns about the continued availability of motor gasoline at desirable prices. Mileage per passenger car immediately declined, to an average of 9.6 thousand in 1974 (22). At the same time, the average fuel rate of the passenger car fleet began to creep upward, and continued to increase throughout the remainder of the 1970's and 1980's, reaching 21 miles per gallon in 1989 (the most recent year for which data are available). Federal regulations designed to encourage improvements in the efficiency of the fleet played a role in the increases in fuel rates.

During 1987, however, new Federal legislation allowed States to raise the speed limit on some highways, and, by 1988, 41 States had increased speed limits. Because vehicles traveling at speeds above 55 miles per hour are less efficient, higher speed limits tend to increase demand for motor fuel. Other factors, such as relatively low motor gasoline prices and increases in highway travel, also tend to increase demand.

Energy-Related Characteristics of Commercial Buildings

In 1989 (the most recent year for which data are available), there were approximately 63 billion square feet of floorspace in the United States (25). The largest amount of commercial floorspace, 22 billion square feet, was found in the South and accounted for 35 percent of the U.S. total. Lighting, space heating, water heating, and cooling were the most prevalent end uses of energy in commercial buildings (25 and 27).

Of activities occurring in commercial buildings, mercantile and service were the most prevalent; in 1989, over 12 billion square feet of commercial floorspace were devoted to mercantile and service activities (24). Office space accounted for close to 12 billion square feet in 1989, a 24-

percent increase from the amount of space devoted to office use in 1986. About 8 billion square feet of commercial floorspace were used for education activities.

About 92 percent (58 billion square feet) of commercial floorspace was in heated buildings (26). Natural gas was the heating energy source for 33 billion square feet, well over half of the total. Electricity, fuel oil, and district heat (steam and hot water) also were prevalent heating energy sources. Close to 19 billion square feet of commercial floorspace were heated with electricity, and 11 billion square feet were heated with fuel oil. District heat was the heating energy source for 6 billion square feet of commercial floorspace.

About 82 percent (52 billion square feet) of commercial floorspace was in cooled buildings (27). Electricity was the cooling energy source for 48 billion square feet, whereas district chilled water and natural gas were the cooling energy sources in only about 2 billion square feet each.

Most commercial floorspace (97 percent) was in lit buildings, and fluorescent lamps were the most common lighting equipment (27). Incandescent bulbs were the second most prevalent, followed by high-intensity discharge lamps. Forty percent of the floorspace in lit buildings was in buildings with high-efficiency ballasts.

Nonfuel Use of Energy Sources

The amount of energy used for nonfuel purposes is small compared with the amount of energy consumed by end users or used in the production, processing, and transportation of energy. In 1990, the 5 quadrillion Btu consumed for nonfuel uses represented a 6-percent share of total energy consumption (12).

The nonfuel use of energy is overwhelmingly the use of petroleum products, primarily asphalt and road oil, petrochemical feedstocks, and liquefied petroleum gases (LPG). Use of petroleum for nonfuel purposes appears to be slightly more in 1990 than in 1980; the apparent increase reflects some combination of actual trends and changes in data collection procedures that resulted from the discontinuation of the Energy Information Administration's survey on LPG sales.

Consumption of Energy for Manufacturing

The U.S. manufacturing sector consumed an estimated 20.5 quadrillion Btu³ of energy in 1988 (the most recent year for which data are available). Natural gas accounted for 5.9 quadrillion Btu, a 29-percent share of total energy consumption (13). Electricity⁴ accounted for 2.4 quadrillion Btu, a 12-percent share, and coal consumption accounted for the same amount. Fuel oil consumption of about 0.8 quadrillion Btu accounted for a 4-percent share.

Of all the industries, the petroleum and coal products industry was the largest user of energy in 1988, consuming 6.4 quadrillion Btu. At 4.4 quadrillion Btu, the chemicals and allied products industry was the second largest user. Together, the two industries accounted for over half of the energy consumption in the manufacturing sector.

Because the manufacturing sector accounts for a large share of total U.S. energy consumption, manufacturers' ability to cope with fluctuations in energy supplies and prices by switching to alternative sources of energy plays a significant role in the Nation's energy security. Fuel switching capability⁵ in 1985 (the most recent year for which data are available) was determined for five major energy sources: natural gas, purchased electricity, coal and coke, residual fuel oil, and distillate fuel oil (14).

Residual fuel oil registered the largest value (43 percent) for switchable consumption as a percentage of actual consumption, indicating substan-

³The manufacturing sector is composed of establishments that use mechanical or chemical processes to transform raw materials into intermediate or final products. It does not include the remainder of the industrial sector (construction, mining, agricultural, fishing, and forestry establishments) or electric utilities. The 20.5 quadrillion Btu total is the *primary consumption of energy*; it includes energy consumed to produce heat and power and to generate electricity, as well as sources of energy consumed as petrochemical feedstocks and raw material inputs, but it excludes byproduct fuels produced from other energy sources.

⁴Net electricity, which is obtained by summing purchases, transfers in, and generation from noncombustible renewable resources, minus quantities sold and transferred out. It excludes electricity generated from combustible fuels, which are counted as generating fuels.

⁵The capability of U.S. manufacturers to switch fuels within 30 days, using only existing equipment and keeping production output constant.

tial fuel-switching capabilities. Almost 20 percent of distillate fuel oil consumption could have been supplied by other sources. It is estimated that about 92 thousand barrels per day of consumption of fuel oil (residual and distillate combined) could have been switched to nonpetroleum sources.

Natural gas registered the largest absolute amount of total switchable consumption. Of the 4.7 quadrillion Btu total of natural gas consumption, 2.0 quadrillion Btu (42 percent) could have been switched to other sources. Of the 1.8 quadrillion Btu of coal and coke consumed, 0.5 quadrillion Btu (30 percent) were switchable. Very little of the 2.2 quadrillion Btu of purchased electricity consumed by manufacturers in 1985 could have been switched to other sources—less than 2 percent if manufacturing output were to be maintained.

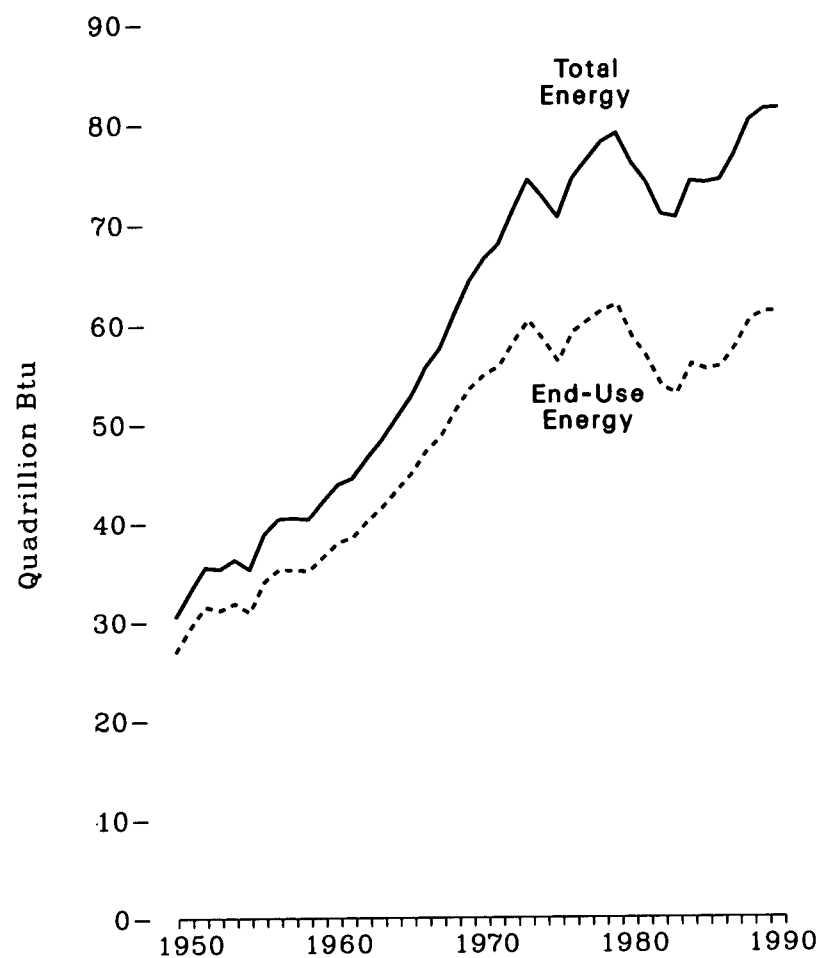

Trends in Industrial Energy Consumption

Energy consumption by the industrial sector increased throughout the 1960's and attained an all-time high in 1973 of 26 quadrillion Btu (11). After 1973, increasing energy prices tended to depress industrial sector demand for energy, and the rate of consumption trended downward. By 1986, the annual total was 20 quadrillion Btu. Following the 1986 fall in crude oil prices, industrial energy consumption rose each year, reaching 23 quadrillion Btu in 1990.

The industrial sector relied on the three major fossil fuels—petroleum, natural gas, and coal—and electricity throughout the 1960-to-1990 period, but the relative contributions of each form of energy changed over time. Coal, which accounted for a 26-percent share in 1960, provided only 12 percent of industrial energy in 1990. Meanwhile, electricity's share rose from 7 percent to 14 percent. The share supplied by petroleum ranged from 33 percent to 41 percent, and the share supplied by natural gas ranged from 33 percent to 42 percent. In 1990, petroleum and natural gas accounted for equal shares, 37 percent each.

1990*	81.44	61.10	248.7	327	-0.3	246	0.0

¹ End-use energy consumption is total energy consumption less losses incurred in the generation, transmission, and distribution of electricity, less power plant electricity use and unaccounted for electrical system energy losses. (See Glossary).

² Resident population of the 50 States and the District of Columbia estimated for July 1 of each year, except for the April 1 census count in 1950, 1960, 1970, and 1980.

³ Percent change calculated from data prior to rounding.

* Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

— = Not applicable.

¹ Previous-year data have been revised. Current-year data are estimated and will be revised in future publications. Other estimated data are Environmental Protection Agency (EPA) 1982 and 1988, U.S. Department of Treasury 1982 and 1983, and National Science Foundation (NSF) 1988 and 1989.

² Includes National Archives, U.S. Department of Commerce, Panama Canal Commission, Tennessee Valley Authority, U.S. Department of Labor, NSF, Federal Trade Commission, Federal Communications Commission, EPA, Railroad Retirement Board, Commodities Futures Trading Commission, Equal Employment Opportunity Commission, Nuclear Regulatory Commission, and Office of Personnel Management.

Note: Sum of components may not equal total due to independent rounding.

Note: This table uses a conversion factor for electricity of 11,600 Btu per kilowatt-hour.

Note: These data include energy consumed at foreign installations and in foreign operations, including aviation and ocean bunkering, primarily by the U.S. Department of Defense. U.S. Government energy use for electricity generation and uranium enrichment is excluded. However, other energy used by U.S. agencies that produce electricity or enrich uranium is included.

Source: U.S. Department of Energy, Form DOE 6200.2, "Quarterly Federal Energy Usage Report."

¹ Includes liquefied petroleum gases, and other.

² Includes purchased steam, coal, and other.

³ Includes U.S. Department of Commerce, Panama Canal Commission, Tennessee Valley Authority, U.S. Department of Labor, National Science Foundation, Federal Communications Commission, and Environmental Protection Agency.

⁴ Data are estimated and will be revised in future publications.

⁵ Includes National Archives, U.S. Department of Commerce, U.S. Department of Labor, Environmental Protection Agency, Federal Communications Commission, Federal Trade Commission, National Science Foundation, Panama Canal Commission, Commodities Futures Trading Commission, Equal Employment Opportunity Commission, Nuclear Regulatory Commission, Office of Personnel Management, Tennessee Valley Authority, and Railroad Retirement Board.

Note: Sum of components may not equal total due to independent rounding.

Note: This table uses a conversion factor for electricity of 11,600 Btu per kilowatthour.

Note: These data include energy consumed at foreign installations and in foreign operations, including aviation and ocean bunkering, primarily by the U.S. Department of Defense. U.S. Government energy use for electricity generation and uranium enrichment is excluded. However, other energy used by U.S. agencies that produce electricity or enrich uranium is included.

¹ Those quantities for which payment was made and that were available onsite for consumption.

² The amount of fuel actually consumed minus the amount of actual consumption that could have been replaced by other fuels.

³ The amount of fuel actually consumed plus the amount of additional consumption that could have occurred if all possible switching from other fuels took place.

⁴ The amount of actual consumption that could have been replaced by other fuels.

⁵ The total estimated quantity of residual and distillate fuel oil combined that is switchable to nonpetroleum alternate fuels is 92 thousand barrels per day.

Note: Consumption includes energy consumed for heat, power, and onsite electricity generation. It excludes energy consumed as petrochemical feedstocks and raw material inputs.

¹ Includes electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal electricity.

² A small amount of natural gas used for air conditioning is included in "Total" and "Natural Gas" under "Total."

Note: No data are available for 1983, 1985, or 1986. Consumption totals for 1979 are available on Table 16.

Note: One Btu of electricity = 0.000293 (1/3,412) kWh.

Note: Sum of components may not equal total due to independent rounding.

Expenditures per 1,000 Square Foot*HDD (cents)	W	W	5.7	5.1	12.7	8.5	7.4	W	8.2	6.9

¹ See Appendix D for Census regions.

² Includes electricity generated for distribution from geothermal, wood, waste, wind, photovoltaic, and solar thermal energy sources.

W = Data withheld because fewer than 10 housing units were sampled.

Notes: • HDD = heating degree-days to base 65 °F. • One Btu of electricity = 0.000293 (1/3,412) kWh. • Averages are for households using the fuel as the main space heating fuel. Space heating consumption and expenditures in this table do not show the small amounts of fuel used by households that use the fuel only as a secondary space heating fuel. • Space heating does not include electricity used by the fan that circulates warm air through the ducts.

¹ Includes mobile homes and individual housing units in apartment buildings. Housing units with more than one type of heating system are classified according to the principal type of heating system.

² Includes coal coke.

³ Includes nonreporting units in 1950 and 1960 which totaled 997 and 2,000 units, respectively.

⁴ Included in distillate fuel oil.

⁵ Data for 1982, 1984, and 1986 are not available. Since 1981, the *American Housing Survey for the United States* has been a biennial survey.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

Price of Motor Gasoline (dollars per gallon)									
Leaded	1.14	1.11	0.90	1.14	1.11	0.90	1.14	1.11	0.90
Unleaded	1.22	1.20	0.99	1.22	1.21	1.00	1.22	1.21	1.00

¹ Included are automobiles, station wagons, passenger vans, cargo vans, motor homes, pickup trucks, and jeeps or similar vehicles. Excluded are motorcycles, mopeds, large trucks, and buses.

Note: Motor fuel includes motor gasoline and a small amount of other fuels such as diesel, gasohol, and propane. These data for 1983 differ from previously published 1983 data, in that the basis for estimating the number of vehicle-owning households was changed to conform with that being used for 1985.

Note: Sum of components may not equal total due to independent rounding.

¹ Includes only motor fuel taxed at the prevailing tax rates in each State. Excludes motor fuel exempt from tax payment, subject to tax refund, or taxed at rates other than the prevailing tax rate. Experience has shown that the total motor fuel consumption quantity cited here equals more than 99.0 percent of gross reported motor fuel consumption.

² Includes motor gasoline, aviation gasoline, and gasohol.

³ Includes distillate fuel oil (diesel oil), liquefied gases, and kerosene when they are used to operate vehicles on highways. Excludes jet fuel beginning in 1962.

⁴ Excludes losses allowed for evaporation, handling, etc.

^a Included in trucks.

^e Previous-year data have been revised. Current-year data are estimated and will be revised in future publications.

Note: Sum of components may not equal total due to independent rounding.

3. Selected Financial Indicators

Fossil Fuel Real Prices Down from Record Levels

From the 1949 level of \$1.12 per million Btu, real prices¹ of fossil fuels² trended downward to a low of \$0.75 in 1969 (29).³ Thereafter, prices began to escalate, sometimes abruptly. In 1974, the composite price of fossil fuels jumped from the 1973 level of \$0.80 to \$1.25, surpassing the 1949 level for the first time and registering the largest year-to-year increase (56 percent) of the 1949–1990 period. The peak of \$2.92 was reached in 1981. Thereafter, the price declined each year through 1988, plunging 36 percent in 1986 alone. In 1990, the composite price of fossil fuels was \$1.40, up 11 percent from the 1988 price.

Crude oil was the most expensive of the fossil fuels over the entire period, with the exception of anthracite in 1975 through 1977. At its peak in 1981, the real price of crude oil reached \$5.83, more than triple the price of natural gas and more than quadruple the price of nonanthracitic coal.

Energy Expenditures Rose in 1988

The energy expenditure measure is the product of energy consumption and energy prices. In 1988 (the most recent year for which data are available), a decline in crude oil prices was more than offset by a substantial rise in energy consumption. Energy expenditures rose from \$393 billion in 1987 to \$406 billion in 1988 (31).

End-use expenditures of \$188 billion for petroleum products accounted for the largest share (46 percent) of total energy expenditures. Sales of electricity (net of expenditures by electric utilities for most fuels used to generate electricity) totaled \$125 billion. The year-to-year increase in electricity sales was close to \$7 billion, over half of the \$13-billion

¹Real prices are expressed in 1982 dollars.

²Crude oil, natural gas, and coal.

³Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

increase in total energy expenditures. Nuclear fuel, wood, and waste used at electric utilities accounted for \$4 billion. Expenditures for natural gas and coal were \$61 billion and \$28 billion, respectively.

Energy Industry Income

In 1989 (the most recent year for which data are available), the 23 major energy companies included in the Financial Reporting System (FRS)⁴ accounted for 57 percent of U.S. crude oil and natural gas liquids production, 43 percent of dry natural gas production, and smaller shares of coal and uranium production (36). They also accounted for 71 percent of refinery capacity. The FRS companies continued to play a significant role in the U.S. economy in 1989, accounting for 19 percent of both the profits and the assets of *Fortune's* 500 largest U.S. industrial corporations.⁵

The FRS companies were involved in a wide range of business activities, but through 1987, petroleum and natural gas production was their primary source of net income (37). However, during 1985 through 1987, sharp swings in oil prices led to fluctuations in the FRS companies' net income and in the share of net income attributable to oil and gas production. In 1988, net income from domestic and foreign oil and gas production fell 26 percent to \$7.5 billion, despite the modest recovery in crude oil prices. Net income from both refining/marketing (\$7.8 billion) and nonenergy activities (\$10.8 billion) exceeded net income from oil and gas production for the first time since at least 1977.

In 1989, the FRS companies' net income declined 11 percent to \$19.8 billion (37). Much of the decline was due to a \$2.1-billion decrease in net income from nonenergy business. Petroleum and natural gas registered a \$1.3-billion decline in net income, as lower refining net income more than offset increases in net income from oil and gas production.

⁴The FRS collects financial data from the major energy-producing companies. See Appendix E, note 3.

¹ Includes lease condensate.

² Wet natural gas, prior to extraction of natural gas plant liquids.

³ Derived by multiplying the price per Btu of each fossil fuel by the total Btu content of the production of each fossil fuel and dividing this accumulated value of total fossil fuel production by the accumulated Btu content of total fossil fuel production.

⁴ In 1982 dollars, calculated using implicit GNP price deflators.

^a Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

— = Not applicable.

Note: All fuel prices taken as close as possible to the point of production.

¹ Includes lease condensate.

² In 1982 dollars, calculated using implicit GNP price deflators. See Appendix C.

³ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

Note: Value is based on fuel prices taken as close as possible to the point of production.

4. Energy Resources

Crude Oil and Natural Gas Resources

The most recent U.S. Geological Survey assessment of U.S. undiscovered recoverable resources provides a mean estimate for 1987 of 49 billion barrels of crude oil (40). Alaska, including its Federal offshore region, accounted for one-third of all U.S. crude oil resources. The Survey's mean estimate of natural gas resources was 399 trillion cubic feet. The Gulf Coast and the Federal offshore region in the Gulf of Mexico accounted for close to one-half and Alaska's onshore and offshore regions accounted for close to one-fifth of the U.S. total.

Crude Oil and Natural Gas Proved Reserves

Proved reserves of crude oil, natural gas, and natural gas liquids combined increased every year from 1949 until 1968 (47),¹ when, for the first time, production exceeded net additions to proved reserves. Except for the addition of Alaska's North Slope reserves in 1970, proved reserves trended downward, falling to 62 billion barrels (crude oil equivalent) in 1989. As of the end of that year, 28 billion barrels of crude oil (including lease condensate) and 175 trillion cubic feet of natural gas remained as proved reserves (41). Through 1989, crude oil cumulative production of 159 billion barrels from 39 thousand fields equaled about 85 percent of estimated ultimate recovery, while natural gas cumulative production of 778 trillion cubic feet from 34 thousand fields equaled about 82 percent of ultimate recovery.

Coal Reserves: An Abundant Supply

The Energy Information Administration has estimated that the demonstrated reserve base of coal contained 472 billion short tons at the beginning of 1990 (48). Although recoverability rates differ from site to site, about one-half of the demonstrated reserve base is estimated to be recoverable.

¹Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

Uranium Resources

At the end of 1989, reasonably assured uranium resources with forward costs (those yet to be incurred in production) of up to \$30 per pound totaled 277 million pounds of U₃O₈, over half of which was in New Mexico (50). Estimated additional resources and speculative resources in the \$30-per-pound category in 1989 totaled 1.4 billion pounds and 1.1 billion pounds, respectively.

Exploring for Energy Resources

Exploration for oil and gas is closely tied to market conditions, particularly to the price of crude oil. When the price rose in 1974, the number of seismic crews and rotary rigs also rose (42) and exploratory well completions increased (43). A second price hike sent all three indicators to record levels in 1981: seismic crews working were 681, rotary rigs in operation were 3,970, and completions of exploratory wells totaled 17.5 thousand. Subsequently, prices declined and then collapsed, leading to drastic cutbacks in exploration. By 1990, seismic crews working had declined to 125 and exploratory well completions had declined to 4.9 thousand, the lowest levels in at least 42 years. Rotary rigs in operation, however, rose to 1,010.

Exploration for uranium also reflects changes in energy markets. The number of exploratory and development holes drilled peaked in 1978 at 104 thousand (49). As uranium market conditions deteriorated after 1978, the number plunged to less than 4 thousand in 1985 and remained in the 4-to-5 thousand range through 1989.

United States Total	49.4	33.2	69.9	399.1	306.8	507.2

¹ The estimates are risked. The methodology computes the marginal probability that economically recoverable hydrocarbons exist in the area. When applied to the mean volume, the methodology adjusts the figure to reflect the probability that the area may be nonproductive.

² The low value of the range is the quantity associated with a 95 percent probability (19 in 20 chance) that there is at least this amount. The high value is the quantity with a 5 percent probability (1 in 20 chance) that there is at least this amount. Totals for the low and high values are not obtained by arithmetic summation; they are derived by statistical methods.

³ The arithmetic average of all possible outcomes.

⁴ Includes the Michigan Basin and Appalachians.

⁵ Less than 0.1 trillion cubic feet.

⁶ Includes only the area encompassed by the Federally Controlled Outer Continental Shelf.

⁷ Includes quantities considered recoverable only if technology permits their exploitation beneath Arctic ice — a condition not yet met.

¹ FRS = Financial Reporting System (see Appendix E, Note 3).

² FRS data for 1982 and 1984 are adjusted to exclude purchases of proved reserves associated with mergers among the FRS Companies.

³ Gross additions to proved reserves equal annual change in proved reserves plus annual production.

⁴ Liquid and gaseous hydrocarbons include crude oil, natural gas liquids, and natural gas.

⁵ Crude oil equivalent: converted to Btu based on annual average conversion factors. See Appendix A.

⁶ Based on net ownership interest (see Glossary).

⁷ Downward revisions of Alaska North Slope natural gas reserves are excluded.

NA = Not available.

Note: Data in this table are for U.S. domestic operations only (see Appendix E, Note 3).

5. Petroleum

Fluctuations in the Price of Crude Oil

After successive price hikes had brought the real price¹ of crude oil to a peak in 1981, oil prices began trending downward in 1982, and then plummeted in 1986 (70).² The average annual composite refiner acquisition cost of a barrel of crude oil fell from \$24.12 in 1985 to \$12.79 in 1986. Of the several factors contributing to the unprecedented decline in crude oil prices during 1986, the most important was excess worldwide production—primarily by members of the Organization of Petroleum Exporting Countries (OPEC) seeking to regain market share.

After 1986, crude oil prices fluctuated. In 1990, the real price of a barrel of crude oil reached to \$16.91. The price rose sharply in the last half of the year as a result of the August 2, 1990, Iraqi invasion of Kuwait.

The swings in crude oil prices often were reflected (though in attenuated form) in changes in the retail prices of petroleum products. For example, the average annual price per gallon, in real terms, of unleaded regular motor gasoline declined from \$1.08 in 1985 to \$0.82 in 1986 (72). However, crude oil price is not the only component of motor gasoline price; refining and distribution costs and taxation are also major determinants of the retail price. In 1990, the real price per gallon of unleaded regular motor gasoline rose 10 percent from the 1989 level, while the composite refiner acquisition cost of crude oil rose 19 percent.

Consumption of Petroleum Products

Consumption of petroleum products (petroleum products supplied) increased throughout the 1949-to-1973 period, at an average annual rate of 4.7 percent, and by 1973, consumption of petroleum products totaled 17 million barrels per day (51). In 1974, however, marked increases in the price of crude oil coupled with a petroleum supply interruption resulted

¹Real prices are expressed in 1982 dollars.

²Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

in a consumption decline of 3.8 percent. Although demand recovered during the late 1970's, peaking at 19 million barrels per day in 1978, by 1983 it had declined to 15 million barrels per day. After that, lower crude oil prices tended to promote consumption, which reached 17.3 million barrels per day in 1989. In 1990, however, mild weather early in

Petroleum Stocks and the Strategic Petroleum Reserve

The U.S. Government established the Strategic Petroleum Reserve (SPR) in response to the oil supply disruptions of the early 1970's. Intended to minimize the effects of any future disruptions, the SPR began storing crude oil in 1977, and by the end of 1989, it held 580 million barrels (66). The first sales of SPR crude oil (4 million barrels) occurred following the August 1990 Iraqi invasion of Kuwait. At the end of 1990, the SPR held 586 million barrels.

One measure of the SPR's adequacy is the number of days of petroleum net imports it could provide in the event of an oil supply interruption. Through 1985, that measure of energy security increased every year, due to additions to the SPR and a decline in the level of net imports. In 1986, however, the measure declined for the first time, from 115 days in 1985 to 94 days in 1986. Due to increasing net imports, by 1989 the measure had fallen to 81 days.

At the end of 1990, SPR stocks plus 323 million barrels of privately held crude oil stocks totaled 909 million barrels (65). Private stocks of crude oil were less than the 341-million-barrel level recorded in 1977, when filling of the SPR began, but, at 715 million barrels, private stocks of petroleum products in 1990 remained considerably below the record level of 964 million barrels recorded in 1977.

the year, a slowing of economic growth, and higher petroleum prices combined to restrain petroleum consumption, which fell to 16.9 million barrels per day.

Motor gasoline consistently accounts for the largest share of all petroleum products supplied (61). From 1949 through 1990, its share was between 38 percent and 43 percent of supply. After peaking in 1978 at 7.4 million barrels per day, consumption declined somewhat and then stabilized at about 6.6 million barrels per day during the early 1980's. Thereafter, declines in motor gasoline prices sparked growth in demand through 1988, but increased prices in 1989 and 1990 resulted in slightly lower consumption.

In contrast, consumption of residual fuel oil declined markedly after 1977, accounting for a smaller and smaller share of all products supplied, as major consumers switched to coal and uranium. Residual fuel consumption had reached an all-time high in 1977 of 3.1 million barrels per day, 17 percent of supply (61). After 8 years of decline, consumption had fallen to 1.2 million barrels per day, less than 8 percent of products supplied, in 1985. Sharply lower oil prices in 1986 encouraged demand for residual fuel, and consumption rose to 1.4 million barrels per day. Demand slackened in 1987 but returned to the 1.4-million-barrel-per-day level in 1988 and 1989. In 1990, consumption of residual fuel oil totaled 1.2 million barrels per day.

Production and Productivity

During much of the 1950's and 1960's, production capacity exceeded demand to such an extent that mechanisms such as production prorationing and import ceilings were implemented to protect domestic production. By the 1970's, however, petroleum demand had increased, the average productivity of wells began to decline, and oil production leveled off (52). Increases in Alaskan production at the end of the decade and through 1988 partially counteracted declines in Lower-48 production. In 1989 and 1990, however, even Alaskan production declined and total domestic production fell to 7.3 million barrels per day in 1990.

Of total U.S. production in 1990, 86 percent came from onshore wells and 14 percent from offshore. The 588 thousand producing wells attained an average productivity of 12 barrels per day per well, down 2 percent from the 1989 level and significantly below peak productivity of over 18 barrels attained in 1972.

Imports and Exports

Despite import quotas, net imports of low-priced petroleum increased throughout most of the 1949-to-1973 period, and in 1973 totaled 6.0 million barrels per day (51). Thereafter, net imports fluctuated, peaking at 8.6 million barrels per day in 1977, then declining to 4.3 million barrels per day in 1985. In 1986, excess world production drove prices down, inhibiting domestic production and boosting demand. Those factors, as well as stockbuilding, resulted in an increase in net imports in 1986 to 5.4 million barrels per day. Subsequently, with prices significantly below peak levels, daily net imports rose to 7.2 million barrels per day in 1989. In 1990, higher petroleum prices contributed to a small decline (to 7.1 million barrels per day) in petroleum net imports.

U.S. dependence on petroleum net imports peaked at 47 percent of consumption in 1977, then fell in 1985 to 27 percent, the lowest level since 1971 (57). By 1990, it had risen to 42 percent, and dependence on net imports from members of OPEC had risen from 12 percent of consumption in 1985 to 25 percent in 1990. That year, Saudi Arabia, Venezuela, Canada, Nigeria, and Mexico were the primary foreign suppliers of petroleum to the United States.

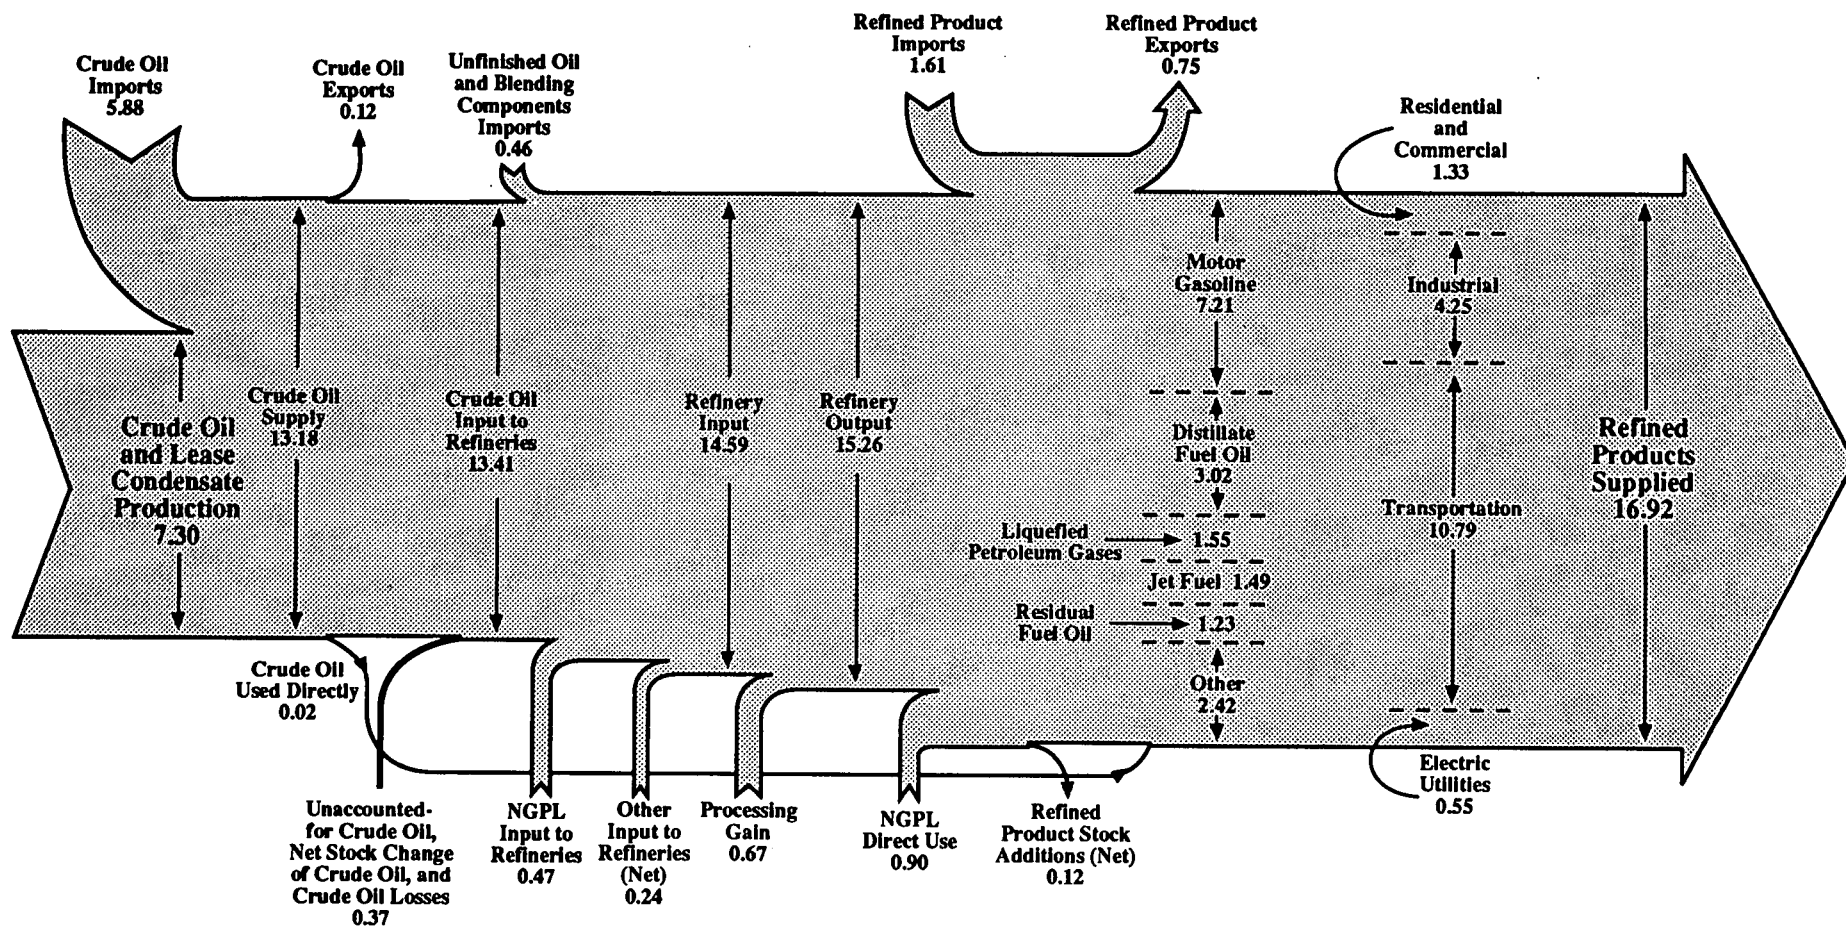

From 1973 on, crude oil net imports surpassed petroleum product net imports; in 1990, the ratio was more than 4 to 1 (53 and 55). Net imports of residual fuel accounted for 22 percent of all product net imports in 1990.

The Refining Industry in a Changing Market

The average daily output from U.S. refineries trended upward from 1949 through 1978, when it peaked at 16 million barrels per day (58). During the next 5 years, output declined, falling to 13 million barrels per day in 1983. As crude oil prices declined in the mid-1980's and the demand for petroleum rose, refinery output began to recover, reaching 15 million barrels per day in 1990.

The rate of refinery utilization fell below 80 percent in 1980 through 1985, but improved thereafter (59). In 1986, the utilization rate was 83 percent, well above its nadir of 69 percent in 1981. Margins guaranteed by netback pricing agreements and decommissioning of less efficient refineries in 1986 both contributed to improvement within the domestic refining industry. In 1987 through 1990, strong product demand contributed to higher utilization rates, which reached 87 percent in 1990.

¹ Includes lease condensate. ² Includes benzol, other hydrocarbons, hydrogen, alcohol, processing gains, and unaccounted-for crude oil. ³ Includes imports for the Strategic Petroleum Reserve, which began in 1977. ⁴ For 1981 and forward, includes motor gasoline blending components, and aviation gasoline blending components. ⁵ Net trade = imports minus exports.

⁶ Negative numbers denote a net addition to stocks or a reduction in supply. Positive numbers denote a net withdrawal from stocks or an addition to supply. ⁷ Less than 5,000 barrels per day.

* Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications. Note: Sum of components may not equal total due to independent rounding.

¹ Includes imports from U.S. possessions and territories.

² Includes imports for the Strategic Petroleum Reserve, which began in 1977.

³ Prior to 1965, imports of kerosene-type jet fuel were included with kerosene, which is listed under "Other Products."

⁴ Excludes motor gasoline blending components after 1980. Prior to 1964, motor gasoline data were for total gasoline, including motor gasoline, aviation gasoline, and special naphtha.

⁵ Includes aviation gasoline, motor gasoline blending components, aviation gasoline blending components, kerosene, petrochemical feedstocks, special naphthas, lubricants, wax, asphalt, petroleum coke, pentanes plus, and miscellaneous products.

⁶ Less than 500 barrels per day.

⁷ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

¹ See Glossary for membership.

² "Other OPEC" consists of Ecuador, Gabon, Iran, Iraq, Kuwait, Libya, Qatar, and United Arab Emirates. Prior to 1988, imports from the Neutral Zone between Kuwait and Saudi Arabia are included in imports from Saudi Arabia. From 1988 forward, those imports are included in imports from "Other OPEC."

³ "Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. "Total OPEC" imports exclude petroleum imported into the United States indirectly from OPEC countries, primarily from Caribbean and West European refining areas, as petroleum products that were refined from crude oil produced in OPEC countries.

⁴ "Total Arab OPEC" consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and United Arab Emirates. Imports from the Neutral Zone are included in imports from "Total Arab OPEC."

* Less than 500 barrels per day.

* Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

Note: Data include imports for the Strategic Petroleum Reserve, which began in 1977.

Note: Sum of components may not equal total due to independent rounding.

¹ Imports minus exports; negative numbers indicate that exports exceed imports.

² "Other OPEC" consists of Algeria, Ecuador, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Qatar, and United Arab Emirates. Prior to 1988, imports from the Neutral Zone between Kuwait and Saudi Arabia are included in imports from Saudi Arabia. From 1988 forward, those imports are included in imports from "Other OPEC."

³ "Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. "Total OPEC" imports exclude petroleum imported into the United States indirectly from OPEC countries, primarily from Caribbean and West European refining areas, as petroleum products that were refined from crude oil produced in OPEC countries.

⁴ "Total Arab OPEC" consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and United Arab Emirates. Imports from the Neutral Zone are included in imports from "Total Arab OPEC."

⁵ Calculated by dividing total net petroleum imports by total U.S. petroleum products supplied (consumption).

⁶ Calculated by dividing net petroleum imports from OPEC countries by total net petroleum imports.

⁷ Calculated by dividing net petroleum imports from OPEC countries by total U.S. petroleum product supplied (consumption).

* Less than 500 barrels per day.

* Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

Note: Data include imports for the Strategic Petroleum Reserve which began in 1977.

Note: Sum of components may not equal total due to independent rounding.

¹ Prior to 1981, includes unfinished oils (net), hydrogen, and hydrocarbons not included elsewhere. 1981 forward includes unfinished oils (net), motor gasoline blending components (net), aviation gasoline blending components (net), hydrogen, other hydrocarbons, and alcohol. See Appendix E, Note 5.

² Prior to 1964, motor gasoline data were for total gasoline, including motor gasoline, aviation gasoline, and special naphtha. Prior to 1965, kerosene-type jet fuel was included in kerosene.

³ Includes kerosene, petrochemical feedstocks, lubricants, wax, petroleum coke, asphalt, road oil, still gas, and miscellaneous products. Since 1964, aviation gasoline and special naphthas are included.

⁴ Less than 5,000 barrels per day.

⁵ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

¹ Prior to 1956, the number of refineries includes only those in operation on January 1. For 1957 and forward, the number of refineries includes all operable refineries on January 1 (see Glossary). ² Capacity in million barrels per calendar day on January 1. ³ See Appendix E, Note 6. ⁴ For 1949 through 1980, utilization is derived by dividing gross input to distillation units by one-half of the current year January 1 capacity and the following year January 1 capacity. Percentages were derived from unrounded numbers. For 1981 and forward, utilization is derived by averaging reported monthly utilization. ⁵ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications. Note: Data are for refineries in the United States, excluding the Hawaiian Foreign Trade Zone. Sources: Operable Refineries: •1949 through 1977—Bureau of Mines, Mineral Industry Surveys, *Petroleum Refineries, Annual*. •1978 through 1981—Energy Information Administration (EIA), Energy Data Reports, *Petroleum Refineries in the United States and U.S. Territories*. •1982 and forward—EIA, *Petroleum Supply Annual*. Gross Input to Distillation Units: •1949 through 1966—Bureau of Mines, *Minerals Yearbook*, "Natural Gas Liquids" and "Crude Petroleum and Petroleum Products" chapters. •1967 through 1977—Bureau of Mines, Mineral Industry Surveys, *Petroleum Refineries, Annual*. •1978 through 1980—EIA, Energy Data Reports, *Petroleum Refineries in the United States and U.S. Territories*. •1981 through 1989—EIA, *Petroleum Supply Annual*. •1990—EIA, *Petroleum Supply Monthly*, February 1991. Utilization: •1949 through 1980—calculated. •1981 through 1989—EIA, *Petroleum Supply Annual*. •1990—EIA, *Petroleum Supply Monthly*, February 1991.

¹ Reported production of ethane-propane mixtures have been allocated 70 percent ethane and 30 percent propane.

² Reported production of butane-propane mixtures have been allocated 60 percent butane and 40 percent propane.

³ Prior to 1984, this category was reported separately as natural gasoline, isopentane, and plant condensate.

⁴ Includes motor gasoline, aviation gasoline, special naphthas, distillate fuel oil, and miscellaneous products.

⁵ Beginning in 1989, finished petroleum products production from natural gas processing plants was no longer available.

* Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

Note: Sum of components may not equal total due to independent rounding.

¹ See Appendix E, Notes 5, 7, and 8.

² Prior to 1964, motor gasoline data were for total gasoline, including motor gasoline, aviation gasoline, and special naphtha.

³ Includes kerosene, petrochemical feedstocks, lubricants, wax, petroleum coke, asphalt, road oil, still gas, pentanes plus, and miscellaneous products. Since 1964, aviation gasoline and special naphthas are included. Prior to 1965, kerosene-type jet fuel was included in kerosene. For 1981 and forward, other products include negative barrels per day of distillate and residual fuel oil reclassified as unfinished oils and other products (from both primary and secondary supply) reclassified as gasoline blending components. Beginning in 1983, product supplied also includes crude oil burned as fuel.

⁴ Percent change from previous year calculated from data prior to rounding.

⁵ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

— = Not applicable.

NA = Not available.

Note: Sum of components may not equal total due to independent rounding.

¹ Includes crude oil stored in the Strategic Petroleum Reserve, which began in 1977. ² Prior to 1964, motor gasoline data were for total gasoline which included motor gasoline, aviation gasoline, and special naphthas. For 1981 and forward, includes motor gasoline blending components. ³ Includes propylene. ⁴ Other is ethane, ethylene, normal butane, butylene, and isobutane. ⁵ Includes kerosene, petrochemical feedstocks, lubricants, wax, petroleum coke, asphalt, road oil, pentanes plus, and miscellaneous products. Since 1964, aviation gasoline and special naphthas are included. For 1981 and forward, includes aviation gasoline blending components, hydrogen, other hydrocarbons, and alcohol. ⁶ Included in liquefied petroleum gases total. ⁷ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications. NA = Not available. Note: Sum of components may not equal total due to independent rounding. Sources: •1949 through 1975—Bureau of Mines, Mineral Industry Surveys, *Petroleum Statement, Annual*. •1976 through 1980—Energy Information Administration (EIA), Energy Data Reports, *Petroleum Statement, Annual*. •1981 through 1989—EIA, *Petroleum Supply Annual*. •1990—EIA, *Petroleum Supply Monthly*, February 1991.

¹ Stocks do not include imported quantities in transit to Strategic Petroleum Reserve terminals, pipeline fill, and above-ground storage.

² Including lease condensate stocks.

³ Derived by dividing end-of-year strategic petroleum reserve stocks by annual average daily net imports of all petroleum. Calculated prior to rounding.

⁴ The quantity of domestic fuel oil which was in storage prior to injection of foreign crude oil.

⁵ Less than 0.005 million barrels.

¹ See Glossary for membership.

² "Other OPEC" consists of Ecuador, Gabon, Iran, Iraq, Kuwait, Libya, Qatar, and United Arab Emirates. Prior to 1988, imports from the Neutral Zone between Kuwait and Saudi Arabia are included in imports from Saudi Arabia. From 1988 forward, those imports are included in imports from "Other OPEC."

³ "Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. "Total OPEC" imports exclude petroleum imported into the United States indirectly from OPEC countries, primarily from Caribbean and West European refining areas, as petroleum products that were refined from crude oil produced in OPEC countries.

⁴ "Total Arab OPEC" consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and United Arab Emirates. Imports from the Neutral Zone are included in imports from "Total Arab OPEC."

* Based on October, November, and December data only.

• Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

W = Value withheld to avoid disclosure of individual company data.

NA = Not available, included in "Other Non-OPEC."

Note: Data include imports for the Strategic Petroleum Reserve, which began in 1977.

Note: Sum of components may not equal total due to independent rounding.

¹ See Glossary for membership.

² "Other OPEC" consists of Ecuador, Gabon, Iran, Iraq, Kuwait, Libya, Qatar, and United Arab Emirates. Prior to 1988, imports from the Neutral Zone between Kuwait and Saudi Arabia are included in imports from Saudi Arabia. From 1988 forward, those imports are included in imports from "Other OPEC."

³ "Total OPEC" consists of Ecuador, Gabon, Indonesia, Iran, Nigeria, and Venezuela, as well as the Arab members. "Total OPEC" imports exclude petroleum imported into the United States indirectly from OPEC countries, primarily from Caribbean and West European refining areas, as petroleum products that were refined from crude oil produced in OPEC countries.

⁴ "Total Arab OPEC" consists of Algeria, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, and United Arab Emirates. Imports from the Neutral Zone are included in imports from "Total Arab OPEC."

⁵ Data shown here represent landed value; they differ from Table 33, which are data from U.S. Customs that represent crude oil value at the port of loading.

⁶ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

W = Value withheld to avoid disclosure of individual company data.

NA = Not available, included in "Other Non-OPEC."

Note: Because the volumes associated with the landed costs are not the same as those used in the calculation of this table, the value of imports do not sum. The values were calculated independently.

Sources: Calculated using prices on Table 68 and volume data as follows: •1973 through 1975—U.S. Department of the Interior, Bureau of Mines, *Petroleum Statement, Annual*. •1976 through 1980—Energy Information Administration (EIA), *Petroleum Statement, Annual*. •1981 through 1989—EIA, *Petroleum Supply Annual*. •1990—EIA, *Petroleum Supply Monthly*, February 1991.

¹ Average motor gasoline prices are calculated from a sample of service stations providing all types of service (i.e., full-, mini-, and self-serve). Geographic coverage - 1949 through 1973, 55 representative cities; 1974 through 1977, 56 urban areas; 1978 forward, 85 urban areas. ² Average residential heating oil (No. 2 fuel oil) prices are derived by dividing the sum of the estimated national value of retail sales for residential heating by the estimated volume of retail sales for residential heating. Data for 1978 and forward exclude all taxes. ³ In 1982 dollars, calculated using implicit GNP price deflators. See Appendix C. ⁴ Based on September through December data only. ⁵ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications. NA = Not available. Sources: Motor Gasoline: •1949 through 1973—*Platt's Oil Price Handbook and Oilmanac, 1974*, 51st Edition. •1974 and forward—Energy Information Administration (EIA), simple annual averages of monthly data from Bureau of Labor Statistics, *Consumer Prices: Energy*. Residential Heating Oil: •1956 through 1974—Bureau of Labor Statistics, *Retail Prices and Indexes of Fuels and Utilities for Residential Usage*, monthly. •January 1975 through September 1977—Federal Energy Administration, Form FEA-P112-M-1, "No. 2 Heating Oil Supply/Price Monitoring Report." •October 1977 through December 1977—EIA, Form EIA-9, "No. 2 Heating Oil Supply/Price Monitoring Report." •1978 through 1989—EIA, *Petroleum Marketing Annual 1989* (October 1990), Table 16. •1990—EIA estimates.

6. Natural Gas

Price Changes in a Regulated Market

Due to different Federal and State rate structures, there are many price categories for natural gas. In addition, prices to consumers vary by region; for example, prices are lower in main producing areas, where transmission costs are lower. Estimated data indicate that the average wellhead price of all categories of natural gas rose from \$1.69 per thousand cubic feet in 1989 to \$1.72 in 1990 (79).¹ In real terms,² however, the average wellhead price per thousand cubic feet declined slightly, from \$1.34 to \$1.31.

When wellhead prices change, savings or price increases are sometimes passed on to consumers differentially. In 1990, the average wellhead price rose 2 percent (79). Similarly, the price per thousand cubic feet of natural gas sold to residential consumers rose 2 percent, to \$5.77, and the price to commercial consumers also rose 2 percent, to \$4.83 (80). In contrast, the price to industrial consumers (excluding lease and plant fuel) declined 2 percent, to \$2.92 per thousand cubic feet.

Sectoral Patterns of Demand

Throughout the 1950's and 1960's, the market for natural gas expanded as low prices encouraged demand (77). Of the many factors affecting natural gas markets during those decades, Federal and State regulatory commissions were the most influential. Below-market rates for certain categories of natural gas coupled with strong demand ultimately resulted in regional shortages during the second half of the 1970's.

In 1972, total consumption of natural gas reached an all-time high of 22 trillion cubic feet. Thereafter, uncertainties about supply and rising

¹Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

²Real prices are expressed in 1982 dollars. Prices are nominal unless specifically noted as real.

energy prices began to erode demand. By the 1980's, lower demand resulted in a short-term surplus of deliverable gas and production curtailments in many producing areas. In 1986, natural gas consumption totaled 16 trillion cubic feet, the lowest annual total since 1965.

Weakened demand spanned all end-use sectors but was most severe in the industrial and electric utility sectors, where, particularly during the early and mid-1980's, the option of fuel switching proved to be most viable. Lower consumption by the industrial sector accounted for over half of the 6-trillion-cubic-foot reduction from 1972 through 1986, and lower use at electric utilities accounted for close to one-fourth.

Meeting Peak Demand

Seasonal, and even daily, fluctuations in natural gas demand are met by withdrawals from storage when demand is high and by injections into storage when demand is low compared with available gas flow in transmission lines. Net withdrawals from storage can provide more than half of some companies' peak winter deliveries. During the 1989-1990 heating season (October through March), net withdrawals of natural gas from storage supplied nearly 13 percent of total consumption.³

Natural gas in storage at the end of the year increased throughout the period of the 1970's when local shortages resulted in curtailments to some consumers (78). Underground storage of working gas—that in excess of the base gas needed to maintain optimum reservoir pressure—equaled 7 percent of annual consumption in 1969 and 16 percent in 1990 (73 and 78). At the end of 1990, working gas in storage was 3.0 trillion cubic feet and base gas was 3.9 trillion cubic feet.

³Energy Information Administration, *Monthly Energy Review* March 1991, DOE/EIA-0035(91/03) (Washington, DC, March 1991), Tables 4.3 and 4.4.

On a share basis, industrial consumption fell from 44 percent in 1972 to 40 percent in 1986, while the electric utilities' share fell from 18 percent to 16 percent in the same period. In contrast, residential consumption accounted for a larger share of the total in 1986 compared with 1972; its share rose from 23 percent to 27 percent. Similarly, the commercial sector's share rose from 12 percent to 14 percent. The amount of natural gas used as pipeline fuel (transportation use) declined somewhat faster than did total consumption of natural gas and, in 1986, accounted for a 3-percent share.

The 1986 low point in natural gas consumption was followed by 3 consecutive years of growth. Consumption in 1987 totaled 17 trillion cubic feet and rose 5 percent in 1988 to 18 trillion cubic feet. Although consumption at electric utilities and for lease and plant fuel declined in 1988, consumption by all other end-use sectors increased. Severe weather conditions—an unusually cold winter and extremely hot summer—boosted demand in the residential and commercial sectors and growth in manufacturing output was accompanied by an increase in demand by the industrial sector in 1988. In 1989, consumption rose to 19 trillion cubic feet. In 1990, natural gas consumption remained at 19 trillion cubic feet. Mild weather in the first and fourth quarters of the year restrained residential and commercial demand. Lower consumption in those two sectors offset higher consumption in the industrial sector, where switching from higher priced residual fuel oil occurred.

Natural Gas Production and Productivity

In 1990, gross withdrawals of natural gas totaled 21 trillion cubic feet, up slightly from the year before but considerably below the level during the early 1970's, when withdrawals averaged 24 trillion cubic feet per year (74). Texas, Louisiana, and Oklahoma, the largest producers of natural gas, accounted for 68 percent of the U.S. total (76). Most withdrawals came from onshore wells and State offshore wells, but 5 trillion cubic feet (close to one-fourth of the total) were Federal offshore withdrawals. The 21 trillion cubic feet of gross withdrawals in 1990 yielded 18 trillion cubic feet of marketed production (74). Reservoir repressuring, removal of nonhydrocarbon gases, and venting and flaring accounted for 3 trillion cubic feet.

The U.S. total of natural gas gross withdrawals includes a small amount of methane produced from coalbeds. In 1989, gross withdrawals of

coalbed methane from 1,445 wells surpassed 91 billion cubic feet, compared with about 41 billion cubic feet from 730 wells in 1988.⁴ Most of the coalbed methane produced in 1989 came from the San Juan Basin in Colorado and New Mexico and the Black Warrior Basin in Alabama. It accounted for about 0.5 percent of the U.S. total.

About 265 thousand gas wells were in operation during 1990 (76). Withdrawals from those wells accounted for three-fourths of all gross withdrawals, while oil wells supplied the remainder (74). After peaking at 435 thousand cubic feet per day in 1971 (76), average gas well productivity declined. Although productivity rose 4 percent from 1983 to 1984 to 181 thousand feet per day, thereafter productivity remained below 165 thousand feet per day. The lower productivity of the 1985-to-1990 period is attributable to excess production capacity. During that period, new wells were added at a slower rate and, because older wells tend to produce less, the average production per well declined. Excess capacity also influenced producers to produce less natural gas overall, further lowering productivity.

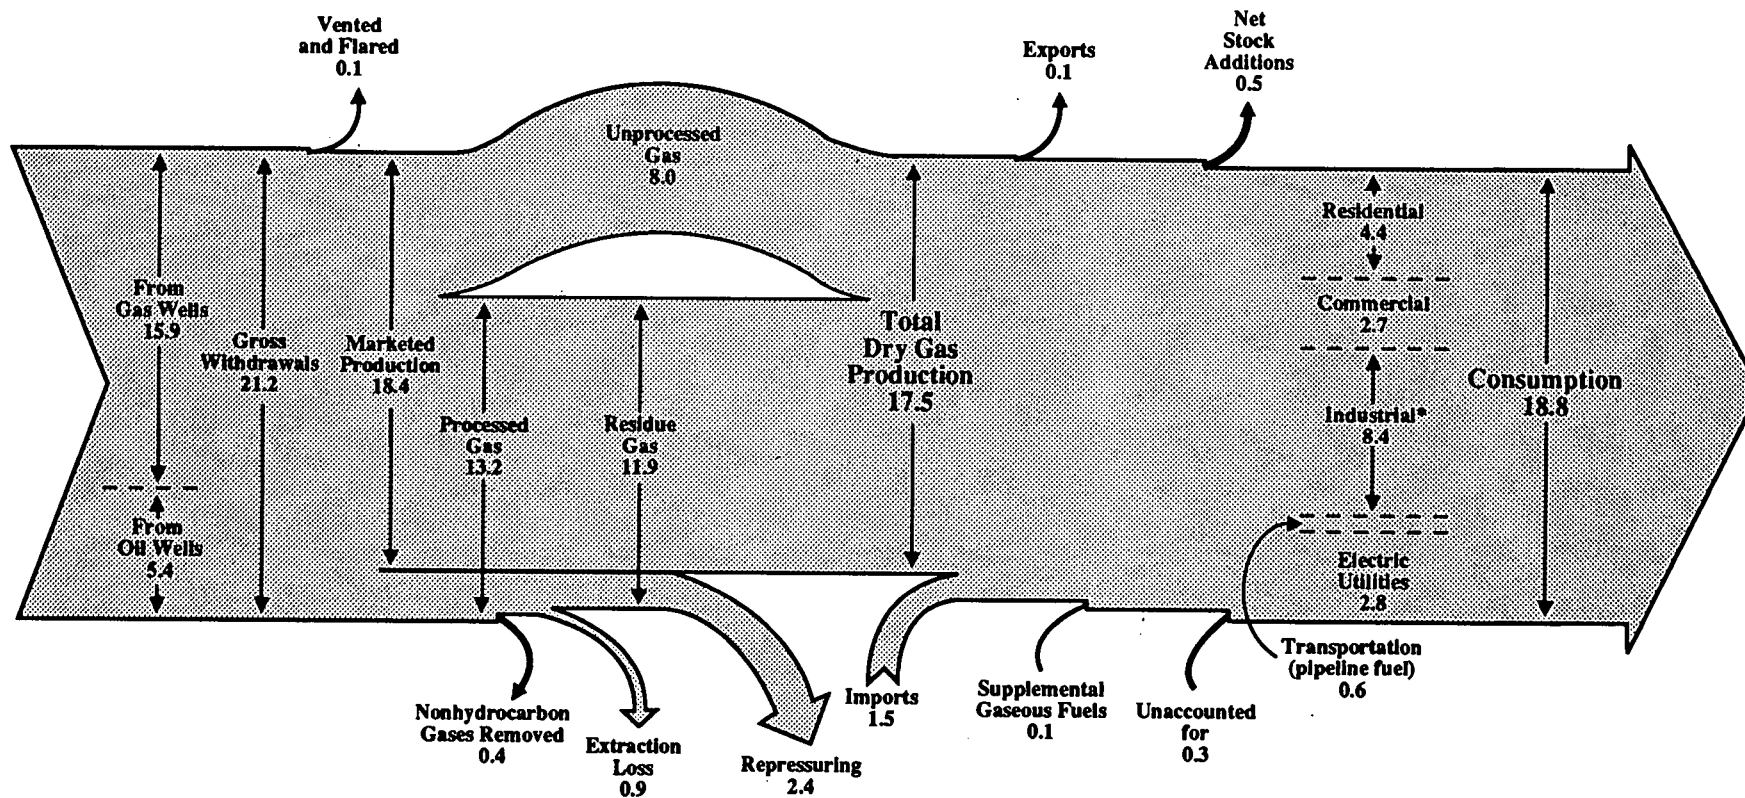

Imports and Exports

U.S. natural gas trade was limited to the border countries of Mexico and Canada until shipping natural gas in liquefied form emerged as an alternative to pipelines. In 1969, the first shipments of liquefied natural gas (LNG) were sent to Japan, and U.S. imports from Algeria began the following year (75). In 1990, U.S. net imports of natural gas by all routes totaled 1.4 trillion cubic feet, up 10 percent from 1989 net imports and the equivalent of 7.5 percent of domestic consumption, up from 6.8 percent in 1989.

Historically, Canada has been the major supplier of U.S. natural gas imports, with Algeria supplying smaller amounts. In 1990, Canada supplied net imports of 1.4 trillion cubic feet and Algeria supplied 79 billion cubic feet. Since 1970, Japan has displaced both Canada and Mexico as the primary purchaser of U.S. natural gas. In 1990, shipments of liquefied natural gas from Alaska to Japan totaled 48 billion cubic feet.

¹ Net imports = imports minus exports.

² Imports from Algeria and exports to Japan are liquefied natural gas.

³ Less than 0.5 billion cubic feet.

⁴ Not meaningful because there were net exports during this year.

⁵ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

Note: Sum of components may not equal total due to independent rounding.

7. Coal

Prices

In 1975, the average real price¹ of bituminous coal and lignite at the minemouth peaked at \$32.43 per short ton, and the average real price of anthracite peaked at \$54.40 per short ton (88).² After 1975, both prices declined, falling to \$16.73 per short ton of bituminous coal and lignite and to \$32.70 per short ton of anthracite in 1990.

The average real price of coal delivered to electric utilities declined during the 1950's and 1960's (88). However, when prices of other fossil fuels rose rapidly after 1973, coal prices also increased, from \$18.20 per short ton in 1973 to \$28.63 per short ton the following year. (Despite that increase, coal remained the least expensive fossil fuel, on a Btu basis.) The price of coal gradually rose after 1974, peaking at \$34.91 per short ton in 1982, and then declined each year through 1990, by which time the price had fallen to \$23.14.

Changing Patterns of Coal Production

Bituminous coal accounts for by far the largest share of all coal production. In 1990, production of all types of coal totaled over 1 billion short tons, of which 943 million were bituminous and subbituminous coal (82). Lignite and anthracite accounted for the remainder. Despite its superior burning qualities, anthracite, mined in northeastern Pennsylvania, accounts for a diminishing share of total coal production. In 1949, anthracite accounted for 9 percent of the total; by 1990, its share had shrunk to less than one-half of 1 percent.

More coal is mined east of the Mississippi than in the West, but the West's share of total production increased almost every year after 1965. That year, production of western coal was 27 million short tons,

¹Real prices are expressed in 1982 dollars.

²Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

5 percent of the total. By 1990, western production had increased by almost 15 times, to 401 million short tons—39 percent of the total. The growth in western coal was due in part to environmental concerns that led to increased demand for low-sulfur coal, which is concentrated in the West. In addition, surface mining, with its higher average productivity, is much more prevalent in the West.

Domestic Markets: Changes in Coal End Use

Electric utilities are the dominant consumers of coal (83). Their consumption grew from 84 million short tons, a 17-percent share, in 1949, to 772 million short tons, an 86-percent share, in 1990.

The Peak in Productivity

The average productivity of all types of mines in the United States increased each year after 1949, reaching 2.4 short tons per miner hour in 1969 (86). Productivity during the 1970's and early 1980's was lower, primarily due to the coal industry's compliance with the Federal Coal Mine Health and Safety Act of 1969, as well as to environmental concerns and other factors.

The growing importance of surface coal mining, where productivity is generally higher than for underground mining, led to increases in average productivity during the 1980's. In 1989, average productivity reached an all-time high of 3.7 short tons per miner hour. That year, productivity of underground mines (excluding anthracite) was 2.5 short tons per miner hour and productivity of surface mines (excluding anthracite) was 5.7 short tons per miner hour.

In contrast, consumption by all other economic sectors in 1990 was lower than it had been in 1949. The most dramatic declines occurred in the transportation sector, where railroads switched to petroleum, and the residential and commercial sector. In 1949, those two sectors accounted for 187 million short tons, 39 percent of total coal consumption. By 1990, their consumption totaled 6 million short tons, less than 1 percent of U.S. consumption.

Consumption by the industrial sector, including coke plants, trended downward after the mid-1960's. From 205 million short tons in 1966, industrial consumption fell to about 112 million short tons in 1986 and 1987. In 1988 and 1989, growth in manufacturing activity was accompanied by a modest increase in industrial consumption, which rose to 118 million short tons in those 2 years. In 1990, the economic slowdown tended to restrain industrial demand for coal, and industrial consumption declined to 115 million short tons.

Foreign Markets

Since World War II, coal has been the United States' major energy export (5). Throughout most of the 1960's and 1970's, U.S. exports of coal increased, peaking at 113 million short tons in 1981 (84). Increased shipments to Canada and Japan and to European markets contributed to the growth.

The level of U.S. coal exports fluctuated throughout the 1980's, falling as low as 78 million short tons in 1983 but attaining 95 million short tons in 1988. That year, difficulties experienced by competing countries (particularly China, Australia, and Poland) allowed the United States to

recapture some export markets. In 1989, coal exports increased 6 percent to 101 million short tons, and in 1990, they increased 5 percent to 106 million short tons.

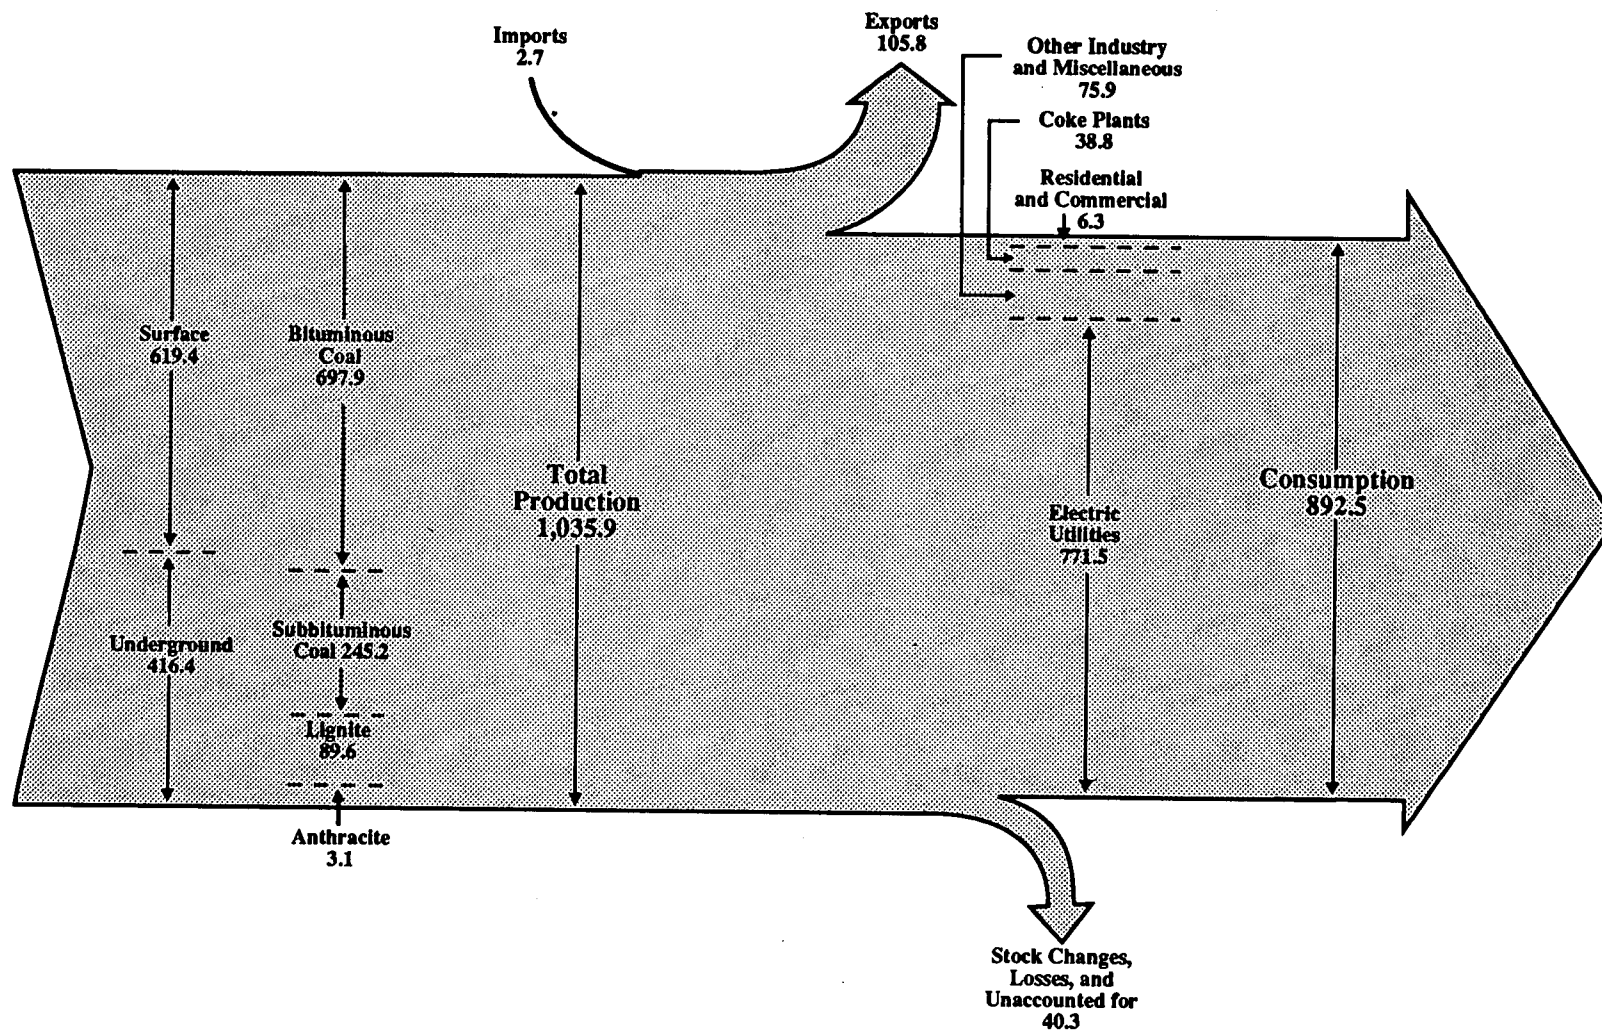

Canada, Japan, and Italy remained the three largest markets for U.S. coal and together accounted for 38 percent of total coal exports in 1990 (84). However, Japan's 1990 purchases were not much more than half those of 1981, and U.S. exports to France, West Germany, and Spain also were down markedly compared with 1981 levels.

Stocks

Although there is little seasonal variation in demand, production of coal can vary considerably due to factors such as coal miners' strikes and bad weather. To compensate for possible supply interruptions, coal producers and distributors, as well as major consumers such as electric utilities and coke plants, generally maintain large stockpiles. For example, in 1980 coal stocks were built up to a year-end total of 228 million short tons (85) and then drawn down to augment supplies during the 1981 miners' strike. Despite stockpiling during the second half of the year, after the strike had ended, 1981 year-end stocks totaled 209 million short tons, 19 million short tons below the level at the end of the previous year.

At the end of 1990, coal stocks totaled 199 million short tons. Electric utilities held over three-fourths of the coal, and coal producers and distributors held most of the remainder. Stocks at coke plants and other industrial sites were relatively small.

¹ Data for bituminous coal and lignite mines 1949 through 1973 and anthracite mines 1949 through 1978 were originally reported in short tons per miner-day. The data were converted to short-tons per miner hour by assuming an eight-hour day. All remaining data were calculated by dividing total production by total labor hours worked by all mine employees except office workers.

² Includes subbituminous coal.

8. Electricity

Measuring Electricity Generation

Electricity generation is measured and recorded in kilowatt-hours. Theoretically, a 1,000-kilowatt generator operating at maximum capacity for 1 year would produce 8,760,000 kilowatt-hours of electricity (1,000 kilowatts times 24 hours per day times 365 days per year). However, generators require maintenance and therefore cannot operate continuously. In addition, electricity demand varies both daily and seasonally, so that continuous operation of all generators is not necessary to meet demand. Electric utilities rely on "baseload" generating plants, usually conventional steam, nuclear, and large hydroelectric plants, to satisfy steady demand. Gas turbine, internal combustion, and other hydroelectric plants are generally used to satisfy peak demand. Those "peaking" plants are used only during relatively short periods of high demand.

Generating Capacity

One measure of generating capacity is net summer capability, which is the steady hourly output that generating equipment is expected to supply to the system load, exclusive of auxiliary power, as demonstrated by testing at the time of summer peak demand. Although data on net summer capability have been collected only since 1985, the Energy Information Administration has estimated values for prior years (95).¹ Estimates and collected data indicate that generating capability during the 1949-to-1990 period increased at an average annual rate of 6.0 percent.

Conventional steam plants, fueled by fossil fuels, wood, and waste, were responsible for most of the growth. In 1990, they accounted for close to

¹Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

two-thirds of total generation capacity. Nuclear-powered plants accounted for 14 percent and hydroelectric facilities accounted for 13 percent of the total in 1990. Internal combustion and gas turbine plants, as well as plants powered by emerging sources of energy such as geothermal, accounted for the remainder.

Net Generation by Source and Prime Mover

Net generation of electricity by electric utilities in 1990 reached 2.8 trillion kilowatt-hours, up 1 percent from the 1989 level (90). Fossil fuels, particularly coal, continued to fuel most of the generation in 1990 (90). Coal accounted for 1.6 trillion kilowatt-hours, and natural gas accounted for 263 billion kilowatt-hours. The rise in petroleum prices in 1990 led to a sharp decline (26 percent) in petroleum-fired generation, which fell to 117 billion kilowatt-hours for the year.

Nuclear-based generation surpassed its previous-year level for the tenth consecutive year, reaching an all-time high in 1990 of 577 billion kilowatt-hours. Hydroelectric generation reached 280 billion kilowatt-hours, up 6 percent from generation in 1989. Geothermal and other alternative energy sources accounted for 11 billion kilowatt-hours.

Fossil-fueled steam generators, consistently the major source of electricity, provided 68 percent of net generation in 1990 (91). Nuclear, hydroelectric, geothermal, and other generators powered by renewables supplied 31 percent. Internal combustion and gas turbine generators, usually reserved for meeting peak demand, supplied 1 percent of net generation.

Fossil Fuel Consumption

During the 1949-to-1990 period, consumption of coal at electric utilities grew at a faster rate than did consumption of natural gas and petroleum (93). On a Btu basis, coal accounted for 67 percent of total fossil fuel consumption in 1949 and 80 percent of the total in 1990. Electric utility consumption of both petroleum and natural gas increased during most of the 1949-to-1990 period, but growth in the use of both fuels began to

slow during the 1970's and, during the first half of the 1980's, consumption actually decreased.

Changes in the consumption of petroleum and natural gas at electric utilities in 1986 through 1988 were particularly illustrative of the utilities' fuel-switching capabilities and their use of them to respond to fluctuations in fuel prices. In 1986, when petroleum prices fell dramatically, petroleum consumption at electric utilities rose 0.36 quadrillion Btu, while natural gas consumption fell 0.47 quadrillion Btu. When petroleum prices recovered somewhat in 1987, electric utilities scaled back consumption of petroleum by 0.19 quadrillion Btu while increasing natural gas consumption by 0.25 quadrillion Btu. In response to the 1988 decline in petroleum prices, electric utilities increased petroleum consumption by 0.30 quadrillion Btu and consumed 0.23 quadrillion Btu less of natural gas.

In 1990, coal accounted for 16 quadrillion Btu of electric utility consumption of fossil fuels. By comparison, natural gas accounted for 3 quadrillion Btu and petroleum accounted for 1 quadrillion Btu.

Emissions and Environmental Equipment at Electric Utilities

The growth in electric utility consumption of fossil fuels was accompanied by increases in the emission of the products of fossil fuel combustion. From 1985 to 1989, consumption of fossil fuels to generate electricity increased 9 percent (93). During the same period, emissions of carbon dioxide from fossil-fueled steam-electric generating units rose 11 percent to 2 billion short tons, and nitrogen oxide emissions rose 8 percent to 7 million short tons (98). In contrast, sulfur dioxide emissions rose only 3 percent, to 17 million short tons. Most emissions, particularly sulfur dioxide, were attributable to coal combustion. Coal accounted for 78 percent of fossil fuels consumed at electric utilities in 1989 (93), but 95 percent of sulfur dioxide emissions.

Sulfur dioxide emissions from coal combustion can be controlled through the use of coal with a lower sulfur content and through the use of scrubbers (flue gas desulfurization units). From 1985 through 1989, the amount of coal-fired capacity equipped with scrubbers increased 14 percent to 69 million kilowatts (99). Coal is also the principal source of ash, which can be prevented from reaching the atmosphere by the use of particulate collectors. Almost all coal-fired capacity (313 million kilowatts) was equipped with particulate collectors in 1989.

Only about one-third of the heat generated by fossil-fueled steam-electric generating units is used to produce electricity. The remaining heat generally is dissipated in cooling water, but in areas where that is not

workable (either because of a lack of cooling water or adverse effects on plant and marine life), cooling towers can be installed. Over the 1985-to-1989 period, the amount of fossil-fueled capacity equipped with cooling towers rose 7 percent to 175 million kilowatts.

Sales to Consumers

From 1949 through 1990, electricity sales increased at an average annual rate of 5.9 percent (94). Annual sales declined only twice, during the economic recessions of 1974 and 1982. In 1974, the decline in sales spanned all sectors, whereas in 1982, lower sales to the industrial sector alone accounted for the decline. During the latter part of the period, growth in electricity sales slowed. From 1980 through 1990, sales increased at an average annual rate of 2.6 percent.

Throughout the 1949-to-1990 period, sales of electricity to the industrial sector exceeded sales to other sectors. In 1990, sales to all sectors combined rose 2 percent from the 1989 level to 2.7 trillion kilowatt-hours. Due in part to the economic slowdown, the industrial sector registered the lowest rate of growth, 1.3 percent. Electricity sales to the residential and commercial sectors rose 1.8 percent and 3.7 percent, respectively.

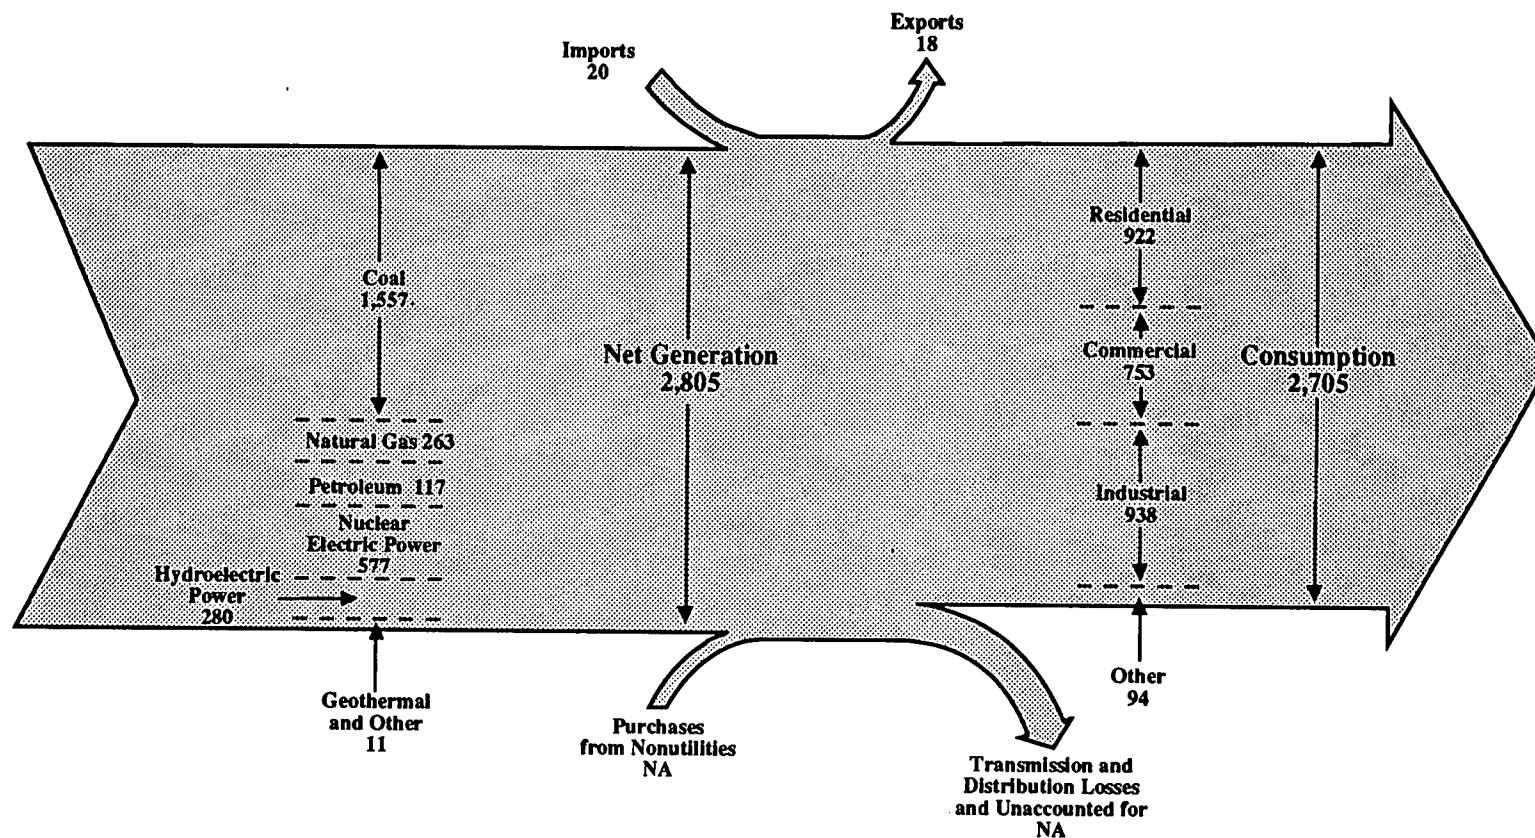

Retail Prices of Electricity

The weighted average real price² of electricity to all sectors in 1990 was 5.0 cents per kilowatthour, 14 percent below the price in 1960 (100). However, the apparent stability in electricity prices masked fluctuations that occurred throughout the period and variations in prices paid by consumers in different end-use sectors. And, although prices of the other major energy sources increased significantly during the 31-year period, electricity remained by far the most expensive source of energy on a Btu basis.

The average real price of electricity sold to the residential sector, where prices have usually been the highest, was 5.9 cents per kilowatthour in 1990, 2 percent below the price in 1989. The commercial sector also experienced a decrease, in real terms, of 2 percent, as the price declined to 5.6 cents per kilowatthour in 1990. Meanwhile, industrial customers continued to pay prices favorable compared with prices in other sectors. In 1990, the real price of electricity sold to industrial users was 3.6 cents per kilowatthour, a decrease, in real terms, of 3 percent.

²Real prices are expressed in 1982 dollars.

¹ See Appendix E, Note 14. ² See Appendix E, Note 1. ³ Electricity purchased from nonutility sources, including cogenerators, small power producers, and other nonutility power producing establishments. ⁴ Electricity transmitted across U.S. borders with Canada and Mexico. ⁵ Balancing item, mainly transmission and distribution losses. ⁶ Less than 0.5 billion kilowatthours. ⁷ Consumption data are revised using the Form EIA-861, "Annual Electric Utility Report," and differ from the Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," data published in previous issues of this publication. Purchases from nonutilities data are also revised for 1986 through 1988 using the Form EIA-861 and differ from the Form FERC-1, "Annual Report of Major Electric Utilities, Licensees and Others," data published in previous issues. Data on losses are modified due to revisions in data for consumption and purchases from nonutilities. ⁸ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications. NA = Not available. Note: Sum of components may not equal total due to independent rounding. Sources: Net Generation: See Table 90. Purchases from Nonutilities: •1978 through 1985—Federal Energy Regulatory Commission, Form FERC-1, "Annual Report of Major Electric Utilities, Licensees and Others." •1986 and forward—Energy Information Administration, Form EIA-861, "Annual Electric Utility Report." Imports and Exports: •1949 through September 1977—unpublished Federal Power Commission data. •October 1977 through 1980—unpublished Economic Regulatory Administration (ERA) data. •1981—Office of Energy Emergency Operations, "Report on Electric Energy Exchanges with Canada and Mexico for Calendar Year 1981." April 1982 (revised June 1982). •1982 and 1983—ERA, *Electricity Exchanges Across International Borders*. •1984 through 1986—ERA, *Electricity Transactions Across International Borders*. •1987 and 1988—ERA, Form ERA-781R, "Annual Report of International Electrical Export/Import Data." •1989—Fossil Energy, Form FE-781R, "Annual Report of International Electrical Export/Import Data." •1990—EIA estimates based on preliminary data from the National Energy Board of Canada and Department of Energy, Fossil Energy. Consumption: See Table 94.

¹ See Appendix E, Note 14.

² These data are petroleum consumed by electric utilities and do not equate to petroleum supplied to (or delivered to) electric utilities. Included are residual fuel oil (including crude oil burned as fuel), distillate fuel oil, jet fuel, and petroleum coke, which is reported in short tons, and has been converted to barrels at a rate of 5 barrels per short ton.

³ Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

Note: Sum of components may not equal total due to independent rounding.

9. Nuclear Energy

Status of Nuclear Generating Units

At the end of 1990, there were 111 operable nuclear generating units in the United States (101).¹ Most of the units were located in the eastern half of the country. In addition, 8 units had received construction permits. No units had construction permits pending and there were no units on order.

Although the number of operable units reached an all-time high in 1990, the total of 119 units in all stages of planning, construction, and operation was well below the total of 236 in 1975.² After 1975, many planned units were canceled; after 1978, no orders for new units were announced.

Several factors contributed to the decline in the number of planned nuclear units. Growth in electricity demand was slower than expected. Longer leadtimes for licensing and construction coupled with higher financing expenses increased the cost of nuclear power plants, and rising interest rates and an uncertain economic environment further eroded electric utilities' willingness to commission new plants.

Contributions to Electricity Net Generation

Nuclear power's contribution to electricity net generation in the United States increased almost every year from the mid-1960's through 1990; the exceptions were 1979 and 1980 (102). In 1990, 577 billion kilowatt-hours (21 percent of all U.S. net generation) came from nuclear power. Net summer capability, a measure of the steady hourly output that generating equipment is expected to supply to the system, also increased almost every year, reaching 100 million kilowatts by 1990.

¹Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

²Energy Information Administration, *Monthly Energy Review* March 1991, DOE/EIA-0035(91/03) (Washington, DC, March 1991), Table 8.2.

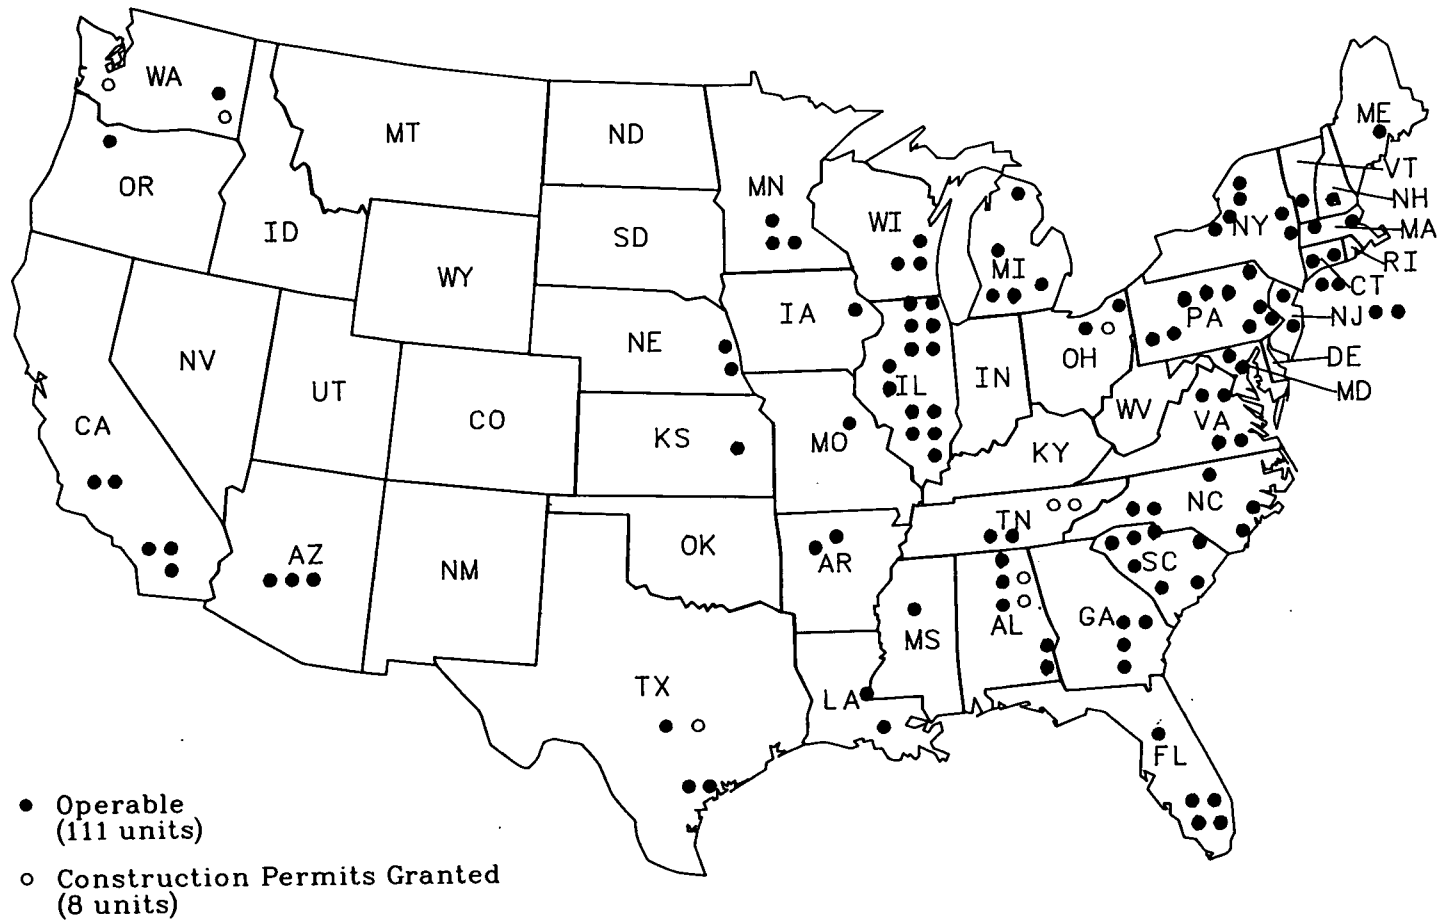

The Uranium Industry

From 1949 through 1967, the Atomic Energy Commission (AEC) was the major purchaser of uranium. The AEC's demand for uranium for military purposes was strong during the 1950's and domestic production, spurred by AEC incentives, grew from 0.4 million pounds of uranium oxide (U₃O₈) in 1949 to 35 million pounds in 1960 (103). As the AEC began to accumulate stockpiles, its purchases declined and U.S. production fell to 21 million pounds in 1965.

From 1966 through 1976, production fluctuated between 21 and 27 million pounds. Subsequently, orders for new nuclear plants led to strong growth, and production peaked at 44 million pounds in 1980. However, plant cancellations and postponements during the late 1970's led to a decline in projected demand and, coupled with buildups of inventories at electric utilities and foreign competition, caused the second major decline in production, which fell to 11 million pounds in 1985. In 1990, production fell to 9 million pounds.

Historically, domestic producers have faced competition from low-cost uranium imports. From 1949 through 1960, net imports actually exceeded domestic production (103). In 1966, the AEC effectively suspended imports by curtailing enrichment services for foreign uranium intended for use in domestic facilities, and no uranium was imported from 1968 through 1974. With the gradual removal of the AEC restrictions during the 1977-to-1983 period, foreign uranium deliveries to the United States increased. In 1989, net imports of U₃O₈ totaled 11 million pounds.

¹ Includes one gas-cooled reactor.

² High-temperature gas-cooled reactor.

³ Units that have received a full-power license from the Nuclear Regulatory Commission, which includes the Hanford-N reactor for 1986 and 1987. Hanford-N, an unlicensed unit used for defense material production, was included in the operable category because power was produced as a by-product and sold commercially. The Hanford-N reactor was placed in a cold standby status by the U.S. Department of Energy in February 1988 and, consequently, is not included in the 1988 total. The Three Mile Island-2 reactor retains an operating license; however, there are no plans to resume operation of the unit, and it also is omitted from the 1988 total.

⁴ Units that have received a low-power license from the Nuclear Regulatory Commission authorizing fuel loading and low-power testing.

Sources: Compiled by the Energy Information Administration from Nuclear Regulatory Commission sources.

¹ Import quantities through 1970 are reported for fiscal years. Prior to 1968 the Atomic Energy Commission was the sole purchaser of all imported U₃O₈.
² Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.
 NA = Not available.

Note: Import and export data prior to 1982 are for transactions conducted by uranium suppliers only. For 1982 forward, transactions by uranium buyers (consumers) are included. In 1983, buyer imports totalled 3,800 million pounds of U₃O₈ and buyer exports totalled 1,000 million pounds of U₃O₈. Buyer imports and exports prior to 1982 are believed to be small.

10. Renewable Energy

Emerging Sources of Renewable Energy

After World War II, the United States relied on petroleum, natural gas, and coal, which, in addition to having high Btu contents, were inexpensive, readily accessible, and easy to transport. During the early 1970's, however, increases in the prices of petroleum and natural gas, coupled with concerns about the stability of supply, stimulated interest in alternative sources of energy. Some sources of renewable energy lend themselves to onsite applications such as the burning of wood for heat and the use of flat-plate solar thermal collectors for domestic hot water. Other sources, such as photovoltaics, can be used to generate electricity for transmission to distant markets. Although other sources with the potential for centralized applications, such as windmills, heliostats, and ocean thermal energy conversion, are not yet widely used, they may eventually contribute significantly to the domestic energy supply.

Renewable Energy Consumption

In 1990, electric utilities and other consumers reported 3.2 quadrillion Btu of renewable energy consumption, most of which was hydroelectric power (104).¹ Additional renewable energy consumption estimates of about 3.6 quadrillion Btu per year consisted primarily of non-electric utility use of biofuels such as wood, waste, and alcohol fuels. When U.S. total energy consumption is adjusted by the addition of the estimates, total renewable energy consumption accounted for an 8-percent share.

¹Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

Wood and Other Biofuels

Energy derived from wood totaled 2.5 quadrillion Btu (105) in 1989. Almost 1.6 quadrillion Btu of wood was consumed by the industrial sector. Industries with ready access to wood and wood byproducts, such as the paper and lumber industries, relied heavily on wood as an energy source. Energy derived from other biofuels, such as agricultural and solid wastes and alcohol fuels, totaled 0.4 quadrillion Btu in 1989.

Solar Energy

Solar energy is an inexhaustible, universally available source of energy. Converting solar energy to useful forms, however, requires large collection areas, and therefore the amount that can be harnessed is limited. Producer shipments of equipment are used as one measure of solar energy consumption. Shipments of low-temperature collectors, used primarily for heating swimming pools, peaked at 12 million square feet in 1980 but totaled only 4.3 million square feet in 1989 (107). Shipments of medium-temperature, special, and other collectors, used primarily for domestic hot water, peaked at 12 million square feet in 1983 and 1984 but, following the expiration of the Federal energy tax credit in 1985, fell to 0.7 million square feet in 1988. In 1989, 2 million square feet were shipped. Shipments of photovoltaic modules totaled 13 thousand peak kilowatts in 1989 (109).

Geothermal Energy

Most geothermal energy is trapped below the Earth's crust in layers of molten rock, but where the crust is thinner, geothermal energy can be harnessed. Geothermal energy may be used directly, for purposes such as space heating, or converted to electricity. In 1960, The Geysers in California became the first U.S. utility to generate electricity from geothermal steam. Subsequently, electricity generation from geothermal sources trended upward and peaked at 10.8 billion kilowatthours of electricity in 1987 (110). From 1988 to 1990, however, electricity generation from geothermal sources declined, falling to 8.6 billion kilowatthours in 1990.

11. International Energy

Fluctuations in Petroleum Prices and Demand

The expanding post-World War II petroleum market reached 57 million barrels per day in 1973 (119).¹ At that point, oil-producing nations became able, for the first time, to exploit the relative inelasticity of petroleum demand in the short term by raising prices substantially. In response, petroleum consumption dipped for 2 years before resuming its climb to 65 million barrels per day in 1979.

A steep price hike in 1979-1980 combined with the longer-term effects of conservation, fuel switching, and increased efficiency began to curb consumption, even as the higher prices stimulated new sources of production. World petroleum consumption had fallen to 59 million barrels per day in 1983 when lowered demand and excess production began to erode the price of oil. In 1986, the price of crude oil plunged 46 percent.² Prices stayed low in the second half of the 1980's and petroleum consumption reached an all-time high of 66 million barrels per day in 1989. Crude oil prices rebounded, however, following the Iraqi invasion of Kuwait in August 1990.

Throughout the 1949-1989 period, the United States consumed more petroleum by far than any other country. In 1989, U.S. consumption accounted for 46 percent of the 38 million barrels per day consumed by the Organization for Economic Cooperation and Development (OECD) countries. Japan consumed 5 million barrels per day. Of the non-OECD countries, the U.S.S.R. was the biggest consumer, accounting for 9 million barrels per day.

Energy Production by Source

World production of crude oil totaled 60 million barrels per day in 1990, up 1 percent from the 1989 level (114). Production gains in Saudi Arabia and elsewhere more than offset production declines in the U.S.S.R.,

¹Numbers in parentheses indicate related tables. Annual data are the most recent available; they frequently are preliminary and may be revised in future publications.

²The composite refiner acquisition cost per barrel of crude oil fell from \$26.75 in 1985 to \$14.55 in 1986 (70).

Iraq, and the United States. The Organization of Petroleum Exporting Countries (OPEC) accounted for 39 percent, and the U.S.S.R. and the United States, combined, for 30 percent of world production.

In 1989, the U.S.S.R. and the United States were the major producers of dry natural gas (121). Together, they accounted for 45 trillion cubic feet out of the world total of 72 trillion cubic feet.

At 5.2 billion short tons in 1989, coal production was unchanged from the 1988 level (125). China, the leading producer, accounted for 1.1 billion short tons in 1989. The United States, the second leading producer, mined 980 million short tons.

In 1990, nuclear-based electricity gross generation by reporting countries totaled 1.7 trillion kilowatthours (129). The U.S. share of the world total rose to 35 percent. France accounted for 18 percent, Japan for 11 percent, and West Germany for 9 percent of the world total.

World Leaders in Energy Production

Worldwide energy production of 338 quadrillion Btu in 1989 was 50 quadrillion Btu greater than in 1979 (111). The U.S.S.R. accounted for 16 quadrillion Btu of the world increase and, in 1986, the U.S.S.R.'s production (66 quadrillion Btu) surpassed U.S. production (64 quadrillion Btu) for the first time. China contributed almost 9 quadrillion Btu to the increase in world supply and, in 1982, became the third largest energy producer.

In contrast, Middle Eastern countries cut back production of energy (primarily petroleum) from 49 quadrillion Btu in 1979 to 26 quadrillion Btu in 1985 in an effort to regain control of world oil markets. Saudi Arabia registered a substantial decline, from 21 quadrillion Btu in 1979 to 9 quadrillion Btu in 1985, before increasing production in an attempt to regain market share.

¹ Prices are usually free on board (f.o.b.) at the foreign port of lading. Prices for the period mid-1974 forward are official selling prices.

² As of January 1, except in 1987, when prices are as of February 1 (see Note below).

³ Prices for 1974 and 1975 are for 40 degrees API gravity. Prices for 1980 include \$4.72 in retroactive charges and market premiums.

⁴ Prices from 1977 forward include 2 cents per barrel harbor dues.

⁵ 1970 through 1985—26° API; 1986 and forward—31° API.

⁶ Mexico does not post official crude oil prices. Prices are formula-determined for each contract. For example, the prices given here are for f.o.b. deliveries to Houston, Texas. They are based on a variety of U.S. domestic crude oil postings and on quotations for fuel oil imports into U.S. Gulf of Mexico ports.

⁷ The United Kingdom does not post official crude oil prices. Prices for 1979 through 1984 are estimated long-term contract prices; prices for 1985 and forward are contractual arrangements based on spot market quotations.

^{*} Price for 1980 includes \$1.87 market premiums and credit charges.

NA = Not available.

Note: The Organization of Petroleum Exporting Countries (OPEC) adopted major changes in their crude oil pricing system at the beginning of 1986. The primary result of these changes was a switch from official prices to netback arrangements and spot crude oil sales for the January 1986 through January 1987 time period. On February 1, 1987, official contract prices were again being used by OPEC as their primary pricing mechanism. However, subsequently in 1987 all OPEC producers moved to spot crude oil sales as a basis for their crude oil pricing systems. Spot market related pricing continued through 1990 and into 1991.

¹ World Energy Council estimates are as of the end of 1987. British Petroleum estimates are as of the end of 1989. ² In World Energy Council data, subbituminous coal is included in the anthracite and bituminous coal category; in the British Petroleum data, subbituminous coal is included in the lignite category. ³ World Energy Council definition of "Proved Recoverable Reserves": The tonnage of Proved Amount in Place that can be recovered (extracted from the earth in raw form) under present and expected local economic conditions with existing available technology. Data are from the 1989 Survey of Energy Resources. ⁴ British Petroleum definition of "Proved Reserves": Proved reserves of coal are generally taken to be those quantities which geological and engineering information indicate with reasonable certainty can be recovered in the future from known deposits under existing economic and operating conditions. Data are from the BP Statistical Review of World Energy (June 1990). ⁵ U.S. data are from Energy Information Administration (EIA), Estimation of U.S. Coal Reserves by Coal Type (October 1989) and include 125,625 million tons of bituminous and 106,770 million short tons of subbituminous coal. Estimates of recoverable reserves of anthracite and certain other U.S. coal deposits are not available. — = Not applicable. Note: Sum of components may not equal total due to independent rounding. The EIA does not certify the international reserves data but reproduces the information as a matter of convenience for the reader. Comparisons between sources for both the anthracite and bituminous coal category and the lignite category require careful interpretation because of the different definitional groupings for subbituminous coal. Source: EIA, International Energy Annual 1989 (February 1991), Table 36.

Appendix A. Thermal Conversion Factors

Using Thermal Conversion Factors

The thermal conversion factors presented in the following seven tables can be used to estimate the heat content in British thermal units¹ (Btu) of a given amount of energy measured in physical units such as barrels or cubic feet. For example, 10 barrels of asphalt has a heat content of approximately 66.36 million Btu (10 barrels X 6.636 million Btu/barrel = 66.36 million Btu).

In general, the annual thermal conversion factors presented in Tables A2 through A7 are computed from final annual data. However, if the current year's final data are not available in time for publication, thermal conversion factors for the current year are computed from the best available data and are labeled "preliminary." The source of each factor is described in a section entitled "Thermal Conversion Factor Source Documentation," which follows Table A7 in this appendix.

Thermal conversion factors for hydrocarbon mixes are weighted averages of the thermal conversion factors for each hydrocarbon included in the mix. For example, in calculating the thermal conversion factor for a 60/40 butane/propane mixture, the thermal conversion factor for butane is weighted 1.5 times more heavily than the thermal conversion factor for propane.

¹More information about British thermal units—the standardized unit of measure for energy—can be found in Appendix B, "Energy Units in Perspective," and in the Glossary.

Table A1. Approximate Heat Content of Petroleum Products and Wood

Energy Source	Heat Content
	Million Btu per Barrel
Asphalt	6.636
Aviation Gasoline	5.048
Butane.....	4.326
Butane-Propane Mixture (60 percent/40 percent)	4.130
Distillate Fuel Oil	5.825
Ethane.....	3.082
Ethane-Propane Mixture (70 percent/30 percent)	3.308
Isobutane	3.974
Jet Fuel, Kerosene Type.....	5.670
Jet Fuel, Naphtha Type	5.355

¹ This is used as the thermal conversion factor for hydroelectric power generation and for wood and waste, wind, photovoltaic, and solar thermal energy consumed at electric utilities.
² Previous-year data may have been revised. Current-year data are preliminary and may be revised in future publications.

— = Not applicable.
 Source: See "Thermal Conversion Factor Source Documentation," which follows this table.

Thermal Conversion Factor Source Documentation

Petroleum and Natural Gas Plant Liquids

Asphalt. Energy Information Administration (EIA) adopted the thermal conversion factor of 6.636 million British thermal units (Btu) per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Aviation Gasoline. EIA adopted the thermal conversion factor of 5.048 million Btu per barrel as adopted by the Bureau of Mines from the Texas Eastern Transmission Corporation publication *Competition and Growth in American Energy Markets 1947-1985*, 1968.

Butane. EIA adopted the Bureau of Mines thermal conversion factor of 4.326 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Butane-Propane Mixture. EIA adopted the Bureau of Mines calculation of 4.130 million Btu per barrel based on an assumed mixture of 60 percent butane and 40 percent propane. See "Butane" and "Propane." EIA use of this term ceased in 1983.

Crude Oil, Exports. Assumed by EIA to be 5.800 million Btu per barrel or equal to the thermal conversion factor for crude oil produced in the United States. See "Crude Oil and Lease Condensate, Production."

Crude Oil, Imports. Calculated annually by EIA by weighting the thermal conversion factor of each type of crude oil imported by the quantity imported. Thermal conversion factors for each type were calculated on a foreign country basis, by determining the average American Petroleum Institute (API) gravity of crude imported from each foreign country from Form ERA-60 in 1977 and converting average API gravity to average Btu content using National Bureau of Standards, Miscellaneous Publication No. 97, *Thermal Properties of Petroleum Products*, 1933.

Crude Oil and Lease Condensate, Production. EIA adopted the thermal conversion factor of 5.800 million Btu per barrel as reported in a Bureau of Mines internal memorandum *Bureau of Mines Standard Average Heating Values of Various Fuels, adopted January 3, 1950*.

Crude Oil and Petroleum Products, Exports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product exported and crude oil exported weighted by the quantity of each petroleum product and crude oil exported. See "Petroleum Products, Exports" and "Crude Oil, Exports."

Crude Oil and Petroleum Products, Imports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product and each crude oil imported weighted by the quantity of each petroleum product and each type of crude oil imported. See "Crude Oil, Imports" and "Petroleum Products, Imports."

Distillate Fuel Oil. EIA adopted the Bureau of Mines thermal conversion factor of 5.825 million Btu per barrel as reported in a Bureau of Mines internal memorandum, *Bureau of Mines Standard Average Heating Value of Various Fuels, adopted January 3, 1950*.

Ethane. EIA adopted the Bureau of Mines thermal conversion factor of 3.082 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Ethane-Propane Mixture. EIA calculation of 3.308 million Btu per barrel based on an assumed mixture of 70 percent ethane and 30 percent propane. See "Ethane" and "Propane." EIA use of this term ceased in 1983.

Isobutane. EIA adopted the Bureau of Mines thermal conversion factor of 3.974 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Jet Fuel, Kerosene Type. EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as published for "Jet Fuel, Commercial" by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985*, 1968.

Jet Fuel, Naphtha Type. EIA adopted the Bureau of Mines thermal conversion factor of 5.355 million Btu per barrel as published for "Jet

Fuel, Military” by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985*, 1968.

Kerosene. EIA adopted the Bureau of Mines thermal conversion factor of 5.670 million Btu per barrel as reported in a Bureau of Mines internal memorandum, *Bureau of Mines Standard Average Heating Values of Various Fuels*, adopted January 3, 1950.

Lubricants. EIA adopted the thermal conversion factor of 6.065 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Miscellaneous Products. EIA adopted the thermal conversion factor of 5.796 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Motor Gasoline. EIA adopted the Bureau of Mines thermal conversion factor of 5.253 million Btu per barrel as published for “Gasoline, Motor Fuel” by the Texas Eastern Transmission Corporation in the report *Competition and Growth in American Energy Markets 1947-1985*, 1968.

Natural Gasoline. EIA adopted the thermal conversion factor of 4.620 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*. EIA use of this term ceased in 1983.

Natural Gas Plant Liquids, Production. Calculated annually by EIA as the average of the thermal conversion factors of each natural gas plant liquid produced weighted by the quantity of each natural gas plant liquid produced.

Pentanes Plus. EIA assumed the thermal conversion factor to be 4.620 million Btu or equal to that for natural gasoline. See “Natural Gasoline.”

Petrochemical Feedstocks, Naphtha less than 401 °F. Assumed by EIA to be 5.248 million Btu per barrel, equal to the thermal conversion factor for special naphtha. See “Special Naphtha.”

Petrochemical Feedstocks, Other Oils equal to or greater than 401 °F. Assumed by EIA to be 5.825 million Btu per barrel, equal to the thermal conversion factor for distillate fuel oil. See “Distillate Fuel Oil.”

Petrochemical Feedstocks, Still Gas. Assumed by EIA to be 6.000 million Btu per barrel, equal to the thermal conversion factor for still gas. See “Still Gas.”

Petroleum Coke. EIA adopted the thermal conversion factor of 6.024 million Btu per barrel as reported in Btu per short ton in the Bureau of Mines internal memorandum *Bureau of Mines Standard Average Heating Value of Various Fuels*, adopted January 3, 1950. Bureau of Mines calculated this factor by dividing the 30,120,000 Btu per short ton as given in the referenced Bureau of Mines internal memorandum by 5.0 barrels per short ton as given in the Bureau of Mines Form 6-1300-M and successor EIA forms.

Petroleum Products, Consumption. Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed, weighted by the quantity of each petroleum product consumed.

Petroleum Products, Consumption by Electric Utilities. • 1949-1959: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed at electric utilities, weighted by the quantity of each petroleum product consumed at electric utilities. • 1960-1989: Calculated from the State Energy Data System as documented in the *State Energy Data Report, Consumption Estimates, 1960-1989*. • 1990: EIA, Integrated Modeling Data System output for the *Monthly Energy Review* (March 1991).

Petroleum Products, Consumption by Industrial Users. • 1949-1959: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed in the industrial sector, weighted by the estimated quantity of each petroleum product consumed in the industrial sector. • 1960-1989: Calculated from the State Energy Data System as documented in the *State Energy Data Report, Consumption Estimates, 1960-1989*. • 1990: EIA, Integrated Modeling Data System output for the *Monthly Energy Review* (March 1991).

Petroleum Products, Consumption by Residential and Commercial Users. • 1949-1959: Calculated annually by EIA as the average of the thermal conversion factors for all petroleum products consumed by the residential and commercial sector, weighted by the estimated quantity of each petroleum product consumed in the residential and commercial sector. • 1960-1989: Calculated from the State Energy Data System as documented in the *State Energy Data Report, Consumption Estimates, 1960-1989*. • 1990: EIA, Integrated Modeling Data System output for the *Monthly Energy Review* (March 1991).

Petroleum Products, Consumption by Transportation Users. • 1949-1959: Calculated annually by EIA as the average of the thermal conversion factor for all petroleum products consumed in the transporta-

tion sector, weighted by the estimated quantity of each petroleum product consumed in the transportation sector. • 1960–1989: Calculated from the State Energy Data System as documented in the *State Energy Data Report, Consumption Estimates, 1960–1989*. • 1990: EIA, Integrated Modeling Data System output for the *Monthly Energy Review* (March 1991).

Petroleum Products, Exports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product weighted by the quantity of each petroleum product exported.

Petroleum Products, Imports. Calculated annually by EIA as the average of the thermal conversion factors for each petroleum product imported weighted by the quantity of each petroleum product imported.

Plant Condensate. Estimated to be 5.418 million Btu per barrel by EIA from data provided by McClanahan Consultants, Inc., Houston, Texas. EIA use of this term ceased in 1983.

Propane. EIA adopted the Bureau of Mines thermal conversion factor of 3.836 million Btu per barrel as published in the *California Oil World and Petroleum Industry*, First Issue, April 1942.

Residual Fuel Oil. EIA adopted the thermal conversion factor of 6.287 million Btu per barrel as reported in the Bureau of Mines internal memorandum *Bureau of Mines Standard Average Heating Values of Various Fuels*, adopted January 3, 1950.

Road Oil. EIA adopted the Bureau of Mines thermal conversion factor of 6.636 million Btu per barrel which was assumed to be equal to that of asphalt (see “Asphalt”) and was first published by the Bureau of Mines in the *Petroleum Statement, Annual, 1970*.

Special Naphtha. EIA adopted the Bureau of Mines thermal conversion factor of 5.248 million Btu per barrel which was assumed to be equal to that of total gasoline (aviation and motor) factor and was first published in the *Petroleum Statement, Annual, 1970*.

Still Gas. EIA adopted the Bureau of Mines estimated thermal conversion factor of 6.000 million Btu per barrel and was first published in the *Petroleum Statement, Annual, 1970*.

Unfinished Oil. EIA assumed the thermal conversion factor to be 5.825 million Btu per barrel or equal to that for distillate fuel oil (see “Distillate Fuel Oil”) and first published in the *Annual Report to Congress, Volume 3, 1977*.

Unfractionated Stream. EIA assumed the thermal conversion factor to be 5.418 million Btu per barrel or equal to that for plant condensate (see “Plant Condensate”) and first published in the *Annual Report to Congress, Volume 2, 1981*. EIA use of this term ceased in 1983.

Wax. EIA adopted the thermal conversion factor of 5.537 million Btu per barrel as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*.

Natural Gas

Natural Gas, Consumption. • 1949–1962: EIA adopted the thermal conversion factor of 1,035 Btu per cubic foot as estimated by the Bureau of Mines and first published in the *Petroleum Statement, Annual, 1956*. • 1963–1979: EIA adopted the thermal conversion factor calculated annually by the American Gas Association (AGA) and published in *Gas Facts*, an AGA annual publication. • 1980–1989: Calculated annually by EIA by dividing the total heat content of natural gas consumed by the total quantity of natural gas consumed. The heat content and quantity consumed are from Form EIA-176. Published sources are as follows: 1980–1984: EIA, *Natural Gas Annual 1988, Volume II*, Table 15. 1985–1989: EIA, *Natural Gas Annual 1989*, Table B1. • 1990: Estimated to be the same as 1989.

Natural Gas, Consumption by Electric Utilities. • 1949–1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.” • 1973–1989: Calculated annually by EIA by dividing the total heat content of natural gas received at electric utilities by the total quantity received at electric utilities. The heat contents and receipts are from Form FERC-423 and predecessor forms. • 1990: Estimated to be the same as 1989.

Natural Gas, Consumption by Non-Electric Utility Users. • 1949–1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.” • 1973–1989: Calculated annually by EIA by subtracting the heat

content of natural gas consumed at electric utilities from the heat content of total natural gas consumed and dividing the result by the quantity of non-utility natural gas consumption (total consumption less electric utility consumption). • 1990: Estimated to be the same as 1989.

Natural Gas, Exports. • 1949–1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.” • 1973–1989: Calculated annually by EIA by dividing the heat content of exported natural gas by the quantity of natural gas exported, both reported on Form FPC-14. • 1990: Estimated to be the same as 1989.

Natural Gas, Imports. • 1949–1972: Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See

“Natural Gas, Consumption.” • 1973–1989: Calculated annually by EIA by dividing the heat content of imported natural gas by the quantity of natural gas imported, both reported on Form FPC-14. • 1990: Estimated to be the same as 1989.

Natural Gas, Production (Dry). Assumed by EIA to be equal to the thermal conversion factor for the consumption of dry natural gas. See “Natural Gas, Consumption.”

Natural Gas, Production (Wet). • 1949–1989: Calculated annually by EIA by adding the heat content of natural gas, dry production and the total heat content of natural gas plant liquids production and dividing this sum by the total quantity of marketed (wet) natural gas production. • 1990: Estimated to be the same as 1989.

Coal and Coal Coke

All Coal, Consumption. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumption by the sum of their respective tonnages.

All Coal, Consumption by Electric Utilities Only. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite received at electric utilities by the sum of their respective tonnages received.

All Coal, Consumption by Non-Electric Utility Users. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite consumed by nonelectric utility users by the sum of their respective tonnages.

All Coal, Exports. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite exported by the sum of their respective tonnages.

All Coal, Imports. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite and anthracite imported by the sum of their respective tonnages.

All Coal, Production. Calculated annually by EIA by dividing the sum of the total heat content of bituminous coal and lignite and anthracite production by the sum of their respective tonnages.

Anthracite, Consumption. • Calculated annually by EIA by dividing the sum of the heat content of anthracite consumed by electric utilities and non-electric utilities by the total quantity of anthracite consumed.

Anthracite, Consumption by Electric Utilities. • 1949–1972: Assumed by EIA that all anthracite consumed at electric utilities was recovered from culm banks and river dredging and estimated to have an average heat content of 17.500 million Btu per short ton. • 1973 forward: Calculated annually by EIA by dividing the heat content of anthracite receipts at electric utilities by the quantity of anthracite received at electric utilities, as reported on Form FERC-423 and predecessor forms.

Anthracite, Consumption by Non-Electric Utility Users. Calculated annually by EIA by dividing the heat content of anthracite production less the heat content of the anthracite consumed at electric utilities, net exports, and shipments to U.S. Armed Forces overseas by the quantity of non-electric utility anthracite consumption less the quantity of anthracite stock changes, losses, and unaccounted for.

Anthracite, Imports and Exports. EIA assumed the anthracite imports and exports to be freshly mined anthracite having an estimated heat content of 25.400 million Btu per short ton.

Anthracite, Production. Calculated annually by EIA by dividing the sum of the heat content of freshly mined anthracite (estimated to have an average heat content of 25.400 million Btu per short ton) and the heat content of anthracite recovered from culm banks and river dredging

(estimated to have an average heat content of 17.500 million Btu per short ton) by the total quantity of anthracite production.

Bituminous Coal and Lignite, Consumption. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumed by electric utilities, coal coke plants, other industrial plants, and by the residential and commercial sector and the transportation sector by the sum of their respective tonnages.

Bituminous Coal and Lignite, Consumption by Coke Plants: Estimated by EIA to be 26.800 million Btu per short ton based on input-output analysis of coal carbonization.

Bituminous Coal and Lignite, Consumption by Electric Utilities. • 1949–1972: EIA adopted the average thermal conversion factor of the Bureau of Mines which used the National Coal Association average thermal conversion factor for electric utilities calculated from Form FPC-1 and published in *Steam Electric Plant Factors*, a National Coal Association annual report. • 1973 forward: Calculated annually by EIA by dividing the total heat content of bituminous coal and lignite received at electric utilities by the total quantity received at electric utilities. Heat contents and receipts are from Form FERC-423 and predecessor forms.

Bituminous Coal and Lignite, Consumption by Other Industrial Users. • 1949–1973: Calculated annually by EIA through regression analysis measuring the difference between the average Btu value of coal consumed by other industrial users and that of coal consumed at electric utilities in the 1974–1983 period. • 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to other industrial users from each coal-producing area (reported on Form EIA-6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to bituminous coal and lignite received at electric utilities from each of the same coal-producing areas (reported on Form FERC-423). The average Btu value of coal by coal-producing area was applied to the volume of deliveries to other industrial users from each coal-producing area, and the sum total of the heat content was divided by the total volume of deliveries. Coal-producing areas are the Bureau of Mines coal-producing districts for 1974 through 1989 and coal-producing States for 1990.

Bituminous Coal and Lignite, Consumption by Residential and Commercial Users. • 1949–1973: Calculated annually by EIA through regression

analysis measuring the difference between the average Btu value of coal consumed by residential and commercial users and that of coal consumed by electric utilities in the 1974–1983 period. • 1974 forward: Calculated annually by EIA by assuming that the bituminous coal and lignite delivered to residential and commercial users from each coal-producing area (reported on Form EIA-6 and predecessor Bureau of Mines Form 6-1419-Q) contained a heat value equal to bituminous coal and lignite received at electric utilities from each of the same coal-producing areas (reported on Form FERC-423). The average Btu value of coal by coal-producing area was applied to the volume of deliveries to residential and commercial users from each coal-producing area, and the sum total of the heat value was divided by the total volume of deliveries. Coal-producing areas are the Bureau of Mines coal-producing districts for 1974 through 1989 and coal-producing States for 1990.

Bituminous Coal and Lignite, Consumption by Transportation Users: Assumed by EIA to be equal to the Btu conversion factor for “Bituminous Coal and Lignite, Consumption by Other Industrial Users.”

Bituminous Coal and Lignite, Exports. • 1949–1972: Assumed by EIA to be all metallurgical coal and to have an average thermal content of 27.000 million Btu per short ton. • 1973 forward: Calculated annually by EIA by dividing the sum of the heat content of exported metallurgical coal (estimated to average 27.000 million Btu per short ton) and the heat content of exported steam coal (estimated to have an average thermal content of 25.000 million Btu per short ton) by the total quantity of bituminous coal and lignite exported.

Bituminous Coal and Lignite, Imports. EIA estimated the average thermal conversion factor to be 25.000 million Btu per short ton.

Bituminous Coal and Lignite, Production. Calculated annually by EIA by dividing the sum of the heat content of bituminous coal and lignite consumption, net exports, stock changes, and unaccounted for by the sum of their respective tonnages. Consumers’ stock changes by sectors were assumed to have the same conversion factor as the consumption sector. Producers’ stock changes and unaccounted for were assumed to have the same conversion factor as consumption by all users.

Coal Coke, Imports and Exports. EIA adopted the Bureau of Mines estimate of 24.800 million Btu per short ton.

Electricity

Fossil Fuel Steam-Electric Power Plant Generation. There is no generally accepted practice for measuring the thermal conversion rates for power plants that generate electricity from hydroelectric, wood and waste, wind, photovoltaic, or solar thermal energy sources. EIA has selected a rate that is equal to the prevailing annual average heat rate factor for fossil-fueled steam-electric power plants in the United States. By using that factor, it is possible to evaluate fossil fuel requirements for replacing those sources during periods of interruption such as droughts. The heat content of a kilowatthour of electricity produced, regardless of the generation process, is 3,412 Btu per kilowatthour. • 1949–1955: The weighted annual average heat rate for fossil-fueled steam-electric power plants in the United States, as published by EIA in *Thermal-Electric Plant Construction Cost and Annual Production Expenses—1981* and *Steam-Electric Plant Construction Cost and Annual Production Expenses—1978*. • 1956 through 1988: The weighted annual average heat rate for fossil-fueled steam-electric power plants in the United States, as published in EIA, *Electric Plant Cost and Power Production Expenses 1988*,

Table 11. • 1989: Prepublished data. • 1990: Estimated to be the same as 1989.

Geothermal Energy Power Plant Generation. • 1960–1981: Calculated annually by EIA by weighting the annual average heat rates of operating geothermal units by the installed nameplate capacities as reported on Form FPC-12. • 1982 forward: Estimated annually by EIA based on an informal survey of relevant plants.

Nuclear Generating Units. • 1957–1989: Calculated annually by EIA by dividing the total heat content consumed in reactors at nuclear generating units by the total (net) electricity generated by nuclear plants. The heat content and electricity generation are reported on Form FERC-1, Form EIA-412, and predecessor forms. The factors, beginning with 1982 data, are published in the following: 1982: EIA, *Historical Plant Cost and Annual Production Expenses for Selected Electric Plants*, p. 215. 1983–1988: EIA, *Electric Plant Cost and Power Production Expenses 1988*, Table 15. 1989: Prepublished data. • 1990: Estimated to be the same as 1989.

Appendix B. Energy Units in Perspective

Using Appendix B

The three tables in this appendix are intended to help the nontechnical reader understand the value of the various energy units used in the *Annual Energy Review*. The values (especially the equivalents in Table B3) shown here are approximations intended to convey a general idea of the magnitude of energy units.

The tables can be used to relate a familiar measure of energy, such as gallons, to energy measures used in this report. For example, Table B1 shows that 8 gallons of motor gasoline is equal to roughly one-fifth of a barrel of crude oil.¹ Using information from Table B2, the reader can calculate that the 8 gallons of motor gasoline was, on average, a six-and-a-half-day supply per capita in 1990. Table B3 indicates that 8 gallons of motor gasoline equals about 10 therms of natural gas or approximately 1 million British thermal units (see Glossary).

¹However, due to the nature of the refining process, one-fifth of a barrel of crude oil would yield less than 8 gallons of motor gasoline.

Table B1. Physical Conversion Factors for Energy Units

Type of Unit	Factor
Weight.....	2,000 pounds/short ton
	1.102 short tons/metric ton
	1.120 short tons/long ton
Volume.....	0.028 cubic meters/cubic foot
	35.315 cubic feet/cubic meter
	42 U.S. gallons/U.S. barrel
	128 cubic feet/cord
Weight and Volume.....	0.136 metric tons/U.S. barrel ¹
	0.150 short tons/U.S. barrel ¹
	7.33 U.S. barrels/metric ton ¹
	6.65 U.S. barrels/short ton ¹
	1.25 short tons/cord ²

¹For crude oil (average gravity).

²For dry hardwood (average).

Table B2. U.S. Daily Per Capita Consumption of Energy by Type, 1973, 1980, and 1990

Type of Energy	1973	1980	1990	Percent Change	
				1973-1980	1980-1990
Gallons					
Petroleum Products	3.4	3.2	2.9	-0.8	-9.8
Motor Gasoline	1.3	1.2	1.2	-7.8	-1.0
Cubic Feet					
Natural Gas (dry).....	286	240	207	-16.1	-13.8
Pounds					
Coal.....	14.6	17.0	19.7	16.5	15.9
Kilowatthours					
Hydroelectricity.....	3.5	3.4	3.1	-4.1	-8.9
Nuclear Electricity.....	1.1	3.0	5.8	180.6	192.2
Electricity (all).....	22.2	25.3	29.8	14.1	17.8
Thousand Btu					
Industrial Energy ¹	409	370	322	-2.9	-1.4
Total Energy	963	919	897	-4.6	-2.4

¹Includes electric losses distributed.

Note: Percent change is calculated from data prior to rounding.

Sources: Tables 4, 7, 51, 61, 73, 81, 89, and 90.

Table B3. Energy Equivalents

Energy Unit	Equivalent ¹
1 Btu of Energy	1 match tip 250 calories (International Steam Table) 0.25 kilocalories (food calories)
1,000 Btu of Energy	2 5-ounce glasses of table wine 250 kilocalories (food calories) 0.80 peanut butter and jelly sandwiches
1 Million Btu of Energy.....	90 pounds of coal 120 pounds of oven-dried hardwood 8 gallons of motor gasoline—enough to move the average U.S. passenger car about 164 miles (1989) 10 therms of dry natural gas 11 gallons of propane 1.1 days of U.S. energy consumption per capita 2 months of the dietary intake of a laborer
1 Quadrillion ² Btu of Energy	45 million short tons of coal 60 million short tons of oven—dried hardwood 1 trillion cubic feet of dry natural gas 170 million barrels of crude oil 470 thousand barrels of crude oil per day for 1 year 28 days of U.S. petroleum imports 26 days of U.S. motor gasoline use 26 hours of world energy use (1989)
1 Barrel of Crude Oil	15 days of U.S. petroleum consumption per capita 5.6 thousand cubic feet of dry natural gas 0.26 short tons (520 pounds) of coal 1,700 kilowatthours of electricity
1 Short Ton of Coal.....	102 days of U.S. coal consumption per capita 3.8 barrels of crude oil 21 thousand cubic feet of dry natural gas 6,500 kilowatthours of electricity
1,000 Cubic Feet of Natural Gas.....	4.8 days of natural gas use per capita 0.18 barrels (7.4 gallons) of crude oil 0.047 short tons (93 pounds) of coal 300 kilowatthours of electricity
1,000 Kilowatthours (kWh) of Electricity.....	34 days of U.S. electricity use per capita 0.59 barrels of crude oil ³ 0.15 short tons (310 pounds) of coal ³ 3,300 cubic feet of dry natural gas ³

¹Equivalents are approximate.

²One quadrillion equals 1,000,000,000,000,000.

³However, because of net energy losses associated with the generation of electricity, about three times as much fossil fuel is required to generate 1,000 kWh: 1.8 barrels of oil, 0.47 short tons of coal, or 10,000 cubic feet of natural gas.

Note: • One million Btu of fossil fuels burned at electric utilities can generate about 100 kilowatthours of electricity, while it takes about 300 kilowatthours of electricity generated at electric utilities to produce 1 million Btu of heat. • Calculations are based on 1990 data where applicable, unless otherwise noted.

Appendix C. GNP Dollars and Deflators

Table C1. GNP¹ Dollars and Implicit Price Deflators, 1949–1990

Years 1949–1969	GNP (billion 1982 dollars)	Deflator (1982=100)	Years 1970–1990	GNP (billion 1982 dollars)	Deflator (1982=100)
1949	1,109.0	23.5	1970	2,416.2	42.0
1950	1,203.7	23.9	1971	2,484.8	44.4
1951	1,328.2	25.1	1972	2,608.5	46.5
1952	1,380.0	25.5	1973	2,744.1	49.5
1953	1,435.3	25.9	1974	2,729.3	54.0
1954	1,416.2	26.3	1975	2,695.0	59.3
1955	1,494.9	27.2	1976	2,826.7	63.1
1956	1,525.6	28.1	1977	2,958.6	67.3
1957	1,551.1	29.1	1978	3,115.2	72.2
1958	1,539.2	29.7	1979	3,192.4	78.6
1959	1,629.1	30.4	1980	3,187.1	85.7
1960	1,665.3	30.9	1981	3,248.8	94.0
1961	1,708.7	31.2	1982	3,166.0	100.0
1962	1,799.4	31.9	1983	3,279.1	103.9
1963	1,873.3	32.4	1984	3,501.4	107.7
1964	1,973.3	32.9	1985	3,618.7	110.9
1965	2,087.6	33.8	1986	3,717.9	113.8
1966	2,208.3	35.0	1987	3,845.3	117.4
1967	2,271.4	35.9	1988	4,016.9	121.3
1968	2,365.6	37.7	1989	4,117.7	126.3
1969	2,423.3	39.8	1990	4,157.3	131.5

Appendix D. U.S. Census Region Map

Source: U.S. Department of Commerce, Bureau of the Census.

Appendix E. Explanatory Notes

1. Electricity Generation. Data on the generation of electricity in the United States represents gross electricity output measured at the generator terminals, minus power plant use (net electricity generated). Nuclear electricity generation data identified by individual countries in this report are gross electricity output. See Tables 2, 89, 90, 91, 128, and 129.

2. Consumption of Primary Energy by End-Use Sector. Sector data are derived from the end-use sector table of each energy commodity. The "Other" sector in the Electric Utility Sales table is allocated to the Residential and Commercial Sector, except for the railways' portion of "Other," which is allocated to the Transportation Sector. See Table 4.

3. Financial Reporting System (FRS) Companies. The FRS data system is designed to permit review of the financial performance of energy companies. Data are disaggregated both by line of business and by geographic area of operation. Domestic operations include Puerto Rico and the Virgin Islands; foreign operations exclude those areas.

The 23 companies included in the FRS for the 1989 reporting year are the following:

Amerada Hess Corporation
American Petrofina Inc.
Amoco Corporation
Ashland Oil Inc.
Atlantic Richfield Company
BP America Inc.
Burlington Resources Inc.
Chevron Corporation
Coastal Corporation
E.I. du Pont de Nemours and Company (Du Pont)
Exxon Corporation
Kerr-McGee Corporation
Mobil Corporation
Occidental Petroleum Corporation
Oryx Energy Company
Phillips Petroleum Company

Shell Oil Company
Sun Company
Texaco Inc.
Total Petroleum (North America) Ltd.
Union Pacific Corporation
Unocal Corporation
USX Corporation

Prior to 1983, the reporting group included 26 companies. Conoco and Marathon were replaced by Du Pont and the United States Steel Corporation, due to the merger of the former companies with the latter companies, respectively, beginning in 1982. Although Occidental acquired Cities Service in 1982, separate financial reports were available for 1982, so each company continued to be treated as a separate FRS company until 1983. In 1984 three more intragroup mergers occurred: (1) Chevron acquired Gulf Oil, (2) Mobil acquired Superior Oil, and (3) Texaco acquired Getty Oil. Since financial reports for 1984 were available for the three acquired companies, they are treated as separate companies through 1984. See Tables 36 through 39 and 46.

4. Well Completions. For the years 1970 forward, annual well completions are estimated by the Energy Information Administration (EIA) using the American Petroleum Institute's drilling data files. For more recent years, these files are not complete, due to delays in the reporting of wells drilled. Based on statistical analysis, EIA employs an adjustment process to impute missing data to show total well completions and footages for current years. See Tables 43 and 44.

5. Reclassified. Accurate calculation of the quantity of petroleum products supplied to the domestic market is complicated by the recycling of products at the refinery, the renaming of products involved in a transfer, and the receipt of products from outside of the primary supply system. Beginning in 1981, a single adjustment (always a negative quantity) is made to total product supplied to correct this accounting problem. The calculation of this adjustment, called "reclassified," involves only unfinished oils and gasoline blending components. It is the sum of their net

changes in primary stocks (net withdrawals is a plus quantity, net additions is a minus quantity) plus imports minus net input to refineries. See Tables 58, 61, and 63.

6. Gross Input to Distillation Units (GIDU). The methods for deriving GIDU in this report are as follows: 1949 through 1966 GIDU is estimated by summing annual crude oil runs to stills, net unfinished oil reruns at refineries and shipments of natural gasoline and plant condensate from natural gas processing plants to refineries. 1967 through 1973 GIDU is estimated by summing annual crude oil runs to stills, net unfinished oil reruns, and refinery input of natural gasoline and plant condensate. 1974 through 1980 GIDU is published annual data. 1981 and forward GIDU is the sum of reported monthly data. See Table 59.

7. Petroleum Products Supplied. Total petroleum products supplied is the sum of the product supplied for each petroleum product, crude oil, unfinished oils, and gasoline blending components. For each of these, except crude oil, product supplied is calculated by adding refinery production, natural gas plant liquids production, new supply of other liquids, imports, stock withdrawals, and subtracting stock additions, refinery inputs, and exports. Crude oil product supplied is the sum of crude oil burned on leases and at pipeline pump stations as reported on Form EIA-813. Prior to 1983, crude oil burned on leases and at pipeline pump stations was reported as either distillate or residual fuel oil and was included as product supplied for these products. Petroleum product supplied is an approximation of petroleum consumption and is synonymous with the term "Petroleum Consumption" in Section 1. Sector data for petroleum products used in more than one sector are derived from surveys of sales to ultimate consumers by refiners, marketers, distributors, and dealers and from receipts at electric utilities. See Explanatory Notes 5 and 8 and Tables 61 through 63.

8. Joint Petroleum Reporting System. Beginning in January 1981, several Energy Information Administration survey forms and calculation methodologies were changed to reflect new developments in refinery and blending plant practices and to improve data integrity. These changes affect production and product supplied statistics for motor gasoline, distillate fuel oil, and residual fuel oil, and stocks of motor gasoline. On the new basis, motor gasoline production during the last half of 1980 would have averaged 289,000 barrels per day higher than that which was published on the old basis. Distillate and residual fuel oil production and product supplied for all of 1980 would have averaged, respectively, 105,000 and 54,000 barrels per day higher than the numbers that were published. See Tables 58, 61, and 63.

9. Crude Oil Domestic First Purchase Prices. Derived as follows: 1949 through 1973—weighted average domestic first purchase values as reported by State agencies and calculated by the Bureau of Mines; 1974 and 1975—weighted averages of a sample survey of major first purchasers' purchases; 1976 and forward—weighted averages of all first purchasers' purchases. See Table 67.

10. Refiner Acquisition Cost of Crude Oil. This cost was estimated for 1968 through 1973. The cost of domestic crude oil was derived by adding estimated transportation costs to the reported average domestic first purchase value. The cost of imported crude oils was derived by adding an estimated ocean transport cost based on the published "Average Freight Rate Assessment" to the average "Free Alongside Ship" value published by the U.S. Bureau of the Census. The composite cost was derived by weighting domestic costs and imported costs based on quantities produced and imported. See Table 70.

11. Natural Gas Consumption. Natural gas consumption statistics are compiled from a survey of natural gas production, transmission, and distribution companies and electric utility companies. Consumption by sector from these surveys is compiled on a national and individual State basis and then balanced with national and individual State supply data. Included in the data are the following: Commercial Sector—consumption by nonmanufacturing establishments, by municipalities for institutional heating and lighting, and those engaged in agriculture, forestry, and fishing; Electric Utility Sector—consumption by electric utilities for the generation of electric power; Industrial Sector—consumption by establishments engaged primarily in processing unfinished materials into another form of product (includes mining, petroleum refining, manufacturing, and natural gas industry use for lease and plant fuel); Residential Sector—consumption by private households for space heating, cooking, and other household uses; Transportation Sector—natural gas transmission (pipeline) fuel. See Tables 77 and 80.

12. Natural Gas Prices by National Gas Policy Act of 1978 (NGPA) Categories. **Old Gas.** Includes natural gas dedicated to interstate commerce and natural gas purchased under existing interstate or rollover contracts (Section NGPA 104, 105, and 106). **New Gas.** Includes new natural gas and certain natural gas produced from the Outer Continental Shelf, stripper well gas, and other new gas categories (Section NGPA 102, 103, 108, and 109). **High-Cost Gas.** Includes natural gas from deep wells and low permeability (tight) reservoirs and unregulated gas (NGPA Section 107). See Table 79.

13. Coal Consumption. Data in this report on the consumption of bituminous coal (including subbituminous coal), lignite, and anthracite are generated primarily from consumption data reported in surveys. Included are data reported by all electric utility companies and coke plant companies. Data on coal consumption by all industrial and manufacturing establishments and by the residential and commercial sector are based on distribution data obtained quarterly from coal companies. Included in sector data are the following: Electric Utility Sector—consumption by privately and publicly owned establishments engaged in the generation and/or distribution of electric power primarily for sale or resale; Industrial and Miscellaneous Sector—consumption at manufacturing plants, large commercial establishments, coking plants, and by agriculture, mining (other than coal mining) and construction industries; Transportation Sector—sales to railroads and vessel bunker fuel; Residential and Commercial Sector—retail dealer sales to households and small commercial establishments. See Table 83.

14. Electricity Statistics. Prior to 1985, electricity supply and distribution statistics included data reported by institutions (such as universities) and military facilities that generated electricity primarily for their own use. Beginning in 1985, electricity statistics exclude data for these facilities and include only data for those organizations that generate electricity primarily for public use. See Tables 89 through 95 and 97.

15. Electrical System Energy Losses. Electrical system energy losses are calculated as the difference between total energy input at electric utilities and the total energy content of electricity sold to end-use consumers. Most of these losses occur at steam electric power plants (conventional and nuclear) in the conversion of heat energy into mechanical energy to turn electric generators. This loss is a thermodynamically necessary feature of the steam electric cycle. Part of the energy input to output losses are a result of imputing fossil energy equivalent inputs for hydroelectric and other energy sources, since there is no generally accepted practice for measuring these thermal conversion rates. In addition to conversion losses, other losses include power plant use of electricity, transmission and distribution of electricity from power plants to end-use consumers (also called "line-losses"), and unaccounted for electricity. Total losses are allocated to the end-use sectors in proportion to each sector's share of total electricity sales. Overall, approximately 67 percent of total energy input is lost in conversion; of electricity generated, approximately 5 percent is lost in plant use and 9 percent in transmission and distribution. Calculated electrical energy system losses may be less than actual losses, because primary consumption does not include the energy equivalent of utility purchases of electricity from nonutilities and from Canada and Mexico, although they are included in electricity sales. See Table 92.

16. Electricity Sales. Data on the sales of electric utility electricity represent gross electricity output measured at the generator terminals, minus power plant use and transmission and distribution losses. Included in each end-use sector are the following: Commercial Sector—sales of electricity to businesses that generally require less than 1,000 kilowatts of service; Industrial Sector—sales of electricity to businesses that generally require more than 1,000 kilowatts of service; Residential Sector—sales of electricity to residences for household purposes; "Other" Sector—sales of electricity to Government, railways, street lighting authorities, and sales not elsewhere included. See Table 94.

17. Net Summer Capability. Net summer capabilities were first collected on Form EIA-860 for the 1984 data year. Units not assigned a net summer capability rating by the utility were given an estimated rating using a statistical relationship between installed nameplate capacity and net summer capability for each prime mover. To estimate net summer capability from 1949 through 1984, two methods were used. For each prime mover except nuclear and "other," net summer capability estimates were calculated in two steps. First, the unit capacity values reported on Form EIA-860 and the unit start dates contained in the 1984 Generating Unit Reference File (GURF) were used to compute preliminary aggregate estimates of annual net summer capability and installed nameplate capacity. These preliminary estimates were obtained by aggregating unit capacity values for all units in service during a given year. Next, the ratio of the preliminary capability to nameplate estimate was computed for each year and multiplied by the previously published installed nameplate capacity values to produce the final estimates of net summer capability.

The net summer capability data for nuclear and "other" units were used directly from the 1984 GURF for all years. Historical aggregates were then developed using the unit start dates on the GURF.

Historical capacity has also been modified to estimate capability based upon the operable definition. This was accomplished by assuming that nonnuclear generating units became operable between 1 and 4 months prior to their commercial operation dates, depending upon the prime mover and time period. The actual operable dates for nuclear units were used. See Tables 95 and 102.

18. Operable Units. Prior to 1973, the number of "Operable Units at End of Year" includes units that were in commercial operation by December 31 of the stated year. Units decommissioned or inoperative for extended periods were generally included. Also included are two U.S. Department of Energy (DOE)-operated plants that supply electricity to the

commercial grid. A third DOE plant, which does not distribute electricity to the grid, is excluded. For 1973 and forward, the number of units includes units issued full-power or operating licenses and generally does not include units in long-term shutdown status. See Table 102.

19. World Primary Energy Production. Includes only crude oil and lease condensate, natural gas plant liquids, dry natural gas, coal, and electricity from hydroelectric power and nuclear power. Crude oil production is measured at the wellhead and includes lease condensate. Natural gas plant liquids are products obtained from processing natural gas at natural gas processing plants, including natural gas plants, cycling plants, and fractionators. Dry natural gas production is that amount of natural gas production that is available to be marketed and consumed as a gas. Coal (anthracite, subanthracite, bituminous, subbituminous, lignite, and brown coal) production is the sum of sales, mine consumption, issues to miners, and issues to coking, briquetting, and other ancillary plants at mines. Coal production data include quantities extracted from surface and underground workings and normally exclude wastes removed at mines or associated preparation plants. The production of electricity from hydroelectric power and nuclear power includes both electric utility and

industrial production reported on a net basis, thus excluding electricity that is generally used by the electric power plant for its own operating purposes or electricity losses in the transformers that are considered integral parts of the station. See Tables 111 and 112.

20. Primary Stocks of Petroleum—OECD. Petroleum stocks reported by the Organization for Economic Cooperation and Development (OECD) include those held at (or in) the following locations or facilities: leases, refineries, natural gas processing plants, bulk terminals, tanks associated with pipelines, barges, intercoastal tankers, ocean tankers in port, inland ship bunkers, major final consumers, and the strategic storage reserve. For an individual country, stocks include those held for the account of that country but located in another country. U.S. stocks include those held in the 50 States and the District of Columbia. "Other OECD" includes stocks held in Puerto Rico and the Virgin Islands. The OECD definition of petroleum stocks excludes petroleum in pipelines, rail tank cars, tank trucks, oceangoing ship bunkers, service stations, retail stores, and tankers at sea. An exception is U.S. stocks which include petroleum in pipelines. See Table 120.

Glossary

Additions to Property: The current year's expenditures on property, plant, and equipment. The amount is predicated upon each reporting company's accounting practices. That is, accounting practices with regard to capitalization of certain items may differ across companies, and, therefore, this figure is a function of each reporting company's policy.

Alcohol: The family name of a group of organic chemical compounds composed of carbon, hydrogen, and oxygen. The series of molecules vary in chain length and are composed of a hydrocarbon plus a hydroxyl group; $\text{CH}_3\text{-(CH}_2)_n\text{-OH}$ (e.g., methanol, ethanol, and tertiary butyl alcohol).

Anthracite: A hard, black, lustrous coal containing a high percentage of fixed carbon and a low percentage of volatile matter. Often referred to as hard coal. It conforms to ASTM Specification D388-84 for anthracite, meta-anthracite, and semianthracite.

API: The American Petroleum Institute, a trade association.

API Gravity: An arbitrary scale expressing the gravity or density of liquid petroleum products. The measuring scale is calibrated in terms of degrees API. A lighter, less dense product has a higher API gravity.

Apparent Consumption, Natural Gas (international): The total of an individual nation's marketed natural gas production plus imports less exports.

Apparent Consumption, Petroleum (international): Consumption which includes internal consumption, refinery fuel and loss, and bunkering. For countries in the Organization for Economic Cooperation and Development (OECD), apparent consumption is derived from refined product output plus refined product imports minus refined product exports plus refined product stock changes plus other oil consumption (such as direct use of crude oil). For countries outside the OECD, apparent consumption is either a reported figure or is derived from refined product output plus refined product imports minus refined product exports, with stock levels assumed to remain the same. Apparent consumption also includes,

where available, liquefied petroleum gases sold directly from natural gas processing plants, for fuel or chemical uses.

Asphalt: A dark-brown-to-black cement-like material containing bitumens as the predominant constituents obtained by petroleum processing. The definition includes crude asphalt as well as the following finished products: cements, fluxes, the asphalt content of emulsions (exclusive of water), and petroleum distillates blended with asphalt to make cutback asphalts.

ASTM: The American Society for Testing and Materials.

Aviation Gasoline Blending Components: Naphthas that are used for blending or compounding into finished aviation gasoline (e.g., straight-run gasoline, alkylate, and reformate). Excludes oxygenates (alcohols, ethers), butane, and pentanes plus.

Aviation Gasoline, Finished: All special grades of gasoline for use in aviation reciprocating engines, as given in ASTM Specification D910 and Military Specification MIL-G-5572. Excludes blending components that will be used in blending or compounding into finished aviation gasoline.

Barrel (petroleum): A unit of volume equivalent to 42 U.S. gallons.

Barrels per Calendar Day: The maximum number of barrels of input that can be processed during a 24-hour period after making allowances for the following limitations: the capability of downstream facilities to absorb the output of crude oil processing facilities of a given refinery (no reduction is made when a planned distribution of intermediate streams through other than downstream facilities is part of a refinery's normal operation); the types and grades of inputs to be processed; the types and grades of products to be manufactured; the environmental constraints associated with refinery operations; the reduction of capacity for scheduled downtime, such as routine inspection, mechanical problems, maintenance, repairs, and turnaround; and the reduction of capacity for unscheduled downtime such as mechanical problems, repairs, and slowdowns.

Base (Cushion) Gas: The volume of gas needed as a permanent inventory to maintain adequate underground storage reservoir pressures and deliverability rates throughout the withdrawal season. All native gas is included in the base gas volume.

Bituminous Coal: A dense, black coal, often with well-defined bands of bright and dull material, with a moisture content usually less than 20 percent. Often referred to as soft coal. It is the most common coal and is used primarily for generating electricity, making coke, and space heating. It conforms to ASTM Specification D388-84 for bituminous coal.

British Thermal Unit (Btu): The quantity of heat needed to raise the temperature of 1 pound of water by 1 °F at or near 39.2 °F.

Butane: A normally gaseous straight-chain or branched-chain hydrocarbon (C₄H₁₀). It is extracted from natural gas or refinery gas streams. It includes isobutane and normal butane and is designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial butane. *Isobutane:* A normally gaseous branched-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of 10.9 °F. It is extracted from natural gas or refinery gas streams. *Normal Butane:* A normally gaseous straight-chain hydrocarbon. It is a colorless paraffinic gas that boils at a temperature of 31.1 °F. It is extracted from natural gas or refinery gas streams.

Butylene: An olefinic hydrocarbon (C₄H₈) recovered from refinery processes.

Capacity Factor: The ratio of the electrical energy produced by a generating unit for the period of time considered to the electrical energy that could have been produced at continuous full-power operation during the same period.

CIF: See Cost, Insurance, Freight.

City Gate: A point or measuring station at which a distribution gas utility receives gas from a natural gas pipeline company or transmission system.

Class A Electric Utility: An electric utility having annual electric operating revenues of \$2.5 million or more. Use of this term ceased on December 31, 1983.

Class B Electric Utility: An electric utility having annual electric operating revenues of \$1.0 million or more but less than \$2.5 million. Use of this term ceased on December 31, 1983.

Coal: A black or brownish-black solid, combustible substance formed by the partial decomposition of vegetable matter without access to air. The rank of coal, which includes anthracite, bituminous coal, subbituminous coal, and lignite, is based on fixed carbon, volatile matter, and heating value. Coal rank indicates the progressive alteration, or coalification, from lignite to anthracite. Lignite contains approximately 9 to 17 million Btu per ton. The heat contents of subbituminous and bituminous coal range from 16 to 24 million Btu per ton, and from 19 to 30 million Btu per ton, respectively. Anthracite contains approximately 22 to 28 million Btu per ton.

Coalbed Methane: Methane that is produced from coalbeds in the same manner as natural gas produced from other strata. Methane is the principal component of natural gas.

Coal Coke: A hard, porous product made from baking bituminous coal in ovens at temperatures as high as 2,000 °F. It is used both as a fuel and as a reducing agent in smelting iron ore in a blast furnace.

Cogenerator: A generating facility that produces electricity and another form of useful thermal energy (such as heat or steam) used for industrial, commercial, heating, and cooling purposes.

Commercial Building: A building with more than 50 percent of its floorspace used for commercial activities. Commercial buildings include, but are not limited to, stores, offices, schools, churches, gymnasiums, libraries, museums, hospitals, clinics, warehouses, and jails. Government buildings are included except for buildings on military bases or reservations.

Commercial Sector: The commercial sector, as defined economically, consists of business establishments that are not engaged in transportation or in manufacturing or other types of industrial activity (agriculture, mining, or construction). Commercial establishments include hotels, motels, restaurants, wholesale businesses, retail stores, laundries, and other service enterprises; religious and nonprofit organizations; health, social, and educational institutions; and Federal, State, and local governments. Street lights, pumps, bridges, and public services are also included if the establishment operating them is considered commercial. SIC codes used to classify an establishment as commercial are 50 through 87, 89, and 90 through 97.

Completion: The installation of permanent equipment for the production of oil or gas. If a well is equipped to produce only oil or gas from one zone or reservoir, the definition of a well (classified as an oil well or

gas well) and the definition of a completion are identical. However, if a well is equipped to produce oil and/or gas separately from more than one reservoir, a well is not synonymous with a completion.

Conversion Factor: A number that translates units of one system into corresponding values of another system. Conversion factors can be used to translate physical units of measure for various fuels into Btu equivalents.

Cost, Insurance, Freight (CIF): A type of sale in which the buyer of the product agrees to pay a unit price that includes the f.o.b. value of the product at the point of origin plus all costs of insurance and transportation. This type of transaction differs from a "delivered" purchase in that the buyer accepts the quantity as determined at the loading port (as certified by the Bill of Lading and Quality Report) rather than pay based on the quantity and quality ascertained at the unloading port. It is similar to the terms of an f.o.b. sale, except that the seller, as a service for which he is compensated, arranges for transportation and insurance.

Crude Oil f.o.b. Price: The crude oil price actually charged at the oil-producing country's port of loading. Includes deductions for any rebates and discounts or additions of premiums, where applicable. It is the actual price paid with no adjustment for credit terms.

Crude Oil (Including Lease Condensate): A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Included are lease condensate and liquid hydrocarbons produced from tar sands, gilsonite, and oil shale. Drip gases are also included, but topped crude oil (residual oil) and other unfinished oils are excluded. Where identifiable, liquids produced at natural gas processing plants and mixed with crude oil are likewise excluded.

Crude Oil Landed Cost: The price of crude oil at the port of discharge, including charges associated with the purchase, transporting, and insuring of a cargo from the purchase point to the port of discharge. Does not include charges incurred at the discharge port (e.g., import tariffs or fees, wharfage charges, and demurrage).

Crude Oil Refinery Input: The total crude oil put into processing units at refineries.

Crude Oil Stocks: Stocks of crude oil and lease condensate held at refineries, in pipelines, at pipeline terminals, and on leases.

Crude Oil Used Directly: Crude oil consumed as fuel by crude oil pipelines and on crude oil leases.

Cubic Foot (natural gas): A unit of volume equal to 1 cubic foot at a pressure base of 14.73 pounds standard per square inch absolute and a temperature base of 60 °F.

Demonstrated Reserve Base, Coal: A collective term for the sum of coal in both measured and indicated resource categories of reliability, representing 100 percent of the in-place coal in those categories as of a certain date. Includes beds of bituminous coal and anthracite 28 or more inches thick and beds of subbituminous coal 60 or more inches thick that can occur at depths of up to 1,000 feet. Includes beds of lignite 60 or more inches thick that can be surface mined. Includes also thinner and/or deeper beds that presently are being mined or for which there is evidence that they could be mined commercially at a given time. Represents that portion of the identified coal resource from which reserves are calculated.

Design Electrical Rating, Net: The nominal net electrical output of a nuclear unit as specified by the electric utility for the purpose of plant design.

Development Well: A well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive.

Distillate Fuel Oil: A general classification for one of the petroleum fractions produced in conventional distillation operations. Included are products known as No. 1, No. 2, and No. 4 fuel oils and No. 1, No. 2, and No. 4 diesel fuels. It is used primarily for space heating, on- and off-highway diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and electric power generation.

Distillation Unit (atmospheric): The primary distillation unit that processes crude oil (including mixtures of other hydrocarbons) at approximately atmospheric conditions. It includes a pipe still for vaporizing the crude oil and a fractionation tower for separating the vaporized hydrocarbon components in the crude oil into fractions with different boiling ranges. This is done by continuously vaporizing and condensing the components to separate higher boiling point material. The selected boiling ranges are set by the processing scheme, the properties of the crude oil, and the product specifications.

Dry Hole: An exploratory or development well found to be incapable of producing either oil or gas in sufficient quantities to justify completion as an oil or gas well.

Dry Natural Gas Production (as a decrement from gas reserves): The volume of natural gas withdrawn from reservoirs during the report year less (1) the volume returned to such reservoirs in cycling, repressuring of oil reservoirs, and conservation operations; (2) shrinkage resulting from the removal of lease condensate and plant liquids; and (3) nonhydrocarbon gases, where they occur in sufficient quantity to render the gas unmarketable. Volumes of gas withdrawn from gas storage reservoirs and native gas, which has been transferred to the storage category, are not considered production. This is not the same as marketed production, since the latter also excludes vented and flared gas but contains liquids.

Dry Natural Gas Production (as an increment to gas supply): Gross withdrawals from production reservoirs less gas used in reservoir repressuring, amounts vented and flared, nonhydrocarbons removed, and various natural gas constituents, such as ethane, propane, and butane, removed at natural gas processing plants. The parameters for measurement are 60 °F and 14.73 pounds standard per square inch absolute.

Electrical System Energy Losses: The amount of energy lost during generation, transmission, and distribution of electricity, including plant and unaccounted-for uses.

Electricity Generation: The process of producing electric energy or transforming other forms of energy into electric energy. Also the amount of electric energy produced or expressed in wathours (Wh).

Electricity Generation, Gross: The total amount of electric energy produced by the generating station or stations, measured at the generator terminals.

Electricity Generation, Net: Gross generation less electricity consumed at the generating plant for station use. Electricity required for pumping at pumped-storage plants is regarded as plant use and is deducted from gross generation.

Electricity Production: Net electricity (gross electricity output measured at generator terminals minus power plant use) generated by publicly and privately owned electric utilities. Excludes industrial electricity generation (except autogeneration of hydroelectric power).

Electricity Sales: The amount of kilowatthours sold in a given period of time, usually grouped by classes of service such as residential, commercial, industrial, and other. Other sales include public street and highway lighting, other sales to public authorities and railways, and interdepartmental sales.

Electric Power Plant: A station containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy.

Electric Utilities: All privately owned companies and all publicly owned agencies engaged in the generation, transmission, or distribution of electric power for public use. Publicly owned agencies include municipal electric utilities; Federal power projects, such as the Tennessee Valley Authority (TVA); rural electrification cooperatives; power districts; and State power projects.

Electric Utility: A corporation, person, agency, authority, or other legal entity or instrumentality that owns and/or operates facilities within the United States, its territories, or Puerto Rico for the generation, transmission, distribution, or sale of electric energy, primarily for use by the public. An entity that solely operates qualifying facilities under the Public Utility Regulatory Policies Act of 1978 is not considered an electric utility.

Electric Utility Sector: Privately and publicly owned establishments that generate electricity primarily for use by the public.

Eliminations: Revenues and expenses resulting from transactions between segments. Consolidated company accounts do not include intersegment revenues and expenses. Therefore, such intersegment transactions must be eliminated.

End-Use Sectors: The residential, commercial, industrial, and transportation sectors of the economy.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Energy Consumption: The use of energy as a source of heat or power, or as an input in the manufacturing process.

Energy Consumption, End-Use: The sum of fossil fuel consumption by the four end-use sectors (residential, commercial, industrial, and transportation) plus electric utility sales to those sectors and generation of

hydroelectric power by nonelectric utilities. Net end-use energy consumption excludes electrical system energy losses. Total end-use energy consumption includes electrical system energy losses.

Energy Consumption, Total: The sum of fossil fuel consumption by the five sectors (residential, commercial, industrial, transportation, and electric utility) plus hydroelectric power, nuclear electric power, net imports of coal coke, and electricity generated for distribution from wood, waste, geothermal, wind, photovoltaic, and solar thermal energy.

Energy Expenditures: The money directly spent by consumers to purchase energy. Expenditures equal the amount of energy used by the consumer times the price per unit paid by the consumer.

Energy Source: A substance, such as petroleum, natural gas, or coal, that supplies heat or power. In Energy Information Administration reports, electricity and renewable forms of energy, such as biomass, geothermal, wind, and solar, are considered to be energy sources.

Energy-Weighted Industrial Output: The weighted sum of real output for all two-digit Standard Industrial Classification (SIC) manufacturing industries plus agriculture, construction, and mining. The weight for each industry is the ratio between the quantity of end-use energy consumption and the value of real output. The base year for those weights is either 1981 or 1982, depending on data availability.

Ethane: A normally gaseous straight-chain hydrocarbon (C_2H_6). It is a colorless, paraffinic gas that boils at a temperature of -127.48 °F. It is extracted from natural gas and refinery gas streams.

Ethylene: An olefinic hydrocarbon (C_2H_4) recovered from refinery processes or petrochemical processes.

Exploratory Well: A well drilled to find and produce oil or gas in an unproved area, to find a new reservoir in a field previously found to be productive of oil or gas in another reservoir, or to extend the limit of a known oil or gas reservoir.

Exports: Shipments of goods from the 50 States and the District of Columbia to foreign countries and to Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Extraction Loss: The reduction in volume of natural gas due to the removal of natural gas constituents, such as ethane, propane, and butane, at natural gas processing plants.

f.a.s.: See Free Alongside Ship.

Federal Energy Regulatory Commission (FERC): The Federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification. FERC is an independent regulatory agency within the Department of Energy and is the successor to the Federal Power Commission.

Federal Power Commission (FPC): The predecessor agency of the Federal Energy Regulatory Commission. The Federal Power Commission was created by an Act of Congress under the Federal Water Power Act on June 10, 1920. It was charged originally with regulating the electric power and natural gas industries. It was abolished on September 30, 1977, when the Department of Energy was created. Its functions were divided between the Department of Energy and the Federal Energy Regulatory Commission, an independent regulatory agency.

First Purchase Price: The marketed first sales price of domestic crude oil, consistent with the removal price defined by the provisions of the Windfall Profits Tax on Domestic Crude Oil (Public Law 96-223, Sec. 4998 (c)).

Flared Natural Gas: Natural gas burned in flares on the base site or at gas processing plants.

Floorspace: All the area enclosed by the exterior walls of a building, including indoor parking facilities, basements, hallways, lobbies, stairways, and elevator shafts. For aggregate floorspace statistics, square footage was summed or aggregated over all buildings in a category (such as all office buildings in the United States).

f.o.b.: See Free On Board.

Footage Drilled: Total footage for wells in various categories, as reported for any specified period, includes (1) the deepest total depth (length of well bores) of all wells drilled from the surface, (2) the total of all bypassed footage drilled in connection with reported wells, and (3) all new footage drilled for directional sidetrack wells. Footage reported for directional sidetrack wells does not include footage in the common bore, which is reported as footage for the original well. In the case of old wells drilled deeper, the reported footage is that which was drilled below the total depth of the old well.

Forward Costs: The operating and capital costs still to be incurred in the production of uranium from estimated reserves; such costs are used in assigning the uranium reserves to cost categories. Those costs include

labor, materials, power and fuel, royalties, payroll and production taxes, insurance, and applicable general and administrative costs. They exclude expenditures prior to reserve estimates—e.g., for property acquisition, exploration, mine development, and mill construction from the forward cost determinations, as well as income taxes, profit, and the cost of money. Forward costs are neither the full costs of production nor the market price at which the uranium will be sold.

Fossil Fuel: Any naturally occurring organic fuel, such as petroleum, coal, and natural gas.

Fossil Fuel Steam-Electric Power Plant: An electricity generation plant in which the prime mover is a turbine rotated by high-pressure steam produced in a boiler by heat from burning fossil fuels.

Free Alongside Ship (f.a.s.): The value of a commodity at the port of exportation, generally including the purchase price plus all charges incurred in placing the commodity alongside the carrier at the port of exportation.

Free on Board (f.o.b.): A transaction whereby the seller makes the product available within an agreed-on period at a given port at a given price. It is the responsibility of the buyer to arrange for the transportation and insurance.

Fuel-Switching Capability: The short-term capability of a manufacturing establishment to have used substitute energy sources in place of those actually consumed. Capability to use substitute energy sources means that the establishment's combustors (for example, boilers, furnaces, ovens, and blast furnaces) had the machinery or equipment either in place or available for installation so that substitutions could actually have been introduced within 30 days without extensive modifications. Fuel-switching capability does not depend on the relative prices of energy sources; it depends only on the characteristics of the equipment and certain legal constraints.

Full-Power Operation: Operation of a nuclear generating unit at 100 percent of its design capacity. Full-power operation precedes commercial operation.

Gasohol: A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol but sometimes methanol) limited to 10 percent by volume of alcohol. Gasohol is included in finished leaded and unleaded motor gasoline.

Gas-Turbine Electric Power Plant: A plant in which the prime mover is a gas turbine. A gas turbine typically consists of an axial-flow air compressor, one or more combustion chambers where liquid or gaseous fuel is burned and the hot gases expand to drive the generator and then are used to run the compressor.

Gas Well: A well completed for the production of natural gas from one or more gas zones or reservoirs. (Wells producing both crude oil and natural gas are classified as oil wells.)

Gas Well Productivity: Derived annually by dividing gross natural gas withdrawals from gas wells by the number of producing gas wells on December 31 and then dividing the quotient by the number of days in the year.

Geothermal Energy: Energy from the internal heat of the Earth, which may be residual heat, friction heat, or a result of radioactive decay. The heat is found in rocks and fluids at various depths and can be extracted by drilling and/or pumping.

Geothermal Energy (as used at electric utilities): Hot water or steam, extracted from geothermal reservoirs in the Earth's crust, which is supplied to steam turbines at electric utilities that drive generators to produce electricity.

Gross Input to Atmospheric Crude Oil Distillation Units: Total input to atmospheric crude oil distillation units. Includes all crude oil, lease condensate, natural gas plant liquids, unfinished oils, liquefied refinery gases, slop oils, and other liquid hydrocarbons (such as shale oil, tar sands oils, and gilsonite).

Gross National Product (GNP): The total value of goods and services produced by the Nation's economy, before deduction of depreciation charges and other allowances for capital consumption. It includes the total purchases of goods and services by private consumers and government, gross private domestic capital investment, and net foreign trade.

Gross National Product (GNP) Implicit Price Deflator: The implicit price deflator, published by the U.S. Department of Commerce, Bureau of Economic Analysis, is used to convert nominal figures to real figures.

Heavy Oil: The fuel oils remaining after the lighter oils have been distilled off during the refining process. Except for start-up and flame stabilization, virtually all petroleum used in steam-electric power plants is heavy oil.

Household: A family, an individual, or a group of up to nine unrelated persons occupying the same housing unit. Occupy means the housing unit was the person's usual or permanent place of residence. The household includes babies, lodgers, boarders, employed persons who live in the housing unit, and persons who usually live in the household but are away traveling or in a hospital. The household does not include persons who are normally members of the household but who are away from home as college students or members of the armed forces. The household does not include persons temporarily visiting with the household if they have a place of residence elsewhere, persons who take their meals with the household but usually lodge or sleep elsewhere, domestic employees or other persons employed by the household who do not sleep in the same housing unit, or persons who are former members of the household, but have since become inmates of correctional or penal institutions, mental institutions, homes for the aged or needy, homes or hospitals for the chronically ill or handicapped, nursing homes, convents or monasteries, or other places in which residents may remain for long periods of time. By definition, the number of households is the same as the number of occupied housing units.

Housing Unit: A structure or part of a structure where a household lives. It has access from the outside of the building either directly or through a common hall. Housing units do not include group quarters, such as prisons or nursing homes where 10 or more unrelated persons live. Hotel and motel rooms are considered housing units if occupied as the usual or permanent place of residence.

Hydrocarbon: An organic chemical compound of hydrogen and carbon in the gaseous, liquid, or solid phase. The molecular structure of hydrocarbon compounds varies from the simplest (methane, a constituent of natural gas) to the very heavy and very complex.

Hydroelectric Power: The production of electricity from the kinetic energy of falling water.

Hydroelectric Power Plant: A plant in which the turbine generators are driven by falling water.

Imports: Receipts of goods into the 50 States and the District of Columbia from foreign countries and from Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Indicated Resources, Coal: Coal for which estimates of the rank, quality, and quantity are based partly on sample analyses and measurements and partly on reasonable geologic projections. Indicated resources

are computed partly from specified measurements and partly from projection of visible data for a reasonable distance on the basis of geologic evidence. The points of observation are 1/2 to 1-1/2 miles apart. Indicated coal is projected to extend as a 1/2-mile-wide belt that lies more than 1/4 mile from the outcrop or points of observation or measurement.

Industrial Sector: The industrial sector comprises manufacturing industries—which make up the largest part of the sector—along with mining, construction, agriculture, fisheries, and forestry. Establishments in the sector range from steel mills, to small farms, to companies assembling electronic components. The SIC codes used to classify establishments as industrial are 1 through 39.

Internal Combustion Electric Power Plant: A power plant in which the prime mover is an internal combustion engine. Diesel or gas-fired engines are the principal types used in electric power plants. The plant is usually operated during periods of high demand for electricity.

International Bunkers: Fuel loaded on vessels and aircraft engaged in international commerce for use as fuel by the vessel or aircraft.

Jet Fuel: The term includes kerosene-type jet fuel and naphtha-type jet fuel. Kerosene-type jet fuel is a kerosene-quality product used primarily for commercial turbojet and turboprop aircraft engines. Naphtha-type jet fuel is a fuel in the heavy naphthas range used primarily for military turbojet and turboprop aircraft engines.

Kerosene: A petroleum distillate that has a maximum distillation temperature of 401 °F at the 10-percent recovery point, a final boiling point of 572 °F, and a minimum flash point of 100 °F. Included are the two grades designated in ASTM D3699 (No. 1-K and No. 2-K) and all grades of kerosene called range or stove oil. Kerosene is used in space heaters, cook stoves, and water heaters; it is suitable for use as an illuminant when burned in wick lamps.

Lease and Plant Fuel: Natural gas used in well, field, and lease operations (such as gas used in drilling operations, heaters, dehydrators, and field compressors), and as fuel in natural gas processing plants.

Lease Condensate: A natural gas liquid recovered from gas well gas (associated and non-associated) in lease separators or natural gas field facilities. Lease condensate consists primarily of pentanes and heavier hydrocarbons.

Light Oil: Lighter fuel oils distilled off during the refining process. Virtually all petroleum used in internal combustion and gas-turbine engines is light oil.

Lignite: A brownish-black coal of low rank with a high content of moisture and volatile matter. Often referred to as brown coal. It is used almost exclusively for electric power generation. It conforms to ASTM Specification D388-84 for lignite.

Line-Miles of Seismic Exploration: The distance along the Earth's surface that is covered by seismic surveying.

Liquefied Natural Gas (LNG): Natural gas (primarily methane) that has been liquefied by reducing its temperature to -260 °F at atmospheric pressure.

Liquefied Petroleum Gases (LPG): Ethane, ethylene, propane, propylene, normal butane, butylene, and isobutane produced at refineries or natural gas processing plants, including plants that fractionate new natural gas plant liquids.

Liquefied Refinery Gases (LRG): Liquefied petroleum gases fractionated from refinery or still gases. Through compression and/or refrigeration, they are retained in the liquid state. The reported categories are ethane/ethylene, propane/propylene, normal butane/butylene, and isobutane. Excludes still gas.

Low-Power Testing: The period of time between a nuclear generating unit's initial fuel loading date and the issuance of its operating (full-power) license. The maximum level of operation during that period is 5 percent of the unit's design thermal rating.

Lubricants: Substances used to reduce friction between bearing surfaces or as process materials either incorporated into other materials used as processing aids in the manufacturing of other products or as carriers of other materials. Petroleum lubricants may be produced either from distillates or residues. Other substances may be added to impart or improve certain required properties. Does not include byproducts of lubricating oil refining, such as aromatic extracts derived from solvent extraction or tars derived from deasphalting. Lubricants include all grades of lubricating oils from spindle oil to cylinder oil and those used in greases. Reporting categories include paraffinic and naphthenic.

Main Cooking Fuel: Fuel most often used for cooking.

Main Heating Equipment: Equipment primarily used for heating ambient air in the housing unit.

Main Heating Fuel: Fuel that powers the main heating equipment.

Major Electric Utility: A utility that, in the last 3 consecutive calendar years, had sales or transmission services exceeding one of the following: (1) 1 million megawatthours of total annual sales; (2) 100 megawatthours of annual sales for resale; (3) 500 megawatthours of annual gross interchange out; or (4) 500 megawatthours of wheeling (deliveries plus losses) for others.

Major Fuels: The energy sources or fuels for which consumption and expenditure data were collected on the 1986 Nonresidential Building Energy Consumption Survey. Those fuels or energy sources are as follows: electricity, fuel oil, liquefied petroleum gases, natural gas, district steam, district hot water, and district chilled water.

Manufacturing Establishment: An economic unit at a single physical location where the mechanical or chemical transformation of materials or substances into new products is performed. Those operations are generally conducted in facilities described as plants, factories, or mills and characteristically use power-driven machines and material-handling equipment. In addition, the assembly of components of manufactured products is considered manufacturing, as is the blending of materials, such as lubricating oil, plastics, resins, or liquors. Manufacturing establishments are covered by SIC codes 20 through 39.

Manufacturing Sector: The universe of manufacturing establishments within the 50 States and the District of Columbia.

Measured Resources, Coal: Coal resources for which estimates of the rank, quality, and quantity have been computed, within a margin of error of less than 20 percent, from sample analyses and measurements from closely spaced and geologically well known sample sites. Measured resources are computed from dimensions revealed in outcrops, trenches, mine workings, and drill holes. The points of observation and measurement are so closely spaced and the thickness and extent of coals are so well defined that the tonnage is judged to be accurate within 20 percent. Although the spacing of the points of observation necessary to demonstrate continuity of the coal differs from region to region, according to the character of the coalbeds, the points of observation are no greater than 1/2 mile apart. Measured coal is projected to extend as a belt 1/4 mile wide from the outcrop or points of observation or measurement.

Metallurgical Coal: Coal that meets the requirements for making coke. It must be low in ash and sulfur and form a coke that is capable of supporting the charge of iron ore and limestone in a blast furnace. A blend of two or more bituminous coals is usually required to make coke.

Metropolitan: Refers to buildings located within Metropolitan Statistical Areas (MSA's) as defined in the 1980 Census. Except in New England, an MSA is a county or a group of contiguous counties that contains at least one city of 50,000 inhabitants or more, or twin cities with a combined population of 50,000 or more. The contiguous counties are included in an MSA if they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, MSA's consist of towns and cities rather than counties.

Miscellaneous Petroleum Products: All finished petroleum products not classified elsewhere—for example, petrolatum, lube refining byproducts (aromatic extracts and tars), absorption oils, ram-jet fuel, petroleum rocket fuels, synthetic natural gas feedstocks, and specialty oils.

Motor Gasoline: A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, obtained by blending appropriate refinery streams to form a fuel suitable for use in spark-ignition engines. Motor gasoline includes both leaded and unleaded grades of finished motor gasoline, blending components, and gasohol.

Motor Gasoline Blending Components: Naphthas that will be used for blending or compounding into finished motor gasoline (e.g., straight-run gasoline, alkylate, and reformat). Excludes oxygenates (alcohols, ethers), butane, and pentanes plus.

Motor Gasoline, Finished: A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, that has been blended to form a fuel suitable for use in spark-ignition engines. Motor gasoline, as given in ASTM Specification D439 or Federal Specification VV-G-1690B, includes a range in distillation temperatures from 122 to 158 °F at the 10-percent recovery point and from 365 to 374 °F at the 90-percent recovery point. The Reid Vapor Pressure ranges from 9 to 15 psi. Motor gasoline includes finished leaded gasoline, finished unleaded gasoline, and gasohol. Blendstock is excluded until blending has been completed. Alcohol that is to be used in the blending of gasohol is also excluded.

Motor Gasoline, Finished Gasohol: A blend of finished motor gasoline (leaded or unleaded) and alcohol (generally ethanol, but sometimes methanol) in which 10 percent or more of the product is alcohol.

Motor Gasoline, Finished Leaded: Motor gasoline that contains more than 0.05 gram of lead per gallon or more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating. Includes leaded gasohol. Blendstock is excluded until

blending has been completed. Alcohol that is to be used in the blending of gasohol is also excluded.

Motor Gasoline, Finished Leaded Premium: Motor gasoline having an antiknock index (R+M/2) greater than 90 and containing more than 0.05 grams of lead per gallon or more than 0.005 grams of phosphorus per gallon.

Motor Gasoline, Finished Leaded Regular: Motor gasoline having an antiknock index (R+M/2) greater than or equal to 87 and less than or equal to 90 and containing more than 0.05 grams of lead or 0.005 grams of phosphorus per gallon.

Motor Gasoline, Finished Unleaded: Motor gasoline containing not more than 0.05 gram of lead per gallon and not more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating. Includes unleaded gasohol. Blendstock is excluded until blending has been completed. Alcohol that is to be used in the blending of gasohol is also excluded.

Motor Gasoline, Finished Unleaded Midgrade: Motor gasoline having an antiknock index (R+M/2) greater than or equal to 88 and less than or equal to 90 and containing not more than 0.05 grams of phosphorus per gallon.

Motor Gasoline, Finished Unleaded Premium: Motor gasoline having an antiknock index (R+M/2) greater than 90, and containing not more than 0.05 grams of lead or 0.005 grams of phosphorus per gallon.

Motor Gasoline, Finished Unleaded Regular: Motor gasoline having an antiknock index of 87 containing not more than 0.05 grams of lead per gallon and not more than 0.005 grams of phosphorus per gallon.

Motor Gasoline, Leaded: Motor gasoline that contains more than 0.05 gram of lead per gallon or more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included.

Motor Gasoline Retail Prices: Motor gasoline prices calculated each month by the Bureau of Labor Statistics (BLS) in conjunction with the construction of the Consumer Price Index (CPI). Those prices are collected in 85 urban areas selected to represent all urban consumers—about 80 percent of the total U.S. population. The service stations are selected initially, and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full-, mini-, and self-service).

Motor Gasoline, Total: Includes finished leaded motor gasoline (premium and regular), finished unleaded motor gasoline (premium, midgrade, and regular), motor gasoline blending components, and gasohol.

Motor Gasoline, Unleaded: Gasoline that contains not more than 0.05 gram of lead per gallon and not more than 0.005 gram of phosphorus per gallon. Premium and regular grades are included, depending on the octane rating.

Naphtha: A generic term applied to a petroleum fraction with an approximate boiling range between 122 and 400 °F.

Native Gas: The total volume of natural gas indigenous to the storage reservoir at the time the storage started.

Natural Gas: A mixture of hydrocarbons (principally methane) and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in underground reservoirs.

Natural Gas, Dry: The marketable portion of natural gas production, which is obtained by subtracting extraction losses, including natural gas liquids removed at natural gas processing plants, from total production.

Natural Gas Gross Withdrawals: Full well stream volume of produced natural gas, excluding condensate separated at the lease.

Natural Gas Liquids (NGL): Those hydrocarbons in natural gas that are separated as liquids from the gas. Natural gas liquids include natural gas plant liquids (primarily ethane, propane, butane, and isobutane), and lease condensate (primarily pentanes produced from natural gas at lease separators and field facilities.)

Natural Gas Marketed Production: Gross withdrawals of natural gas from production reservoirs, less gas used for reservoir repressuring; nonhydrocarbon gases removed in treating and processing operations; and quantities vented and flared.

Natural Gas Plant Liquids (NGPL): Natural gas liquids recovered from natural gas in processing plants and, in some situations, from natural gas field facilities, as well as those extracted by fractionators. Natural gas plant liquids are defined according to the published specifications of the Gas Processors Associations and the American Society for Testing and Materials as follows: ethane, propane, normal butane, isobutane, pentanes plus, and other products from natural gas processing plants (i.e., products meeting the standards for finished petroleum products produced at natural gas processing plants, such as finished motor gasoline,

finished aviation gasoline, special naphthas, kerosene, distillate fuel oil, and miscellaneous products).

Natural Gas Wellhead Price: The wellhead price of natural gas is calculated by dividing the total reported value at the wellhead by the total quantity produced as reported by the appropriate agencies of individual producing States and the U.S. Minerals Management Service. The price includes all costs prior to shipment from the lease, including gathering and compression costs, in addition to State production, severance, and similar charges.

Natural Gas, Wet: Natural gas prior to the extraction of liquids and other miscellaneous products.

Net Income: Operating income plus earnings from unconsolidated affiliates; gains from disposition of property, plant, and equipment; minority interest income; and foreign currency translation effects less income taxes, extraordinary items, and the cumulative effect of accounting changes.

Net Ownership Interest: The sum of net working interest and royalty interest. Net ownership interest applies to both production and reserves.

Net Property Investment: The original cost of property, plant, and equipment (PP&E), less accumulated depreciation.

Net Summer Capability: The steady hourly output that generating equipment is expected to supply to system load, exclusive of auxiliary power, as demonstrated by testing at the time of summer peak demand.

Net Working Interest: A company's working interest, not including any basic royalty or overriding royalty interests.

Nominal Price: The price paid for a product or service at the time of the transaction.

Nonhydrocarbon Gases: Typical nonhydrocarbon gases that may be present in reservoir natural gas are carbon dioxide, helium, hydrogen sulfide, and nitrogen.

Nonmetropolitan: Refers to buildings not located within Metropolitan Statistical Areas as defined in the 1980 Census.

Nontraceables: Those revenues, costs, assays, and liabilities that cannot be directly attributed to a type of business by use of a reasonable allocation method developed on the basis of operating-level utilities.

Nuclear Electric Power: Electricity generated by an electric power plant whose turbines are driven by steam generated in a reactor by heat from the fissioning of nuclear fuel.

Nuclear Electric Power Plant: A single-unit or multiunit facility in which heat produced in one or more reactors by the fissioning of nuclear fuel is used to drive one or more steam turbines.

Nuclear Reactor: An apparatus in which the nuclear fission chain can be initiated, maintained, and controlled so that energy is released at a specific rate. The reactor includes fissionable material (fuel), such as uranium or plutonium; fertile material; moderating material (unless it is a fast reactor); a heavy-walled pressure vessel; shielding to protect personnel; provision for heat removal; and control elements and instrumentation.

Offshore: That geographic area that lies seaward of the coastline. In general, the coastline is the line of ordinary low water along with that portion of the coast that is in direct contact with the open sea or the line marking the seaward limit of inland water.

Oil: See Crude Oil (Including Lease Condensate).

Oil Well: A well completed for the production of crude oil from one or more oil zones or reservoirs. Wells producing both crude oil and natural gas are classified as oil wells.

Operable (nuclear): A U.S. nuclear generating unit is considered operable after it completes low-power testing and is issued a full-power operating license by the Nuclear Regulatory Commission. A foreign nuclear generating unit is considered operable once it has generated electricity to the grid.

Operable Refineries: Refineries that were in one of the following three categories at the beginning of a given year: in operation; not in operation and not under active repair, but capable of being placed into operation within 30 days; or not in operation, but under active repair that could be completed within 90 days.

Operating Income: Operating revenues less operating expenses. Excludes items of other revenue and expense, such as equity in earnings of unconsolidated affiliates, dividends, interest income and expense, income taxes, extraordinary items, and cumulative effect of accounting changes.

Organization for Economic Cooperation and Development (OECD): Current members are Australia, Austria, Belgium, Canada, Denmark,

Finland, France, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States and its territories (Guam, Puerto Rico, and the Virgin Islands), and West Germany.

Organization of Petroleum Exporting Countries (OPEC): Countries that have organized for the purpose of negotiating with oil companies on matters of oil production, prices, and future concession rights. Current members are Algeria, Ecuador, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.

Other Hydrocarbons (petroleum): Other materials processed at refineries. Includes coal tar derivatives, hydrogen, gilsonite, and natural gas received by the refinery for reforming into hydrogen.

Pentanes Plus: A mixture of hydrocarbons, mostly pentanes and heavier, extracted from natural gas. Includes isopentane, natural gasoline, and plant condensate.

Petrochemical Feedstocks: Chemical feedstocks derived from petroleum principally for the manufacture of chemicals, synthetic rubber, and a variety of plastics. The categories reported are naphthas less than 401 °F endpoint and other oils equal to or greater than 401 °F endpoint.

Petroleum: A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oils, petroleum products, natural gas plant liquids, and nonhydrocarbon compounds blended into finished petroleum products.

Petroleum Coke: A residue, the final product of the condensation process in cracking. The product is either marketable petroleum coke or catalyst petroleum coke.

Petroleum Coke, Catalyst: The carbonaceous residue that is deposited on and deactivates the catalyst used in many catalytic operations (e.g., catalytic cracking). Carbon is deposited on the catalyst, thus deactivating the catalyst. The catalyst is reactivated by burning off the carbon, which is used as a fuel in the refining process. That carbon or coke is not recoverable in a concentrated form.

Petroleum Coke, Marketable: Those grades of coke produced in delayed or fluid cokers that may be recovered as relatively pure carbon. That "green" coke may be sold as is or further purified by calcining.

Petroleum Consumption: The sum of all refined petroleum products supplied. For each refined petroleum product, the amount supplied is calculated by adding production and imports, then subtracting changes in primary stocks (net withdrawals are a plus quantity and net additions are a minus quantity) and exports.

Petroleum Imports: Imports of petroleum into the 50 States and the District of Columbia from foreign countries and from Puerto Rico, the Virgin Islands, and other U.S. territories and possessions. Included are imports for the Strategic Petroleum Reserve and withdrawals from bonded warehouses for onshore consumption, offshore bunker use, and military use. Excluded are receipts of foreign petroleum into bonded warehouses and into U.S. territories and U.S. Foreign Trade Zones.

Petroleum Products: Products obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products.

Petroleum Products Supplied: See **Petroleum Consumption**.

Petroleum Stocks, Primary: For individual products, quantities held at refineries, in pipelines, and at bulk terminals that have a capacity of 50,000 barrels or more, and in transit thereto. Stocks held by product retailers and resellers, as well as tertiary stocks held at the point of consumption, are excluded. Stocks of individual products held at gas processing plants are excluded from individual product estimates but included in other oils estimates and total.

Photovoltaic and Solar Thermal Energy (as used at electric utilities): Energy radiated by the sun as electromagnetic waves (electromagnetic radiation) that is converted at electric utilities into electricity by means of solar (photovoltaic) cells or concentrating (focusing) collectors.

Photovoltaic Module: A group of photovoltaic cells. (Cells are solid-state devices that produce electricity when exposed to sunlight.) The electricity is used primarily in applications requiring remote power, such as radio communication, cathodic protection, and navigational aids.

Pipeline: A continuous pipe conduit, complete with such equipment as valves, compressor stations, communications systems, and meters for transporting natural gas and/or supplemental gaseous fuels from one

point to another, usually from a point in or beyond the producing field or processing plant to another pipeline or to points of utilization. Also refers to a company operating such facilities.

Plant Condensate: One of the natural gas liquids, mostly pentanes and heavier hydrocarbons, recovered and separated as liquids at gas inlet separators or scrubbers in processing plants.

Primary Energy Consumption Expenditures: Expenditures for energy consumed in each of the four major end-use sectors, excluding energy in the form of electricity, plus expenditures by the electric utilities sector for energy used to generate electricity. There are no fuel-associated expenditures for hydroelectric power, geothermal energy, photovoltaic and solar energy, or wind energy. Also excluded are the quantifiable consumption expenditures that are an integral part of process fuel consumption.

Process Fuel: All energy consumed in the acquisition, processing, and transportation of energy. Quantifiable process fuel includes three categories: natural gas lease and plant operations, natural gas pipeline operations, and oil refinery operations.

Processing Gain: The amount by which total volume of refinery output is greater than the volume of input for a given period of time. The processing gain arises when crude oil and other hydrocarbons are processed into products that are, on average, less dense than the input.

Processing Loss: The amount by which total volume of refinery output is less than input for a given period of time. The processing loss arises when crude oil and other hydrocarbons are processed into products that are, on average, more dense than the input.

Propane: A normally gaseous straight-chain hydrocarbon (C_3H_8). It is a colorless paraffinic gas that boils at a temperature of -43.67 °F. It is extracted from natural gas or refinery gas streams. It includes all products designated in ASTM Specification D1835 and Gas Processors Association Specifications for commercial propane and HD-5 propane.

Propylene: An olefinic hydrocarbon (C_3H_6) recovered from refinery or petrochemical processes.

Proved Reserves, Crude Oil: The estimated quantities of all liquids defined as crude oil that geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.

Proved Reserves, Lease Condensate: The volumes of lease condensate expected to be recovered in future years in conjunction with the production of proved reserves of natural gas based on the recovery efficiency of lease and/or field separation facilities installed.

Proved Reserves, Natural Gas: The estimated quantities of natural gas that analysis of geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.

Proved Reserves, Natural Gas Liquids: Those volumes of natural gas liquids (including lease condensate) demonstrated with reasonable certainty to be separable in the future from proved natural gas reserves, under existing economic and operating conditions.

Real Price: A price that has been adjusted to remove the effect of changes in the purchasing power of the dollar. A real price usually reflects buying power relative to a base year.

Refiner Acquisition Cost of Crude Oil: The cost of crude oil to the refiner, including transportation and fees. The composite cost is the weighted average domestic and imported crude oil costs.

Refinery Input: The raw materials and intermediate materials processed at refineries to produce finished petroleum products. They include crude oil, products of natural gas processing plants, unfinished oils, other hydrocarbons and alcohol, motor gasoline and aviation gasoline blending components, and finished petroleum products.

Refinery Output: The total amount of petroleum products produced at a refinery. Includes petroleum consumed by the refinery.

Refinery (petroleum): An installation that manufactures finished petroleum products from crude oil, unfinished oils, natural gas liquids, other hydrocarbons, and alcohol.

Renewable Energy: Energy obtained from sources that are essentially inexhaustible (unlike, for example, the fossil fuels, of which there is a finite supply). Renewable sources of energy include wood, waste, photovoltaic, and solar thermal energy.

Reservoir Repressuring: The injection of a pressurized fluid (such as air, gas, or water) into oil and gas reservoir formations to effect greater ultimate recovery.

Residential Building: A structure used primarily as a dwelling for one or more households.

Residential Sector: The residential sector is considered to consist of all private residences whether occupied or vacant, owned or rented, including single-family homes, multifamily housing units, and mobile homes. Secondary homes, such as summer homes, are also included. Institutional housing such as school dormitories, hospitals, and military barracks generally are not included in the residential sector; they are included in the commercial sector. The SIC code used to classify an establishment as residential is 88 (Household).

Residential Vehicles: Motorized vehicles used by U.S. households for personal transportation. Excluded are motorcycles, mopeds, large trucks, and buses. Included are automobiles, station wagons, passenger vans, cargo vans, motor homes, pickup trucks, and jeeps or similar vehicles. In order to be included, vehicles must be: (1) owned by members of the household, or (2) company cars not owned by household members but regularly available to household members for their personal use and ordinarily kept at home, or (3) rented or leased for 1 month or more.

Residual Fuel Oil: The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations and that conform to ASTM Specifications D396 and 975. Included are No. 5, a residual fuel oil of medium viscosity; Navy Special, for use in steam-powered vessels in government service and in shore power plants; and No. 6, which includes Bunker C fuel oil and is used for commercial and industrial heating, electricity generation, and to power ships. Imports of residual fuel oil include imported crude oil burned as fuel.

Residue Gas: Natural gas from which natural gas processing plant liquid products and, in some cases, nonhydrocarbon components have been extracted.

Road Oil: Any heavy petroleum oil, including residual asphaltic oil used as a dust palliative and surface treatment on roads and highways. It is generally produced in six grades, from 0, the most liquid, to 5, the most viscous.

Rotary Rig: A machine used for drilling wells that employs a rotating tube attached to a bit for boring holes through rock.

Royalty Interest: An interest in a mineral property provided through a royalty contract.

Rural Area: A place that had a population of less than 2,500 as of the 1970 U.S. Census.

Short Ton (coal): A unit of weight equal to 2,000 pounds.

SIC: See Standard Industrial Classification.

Solar Collector: Equipment that actively concentrates thermal energy from the sun. The energy is usually used for space heating, for water heating, or for heating swimming pools. Either air or liquid is the working fluid.

Solar Energy: The radiant energy of the sun, which can be converted into other forms of energy, such as heat or electricity.

Solar Thermal Collector: A device designed to receive solar radiation and convert it into thermal energy. Normally, a solar thermal collector includes a frame, glazing, and an absorber, together with appropriate insulation. The heat collected by the solar thermal collector may be used immediately or stored for later use.

Solar Thermal Collector, Low-Temperature: A collector that generally operates in the temperature range below 110 °F. Typically, it has no glazing or insulation and is made of plastic or rubber, although some are made of metal.

Solar Thermal Collector, Medium-Temperature: A collector that generally operates in the temperature range of 140 °F to 180 °F, but may also operate as low as 110 °F. Typically, it has one or two glazings, a metal frame, a metal absorption panel with integral flow channels or attached tubing (liquid collector) or with integral ducting (air collector) and insulation on the sides and back of the panel.

Solar Thermal Collector, Special: An evacuated tube collector or a concentrating (focusing) collector. Special collectors operate in the temperature range from just above ambient temperature (low concentration for pool heating) to several hundred degrees Fahrenheit (high concentration for air conditioning and specialized industrial processes).

Space Heating: The use of mechanical equipment (including wood stoves and active solar heating devices) to heat all, or part, of a building to at least 50 °F.

Special Naphthas: All finished products within the naphtha boiling range that are used as paint thinners, cleaners, or solvents. Those products are refined to a specified flash point. Special naphthas include all commercial hexane and cleaning solvents conforming to ASTM Specifications D1836 and D484, respectively. Naphthas to be blended or marketed as motor gasoline or aviation gasoline, or that are to be used as petrochemical and synthetic natural gas (SNG) feedstocks, are excluded.

Spot Market Price: A transaction price concluded "on the spot," that is, on a one-time, prompt basis; usually the transaction involves only one specific quantity of product. This contrasts with a term contract sale price, which obligates the seller to deliver a product at an agreed frequency and price over an extended period.

Standard Industrial Classification (SIC): A set of codes developed by the Office of Management and Budget which categorizes businesses into groups with similar economic activities.

Startup Test Phase of Nuclear Power Plant: A nuclear power plant that has been licensed by the Nuclear Regulatory Commission to operate but is still in the initial testing phase, during which the production of electricity may not be continuous. In general, when the electric utility is satisfied with the plant's performance, it formally accepts the plant from the manufacturer and places it in commercial operation status. A request is then submitted to the appropriate utility rate commission to include the power plant in the rate base calculation.

Steam-Electric Power Plant: A plant in which the prime mover is a steam turbine. The steam used to drive the turbine is produced in a boiler where fossil fuels are burned.

Still Gas (refinery gas): Any form or mixture of gas produced in refineries by distillation, cracking, reforming, and other processes. The principal constituents, are methane, ethane, ethylene, normal butane, butylene, propane, and propylene. It is used primarily as refinery fuel and petrochemical feedstock.

Strategic Petroleum Reserve (SPR): Petroleum stocks maintained by the Federal Government for use during periods of major supply interruption.

Stripper Well (natural gas): A well that produces 60 thousand cubic feet per day or less of gas well gas for a period of 3 consecutive months while producing at its maximum rate flow. In determining abandonments, a stripper well is one that produced less than 22.5 million cubic feet in its last 12 months of production.

Stripper Well Property (petroleum): A property whose average daily production of crude oil per well (excluding condensate recovered in nonassociated natural gas production) did not exceed an average of 10 barrels per day during any preceding consecutive 12-month period beginning after December 31, 1972.

Subbituminous Coal: A dull, black coal of rank intermediate between lignite and bituminous coal. It conforms to ASTM Specification D388-84 for subbituminous coal.

Supplemental Gaseous Fuels: Any gaseous substance that, introduced into or commingled with natural gas, increases the volume available for disposition. Such substances include, but are not limited to, propane-air, refinery gas, coke oven gas, still gas, manufactured gas, biomass gas, or air or inert gases added for Btu stabilization.

Synthetic Natural Gas (SNG): A manufactured product chemically similar in most respects to natural gas, resulting from the conversion or reforming of petroleum hydrocarbons. It may easily be substituted for or interchanged with pipeline quality natural gas. Also referred to as substitute natural gas.

Transportation Sector: The transportation sector comprises establishments that transport goods or people via railways, buses, trucks, ships, barges, and aircraft. The SIC codes used to classify establishments as belonging to the transportation sector are 40 through 49.

Unaccounted-for Crude Oil: Arithmetic difference between the calculated supply and the calculated disposition of crude oil. The calculated supply is the sum of crude oil production phase imports, less changes in crude oil stocks. The calculated disposition of crude oil is the sum of crude oil input to refineries, crude oil exports, crude oil burned as fuel, and crude oil losses.

Unaccounted-for Natural Gas: Quantities lost, the net result of flow data metered at varying temperature and pressure conditions and converted to a standard temperature and pressure base; metering inaccuracies; differences between the billing cycle and calendar period timeframes; the effect of variations in company accounting and billing practices; and imbalances from the merger of data reporting systems which vary in scope, format, definitions, and type of respondents.

Underground Storage: The storage of natural gas in underground reservoirs at a different location from which it was produced.

Undiscovered Recoverable Reserves (crude oil and natural gas): Those economic resources of crude oil and natural gas, yet undiscovered, that are estimated to exist in favorable geologic settings.

Unfinished Oils: All oils requiring further refinery processing, except those requiring only mechanical blending. Includes naphthas and lighter oils, kerosene and light gas oils, heavy gas oils, and residuum.

Unfractionated Streams: Mixtures of unsegregated natural gas liquid components, excluding those in plant condensate. This product is extracted from natural gas.

United States: Unless otherwise noted, "United States" in this publication means the 50 States and the District of Columbia. U.S. exports include shipments to U.S. territories, and imports include receipts from U.S. territories.

Uranium: A heavy, naturally radioactive, metallic element (atomic number 92). Its two principally occurring isotopes are uranium-235 and uranium-238. Uranium-235 is indispensable to the nuclear industry, because it is the only isotope existing in nature to any appreciable extent that is fissionable by thermal neutrons. Uranium-238 is also important, because it absorbs neutrons to produce a radioactive isotope that subsequently decays to plutonium-239, an isotope that also is fissionable by thermal neutrons.

Uranium Ore: Rock containing uranium mineralization (typically 1 to 4 pounds of U_3O_8 per ton or 0.05 percent to 0.2 percent U_3O_8) that can be mined economically.

Uranium Oxide: Uranium concentrate or yellowcake.

Uranium Resources: Uranium resource estimates are divided into three separate categories reflecting different levels of confidence in the quantities estimated: reasonable assured resources, estimated additional resources, and speculative resources. *Reasonably assured resources* refers to uranium in known mineral deposits of such size, grade, and configuration that it could be recovered within the given cost ranges, with currently proven mining and processing technology. *Estimated additional resources* refers to uranium in addition to reasonably assured resources that is expected, mostly on the basis of direct geological evidence, to occur in extensions of well-explored deposits and in deposits in which geological continuity has been well established, as well as in deposits believed to exist in well-defined geologic trends or areas of mineralization with known deposits. Deposits in this category can be discovered and delineated and the uranium subsequently recovered, all within the given cost range. *Speculative resources* refers to uranium in addition to estimated additional resources that is thought to exist, mostly on the basis of indirect evidence and geological extrapolations.

Urban Area: A place that had a population of 2,500 or more as of the 1970 U.S. Census.

Vented Natural Gas: Gas released into the air on the base site or at processing plants.

Vessel: Tankers used to transport crude oil and petroleum products. Vessel categories are as follows: Ultra Large Crude Carrier (ULCC), Very Large Crude Carrier (VLCC), Other Tanker, and Specialty Ships (LPG/LNG).

Waxes: Solid or semisolid materials derived from petroleum distillates or residues. Waxes are light-colored, more or less translucent crystalline masses, slightly greasy to the touch, consisting of a mixture of solid hydrocarbons in which the paraffin series predominates. Includes all marketable waxes, whether crude scale or fully refined. Waxes are used primarily as industrial coating for surface protection.

Well: A hole drilled in the Earth for the purpose of finding or producing crude oil or natural gas; or providing services related to the production of crude oil or natural gas. Wells are classified as oil wells, gas wells, dry holes, stratigraphic test wells, or service wells. The latter two types of wells are counted for Federal Reporting System data reporting. Oil wells, gas wells, and dry holes are classified as exploratory wells or development wells. Exploratory wells are subclassified as new-pool wildcats, deeper-pool tests, shallow-pool tests, and outpost (extension) tests. Well classifications reflect the status of wells after drilling has been completed.

Wellhead Price: The value of crude oil or natural gas at the mouth of the well.

Wind Energy (as used at electric utilities): The kinetic energy of wind converted at electric utilities into mechanical energy by wind turbines (i.e., blades rotating from a hub) that drive generators to produce electricity for distribution.

Wood and Waste (as used at electric utilities): Wood energy, garbage, bagasse, sewerage gas, and other industrial, agricultural, and urban refuse used to generate electricity for distribution.

Wood Energy: Wood and wood products used as fuel, including round wood (cord wood), limb wood, wood chips, bark, sawdust, forest residues, charcoal, pulp waste, and spent pulping liquor.

Working Gas: The gas in a reservoir that is in addition to the base (cushion) gas. It may or may not be completely withdrawn during any particular withdrawal season. Conditions permitting, the total working capacity could be used more than once during any given season.

Working Interest: An interest in a mineral property that entitles the owner to explore, develop, and operate a property. The working interest owner bears the costs of exploration, development, and operation of the property and, in return, is entitled to a share of the mineral production from the property or to a share of the proceeds.

Yellowcake: A uranium oxide concentrate that results from milling (concentrated) uranium ore. It is the final precipitate formed in the milling process. U_3O_8 , a common form of triuranium oxide, is the powder obtained by evaporating an ammonia solution of the oxide. Yellowcake typically contains 80 percent to 90 percent U_3O_8 .

Order Form for *Annual Energy Review 1990*

Published: May 1991
Energy Information Administration
DOE/EIA-0384(90)
Price per copy: \$17.00*

Company or Personal Name: _____
Additional Address/Attention Line: _____
Street Address: _____
City, State, Zip Code: _____
Daytime Phone Number (area code first): _____

**Please include payment with this order form.
Allow 2 weeks for delivery.**

Number of copies _____ x \$17.00* = total due: _____ (Foreign orders add 25%.)

*Price is subject to change without advance notice.

- Check payable to Superintendent of Documents
 Money order payable to Superintendent of Documents
 Charge to my GPO Deposit Account No. _____ Order No. _____

Government Books **FOR YOU**

Take advantage of the wealth of knowledge available from your Government. The Superintendent of

Documents produces a catalog that tells you about new and popular books sold by the Government.

Hundreds of books on agriculture, business, children, energy, health, history, space, and much, much more. For

a free copy of this catalog, write—
