

Advance Report of Final Mortality Statistics, 1983

Highlights

In 1983, numbers of deaths and the death rate increased from the previous year. A total of 2,019,201 deaths were registered in the United States, 44,404 more than in 1982 and the largest annual number ever recorded. The death rate for 1983 was 862.8 deaths per 100,000 population compared with a rate of 852.0 in 1982. Contributing to these increases were two factors: (a) the "aging" of the U.S. population, that is, the increasing proportion of older people in the population and (b) an influenza outbreak at the beginning of 1983.

In contrast, the risk of dying actually declined between 1982 and 1983. The age-adjusted death rate, which eliminates the effects of the aging of the population, declined somewhat to 550.5, the lowest level ever reported in the United States. In 1983, life expectancy at birth reached a record high level, 74.6 years. Although the difference in life expectancy for males and females continued to narrow, women are still expected to outlive men by an average of 7.1 years. While between 1982 and 1983 improvements were greater for the black than for the white population, life expectancy at birth in 1983 was 5.6 years higher for the white population.

Continuing to account for almost three out of four deaths in the United States were the first four of the 15 leading causes of death—Diseases of heart; Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues (cancer); Cerebrovascular diseases (stroke); and Accidents and adverse effects. The age-adjusted death rates for three of these four major causes declined between 1982 and 1983. The age-adjusted rate for Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues, increased. Homicide and legal intervention showed the largest decrease in age-adjusted death rates since the rates began to decline in the mid 1970's.

As in previous years, males experienced higher mortality than females for each of the 15 leading causes of death. The greatest sex difference in mortality was for Homicide and legal intervention; the smallest for Diabetes mellitus. The black population had higher rates than the white population for most

leading causes of death. The two exceptions to this general race differential included the age-adjusted rates for Suicide and Chronic obstructive pulmonary diseases and allied conditions, with rates for the black population being lower than those for the white population. The greatest race difference continued to be for Homicide and legal intervention, for which the age-adjusted rate was substantially higher for the black than for the white population.

Infant mortality was at a record low in 1983. While the downward trend in neonatal mortality continued for both the white and black populations, for the first time since 1965 there was an increase in postneonatal mortality for the black population. The infant mortality rate for the black population continued to be about twice that for the white population.

Deaths and death rates

In 1983 there were 2,019,201 deaths recorded in the United States, 44,404 more than in 1982. The death rate increased in 1983 to 862.8 deaths per 100,000 population, compared with 852.0 in 1982. Provisional data indicate that the rate for 1984 was 866.8, somewhat higher than that for 1981, 1982, and 1983, but lower than that for 1980. The main factor accounting for the higher death rate in 1983 than in the previous year was the aging of the U.S. population. While the total U.S. population grew by 1 percent between 1982 and 1983 (from 232 million to 234 million), the population aged 65 years and over grew by over 2 percent (from 26.8 million to 27.5 million). Also contributing to the increase between 1982 and 1983 was an outbreak of influenza in the latter year, which resulted in an elevated level of mortality.¹

The age-adjusted death rate decreased to 550.5 in 1983, down from 553.8 deaths per 100,000 population in 1982. The decrease in 1983 continues the long-term downward trend in the risk of mortality in the United States, bringing the age-adjusted rate to a record low (figure 1). Age-adjusted death rates show what the level of mortality would be if there were no

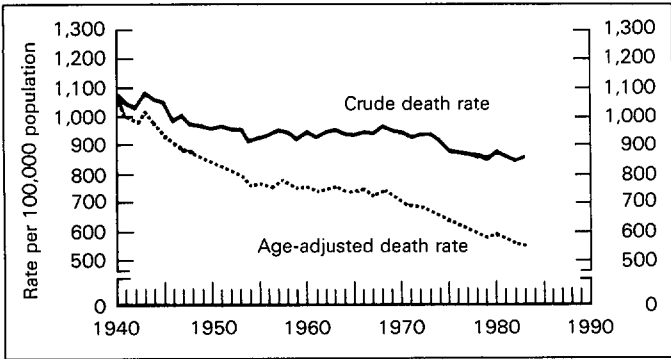

Figure 1. Crude and age-adjusted death rates: United States, 1940-83

changes in the age composition of the population from year to year. Thus, they are better indicators than unadjusted death rates in showing changes in the risk of death over a period of time when the distribution of the population by age is changing. They are also better indicators of risk when comparisons of mortality are being made for sex or race subgroups of the population that have different age compositions.

Death rates by age, sex, and race

Death rates for most age groups for both sexes combined declined between 1982 and 1983 except for ages 55-64, 75-84, and 85 years and over for whom death rates increased (figure 2). The largest increase was for the age group 75-84

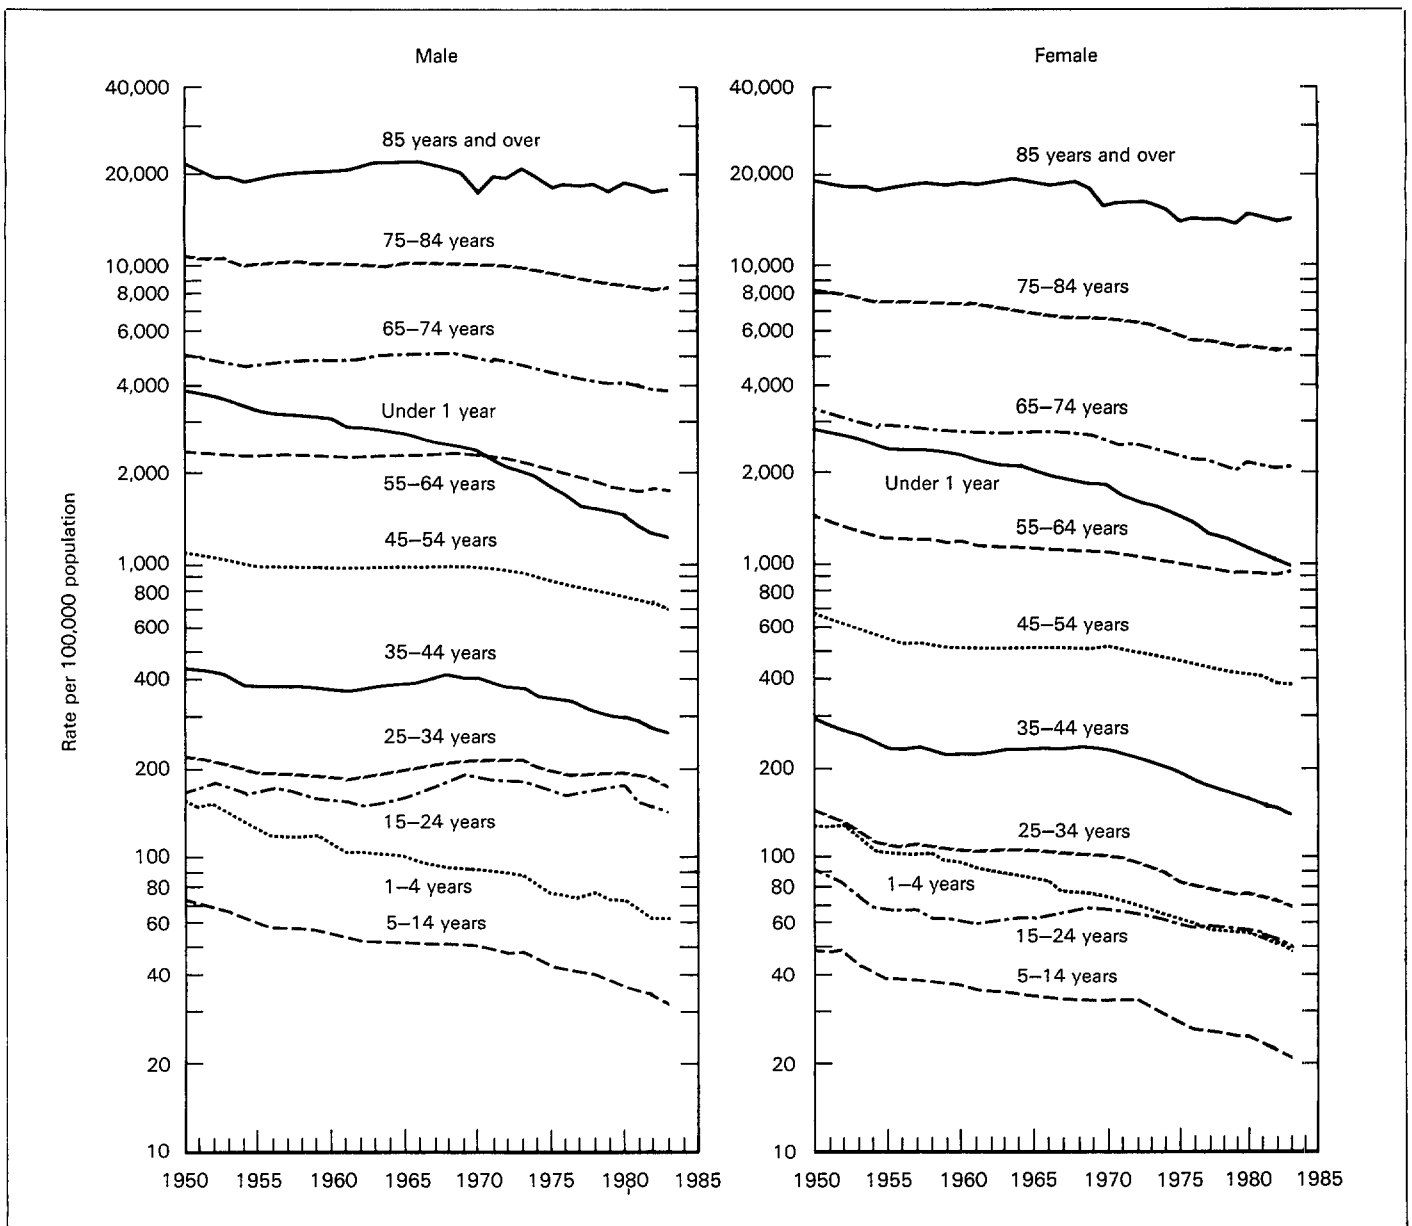

Figure 2. Death rates by age and sex: United States, 1950-83

years (2 percent), while the smallest decline was for the age group 65–74 years (less than 1 percent). The largest declines occurred in the age groups under 1, 5–14, and 15–24 years (5 percent each) (table A). For age groups under 55 years for males and females, the decline in death rates between 1982 and 1983 represents a continuation of the general downward trend observed since 1950. In the past, males 15–24 years of age have been the primary exception to this general decline in age-specific death rates. However, since 1980, there has been a substantial decline in death rates for males aged 15–24 years, reflected in declines in motor vehicle accident mortality, a major cause of death for this group.

Between 1982 and 1983 the age-adjusted death rate for males decreased 1 percent while that for females increased slightly (0.1 percent). Both white males and black males experienced a decrease of 1 percent. The rate for white females declined slightly (0.2 percent), whereas the rate for black females increased nearly 2 percent. As in 1982, the 1983 age-adjusted death rate for males was 1.8 times that for females. The age-adjusted death rate decreased 1 percent for the white population and only 0.1 percent for the black population between 1982 and 1983. In 1983 the rate for the black population was 1.5 times that for the white population, the same as the ratio in 1982.

Expectation of life at birth and at specified ages

In 1983 the average expectation of life at birth reached a record high of 74.6 years, up 0.1 year from 1982 (figure 3). This increase continued the general upward trend in life expectancy in the United States that was interrupted in 1980.

The expectation of life at birth for 1983 represents the average number of years that a group of infants would live if they were to experience throughout life the age-specific death rates prevailing in 1983. In 1983, females could expect to live an average of 78.1 years compared with 71.0 years for males.

Between 1982 and 1983 life expectancy for males increased 0.1 year while life expectancy for females remained

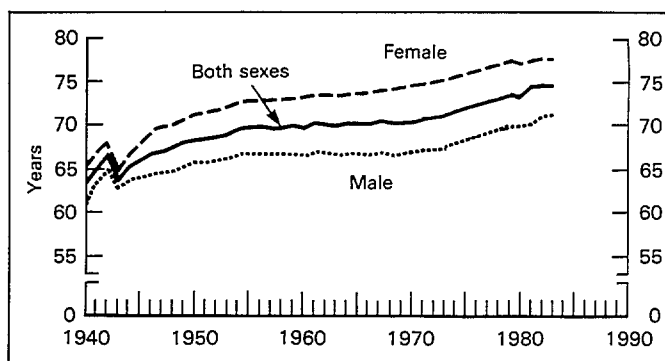

Figure 3. Life expectancy by sex: United States, 1940–83

the same. The difference in life expectancy between the sexes, which was widening for many years, now appears to be decreasing. The difference was 7.1 years in 1983, 7.2 years in 1982, 7.4 years in 1981 and 1980, compared with 7.6 years in 1970 and 6.5 years in 1960.

Between 1982 and 1983 the black population experienced an increase of 0.2 year in life expectancy, to 69.6 years, while the white population experienced an increase of 0.1 year, to 75.2 years in 1983. In 1970 life expectancy for the white population was 71.7 years, while that for the black population was 64.1 years. The difference in life expectancy between the white and black populations thus narrowed from 7.6 years in 1970 to 5.6 years in 1983.

Among the race-sex groups, white females continued to have the highest life expectancy at birth (78.7 years), followed by black females (73.6 years), white males (71.7 years), and black males (65.4 years). The largest gain in life expectancy between 1970 and 1983 was for black males (5.4 years), followed by black females (5.3 years), white males (3.7 years), and white females (3.1 years).

The 1983 life tables shown in this report may be used to compare life expectancies at any age from birth onward. For example, a person who has attained the age of 65 years may look forward to living to an older age, on the average, than one who has attained the age of 50 years. The person aged 50 years could expect to live an average of 28.3 more years for a total of 78.3 years, while the person 65 years of age could expect to live an average of 16.7 more years for a total of 81.7 years.

Table A. Percent change in death rates between 1982 and 1983 by age and sex: United States

Age	Total	Male	Female
Percent change			
All ages	+1.3	+0.5	+2.2
Under 1 year	-4.9	-5.2	-4.4
1–4 years	-3.0	-	-6.4
5–14 years	-4.9	-4.7	-5.8
15–24 years	-5.0	-5.9	-1.7
25–34 years	-3.0	-3.3	-2.1
35–44 years	-2.7	-2.5	-2.9
45–54 years	-2.5	-3.6	-1.0
55–64 years	+0.1	-0.6	+1.1
65–74 years	-0.4	-1.1	+0.4
75–84 years	+1.8	-1.8	+1.5
85 years and over	+0.8	-1.1	+0.8

Leading causes of death

Deaths assigned to the 15 leading causes accounted for 89 percent of the total number of deaths in 1983 (table B). (For ranking procedures, see Technical notes.) The ranking of the leading causes for 1983 changed slightly from the list based on data for 1982. Septicemia, the 15th leading cause in 1982, moved to 14th; while Congenital anomalies, the 14th leading cause in 1982, became the 15th in 1983. Age-adjusted death rates are shown in table C and figure 4 for 13 of the 15 leading causes. Because deaths from the other two causes (Congenital anomalies and Certain conditions originating in the perinatal

Table B. Death rates and percent of total deaths for the 15 leading causes of death: United States, 1983

[Rates per 100,000 population]

Rank ¹	Cause of death (Ninth Revision International Classification of Diseases, 1975)	Rate	Percent of total deaths
...	All causes	862.8	100.0
1	Diseases of heart	329.2	38.2
2	Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues	189.3	21.9
3	Cerebrovascular diseases	66.5	7.7
4	Accidents and adverse effects	39.5	4.6
...	Motor vehicle accidents	19.0	...
...	All other accidents and adverse effects	20.5	...
5	Chronic obstructive pulmonary diseases and allied conditions	28.3	3.3
6	Pneumonia and influenza	23.9	2.8
7	Diabetes mellitus	15.5	1.8
8	Suicide	12.1	1.4
9	Chronic liver disease and cirrhosis	11.7	1.4
10	Atherosclerosis	11.3	1.3
11	Homicide and legal intervention	8.6	1.0
12	Certain conditions originating in the perinatal period	8.3	1.0
13	Nephritis, nephrotic syndrome, and nephrosis	8.1	0.9
14	Septicemia	5.7	0.7
15	Congenital anomalies	5.6	0.7
...	All other causes	99.3	11.5

¹Rank based on number of deaths; see Technical notes.

period) occur mainly among infants under 1 year, age-adjusted rates for these causes are not shown.

For 7 of these 13 leading causes of death the age-adjusted death rates decreased between 1982 and 1983 (table C). These causes were Diseases of the heart, Cerebrovascular diseases, Accidents and adverse effects, Suicide, Chronic liver disease and cirrhosis, Atherosclerosis, and Homicide and legal intervention. Among these seven causes showing a decline in 1982, the largest decline was for Homicide and legal intervention (11 percent) followed by Atherosclerosis, Cerebrovascular diseases, and Accidents and adverse effects (4 percent each).

Increases in the age-adjusted death rates between 1982 and 1983 occurred for six causes—Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues; Chronic obstructive pulmonary diseases and allied conditions; Pneumonia and influenza; Diabetes mellitus; Nephritis, nephrotic syndrome, and nephrosis; and Septicemia. For Septicemia the increase of 13 percent continued the rapid increase observed for the past three decades (figure 4). The increase for Pneumonia and influenza was 8 percent and the increase for Chronic obstructive pulmonary diseases and allied conditions was 7 percent; both were reflections of the influenza outbreak. Increases for the other three leading causes were 3 percent or less.

Mortality levels for each of the 15 leading causes of death were higher for males than for females (table D). The largest differences were for violent and accidental causes of death.

Table C. Age-adjusted death rates for 1983 and percent changes in age-adjusted death rates for the 15 leading causes of death from 1982 to 1983 and 1979 to 1983: United States

[Rates per 100,000 population]

Rank ¹	Cause of death (Ninth Revision International Classification of Diseases, 1975)	Age-adjusted death rates for 1983	Percent change from—	
			1982 to 1983	1979 to 1983

13	Nephritis, nephrotic syndrome, and nephrosis	4.6	+2.2	+7.0
14	Septicemia	3.4	+13.3	+47.8
15	Congenital anomalies ²	-2.1	-6.0

¹Rank based on number of deaths; see Technical notes.

²Inasmuch as deaths from these causes occur mainly among infants, percent changes are based on infant mortality rates instead of age-adjusted death rates.

Specifically, the age-adjusted death rates for Homicide and legal intervention and Suicide were almost four times as high for males as for females. The rate for Accidents and adverse effects was almost three times as high for males as for females. The smallest sex difference was for Diabetes mellitus, with a male-to-female ratio of 1.01.

The slight increase (less than 1 percent) in the age-adjusted death rate for women between 1982 and 1983 reflected increases in rates for a number of leading causes, including: Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues; Chronic obstructive pulmonary diseases and allied conditions; and Pneumonia and influenza. These increases were of sufficient magnitude to more than offset decreases in rates for other leading causes of death including Diseases of the heart, Cerebrovascular diseases, and Accidents

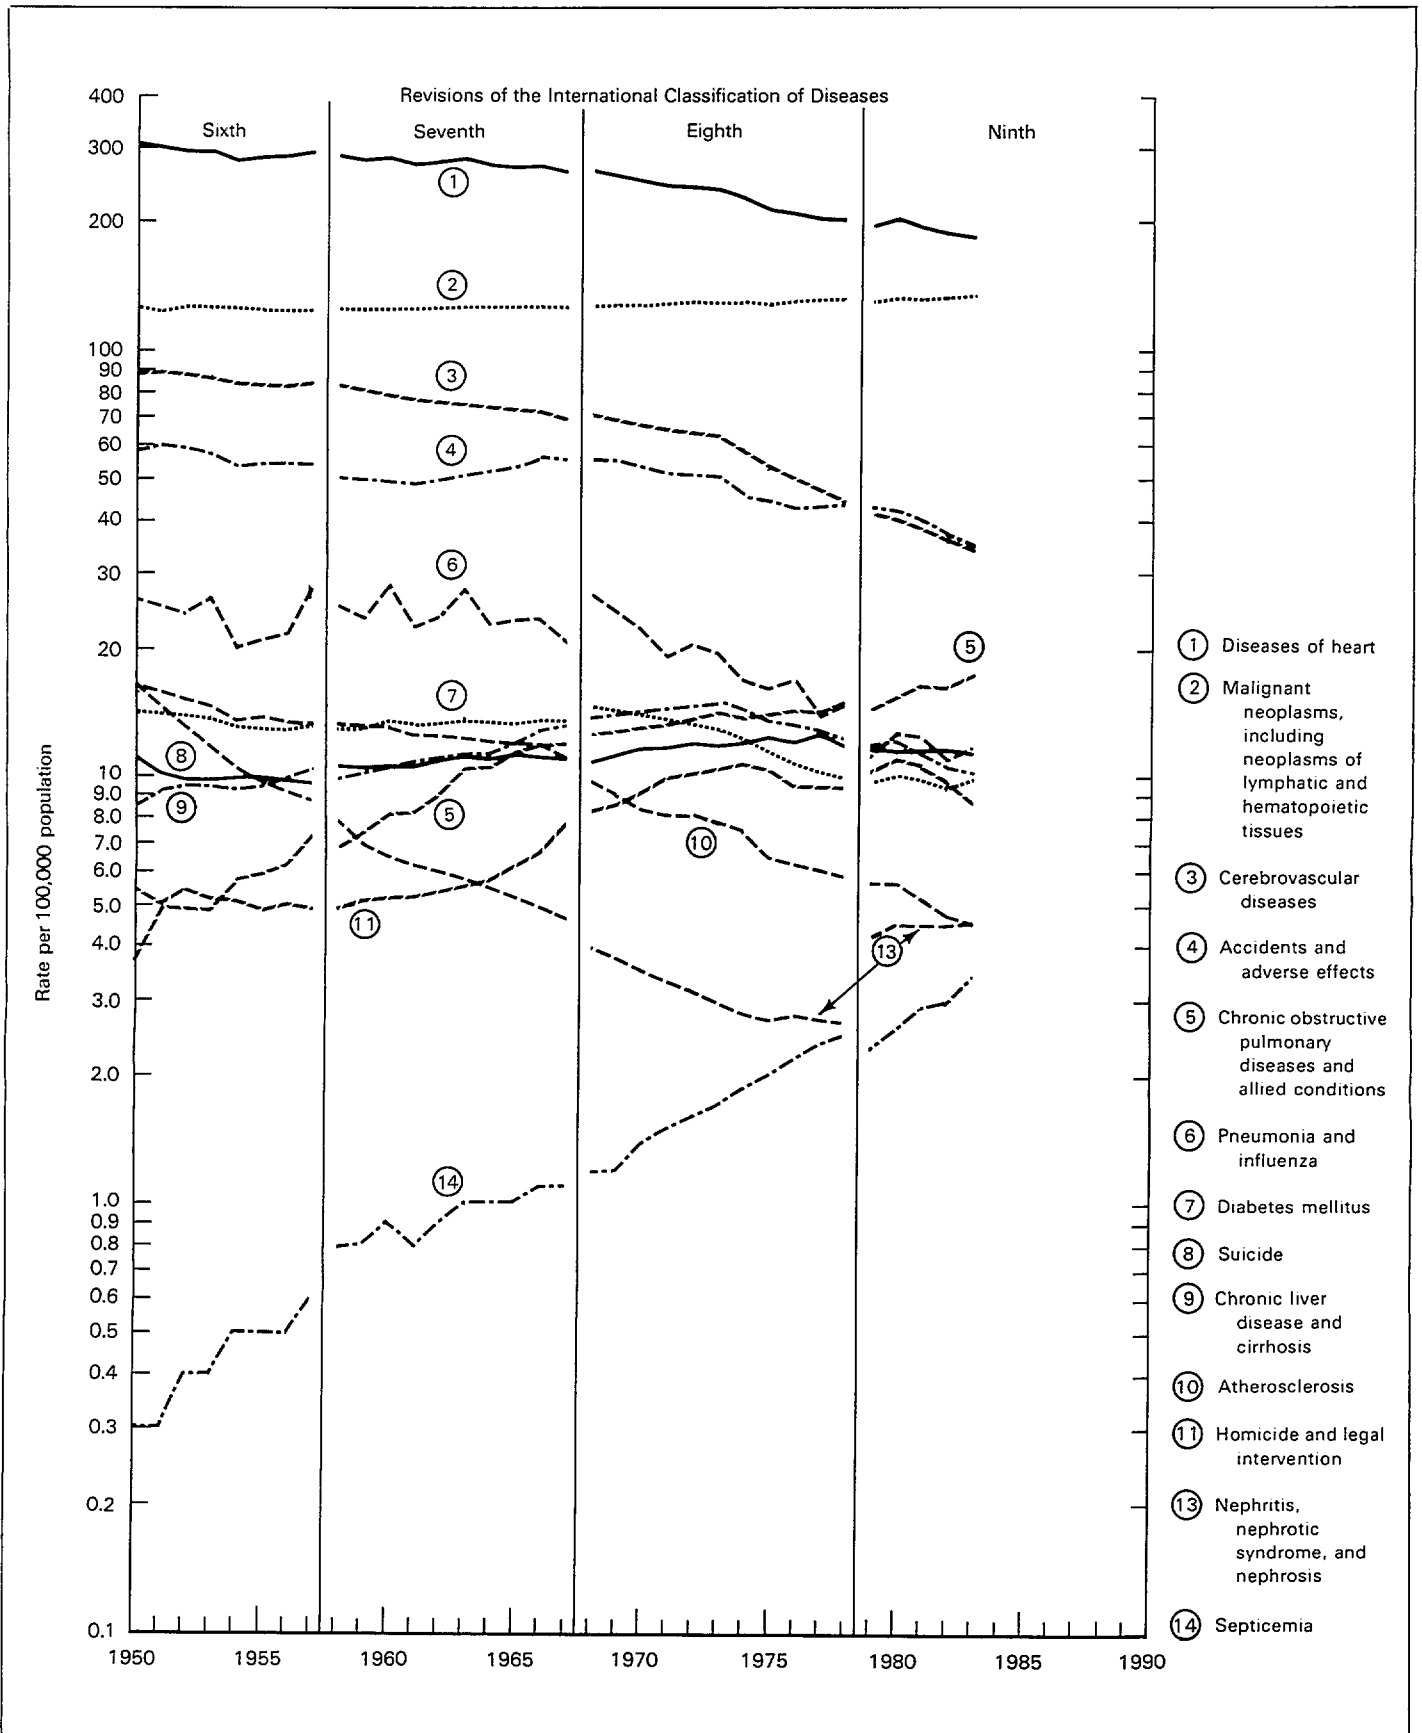

Figure 4. Age-adjusted death rates for 13 of the 15 leading causes of death: United States, 1950-83

Table D. Ratio of age-adjusted death rates for the 15 leading causes of death, by sex and race: United States, 1983

¹Rank based on number of deaths; see Technical notes.
²Inasmuch as deaths from these causes occur mainly among infants, ratios are based on infant mortality rates instead of age-adjusted death rates.

and adverse effects. For men, the age-adjusted death rate for all causes combined decreased by over 1 percent between 1982 and 1983, but rates for some leading causes increased. These included Chronic obstructive pulmonary diseases and allied conditions and Pneumonia and influenza.

Mortality was higher for the black population than for the white population for 13 of the 15 leading causes. The largest differential was for Homicide and legal intervention, where the age-adjusted rate for the black population was nearly six times that of the white population. Other causes for which the differential was large include Septicemia and Nephritis, nephrotic syndrome, and nephrosis, with black-to-white ratios of 2.8 and 2.7, respectively. Age-adjusted rates for the black population were lower than those for the white population for two causes—Chronic obstructive pulmonary diseases and allied conditions and Suicide.

Infant mortality

In 1983 there were 40,627 deaths under 1 year of age. The infant mortality rate of 11.2 infant deaths per 1,000 live births was the lowest rate ever recorded for the United States. The rate declined 3 percent from the level of 11.5 in 1982. Provisional data indicate that the rate for 1984 declined further, to 10.6. Among white infants, the mortality rate (per 1,000 live births) decreased 4 percent, from 10.1 in 1982 to 9.7 in 1983,

while for black infants the rate decreased 2 percent, from 19.6 in 1982 to 19.2 in 1983. The infant mortality rate for black infants was almost twice that for white infants in 1983, as it was 20 years earlier (figure 5).

The downward trend in infant mortality has slowed since 1981. While the downward trend in neonatal mortality has continued and has been shared by both the white and black populations, the postneonatal mortality rate increased 3 percent between 1982 and 1983. The increase in postneonatal mortality reflects an increase for the black population; the rate for the white population was unchanged between the two years. The rate for the black population was unchanged between the previous two years, 1981 and 1982, while the rate for the white population declined 3 percent.

The leading cause of infant mortality was Congenital anomalies, with an infant mortality rate of 240.0 deaths per 100,000 live births. Rates for the next three leading causes were at substantially lower levels—Sudden infant death syndrome (145.8), Respiratory distress syndrome (101.2), and Disorders relating to short gestation and unspecified low birth-weight (91.6). These four causes accounted for just over half of all deaths of infants under 1 year of age in 1983. Among the 10 leading causes of infant deaths, those ranking fifth through tenth accounted for only 15 percent of all infant deaths.

The difference between infant mortality rates for black and

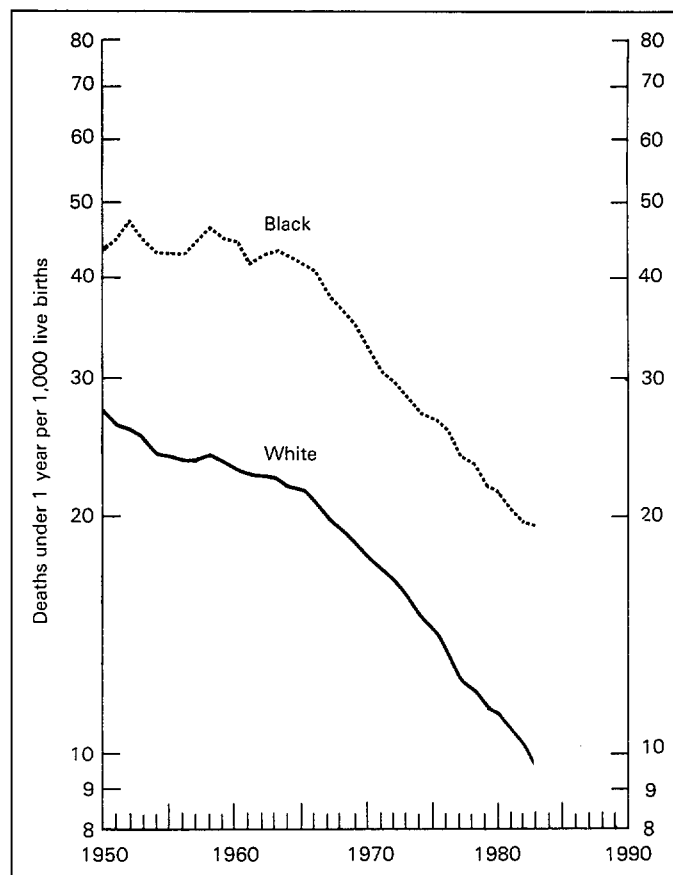

Figure 5. Infant mortality rates by race: United States, 1950-83

white infants varied by cause, although the risk was higher for black infants than for white infants for all leading causes. Expressed as the ratio of the infant mortality rate for black infants to that for white infants, the leading causes may be ranked, beginning with the highest ratio, as follows: Disorders relating to short gestation and unspecified low birthweight (3.4); Pneumonia and influenza (3.0); Newborn affected by maternal complications of pregnancy (2.1); Sudden infant death syndrome (2.1); Accidents and adverse effects (2.0); Intrauterine hypoxia and birth asphyxia (1.9); Respiratory distress syndrome (1.7); Infections specific to the perinatal period (1.7); and Newborn affected by complications of placenta, cord, and membranes (1.7). The smallest race ratio was for Congenital anomalies (1.02).

Maternal mortality

In 1983, 290 women were reported to have died of maternal causes (table E). As in previous years, this number does not include all deaths occurring to pregnant women, but only deaths

Table E. Maternal deaths and maternal mortality rates by race: United States, 1983

[Maternal deaths are those assigned to Complications of pregnancy, childbirth, and the puerperium, category numbers 630-676 of the *Ninth Revision International Classification of Diseases, 1975*. Rates per 100,000 live births in specified group]

<i>Race</i>	<i>Number</i>	<i>Rate</i>
All races.....	290	8.0
White.....	170	5.9
All other.....	120	16.3
Black.....	107	18.3

assigned to Complications of pregnancy, childbirth, and the puerperium (ICD-9 Nos. 630-676). The maternal mortality rate was 1 percent higher in 1983 (8.0 deaths per 100,000 live births) than in 1982 (7.9), but the increase is not statistically significant. Black women were three times as likely as white women to die of causes associated with pregnancy, childbirth, and the puerperium.

Table 1. Deaths, death rates, age-adjusted death rates, and life expectancy at birth, by race and sex: United States, 1940, 1950, 1960, and 1970-83—Con.

[Rates per 100,000 population in specified group. Rates and life expectancy at birth are based on populations enumerated as of April 1 for census years and estimated as of July 1 for all other years. Beginning 1970 excludes deaths of nonresidents of the United States]

¹Per 100,000 population in each race-sex group and area.
²Per 1,000 live births in each race-sex group and area.

NOTE: Caution should be used in comparing crude death rates by State. Death rates are affected by the population composition of the area.

Table 14. Deaths and death rates for major causes of death for the United States, each division, and State; and by race and sex for the United States: 1983

[Rates per 100,000 population in each race-sex group and area. Numbers after causes of death are category numbers of the *Ninth Revision International Classification of Diseases, 1975*]

Race, sex, and area	Diseases of heart (390-398,402, 404-429)		Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues (140-208)		Cerebrovascular diseases (430-438)		Accidents and adverse effects (E800-E949)		Motor vehicle accidents (E810-E825)		Suicide (E950-E959)

NOTE: Caution should be used in comparing crude death rates by State. Death rates are affected by the population composition of the area.

Technical notes

Nature and sources of data

Data shown in this report are based on information from all death certificates filed in the 50 States and the District of Columbia.

Mortality statistics are based on information coded by the National Center for Health Statistics (NCHS) from copies of the original certificates received from the State registration offices, and on State-coded data provided to NCHS through the Vital Statistics Cooperative Program (VSCP). In 1983, 46 States participated in this program. For these States part or all of the mortality data for 1983 were provided on computer tape to NCHS. The following 16 States in the VSCP submitted precoded medical and nonmedical data for all deaths on computer tape: Colorado, Iowa, Kansas, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Nebraska, New Hampshire, North Carolina, Pennsylvania, South Carolina, Virginia, and Wisconsin. The remaining 30 VSCP States submitted precoded nonmedical data for all deaths along with copies of the original certificates from which NCHS coded the medical data: Alabama, Alaska, Arkansas, Connecticut, Florida, Hawaii, Idaho, Illinois, Indiana, Kentucky, Maryland, Missouri, Montana, Nevada, New Jersey, New Mexico, New York, North Dakota, Ohio, Oklahoma, Oregon, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, West Virginia, and Wyoming. For the four States and the District of Columbia which were not participants in the VSCP in 1983, NCHS coded all the nonmedical data and all or part of the medical data.

Data for the United States as a whole refer to events occurring within the United States. Data shown for geographic areas are by place of residence. Beginning with 1970, mortality statistics exclude deaths of nonresidents of the United States. All data exclude fetal deaths.

Cause-of-death classification

The mortality statistics presented here were compiled in accordance with the World Health Organization regulations, which specify that member nations classify causes of death by the current *Manual of the International Statistical Classification of Disease, Injuries, and Causes of Death*.²

Causes of death for 1979–83 were classified according to the *Ninth Revision International Classification of Diseases*.² For earlier years causes of death were classified according to the revisions then in use, as follows: 1968–78, Eighth Revision; 1958–67, Seventh Revision; and 1949–57, Sixth Revision. Changes in classification of causes of death due to these revisions may result in discontinuities in cause-of-death trends. Conse-

quently, cause-of-death comparisons between revisions require consideration of the comparability ratios and, where available, estimates of their standard errors. Comparability ratios between the Eighth and Ninth Revisions, between the Seventh and Eighth Revisions, and between the Sixth and Seventh Revisions may be found in other NCHS reports.^{3–5}

Besides specifying the classification, the World Health Organization regulations outline the form of medical certification and the coding procedures to be used. In general, when more than one cause of death is reported, the cause designated by the certifying physician as the underlying cause of death is the cause tabulated.

Cause-of-death data presented in this publication were coded by procedures outlined in issues of Part 2a of the *NCHS Instruction Manual*.⁶

Population bases for computing rates

The population used for computing rates shown in this report (furnished by the U.S. Bureau of the Census) represents the population residing in the specified area. Death rates for 1983 are based on populations estimated as of July 1, 1983.^{7,8} The estimates are based on the 1980 census count. The 1980 census counts by race were modified to be consistent with Office of Management and Budget categories and historical categories for death data. The modification procedures are discussed in detail in a report of the U.S. Bureau of the Census.⁹

Cause-of-death rankings

The cause-of-death rankings shown in tables B–D are based on the List of 72 Selected Causes of Death; the cause-of-death ranking for infants in table 4 is based on the List of 61 Selected Causes of Infant Death.

The group titles Major cardiovascular diseases and Symptoms, signs, and ill-defined conditions are not ranked from the List of 72 Selected Causes; Certain conditions originating in the perinatal period and Symptoms, signs, and ill-defined conditions are not ranked from the List of 61 Selected Causes of Infant Death. In addition, category titles that begin with the words “Other” or “All other” are not ranked to determine the leading causes of death. When one of the titles that represents a subtotal is ranked (for example, Tuberculosis), its component parts (in this case, Tuberculosis of respiratory system and Other tuberculosis) are not ranked.

Age-adjusted rates

The age-adjusted rates presented in this report were computed by the direct method, that is, by applying the age-specific

NOTE: A list of references follows the text.

death rates for a given cause of death to the standard population distributed by age. The total population as enumerated in 1940 was selected as the standard. The rates for the total population and for each race-sex group were adjusted separately, by using the same standard population. The age-adjusted rates were based on 10-year age groups. It is important not to compare age-adjusted death rates with crude rates.

Life tables

U.S. abridged life tables are constructed by reference to a standard life table.¹⁰ Life table values for 1980-82 appearing in this publication have been revised using life tables for the decennial period 1979-81 as the standard life tables; therefore, these figures may differ from those previously published.

NOTE: A list of references follows the text.

This report presents summary tabulations from the final mortality statistics for 1983. More detailed tabulations for 1983 will be published in *Vital Statistics of the United States, 1983, Volume II—Mortality*. Prior to the publication of that volume, the National Center for Health Statistics will respond to requests for unpublished data whenever possible.
