

Description

‘Muckalee Germplasm’ Woolgrass [*Scirpus cyperinus* (L.) Kunth.] is a native perennial herbaceous sedge. It grows in tussocks from short branching rhizomes. The tussocks range in width from 40 to 80 cm. Fertile culms are upright and triangular in shape. They range in height from 175 to 200 cm. There are usually 5 to 10 leaves per culm. Leaf blades are 3 to 8 mm wide. Leaves ascend up the tussock 40 to 60 cm. Spikelets form in dense cymes of 2 to 12 at apex of each fertile culm. Scales of the spikelets are reddish brown. Spikelets are characteristically brown and drooping from the top of the fertile culm.

Achenes are three angled, smooth and whitish. Mature inflorescence appears woolly. Flowers and fruit appear late summer-fall. It is classified as an obligate hydrophytic plant by National List of Plant Species That Occur in Wetlands: Southeast (Region 2).

It is listed as native to lower 48 states. Native populations occur in fresh water marshes, shores, wet meadows, sloughs, and wet depressions.

Development and Adaptation

‘Muckalee Germplasm’ Woolgrass is a native source identified release which has undergone no purposeful selection pressure. It is most adapted to the Georgia coastal plain. MLRA 133A and 153 B.

Establishment and Management

Constructed wetland sites should be shaped, disked, harrowed, and otherwise prepared for planting vegetative root stocks. It is recommended that the original topsoil excavated from the constructed wetland be stockpiled for later use as a soil amendment. Release water onto a site prior to planting to improve moisture conditions. **Planting rate:** Rootstocks can be planted to 3 foot rows and 2 to 3 feet within rows for moderate coverage. **Planting date:** Losses from heat stress can occur when stock is planted in the hot summer months. Suggested planting dates extend from early April to mid-June. Rootstock and potted material can be planted by hand or with the aid of a modified tree planter. **Substrate:** many substrates are

suitable for constructed wetlands establishment. Loamy soils are especially suitable because they are friable allowing for easy rhizome and root development. However a fine-textured clay may limit root and rhizome growth. **Water level:** Apply water before planting to hydrate the soil. After planting the substrate should be saturated with pond water or other clean water sources to about 1 inch depth for four to five weeks. After the sixth week or when the plants show new and vigorous growth, water levels should be slowly and gradually increased to support upright growth. The plants should be allowed to become established before waste water effluent (especially animal waste) is discharged into the constructed wetland.

Conservation Uses

Uses for ‘Muckalee Germplasm’ include residential septic systems and other small constructed wetlands for tertiary wastewater treatment.

Availability

Plant material of 'Muckalee Germplasm' Woolgrass is being maintained at the Jimmy Carter Plant Materials Center in Americus, Georgia. Mepkin Abbey Nursery near Moncks Corner South Carolina is growing nursery stock for public consumption.
