Administrative Report^a – July 3, 2003

This report summarizes information about the status of duck populations and their habitats during spring 2003, and focuses on areas encompassed by the Breeding Waterfowl and Habitat Survey. These estimates do not include information from State or Provincial agency surveys. The traditional survey area includes strata 1-18, 20-50, and 75-77. In the traditional survey area, the total duck population estimate (excluding scoters [*Melanitta* spp.], eiders [*Somateria* and *Polyysticta* spp.], long-tailed ducks [*Clangula hyemalis*], mergansers [*Mergus* and *Lophodytes* spp.], and wood ducks [*Aix sponsa*]) was 36.2 ± 0.7 [SE] million birds, 16% above ($P < 0.001$) last year's estimate of 31.2 ± 0.5 million birds, and 9% above ($P < 0.001$) the 1955-2002 long-term average. Mallard abundance was 7.9 ± 0.3 million birds, which was similar to last year's estimate of 7.5 ± 0.2 million birds ($P = 0.220$) and the long-term average ($P = 0.100$). Blue-winged teal abundance was estimated to be 5.5 ± 0.3 million birds. This value was 31% above last year's estimate of 4.2 ± 0.2 million birds ($P < 0.001$) and 23% above the long-term average ($P = 0.001$). Estimates of shovanders (3.6 ± 0.2 million; +56%) and pintails (2.6 ± 0.2 million; +43%) were above 2002 estimates ($P < 0.001$), while estimates of gadwall (2.5 ± 0.2 million), wigeon (2.6 ± 0.2 million), green-winged teal (2.7 ± 0.2 million), redheads (0.6 ± 0.1 million), canvasbacks (0.6 ± 0.1 million), and scaup (3.7 ± 0.2 million) were unchanged from 2002 estimates ($P \geq 0.149$). Gadwall (+55%) and shovanders (+72%) were above their 1955-2002 averages ($P < 0.001$), as were green-winged teal (+46%; $P < 0.001$), which were at their second highest level since 1955. Pintails (-39%) and scaup (-29%) remained well below their long-term averages ($P < 0.001$). Estimates of wigeon, redheads, and canvasbacks were unchanged from their long-term averages ($P \geq 0.582$).

The eastern survey area is comprised of strata 51-56 and 62-69. The 2003 total-duck population estimate for this area was 3.5 ± 0.3 million birds. This estimate is 21% lower than that of last year (4.4 ± 0.3 million birds, $P = 0.025$), but is similar to the 1996-

^a This report is intended for administrative use only and is not for publication without the permission of the Director, U.S. Fish and Wildlife Service.

2002 average ($P = 0.531$). Numbers of the individual species were similar to those of last year and the 1996-2002 average, with the exception of mergansers (0.6 ± 0.1 million), which decreased 30% from the 2002 estimate ($P = 0.035$).

Habitat conditions for breeding waterfowl have greatly improved over last year in most of the prairie survey areas. These improved conditions are reflected in the numbers of ponds counted this year. The estimate of May ponds (U.S. Prairies and Prairie and parkland Canada combined) of 5.2 ± 0.2 million is 91% higher than last year ($P \leq 0.001$) and 7% above the long-term average ($P = 0.034$). Numbers of ponds in Canada (3.5 ± 0.2 million) and the U.S. (1.7 ± 0.1 million) were above 2002 estimates (+145% in Canada and +30% in the U.S.; $P < 0.001$). Canadian ponds were similar to the 1974-2002 average ($P = 0.297$), while ponds in the U.S. were 10% above the 1974-2002 average ($P = 0.037$).

Most prairie areas had warm temperatures and abundant rain this spring. Two areas of dramatic improvement over the past several years were south-central Alberta and southern Saskatchewan, where conditions went from poor to good after much needed precipitation relieved several years of drought. Other areas in the prairies also improved over 2002, but to a lesser extent. However, years of dry conditions in parts of the U.S. and Canadian prairies, combined with agricultural practices, have reduced the quality and quantity of residual nesting cover and overwater nest sites in many regions. This could potentially limit production for both dabbling and diving ducks, if the warm spring temperatures and good moisture of 2003 do not result in rapid growth of new cover. Eastern South Dakota was the one area of the prairies where wetland habitat conditions were generally worse than last year, mostly due to low soil moisture, little winter precipitation, and no significant rains in April. This region received several inches of rain in May, but most birds had probably flown to other regions with more favorable wetland conditions.

In the northern part of the traditional survey area, habitat was in generally good condition and most areas had normal water levels. The exception was northern Manitoba, where low water levels in small streams and beaver ponds resulted in overall breeding habitat conditions that were only fair. Warm spring temperatures arrived much earlier this year than the exceptionally late spring last year. However, a cold snap in early May may have hurt early nesting species such as mallards and pintails, particularly in the northern Northwest Territories.

Habitat conditions in the eastern survey area ranged from excellent to fair. In the southern and western part of this survey area, water and nesting cover were plentiful and temperatures were mild this spring. Habitat quality decreased to the north, especially in northern and western Quebec, where many shallow marshes and bogs were either completely dry or reduced to mudflats. Beaver pond habitat was also noticeably less common than normal. To the east in Maine and most of the Maritime provinces, conditions were excellent, with adequate water, vegetation, and warm spring temperatures.

The data in this report were contributed by the following individuals:

Alaska, Yukon Territory, and Old Crow Flats (Strata 1-12): B. Conant and D. Groves

Northern Alberta, Northeastern British Columbia, and Northwest Territories (Strata 13-18, 20, and 77):
C. Ferguson and A. Straughn

Northern Saskatchewan and Northern Manitoba (Strata 21-24): F. Roetker and P. Stinson

Southern and Central Alberta (Strata 26-29, 75, and 76):

^a LTA = Long-term average (1996-2002).

^b Includes species in table plus gadwall, northern shoveler, northern pintail, and scaup. Excludes eiders, long-tailed duck, wood duck, redhead, canvasback, and ruddy duck.

Figure 2. Transects and strata for areas of the Breeding Waterfowl and Habitat Survey (stratum 57 is experimental and survey counts are not included in this report).

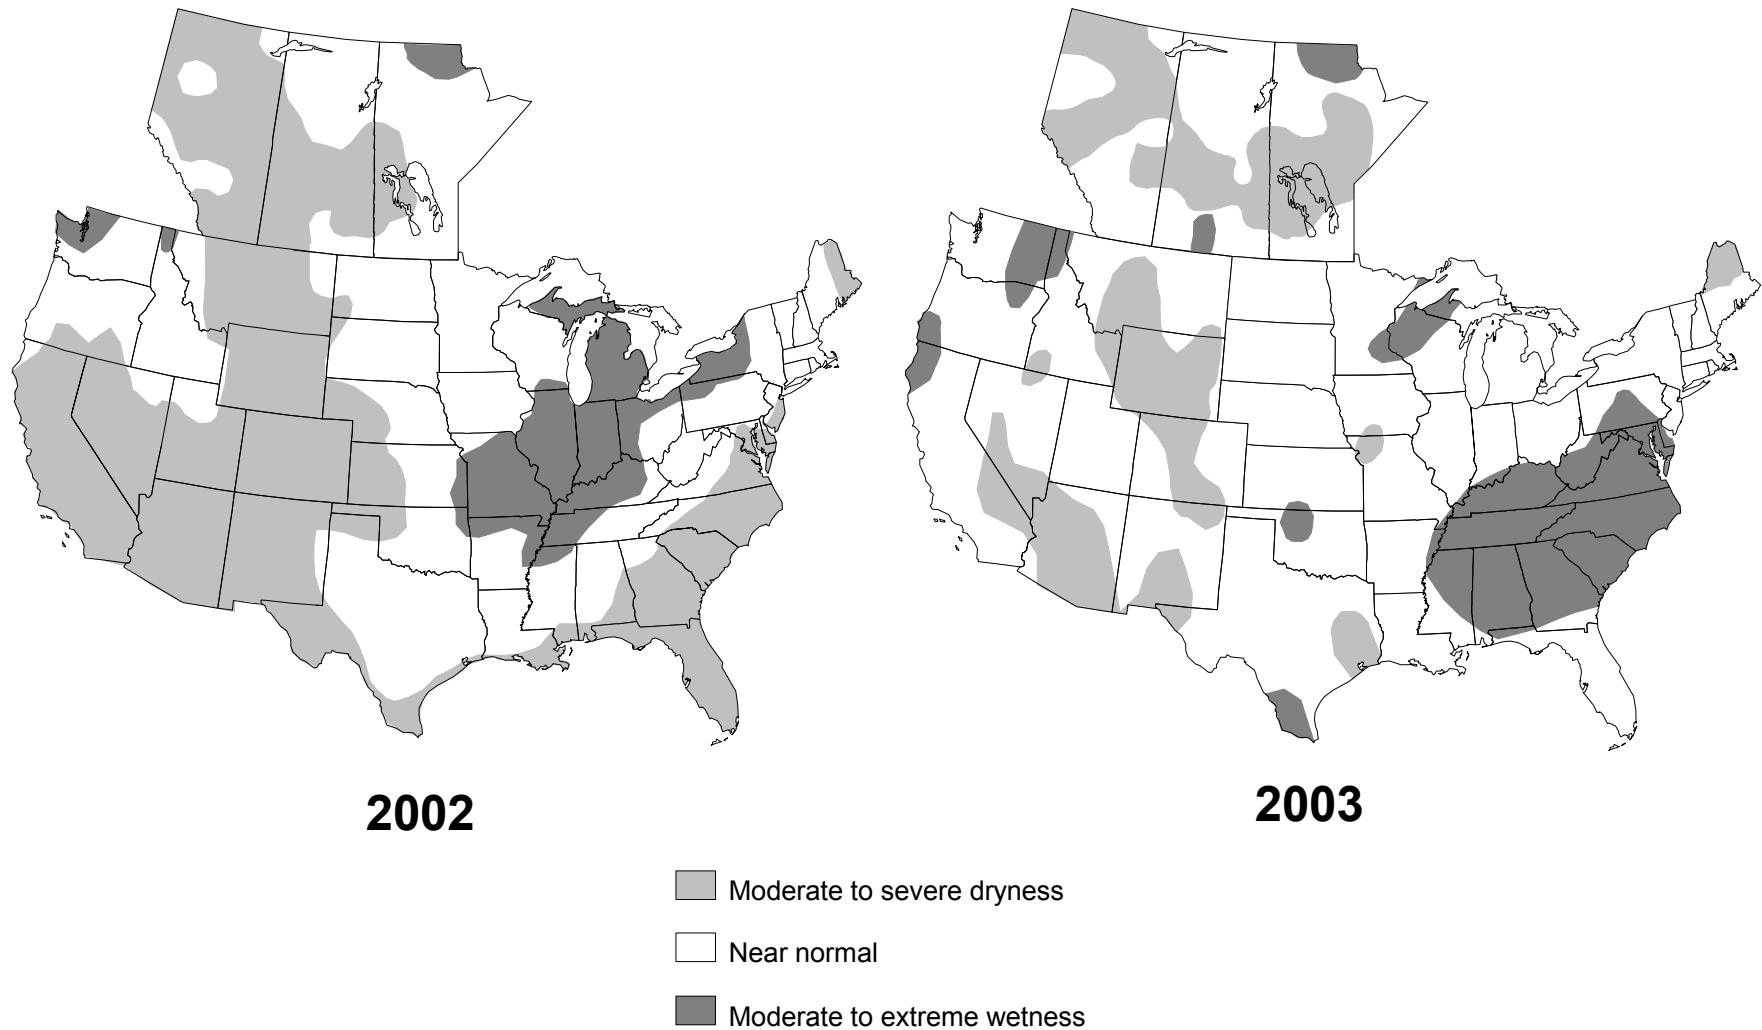

Figure 3. Palmer long-term drought indices (PDI) for the contiguous U.S. and provinces of Canada for which data were available. U.S. PDI map from Weekly Weather and Crop Bulletin - May 29, 2002 and May 28, 2003; Canadian PDI map from Environment Canada - May 2002 and May 2003.

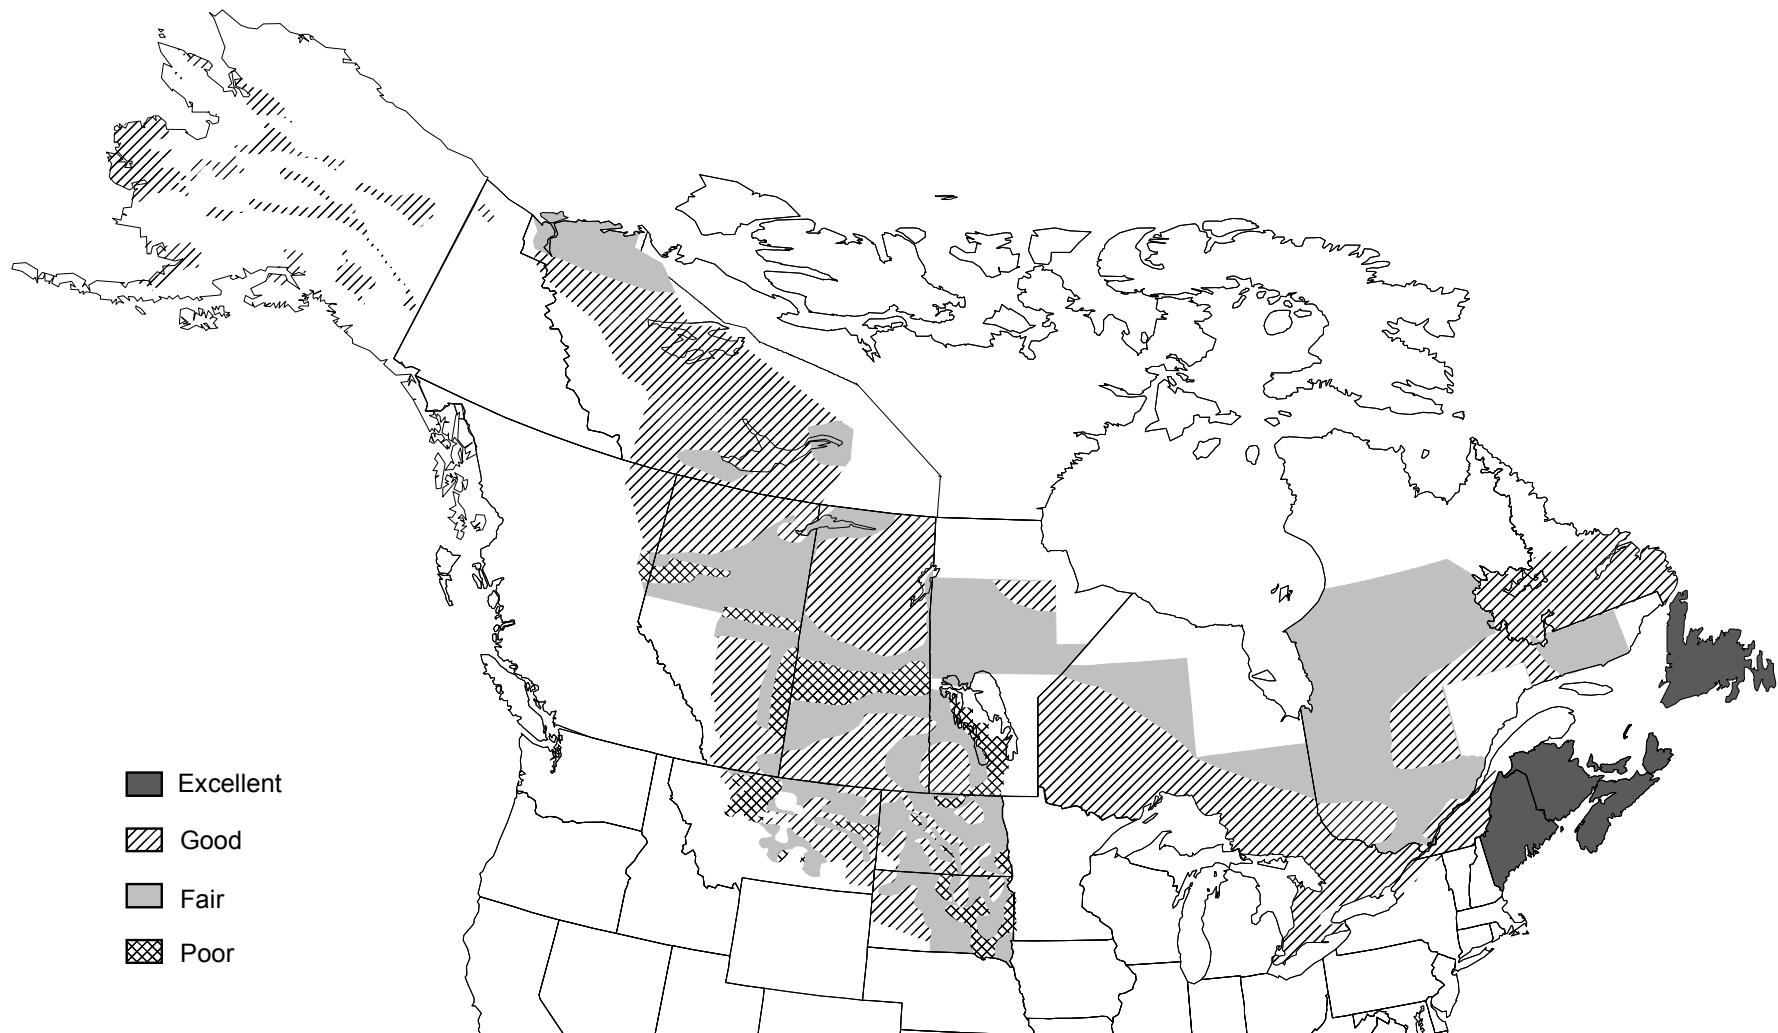

Figure 4. Breeding waterfowl habitat conditions during May and June 2003, as judged by U.S. Fish & Wildlife Service Flyway Biologists.

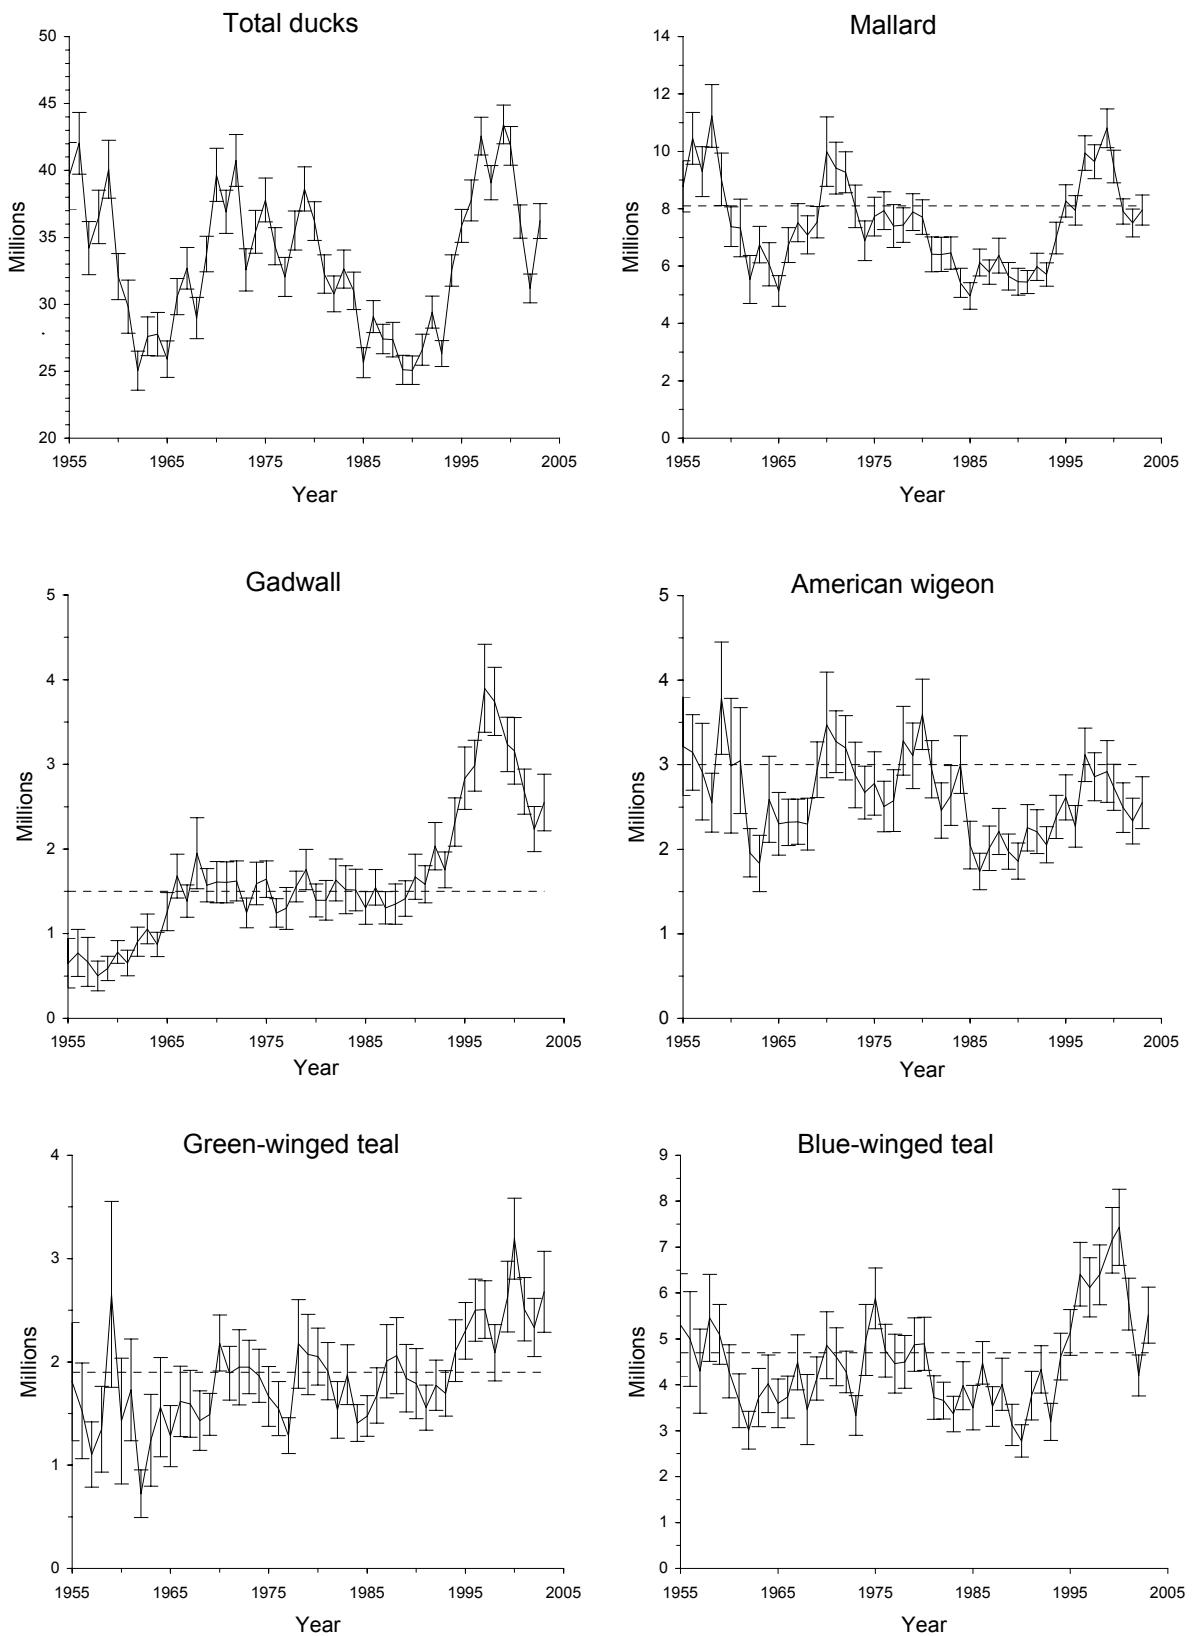

Figure 5. Breeding population estimates, 95% confidence intervals, and North American Waterfowl Management Plan population goal (dashed line) for selected species in the traditional survey area (strata 1-18, 20-50, 75-77).

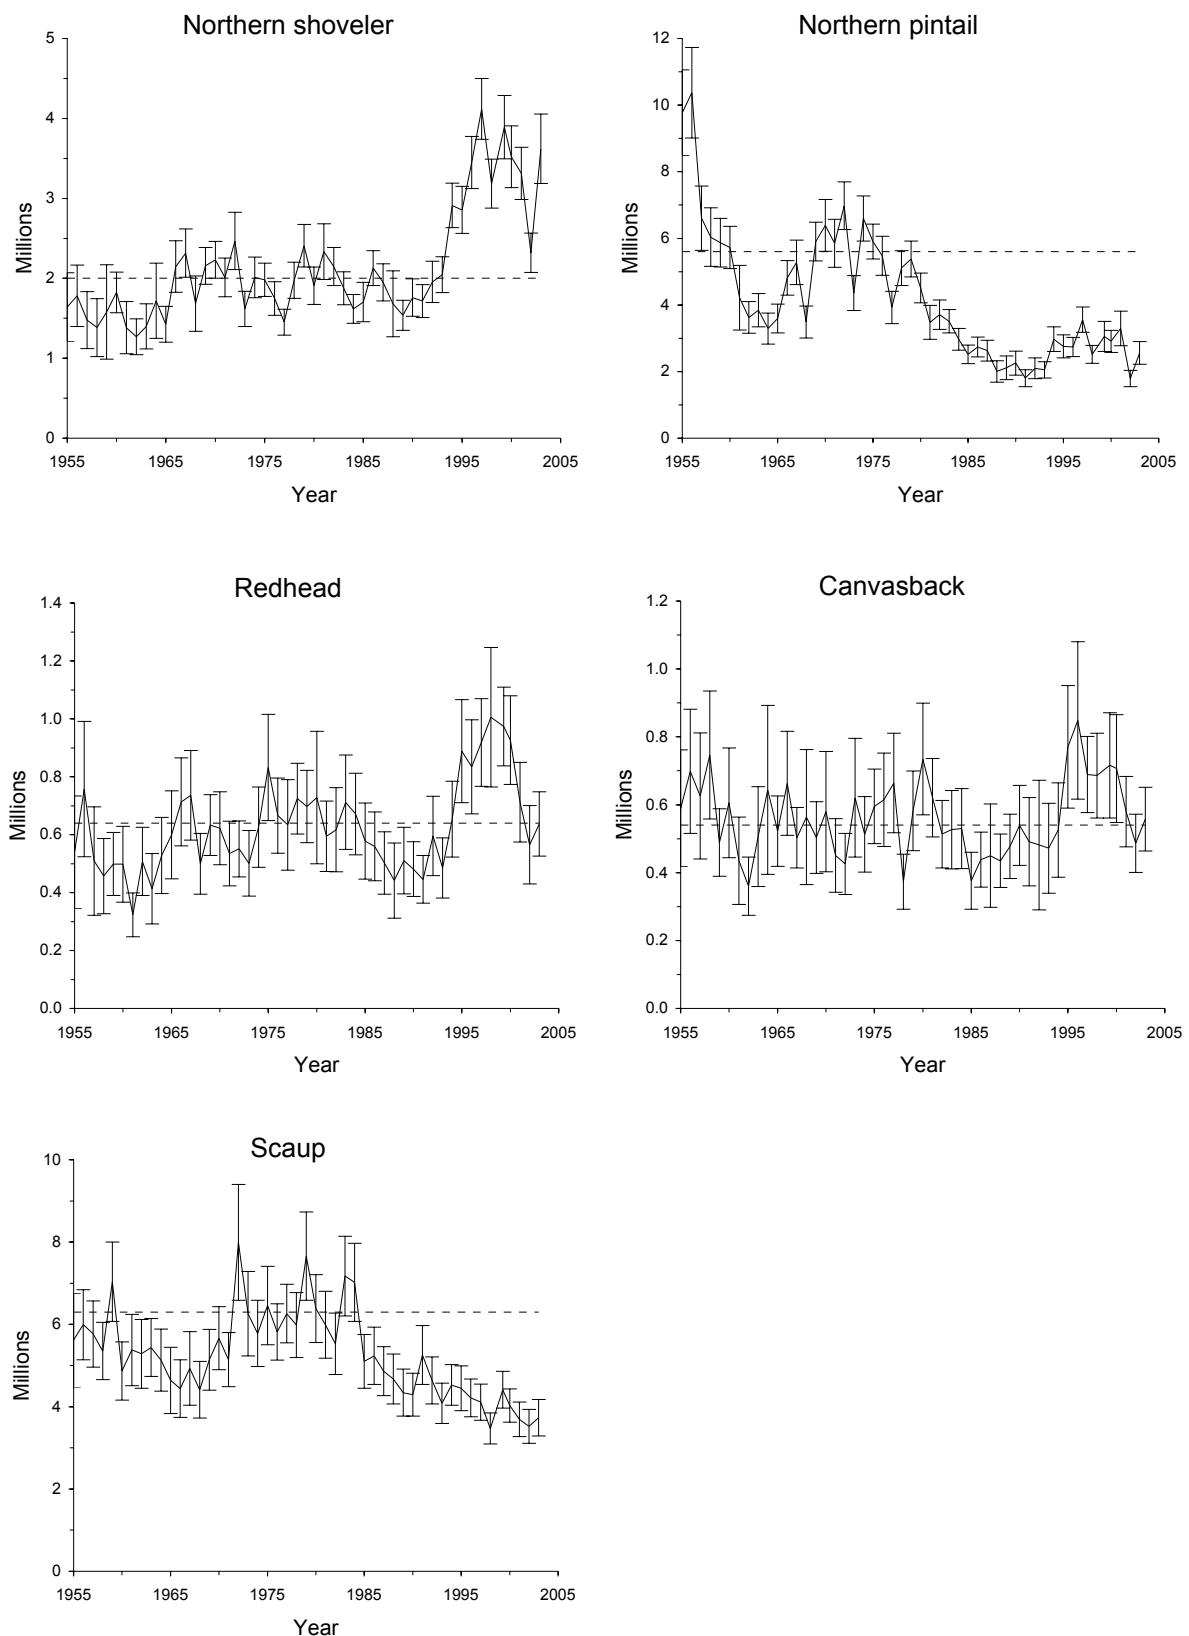

Figure 5, continued.

Appendix A. Breeding population estimates and standard errors (in thousands) for 10 species of ducks from the traditional survey area (strata 1-18, 20-50, 75-77).
