Trends in Relative Income: 1964 to 1989

U.S. Department of Commerce Economics and Statistics Administration BUREAU OF THE CENSUS

Acknowledgments

John McNeil of the Housing and Household Economic Statistics Division developed and wrote this report. Victor Valdisera of the Computer Programming and Applications Staff created the required data files and programmed the tables. Edward Welniak provided technical advice on processing issues, and Robert Clemons wrote the programs to assemble the tables in a publication format. Deborah Largent and Viola Hughes provided word processing assistance.

Wendy Scholetzky of the Statistical Methods Division conducted the sampling review.

The staff of the Administrative and Publications Services Division, **Walter C. Odom,** Chief, provided publication planning, design composition, and printing planning and procurement. **Gail Farren** edited and coordinated the publication.

Trends in Relative Income: 1964 to 1989

INTRODUCTION

This report introduces a measure that describes the distribution of income among persons and presents data based on the new measure for the years 1964, 1969, 1974, 1979, 1984, and 1989. The data are from the March supplements to the Current Population Survey.

The measure, called relative income, is intended to supplement the information available from traditional measures such as median family income and the percent of the population below the poverty line. The latter measures have been and will continue to be of critical interest, but no single measure or small set of measures can fully describe all aspects of the distribution of income.

Median family income is the amount that divides the distribution of families in half. The measure is widely used to compare the economic status of population subgroups and to determine the direction and rate of change in overall economic well-being. The measure is very useful for such purposes, but differences between groups and over time must be interpreted with a certain amount of caution. The first point of caution is that the situation of unrelated individuals is not reflected in the measure. The second point of caution is that the size of families may differ between groups and over time. For example, if families in group A and group B have the same median income but differ in average size, it seems inappropriate to consider the two groups of families as having equivalent levels of economic well-being.

Median family income is not a measure of income inequality. That is, it does not provide information about the shape of the distribution below and above the median.

The poverty measure has some features that the median family income measure lacks. It is inclusive in that it covers both family members and unrelated individuals. Poverty status is determined by comparing the family income of a person (or the person's income if an unrelated individual) to a poverty threshold that varies by family size. The introduction of a family size variable means that the poverty measure, unlike the median family income measure, takes family size differences into account when comparing families at a point in time or over time.

By itself, the poverty measure is not a measure of income inequality. The poverty measure provides information on the number of persons below certain constant-dollar thresholds. Because the thresholds are expressed in constant dollars, changes in the poverty population need not be associated with changes in the distribution of income (poverty rates may change as a consequence of a shift in the entire distribution even when the shape of the distribution remains unchanged).

The two measures of income inequality most often used in Census Bureau reports are the Gini index of income concentration and the proportion of aggregate income received by households (or families) in the bottom and top income quintiles. The Gini index is a critical measure but it summarizes the extent of inequality into a single value and must be supplemented with additional information on the shape of the distribution. The second measure, the proportion of aggregate income received by households or families in the bottom and top income quintiles, is a very useful measure of overall inequality. Some caution is required in making comparisons over time because of possible changes in average family size.

The relative income measure that is introduced in this report shows the extent to which the income of a person (or group of persons) diverges from the middle income of the universe. At a point in time, it shows how the divergence pattern of one group compares with another. Over time, the measure shows whether the total extent of divergence is increasing or decreasing (whether income inequality is increasing or decreasing).

The relative income measure of an individual is the distance from the middle of an income distribution that contains adjustments for differences in family size. A person with a relative income of .25 has only one-fourth the income of a person in the middle of the distribution and a person with a relative income of 2.00 has twice the income of a person in the middle.

The calculation of relative income involves the following steps:

- Assign an income value to each person equal to the income of the person's family (assign the income of the person if the person is an unrelated individual).
- Use a set of equivalence factors to adjust incomes for differences in family size. The factors reduce the incomes assigned to members of large families relative to members of small families because the

cost of needs increases as family size increases. The equivalence scale used in calculating relative income is one developed by Patricia Ruggles and described in her 1990 book, *Drawing the Line*. The scale is based entirely on family size and does not vary by individual characteristics such as age or sex. For additional information, see the section on "Relative Income" in appendix A.

- 3. Calculate the median level of equivalence-adjusted income using the entire universe of persons.
- 4. Assign a relative income value to each person equal to the ratio of his or her equivalence-adjusted income to median equivalence-adjusted income

The measure is well-suited for studying the extent of income inequality and changes over time in inequality. Table A, for example, shows the percent of the population with specified levels of relative income over a 25-year span at 5-year intervals.

The measure is also well-suited for comparing the income situation of one population group with another. Median family income is inappropriate for this purpose when the interest is in persons rather than families, and the poverty rate is focused on a particular part of the income distribution. For example, table B shows distributions of relative income as well as median relative incomes for persons under 18 years, persons 18 to 64 years old, and persons 65 years old and over.

This report uses the following terms to describe certain aspects of the income distribution.

Low Relative Income. Equivalence-adjusted income less than one-half of median equivalence-adjusted income.

High Relative Income. Equivalence-adjusted income at least twice that of median equivalence-adjusted income.

Income Inequality. Measured by the proportion of the population with relative incomes that lie outside a central band. In this report, the measure is the proportion of the population with either low or high relative income values. For population subgroups, the proportion of the population with relative incomes that lie outside a central band is not a measure of within group inequality, but it is a measure of the extent to which the incomes of the subgroup diverge from the central income of the complete population.

Median Relative Income. By definition, the median relative income for the entire universe of persons is equal to 1.00. Population subgroups may have median relative incomes below or above 1.00 depending on the distribution of relative income within the population subgroups.

The relative income data presented in this report are based on a money definition of income. For most of the period 1964 to 1989, that is the only definition possible. The Bureau has developed income definitions for the years 1986 to 1990 that attach values to certain kinds of noncash benefits and has a project to extend the series back to 1979. It will not be possible to go back further than 1979 because the questionnaires used in March Current Population Surveys prior to 1980 did not collect information about noncash benefits.

Because of cost constraints, estimates of the distribution of relative income were prepared for every fifth year over the 1964 to 1989 period rather than for each year during the period. Because changes in aggregate economic activity may affect the distribution of income, readers may want to examine various economic measures for each of the years shown. For example, the civilian rate of unemployment averaged 5.2 percent in 1964, 3.5 percent in 1969, 5.6 percent in 1974, 5.8 percent in 1979, 7.5 percent in 1984, and 5.3 percent in 1989.

HIGHLIGHTS

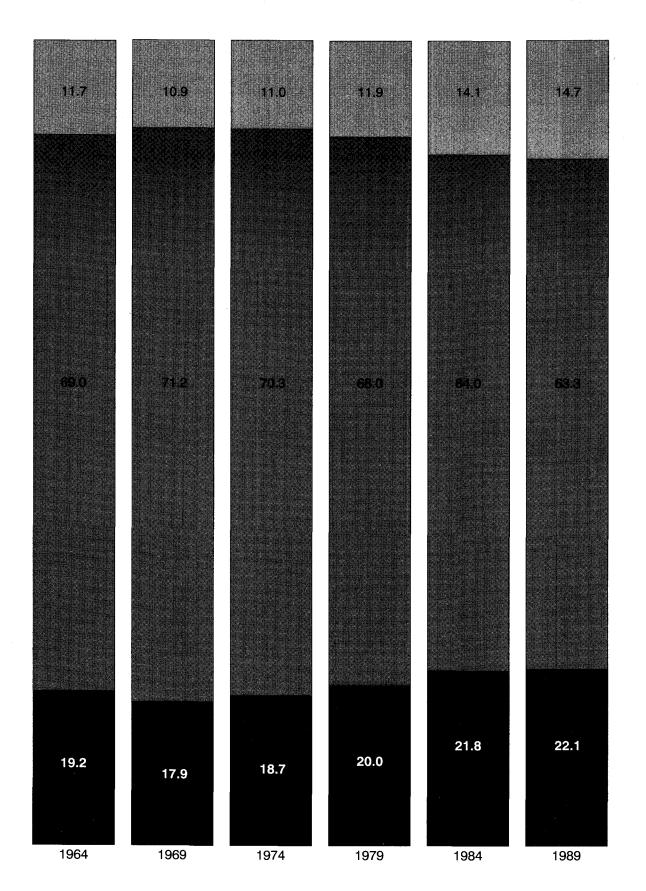

(Note: The figures in parentheses signify the 90-percent confidence intervals of the estimates.)

- From 1969 to 1989, the distribution of income was marked by an increase in overall inequality. The percent of the population with either low or high relative income values (the measure of income inequality used in this report) increased from 28.8 (±0.2) to 36.7 (±0.2) over the period. The percent with relative incomes in the middle range (neither low nor high) declined from 71.2 (± 0.2) percent in 1969 to 63.3 (± 0.2) percent in 1989. (See figure 1)
- The proportion of the population with low relative incomes increased from 17.9 (\pm 0.2) percent in 1969 to 22.1 (\pm 0.2) percent in 1989.
- Over the same time period, the proportion of the population with high relative incomes increased from 10.9 (± 0.2) percent to 14.7 (± 0.2) percent.
- During an earlier period, 1964 to 1969, the degree of inequality in the distribution of income had declined. The percent with low relative incomes fell from 19.2 (±0.3) to 17.9 (±0.2), the percent with high relative incomes fell from 11.7 (±0.2) to 10.9 (±0.2), and the percent with either low or high relative income values fell from 31.0 (±0.3) to 28.8 (±0.2).
- For the age groups under 18 years and 18 to 64 years, the proportion of persons with low relative incomes rose sharply over the 1969 to 1989 period. In 1969, 19.4 (±0.3) percent of persons under 18 years had low relative incomes; in 1989, the figure was 29.1

Figure 1.

Percent of Persons With High, Middle, and Low Relative Incomes: 1964, 1969, 1974, 1979, 1984, and 1989

 (±0.4) percent. Among those 18 to 64 years of age, 12.9 (±0.2) percent had low relative incomes in 1969 and 17.3 (±0.2) percent had low relative incomes in 1989.

- Among persons 65 years old and over, the percent with low relative incomes was 42.0 (± 0.8) percent in 1969 and 31.5 (± 0.7) percent in 1989. In spite of the improvement, the 1989 low relative income rate of persons 65 years and over was well above the rate of persons 18 to 64 and somewhat above the rate of persons under 18.
- Among Whites, both the percent with low relative incomes and the percent with high relative incomes increased over the 1969 to 1989 period. The proportion with low relative incomes increased from 14.7 (±0.2) percent to 18.8 (±0.2) percent, and the proportion with high relative incomes increased from 11.9 (±0.2) percent to 16.0 (±0.2) percent.
- The proportion of Blacks with low relative incomes fell during the 1964 to 1969 period from 48.5 (±1.7) percent to 42.6 (±0.8) percent, but increased to 43.9 (±0.8) percent by 1989. A measure that does indicate some improvement in the relative income situation of Blacks over the 1969 to 1989 period is the increasing proportion with incomes equal to or greater than the median. In 1969, 22.6 (±0.7) percent of Blacks had relative incomes equal to or greater than the median; in 1989, the figure was 28.8 (±0.7) percent.
- Data for persons of Hispanic origin are not available for 1964 or 1969, but the proportion of persons with low relative incomes in 1989, 40.1 (±0.9) percent, was higher than the 1974 figure of 34.1 (±1.3) percent. The proportion with high relative incomes also increased over the 1974 to 1989 period, from 3.6 (±0.5) to 5.2 (±0.4) percent.
- The economic disadvantage of not obtaining a college education is increasing. From 1964 to 1989, the percent of persons with low relative incomes increased from 22.6 (±0.6) percent to 38.4 (±0.8) percent among persons without a high school diploma, from 7.7 (±0.4) percent to 15.7 (±0.4) percent among persons with a high school diploma but no college, and from 5.5 (±0.7) percent to 10.2 (±0.5) percent among persons with 1 to 3 years of college.

DISTRIBUTION OF RELATIVE INCOME

The period 1964 to 1989 was marked by an initial period (1964 to 1969) during which income inequality decreased and a longer period (1969 to 1989) during which inequality increased.

The measure of inequality that is used in this report is based on the proportion of the population with relative incomes that are either high or low. Growing inequality can reflect increases in the proportion with low relative incomes (values less than .50), increases in the proportion with high relative incomes (values of 2.00 or higher), or increases in both.

From 1964 to 1969, the proportion of the population with low relative incomes declined from 19.2 percent to 17.9 percent (see table A), but the proportion increased during each of the next four 5-year periods. The proportion was 18.7 percent in 1974, 20.0 percent in 1979, 21.8 percent in 1984, and 22.1 percent in 1989.

At the same time a greater proportion of the population was experiencing low relative incomes, there were increases in the proportion with high relative incomes. In 1969, the proportion with high relative incomes was 10.9 percent. The figure for 1974, 11.0 percent, was not statistically different from the 1969 figure, but the rate increased during the next three 5-year periods. The proportion was 11.9 percent in 1979, 14.1 percent in 1984, and 14.7 percent in 1989.

The measure of overall income inequality, the proportion with relative incomes that are either high or low, declined from 31.0 percent in 1964 to 28.8 percent in 1969 but increased after 1969. The proportion was 29.7 percent in 1974, 32.0 percent in 1979, 36.0 percent in 1974, and 36.7 percent in 1989.

RELATIVE INCOME BY CHARACTERISTICS

Age

Over the period 1964 to 1989, there were major changes in the age composition of the population. In 1964, 36.7 percent of the population were less than 18 years old, 54.1 percent were between the ages of 18 and 64, and 9.2 percent were 65 years old or over. By 1989, these proportions had changed to 26.1 percent, 61.9 percent, and 12.0 percent, respectively.

At the beginning of the period, 21.2 percent of persons under 18 years, 14.5 percent of persons 18 to 64 years, and 39.4 percent of persons 65 years and over had low relative incomes. By 1969, the proportion with low relative incomes had declined for the younger groups (to 19.4 percent for persons under 18 and 12.9 percent for persons 18 to 64) and increased for the oldest group (to 42.0 percent). When 1969 figures are compared to 1989 figures, the later data show an increased likelihood of having a low relative income for persons under 65 and a decreased likelihood for persons 65 and over. In 1989, 29.1 percent of the youngest age group, 17.3 percent of the middle age group, and 31.5 percent of the oldest age group had low relative incomes.

In spite of the improvement since 1969, the 65 and over age group was much more likely than persons 18 to 64 and somewhat more likely than persons under 18 to have low relative incomes in 1989 (see the figures

above). In addition, the oldest age group was more likely to have relative incomes below the median level. In 1989, 65.7 percent of persons 65 and over had below median relative incomes. The comparable figures for the other age groups were 43.0 percent for persons 18 to 64 and 59.4 percent for persons under 18.

The two younger groups had higher levels of income inequality in 1989 than in 1969. The proportion with high or low relative incomes was 25.4 percent in 1969 and 37.5 percent in 1989 among persons under 18; the comparable figures were 27.6 percent and 35.6 percent among persons 18 to 64. The extent of income inequality was less in 1989 than in 1969 for the oldest group, the percent with high or low relative income was 48.7 percent in 1969 and 40.9 percent in 1989.

Race and Hispanic Origin

In 1989, 18.8 percent of Whites, 43.9 percent of Blacks, and 40.1 percent of persons of Hispanic origin had low relative incomes. (See table C.)

The percent of Whites with low relative incomes declined from 1964 to 1969 (from 15.5 percent to 14.7 percent) but increased during the next three 5-year periods (the percentages were 15.5 percent in 1974, 16.7 percent in 1979, and 18.6 percent in 1984). The 1989 figure of 18.8 percent was not statistically different from the 1984 figure.

At the same time a growing proportion of Whites was experiencing low relative incomes, there were increases in the proportion with high relative incomes. The percent with high relative incomes declined from 1964 to 1969 (from 12.9 to 11.9 percent), did not change in a statistically significant way from 1969 to 1974, but increased in succeeding 5-year periods (the proportion was 12.0 percent in 1974, 13.1 percent in 1979, 15.4 percent in 1984, and 16.0 percent in 1989).

There was a substantial decline from 1964 to 1969 in the proportion of Blacks with low relative incomes (from 48.5 to 42.6 percent) but the proportion in 1989 (43.9 percent) was higher than the 1969 figure. There were differences between 1969 and 1989 in the proportions with relative incomes below and above the median. In 1969, 77.4 percent of Blacks had relative incomes below the median and 22.6 percent were at or above the median. In 1989, the comparable figures were 71.2 and 28.8, respectively. The percent of Blacks with high relative incomes was higher in 1989 (5.0 percent) than in 1964 (2.3 percent).

Data for persons of Hispanic origin are not available for 1964 or 1969, but table C shows that the proportion with low relative incomes did not change significantly from 1974 to 1979, increased from 1979 to 1984, and increased again from 1984 to 1989. The percentages were 34.1 in 1974, 34.2 in 1979, 38.4 in 1984, and 40.1 in 1989. The proportion with high relative incomes was

higher in 1989 (5.2 percent) than in 1974 (3.6 percent). The increases in the proportions with low or high relative incomes meant that income inequality increased among persons of Hispanic origin between 1974 and 1989.

Years of School Completed

There were enormous changes over the 1964 to 1989 period in the educational characteristics of the population. In 1964, of a population of 84.2 million persons between the ages of 25 and 64, 45.6 percent had not completed high school, 34.2 percent had completed high school but no years of college, 9.7 percent had completed 1 to 3 years of college, and 10.6 percent had completed 4 or more years of college. In 1989, the educational characteristics of the 127.0 million persons between the ages of 25 and 64 was as follows; 17.2 percent had not finished high school, 39.7 percent had completed high school but no years of college, 19.6 percent had completed 1 to 3 years of college, and 23.5 percent had completed 4 or more years of college. (See table D.)

The relative income situation of persons without a high school diploma was much worse 1989 than in 1964. In 1964, 22.6 percent of persons in this schooling group had low relative incomes, 54.2 percent had relative incomes below the median, and 9.0 percent had high relative incomes. In 1989, 38.4 percent had low relative incomes, 71.0 percent had relative incomes below the median, and 4.5 percent had high relative incomes.

The data for persons with only a high school diploma also show a decline in relative economic status. In 1964, 7.7 percent of this educational group had low relative incomes, 34.6 percent had relative incomes below the median, and 17.2 percent had high relative incomes. The comparable figures in 1989 were 15.7 percent (low relative incomes), 45.2 percent (relative incomes below the median), and 12.9 percent (high relative incomes).

In terms of its effect on relative income, the benefits of completing 1 to 3 years of college were smaller in 1989 than in 1964. In 1964, the proportion of this group with low relative incomes was 5.5 percent, the percent with relative incomes below the median was 25.6 percent, and the percent with high relative incomes was 26.2 percent. The comparable rates for 1989 were 10.2 percent, 34.3 percent, and 20.2 percent, respectively.

Even though there was a large increase from 1964 to 1989 in the number of persons with a college education, the effect of such schooling on relative income remained very large in 1989. In 1964, 5.8 percent of college graduates had low relative incomes, 16.3 percent had relative incomes below the median, and 39.6 percent had high relative incomes. In 1989, 4.6 percent had low relative incomes (lower than the 1964 figure), and 17.8 percent had incomes below the median (higher than the

1964 figure). Although the proportion of college graduates with high relative incomes in 1989 was not statistically different from the 1964 figure, there was actually a decline and recovery during the period. The figure was 39.6 percent in 1964, 33.9 percent in 1979, and 40.4 percent in 1989.

A summary statistic, median relative income, provides a measure of how the four educational groups fared over the 1964 to 1989 period. Median relative incomes fell from .93 to .65 among those who did not finish high school, fell from 1.23 to 1.08 among those with only a high school diploma, and fell from 1.43 to 1.29 among those with 1 to 3 years of college. Among those with a college education, median relative income fell from 1.72 in 1964 to 1.61 in 1979, but rebounded to 1.75 in 1989 (the 1964 and 1989 figures are not statistically different).

Children by Family Relationship

Over the 1964 to 1989 period, there was a sharp decline in the likelihood that a child would live in a married-couple family. In 1964, 88.9 percent of all persons under 18 years of age lived in such a family; by 1989, the figure had dropped to 74.7 percent.

The relative income status of persons under 18 years living in married-couple families changed somewhat over the 25 year period. After declining from 16.3 percent in 1964 to 13.0 percent in 1969, the percent with low relative incomes has tended to increase over time. The 17.6 percent figuring of 1989 is not statistically different from the 18.2 percent figure of 1984, but both are well above the 1969 figure. The proportion of this group with high relative incomes has also increased over time, from 6.8 percent in 1964 to 10.6 percent in 1989.

Persons under 18 living in single parent families tend to have very low relative incomes. In 1989, 63.0 percent had low relative incomes and 86.5 percent had relative incomes below the median. Comparable 1964 figures were 60.0 percent and 85.8 percent (the 1989 and 1964 figures on the percent with relative incomes below the median are not statistically different).

Table F shows relative income by family relationship for children under 6 years of age. The change over time in the likelihood of living in a married-couple family is readily apparent from this table. In 1964, 91.3 percent of all young children, 94.1 of all young White children, and 75.0 percent of all young Black children lived in such a family. By 1989, these proportions had declined to 76.2 percent for all children, 83.1 percent for White children, and 39.0 percent for Black children. Data for children of Hispanic origin are not available for 1964 or 1969, but the proportion of young Hispanic origin children living in married-couple families declined from 82.0 percent in 1974 to 70.5 percent in 1989.

There has been a considerable rise over time in the proportion of young children in married-couple families with low relative incomes, from 14.5 percent in 1969 to 20.7 percent in 1989. There has also been an overall increase in inequality among this population. In 1969, 18.4 percent of this group had relative incomes that were either high or low; in 1989, the figure was 29.8 percent.

Among those in married-couple families, White children were less likely than Black children and Black children were less likely than Hispanic origin children to have low relative incomes. In 1989, the proportions were 19.1 percent for young White children, 35.6 percent for young Black children, and 45.1 percent for young children of Hispanic origin.

By one measure, the relative economic status of young Black children in married-couple families has improved considerably over time. In 1964, the proportion of such children with relative incomes equal to or greater than the median was 15.1 percent; in 1989, the figure was 31.5 percent.

For those young children not living in a married-couple family, the likelihood of having a low relative income was extremely high, regardless of race or ethnicity. In 1989, 65.5 percent of the young White children in this situation had low relative incomes, and an even greater proportion of Black and Hispanic origin children had low relative incomes. The rates for the latter were 80.3 percent and 79.4 percent, respectively (the two figures are not statistically different).

Adults by Sex and Family Relationship

The data in tables G and H show a steep decline in the likelihood that a person 18 to 64 years of age is married and living with a spouse. The proportion of males in this age group who were married and living with a spouse was 75.0 percent in 1964 and 59.2 percent in 1989. From 1964 to 1989, the percentage of females in this age group who were married, spouse present, declined from 72.8 percent to 59.6 percent (this figure is not statistically different from the figure of 59.2 percent for males), and the proportion who were family householders with no spouse present rose from 7.2 percent to 12.6 percent.

In 1989, persons who were married, spouse present tended to have higher relative incomes than persons in other statuses. The data also show that, among those persons not living with a spouse, females are much more likely than males to have low relative incomes. Among males the proportion with low relative incomes was 11.5 percent among those living with a spouse, 22.2 percent among family householders with no spouse present, and 18.7 percent among persons with some other family relationship status (including not living in a family). Among females, the proportion with low relative

income was 51.1 percent for family householders with no spouse present, and 23.3 percent among persons who were neither married nor family householders.

Table H shows that the relative income position of female householders with no spouse present declined from 1964 to 1989. In 1964, 42.9 percent of this group had low relative incomes and 72.6 percent had relative incomes below the median; in 1989, the comparable figures were 51.1 percent (low relative incomes) and 78.0 percent (relative incomes below the median).

In 1989, among persons 65 years old and over, the proportion with low relative incomes was 25.0 percent among males and 36.1 percent among females. One

reason for this difference is the fact that females in this age group are much less likely than males to be married, spouse present (39.7 percent compared with 74.3 percent in 1989), and persons who are married, spouse present are less likely than other persons to have low relative income. A second reason for the male-female difference is the fact that females who are not living with a spouse are much more likely than their male counterparts to have low relative incomes. In 1989, 45.0 percent of females with no spouse present had low relative incomes; the comparable figure for males was 34.5 percent.

Appendix A. Definitions and Explanations

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of Armed Forces.

Metropolitan-nonmetropolitan residence. The population residing in metropolitan statistical areas (MSA's) constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definitions specify a boundary around each large city so as to include most or all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term SMSA was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's). References to metropolitannonmetropolitan residence by size are based on the population of the CMSA.

Central cities. The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA, there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to "suburbs."

Geographic regions. The four major regions and nine Census divisions of the United States for which data are presented in this report represent groups of States as follow:

Northeast:

New England: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont.

Middle Atlantic: New Jersey, New York, and Pennsylvania.

Midwest (formerly North Central):

East North Central: Illinois, Indiana, Michigan, Ohio, and Wisconsin.

West North Central: Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, and South Dakota.

South:

South Atlantic: Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, and West Virginia.

East South Central: Alabama, Kentucky, Mississippi, and Tennessee.

West South Central: Arkansas, Louisiana, Oklahoma, and Texas.

West:

Mountain: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming.

Pacific: Alaska, California, Hawaii, Oregon, and Washington.

North and West:

Northeast, Midwest, and West combined.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," or "occupied without payment of cash rent". For some tabulations, the latter of the groups are combined into a single "renter occupied" group.

Income. For each person in the sample 15 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: 1) earnings from

longest job (or self-employment); 2) earnings from jobs other than longest job; 3) unemployment compensation; 4) worker's compensation; 5) Social Security; 6) Supplemental Security income; 7) public assistance; 8) veterans' payments; 9) survivor benefits; 10) disability benefits; 11) retirement pensions; 12) interest; 13) dividends; 14) rents and royalties or estates and trusts; 15) educational assistance; 16) alimony; 17) child support; 18) financial assistance from outside of the household, and other periodic income.

It should be noted that although the income statistics refer to receipts during the preceding calendar year, the demographic characteristics such as age, labor force status, and family or household composition are as of the survey date. The income of the family/household does not include amounts received by persons who were members during all or part of the income year if these persons no longer resided in the family/household at the time of interview. However, income data are collected for persons who are current residents but did not reside in the household during the income year.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes. Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of noncash benefits such as food stamps, health benefits. noncash benefits in the form of rent-free housing and goods produced and consumed on the farm; or that non-cash benefits are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that income earned from wages or salaries is much better reported than other sources of income, and is nearly equal to independent estimates of aggregate income.

The various sources for which income is reported are defined as follows:

Longest job and other employment earnings can be classified into the three types:

 Money wage or salary income is the total received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

- 2. Net income from nonfarm self-employment is the net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of saleable merchandise consumed by the proprietors of retail stores is not included as part of net income.
- 3. Net income from farm self-employment is the net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government farm programs, money received from the rental of farm equipment to others, rent received from farm property if payment is made based on a percent of crops produced and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal personal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise, inventory changes were not taken into account.

Unemployment compensation includes payments received from government unemployment agencies or private companies during periods of unemployment and any strike benefits received from union funds.

Workers compensation includes payments received periodically from public or private insurance companies for injuries received at work.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance. Medicare reimbursements are not included.

Supplemental Security income includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) 65 years old or over, (2) blind, or (3) disabled.

Public assistance or welfare payments include public assistance payments made to low income persons, such as aid to families with dependent children and general assistance.

Veterans' payments include payments made periodically by the Department of Veterans Affairs to disabled members of the Armed Forces or to survivors of deceased veterans for education and on-the-job training, and means-tested assistance to veterans.

Survivor benefits include payments from survivor or widows' pensions, estates, trusts, annuities, or any other types of survivor benefits. Payments can be reported from 10 different sources: 1) private companies or unions; 2) Federal government (Civil Service); 3) military; 4) state or local governments; 5) railroad retirement; 6) workers' compensation; 7) Black lung payments; 8) estates and trusts; 9) annuities or paid-up insurance policies; and 10) other survivor payments.

Disability benefits include all payments received as a result of a health problem or disability. Payments can be reported from 10 sources: 1) workers' compensation; 2) companies or unions; 3) Federal government (Civil Service); 4) U.S. Military; 5) state or local governments; 6) railroad retirement; 7) accident or disability insurance; 8) Black lung payments; 9) state temporary sickness; or 10) other disability payments.

Retirement benefits include payments reported from 8 sources: 1) companies or unions; 2) Federal government (Civil Service); 3) U.S. Military; 4) state or local governments; 5) railroad retirement; 6) annuities or paid-up insurance policies; 7) IRA or KEOGH payments; or 8) other retirement income.

Interest income includes payments received or credited to: savings accounts, bonds, treasury notes, IRA's, certificates of deposit, interest-bearing checking accounts, and all open investments that pay interest.

Dividends include income received from stockholdings and mutual fund shares. Capital gains from the sale of stockholdings are not included as dividends.

Rents, royalties, and estates and trusts include the net income from the rental of a house, store, or other property, receipts from boarders or lodgers, net royalty income, and periodic payments from estate or trust funds.

Educational assistance includes Pell Grants, other government educational assistance, any scholarships or grants, or financial assistance from employers, friends, or relatives not residing in the students household.

Child support includes all periodic payments paid by parents for the support of children, even if these payments are made through a state or local government office.

Alimony includes all periodic payments to ex-spouses. One-time property settlements are not included.

Financial assistance from outside of the household includes periodic payments from nonhousehold members. Gifts or sporadic assistance are not included.

Government transfers include payments from the following sources: 1) Unemployment compensation, 2) State workers compensation, 3) Social Security, 4) Supplemental Security Income (SSI), 5) Public assistance, 6) Veterans' benefits, 7) government survivor benefits, 8) government disability benefits, 9) government pensions, and 10) government educational assistance.

Other income includes all other regularly received payments that are not included elsewhere on the questionnaire. Some examples include: state programs such as foster child payments, military family allotments, income received from foreign government pensions, etc.

Receipts not counted as income include: (1) capital gains such as money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings is the algebraic sum of money wages and salary and net income from farm and non-farm self-employment.

Income other than earnings is the algebraic sum of all sources of money income except wages and salaries and income from self employment.

Relative income. Relative income is equal to the ratio of a person's equivalence-adjusted family income (unrelated individuals are treated as one-person families) to the median equivalence-adjusted income of all persons. The definition uses equivalence factors developed by Patricia Ruggles and described in her 1990 book "Drawing the Line" to adjust for the fact that larger families have higher levels of need. The equivalence scale is shown below along with an illustration of the level of family income required to make families of different sizes equivalent in income to a four-person family with an income of \$30,000.

| Family size | Equivalence factor | Income required for equivalence |
|-------------|--------------------|---------------------------------|
| 1 1 2 2 2 1 | 2.000 | \$15,000 |
| 2 1 | 1.418 | 21,157 |
| 3 | 1.156 | 25,952 |
| 4 | 1.000 | 30,000 |
| 5 | .893 | 33,595 |
| 6 | .816 | 36,765 |
| 7 | .755 | 39,735 |
| 8 | .707 | 42,433 |
| 9 or more | .640 | 46,875 |

The calculation of relative income involves the following steps:

- 1. Calculate the equivalence-adjusted income for each person. Note that all members of a given family have the same equivalence-adjusted income. If, for example, family A has five members and a total cash income of \$28,000, the equivalence-adjusted income of each member would be \$28,000 multiplied by .893 or \$25,000. If another family exists with three members and a total cash income of \$28,000, the equivalence-adjusted income for each member of that family would be \$28,000 multiplied by 1.156, or \$32,368.
- Determine the median equivalence-adjusted income for all persons. The median is the amount that splits the distribution into two equal groups, half having incomes above the median, half having incomes below the median.
- 3. The relative income of any individual is the ratio of his or her equivalence-adjusted income to the median equivalence-adjusted income.

Households. Households consist of all persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. Group quarters contain five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses. All persons who are not members of households are regarded as living in group quarters. Persons living in military barracks and inmates of institutions were excluded from the survey.

Householder. The person (or one of the persons) in whose name the home is owned or rented. If the house is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of the other household members is recorded. One person in each household is designated as the "householder." The number of householders, therefore, is equal to the number of households.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

Families. Families are groups of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family.

In this report, the term "family householder" includes householders of unrelated subfamilies as well as householders of primary families.

Unrelated subfamilies. Formerly called secondary families, unrelated subfamilies include two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. An unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household.

Unrelated individuals. These are persons (other than inmates of institutions) who are not living with any relatives. An unrelated individual may (1) constitute a one-person household, (2) be part of a household including one or more other families or unrelated individuals, or (3) reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Related children under 18 years of age. In a family, related children under 18 years of age include sons and daughters, including stepchildren and adopted children,

of the householder and all other children in the household who are related to the householder by blood, marriage, or adoption. In this report, the term also includes children in unrelated subfamilies.

Related persons and family members. This includes all persons in the household related to the householder.

Marital status. This classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of interview.

The category "married" is further divided into "married, spouse present," "separated," and "other married. spouse absent." A householder is classified as "married, spouse present" if their spouse is reported as a member of the household, even though he or she might be temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the interview. Persons reported as "separated" includes those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the wife or the husband is employed and living a considerable distance from home, is residing in an institution, has moved to another area, or has a different place of residence for any other reason except separation as defined above.

Age. This classification is based on the age of the person at his last birthday.

Race. Race is based on five groups: (1) White, (2) Black, (3) Asian or Pacific Islander, (4) American Indian, Aleut, or Eskimo, and (5) other.

Hispanic origin. Persons of Hispanic origin are identified by a question that asks for self-identification of the person's origin or descent. Respondents are asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Persons of Hispanic origin, in particular, are those who indicate that their origin is Mexican, Puerto Rican, Cuban, Central or South American, or some other Hispanic origin. It should be noted that persons of Hispanic origin may be of any race.

Years of school completed. Data on years of school completed are derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions of educational attainment apply only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior), colleges, universities, and professional schools (whether day schools or

night schools). Thus, regular schooling is that which may advance a person toward an elementary school certificate, a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools is counted only if the credits obtained are regarded as transferable to schools in the regular school system. The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Work experience. Work experience is based on work for pay or profit or work without pay on a family-operated farm or business at any time during the previous year, on a part time or full time basis.

Weeks worked in the income year. This is based on the number of different weeks, during the preceding calendar year, in which a person did any work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time employment. Defined as follows: part-time indicates less than 35 hours of work per week in a majority of the weeks worked during the year. Full-time indicates 35 hours or more per week during a majority of the weeks worked.

Year-round, full-time. Indicates 50 or more weeks of full-time employment during the previous calendar year.

Nonworkers. Nonworkers are persons who did not do any work in the calendar year preceding the survey.

Workers. Persons who worked one or more days during the previous calendar year.

Symbols. A dash (-) represents zero or rounds to zero, the symbol "B" means that the base for the derived figure is less than 75,000, the symbol "X" means not applicable, the symbol "NA" means not available, and the symbol "r" means revised.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. Since 1979, base figures are based on civilian noninstitutional population controls for age, race, and sex established by the 1980 census. The base figures shown for 1971 to 1978 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years from 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census.

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis, Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

- 1. Income definition. The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, however, includes such items as regular contributions for support received from persons who do not reside in the same living quarters. income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.
- 2. Source of data. The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employer's wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households.

As discussed in the section, "Source and Accuracy of Estimates," income data obtained in household interviews are subject to various types of

reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 89 percent of the comparable total money income aggregates and about 99 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see Size Distribution of Family Personal Income: Methodology and Estimates for 1964, by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

- 3. Population coverage. The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition, the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.
- 4. Average income. The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for households, families, unrelated individuals, or income recipients 15 years old and over.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differ somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts, such as veterans' payments, SSI, and AFDC, are not reported on Federal tax returns. Moreover, the coverage of income tax statistics is less inclusive because many persons with low incomes are not required to file tax returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

COMPARABILITY OF CURRENT CPS ESTIMATES WITH THOSE FROM PREVIOUS YEARS

Estimates from the CPS are in some instances not strictly comparable with those from previous years due to several factors. Among these factors are changes in (1) population controls and metropolitan residence definitions; (2) collection of income and work experience

data; (3) noninterviews, nonresponses, and allocations; (4) questionnaire wording and procedures; (5) sample size and interpolation procedures; and (6) definition of the income universe. Each of these factors is discussed in the following sections, and readers should consider these differences when comparing current with previous years' estimates.

Population Controls and Metropolitan Residence Definitions

In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 20, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan area as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

The data for 1971 through 1989 are in some instances not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. The estimates for 1979 to 1989 are based on civilian noninstitutional population established by the 1980 census. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. The data for 1971 through 1978 are based on civilian noninstitutional population established by the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. In a number of instances. data from the March 1970 and 1971 CPS's were revised to take account of 1970 census-based population controls, thus providing some measure of the impact of the changes. (See table 3, Current Population Reports, Series P-60, No. 91.) Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions and low-income or poverty rates. However, the changes may have more impact on the population levels in different subgroupings, such as the total number of persons or families either overall, within some particular income interval, or below the low-income level. A detailed description of these changes appears in the Bureau of Labor Statistics report, Employment and Earnings, Vol. 18, No. 8, February 1972.

Comparability of metropolitan and nonmetropolitan data from the March 1980 CPS with data for previous years. Changes in the CPS design and procedures made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures should be avoided. Trends in metropolitan and

nonmetropolitan population growth over the 1970-83 period should not be appreciably affected by the procedural changes. The major revisions to earlier CPS sample design and estimation methods have involved the varying of the number of sample units. Incorporation of approximately 10,000 supplemental housing units into the March CPS sample in 1977 was accompanied by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample that the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS supplement data had resulted in an apparent overestimate of the nonmetropolitan population and corresponding underestimate of the metropolitan population for those years. For the March 1979 CPS, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a large spurious increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 CPS levels.

Collection of Income and Work Experience Data

This report presents data showing income of persons and family householders with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the Surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person with a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for these non-matches were migration, noninterviews, and coding errors. In order to eliminate the nonmatches and to improve the consistency between income and work experience data, both the income and work experience data were collected together beginning with the March 1970 survey.

The remaining persons, whose work experience data were assigned, resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions. It should be noted that the proportions of year-round, full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, Special Labor Force

Reports, Work Experience of the Population. The difference exists because the proportions are not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

Noninterviews, Nonresponses, and Allocations

In the March 1990 CPS, no interview was obtained for approximately 4.5 percent of the 60,000 households in the sample. No interview was obtained at these households during the enumeration week for reasons such as "no one home," "temporarily absent," or "refusals." In order to account for these households, the weights assigned to households in which interviews were obtained have been increased slightly. This "non-interview" adjustment procedure adjusts the weights of sample households by race of householder and within a specified set of geographical restrictions.

The nonresponse problem, which is sometimes referred to as "item nonresponse," is a serious problem in most household surveys and is especially troublesome for income. Even though an interview is obtained in many cases, complete information for all of the income questions is not available, unknown or refused. In March 1991, for example, an interview was not completed for approximately 8 percent of all income supplements. In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics.

Questionnaire Wording and Procedures

Modifications in collecting income data in the March 1979 Current Population Survey. As part of the March 1979 CPS, the Bureau conducted an experiment in an effort to improve the reporting of income data. An alternative questionnaire was used on three of the eight rotation groups. The experimental questionnaire used more probing questions and inquired about more detailed sources of income. The results of the experiment and its subsequent impact on the estimates are discussed in the Current Population Reports, Series P-60, No. 123, page 12. Beginning in March of 1980, this new questionnaire was used for the full CPS sample; with few modifications, this questionnaire is still in use.

Definition of Income Universe

Starting in the March 1980 CPS, a decision was made to restrict the universe for presenting income data to persons 15 years old and over instead of 14 years old

and over. This change was made to establish consistency between the results from the March 1980 CPS and the 1980 Census of Population. Although income data were collected for persons 14 years old and over, the income of the 14-year-olds was not used for processing and tabulation purposes.

The March 1980 CPS also incorporated the use of the "householder" concept rather than the traditional "head" concept. Under the new procedure, the householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented.

Another change made in the March 1980 CPS was the exclusion of secondary families (now called unrelated subfamilies) from the count of all families. This modification was required because of the introduction of the householder concept, since unrelated subfamilies do not have a householder. For more discussion on all of these changes, see the section, "Modifications to the March 1980 CPS," Current Population Reports, Series P-60, No. 129.

REVISIONS TO MARCH 1989 CPS PROCESSING SYSTEM

Between 1988 and 1989 a new computer processing system was introduced for the March Current Population Survey. This processing system rewrite was long overdue; the system in use before this year was first introduced in March 1976 and was never fully updated to reflect the numerous questionnaire changes that have taken place since that time. In addition, the programs used to process the CPS files were written in a computer language that is being phased out of use at the Census Bureau.

Since the Census Bureau began imputing for missing income data on the CPS in 1962, there have been three major revisions to the processing system (in 1967, 1976, and 1989). Through all of these revisions, the basic strategy used to make imputations has remained the same. This approach, commonly referred to as "hot deck" imputation, assigns missing responses to sample persons with information from matched sample persons with similar demographic and economic information who answered these questions.

Under the new March processing system, there were three main modifications to the income imputation programs:

- The edits and imputations were expanded to reflect the full detail of the March income questionnaire. The original processing system was still based on a less detailed CPS income questionnaire that has not been in use since 1980.
- Under the revised processing procedures, entire sets of March income and noncash benefits data were imputed to supplement noninterviews from the

same interviewed person. Under the original processing procedures, earnings, unearned income, and noncash benefits were imputed in separate stages during the processing system. Thus, the new processing system imputes noninterviews more efficiently and is better able to preserve the correlation between earnings, unearned income, and noncash benefits.

3. Both the old and new processing systems employ what are called "statistical matches" to link sample cases with reported data to those requiring imputation for missing responses. In the original processing system, under certain circumstances, reported data were removed and replaced with imputed data during the statistical matching process. Under the new system, reported data are never removed. This was accomplished by expanding the number of statistical matches in the income imputation system

For details on the results of the revised processing procedures, see Current Population Reports, Series P-60, No. 166, *Money Income and Poverty Status in the United States: 1988.*

QUALITY OF INCOME DATA

The quality of the income data derived from the March Current Population Survey (CPS) is affected by five main sources of error. The first, sampling errors, are errors attributable to the fact that a sample rather than a census was taken. Discussion of these errors is included in appendix D of this report. The other four main sources of error, usually termed collectively as nonsampling errors, result from 1) use of a sampling frame that does not include all units for which the survey was intended to provide data, 2) failure to contact all sample units selected, i.e., noninterview and undercoverage problems, 3) poor quality of responses, and 4) missing data problems.

Over the years evaluations of the quality of the March CPS income estimates have revealed downward biases when the survey estimates are compared to independent estimates derived from sources such as the National Income and Product Accounts (NIPA), statistics based on Federal individual income tax returns, data from the Social Security Administration (SSA), etc.

Most analyses of the magnitude of nonsampling errors in the March CPS income estimates have been made at the "aggregate" level since the kind of data needed to make such comparisons are relatively easy to obtain. Some studies have also been conducted at the "micro" level by matching the data provided by individuals with data obtained from administrative records systems for those same individuals. These studies, such

as the March 1973 CPS-IRS-SSA exact match, have shown that the nonsampling error problem is much more complex than that measured at the aggregate level. For example, a significant number of respondents provide responses to the amounts of income received that appear to exceed the actual amount received. These are offset by larger errors in the other direction by a somewhat higher proportion of other respondents.

Deriving independent estimates of aggregate income for purposes of evaluating the survey data is difficult. The survey and administrative sources use different definitions, cover different universes, and are based on concepts that are not exactly the same. Therefore, adjustments to the administrative sources must be made to help correct for these inconsistencies and arrive at a valid independent estimate that can be used to make fair and accurate estimates of the quality of the survey estimates. These adjustments attempt to 1) remove income that is received by the institutional population, the deceased, and persons not residing in the United States at the time of the interview, 2) remove any components of income that are received as "inkind" payments or benefits, and 3) remove any lumpsum or one-time payments, withdrawals, etc.

A degree of uncertainty must be attached to the independent estimates for several reasons. First, not all of the information needed to make some of these adjustments mentioned above are available. Second, administrative sources are also subject to estimation problems resulting from the lack of adequate data, and in the case of the NIPA, periodically undergo significant revision to correct for some of these errors when more recent or more accurate information become available. Third, even though attempts are made to include income received by those operating in the legal "informal" economy in the NIPA these estimates are subject to some unknown degree of error. Fourth, no attempt is made to include estimates of income received through illegal means.

In spite of this uncertainty regarding development of independent estimates it is important to attempt to monitor the quality of the income estimates using these sources. Table A-1 contains comparisons of survey and independent estimates of aggregate income by type of income for 1987. The estimates shown in this table are not directly comparable to those for 1983, which was the last year for which independent estimates were made. Major revisions to the NIPA and some revisions in the methods for arriving at the CPS concepts make most comparisons for these years inconsistent. Because of the difficulties in deriving adequate independent estimates, the table does not cover all types of income identified in the March CPS.

Table A-1. Comparison of CPS Aggregate Money Income Concepts in 1987 With Independent Estimates of Aggregate Money Income Adjusted to CPS Money Income Concepts, by Type of Income and Reported and Imputed CPS Amounts: 1987

¹Only includes estates and trusts reported as survivor benefits. Other estates and trusts are included with rent and royalty income.

Overall, the survey estimate of \$2.941 trillion was about 89 percent of the independent estimate. This result is achieved mainly because the survey estimate of wage and salary income was 99 percent of the independent estimate and this income source accounts for 75 percent of the CPS income estimate from all sources. For the other sources of income the survey estimates range from 34 percent of the independent estimate for farm income to 99 percent for Federal government and military pensions.

The apparent extreme underreporting problem for farm income helps to illustrate the difficulty in developing meaningful independent estimates. The estimate of \$46.9 billion shown in table A-1 for farm income was derived directly from the NIPA which bases its estimates on data from the United States Department of Agriculture. In contrast, farm income reported on Federal individual income tax returns for 1987 was only \$10.5 billion.

The CPS continues to have serious underreporting problems for property income (interest, dividends, net rent, and net royalty income) where the survey estimates range between 53 and 72 percent of the independent estimates.

Benefits from the means-tested programs, Aid to Families With Dependent Children (AFDC) and Supplemental Security Income (SSI) also exhibit significant survey underestimates at 73 and 83 percent of the independent estimates respectively. For these incomes, however, a significant portion of this problem is associated with misclassification of the source of income. In the CPS, AFDC benefits are often reported by survey respondents as having come from other sources of welfare payments, mainly General Assistance. Benefits from the SSI program are sometimes reported as Social Security income by respondents who do not know the true source of the benefit.

Benefits from the Veterans' Administration, unemployment compensation, and workers' compensation, all of which have a past history of significant underestimation in the March CPS, continue to have such a problem. Veterans' payments have also been shown to be subject to errors of misclassification with a significant proportion of these benefits being reported incorrectly by respondents as military retirement. The low reporting rate for workers' compensation may be in part related to significant levels of one-time, lump-sum settlements that are conceptually excluded from the survey's definition of income. Since no data are available that permit a precise adjustment to the independent estimate for the existence lump-sum payments, this figure may be overestimated. While undoubtedly some persons incorrectly report lump-sum amounts in the survey, resulting in an error in the opposite direction, these errors are thought to be much smaller.

Pension income estimates from the survey show a peculiar pattern of underreporting problems. For Federal and military pensions the survey estimate is about 99 percent of that derived from independent sources while for private pensions and annuities the survey estimate is only about 46 percent of the independent source. The high level of reporting indicated for Federal and military retirement may be overstated somewhat because of the misreporting problem that exists between military retirement and Veteran's payments. The extremely low level of reporting for private pensions may be, in part, due to a significant overestimate of the independent estimate. Since information concerning the prevalence of lump-sum payments is not available, adequate adjustments to exclude these types of payments have not been made.

Table A-2 has been included in this report to illustrate the wide variation between income estimates based on Federal individual income tax returns and the NIPA. The NIPA estimates adjusted to survey concepts (column 4 of table A-2) were used as the basis for the calculations in table A-1. In some cases these income amounts differ significantly from those shown in the other columns of table A-2. The first column labeled "IRS AGI as reported" represents the amounts as computed from unaudited Federal tax returns. The second column labeled "IRS AGI after TCMP adjustment" reflects adjustments made to the amounts shown in column 1 based on results of the Taxpayer Compliance Measurement Program (TCMP). This program, which performs extensive audits of a sample of tax returns every 3 years, provides estimates of the amount of income that should have been reported but was not reported for both tax filers and nonfilers that should have filed. Finally, the third column labeled "AGI after BEA reconciliation" are estimates of adjusted gross income (AGI) for Federal individual tax returns derived by adjusting the NIPA amounts to AGI concepts. This reconciliation is performed annually by the Bureau of Economic Analysis (BEA).

Table A-2. Comparison of Independent Sources of Income for 1987

(Billions of dollars)

| Source | IRS AGI as reported | IRS AGI after TCMP adjust- ment | AGI after BEA reconcil- iation | NIPA adjusted to sur- vey concept |
|-------------------------|------------------------------|--|--|---|
| Wages and salary | 2,163.9 | 2,239.8 | 2,238.9 | 2,215.9 |
| Nonfarm self-employment | 105.5 | 276.1 | 210.8 | 219.8 |
| Farm self-employment | -1.3 | 10.5 | 39.9 | 46.9 |
| Interest | ¹ 169.0 | 186.4 | 178.7 | 244.4 |
| Dividends | 66.8 | 75.5 | 100.4 | 73.7 |
| Net rents and royalties | -7.2 | 6.5 | 23.5 | 40.3 |
| Pensions and annuities | ² 124.8 | 147.1 | 164.6 | 125.8 |

¹Excludes \$31.0 in tax exempt interest not in AGI.

²Excludes \$47.9 in pensions and annuities not in AGI and an unknown amount of taxable lump-sum payments.

The results of the TCMP indicate that large amounts of income are not reported on tax returns as shown by the differences in columns 1 and 2. The differences for self-employment income are especially large.

The NIPA estimates used to evaluate the quality of the survey data differ from AGI income for five main reasons. First, the NIPA estimates include the income of persons who are not required to file tax returns. Second, the NIPA estimates reflect both taxable and nontaxable income amounts. Third, the accounting methods used in the NIPA, such as the treatment of depreciation, differ from those used by the IRS. Fourth, the NIPA does not use individual income tax return data extensively in its estimation methodology because of concerns regarding high levels of misreporting. Fifth, some attempts have been made to adjust the NIPA estimates to exclude lump-sum payment, withdrawals, etc. that are sometimes included as income for tax purposes.

Appendix B. Source and Accuracy of Estimates

SOURCE OF DATA

The estimates in this report come from data obtained in March 1965 through 1990 in the Current Population Survey (CPS). The Bureau of the Census conducts the survey every month, but this report uses only March data for its estimates. The March survey uses two sets of questions, the basic CPS and the supplement.

Basic CPS. The basic CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The present CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 60,000 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,600 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

The following table summarizes changes in the CPS designs for the years for which data appear in this report.

March Supplement. In addition to the basic CPS questions, interviewers asked supplementary questions in March about money income received the previous calendar year.

To obtain more reliable data for the Hispanic origin population, the March CPS sample was increased by adding eligible housing units, interviewed the previous November, that contained at least one sample person of Hispanic origin (the addition in March 1990 was approximately 2,500 eligible housing units). In addition, the sample included persons in the Armed Forces living off post or with their families on post.

Estimation Procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of Description of March Current Population Survey

| | Ni mahamad | Housing units eligible ¹ | | | | | |
|--------------|------------------------|-------------------------------------|--------------------|--|--|--|--|
| Time period | Number of sample areas | Interviewed | Not interviewed | | | | |
| 1990 | 729 | 57,400 | 2,600 | | | | |
| 1989 | 729 | 53,600 | 2,500 | | | | |
| 1986 to 1988 | 729 | 57,000 | 2,500 | | | | |
| 1985 | ² 629/7292 | 57,000 | 2,500 | | | | |
| 1982 to 1984 | 629 | 59,000 | 2,500 | | | | |
| 1980 to 1981 | 629 | 65,500 | 3,000 | | | | |
| 1977 to 1979 | 614 | 55,000 | 3,000 | | | | |
| 1973 to 1976 | 461 | 46,500 | 2,500 | | | | |
| 1972 | 449 | 45,000 | 2,000 | | | | |
| 1967 to 1971 | 449 | 48,000 | 2,000 | | | | |
| 1965 to 1966 | 357 | 33,500 | 1,500 | | | | |

¹Excludes about 2,500 Hispanic households added from the previous November sample. (See "March Supplement.")

²The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from the new and old designs were in the sample.

the United States by age, sex, race and Hispanic/non-Hispanic categories. The independent estimates were based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the size of the Armed Forces. The independent population estimates used for 1981 (1980 for income estimates) to present were based on updates to controls established by the 1980 Decennial Census. Data previous to 1981 were based on independent population estimates from the most recent decennial census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P60, No. 133). The estimation procedure for the March supplement included a further adjustment so husband and wife of a household received the same weight.

The estimates in this report for 1983 (from March 1984 CPS) and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

ACCURACY OF ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of error: nonsampling and sampling. The accuracy of an estimate depends on both types of error, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling Variability. Nonsampling errors can be attributed to many sources. These sources include the inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, respondents' inability or unwillingness to provide correct information or to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 Decennial Census. overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias because of undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

Answers to questions about money income often depend on the memory or knowledge of one person in a household. Recall problems can cause underestimates of income in survey data, because it is easy to forget minor or irregular sources of income. Respondents may also misunderstand what the Census Bureau considers money income, or may simply be unwilling to answer these questions correctly because the questions are considered too personal. See appendix A for definitions and explanations.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey,* Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology,* Bureau of the Census, U.S. Department of Commerce.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates, which reflect 1980 census-based population controls, with estimates for 1979 (from March 1980 CPS) and earlier years, which reflect census-based population controls derived from previous decennial censuses. This change in population controls had relatively little impact on summary measures such as means. medians, and percentage distributions, but did have a significant impact on levels. For example, use of 1980 based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1983, compare Hispanic estimates over time cautiously.

A number of changes were made in data collection and estimation procedures beginning with the March 1980 CPS. The major changes were the use of a more detailed income questionnaire, the use of the "householder" concept, the introduction of the new farm definition, and use of more detailed income intervals in the upper range of the income distribution. Due to these and other changes, one should use caution when comparing estimates for 1979 through 1989 with estimates for earlier years. A description of these changes and the effect they had on the data is given in the section "Modifications to the March 1980 CPS" of an earlier report (Series P-60, No. 129).

Another major change is that income estimates for 1985 are the first based entirely on households selected from the 1980 census based sample design. Estimates by type of residence category such as metropolitan, nonmetropolitan, farm and nonfarm, which were omitted from the 1984 report because of the mixed 1970 and

1980 census sampling frame used for the March 1985 CPS, have been resumed. The residence categories reflect metropolitan areas defined as of June 1984. In addition, the March 1986 supplement questionnaire was revised to enable the coding of higher amounts of earnings from longest job.

Note When Using Small Estimates. Summary measures (such as medians and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Sampling Variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described in "Standard Errors and Their Use," are primarily measures of sampling variability, although they may include some nonsampling error.

Standard Errors and Their Use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, a and b parameters are provided for various types of characteristics. These parameters are listed in tables B-1 through B-6.

The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to

calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (± 1.0) ," the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the percent of Whites with low relative incomes to the percent of Blacks with low relative incomes.

Tests may be performed at various levels of significance, where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.645 times the standard error of the difference.

Standard Errors of Estimated Numbers. The approximate standard error, s_x , of an estimated number shown in this report can be obtained by using the formula

(1) sxax2 + bxHere x is the size of the estimate and a and b are the parameters in tables B-1 through B-6 associated with the particular type of characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the set of parameters for the characteristic which will give the largest standard error.

Illustration

Table D shows that there were 21,862,000 persons 25 to 64 years old without a high school diploma in 1989. Using formula (1) with a=-0.000019 and b=2,468 from table B-1, the approximate standard error of 21,862,000 is

sx = -0.000019x21,862,0002 + 2,468x21,862,000 = 212,000

The 90-percent confidence interval for the estimated number of persons 25 to 64 years old without a high school diploma in 1989 is from 21,513,000 to 22,211,000, i.e., $21,862,000 \pm 1.645(212,000)$.

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or

more. When the numerator and denominator of the percentage are in different categories, use the parameter from tables B-1 through B-6 indicated by the numerator.

The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula

(2) sx,p = bx p (100 - p)Here x is the total number of persons, families, households, or unrelated individuals which is the base of the percentage, p is the percentage $(0 \le p \le 100)$, and b is the parameter in tables B-1 through B-6 associated with the characteristic in the numerator of the percentage.

Illustration

Table D shows that 8,395,000 or 38.4 percent of the 21,862,000 persons 25 to 64 years old without a high school diploma had low relative incomes in 1989. Using formula (2) with b=2,468 from table B-1, the approximate standard error of 38.4 percent is

sx,p = 2,46821,862,000(38.4) (100.0-38.4)=0.5The 90-percent confidence interval for the estimated percentage of persons 25 to 64 years old without a high school diploma and low relative incomes in 1989 is from 37.6 percent to 39.2 percent, i.e., $38.4 \pm 1.645(0.5)$.

Standard Error of a Difference. The standard error of the difference between two sample estimates is approximately equal to

(3) sx-y = sx2 + sy2where s_x and s_y are the standard errors of the estimates, x and y. The estimates can be numbers, percentages, ratios, etc. This will represent

the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration

Table D shows that the median relative income of persons 25 to 64 years old without a high school diploma in 1964, x, was 0.93 and the median relative income of persons 25 to 64 years old without a high school diploma in 1989, y, was 0.65. The apparent difference between the median relative incomes from 1964 to 1989 is 0.28. Table D also shows the approximate standard errors, s_x and s_y, are 0.0070 and 0.0071, respectively. Using formula (3), the approximate standard error of 0.28 is

sx-y =0.00702 + 0.00712 = 0.01The 90-percent confidence interval for the estimated difference of the median relative incomes of persons 25 to 64 years old without a high school diploma between 1964 and 1989 is from 0.26 to 0.30, i.e., $0.28 \pm 1.645(0.01)$. Because this interval does not contain zero, we can conclude with 90-percent confidence that the median relative income of persons 25 to 64 years old without a high school diploma in 1964 was larger than the median relative income of persons 25 to 64 years old without a high school diploma in 1989.

Standard Error of a Median. The standard error is computed for all estimated medians in this report.
