# Living Arrangements of Children: 2001 

## Introduction and Highlights

Children live in a variety of family arrangements that usually reflect the marriage, divorce, and remarriage patterns of their parents. In addition, onethird of children today are born out-ofwedlock and may grow up in singleparent families or spend significant portions of their lives with other relatives or stepparents.' This report examines the diversity of children's living arrangements in American households. ${ }^{2}$ The data are from the household relationship module of the Survey of Income and Program Participation (SIPP) collected in 2001 and update an earlier study from the 1996 SIPP panel of children growing up in various family situations. ${ }^{3}$

Detailed information was obtained on each person's relationship to every other person in the household, permitting the identification of various types of relatives and of parent-child and sibling relationships. This report describes extended family households with relatives and

[^0]Children are defined in this report as all individuals under 18 years old.

Adopted children are identified by the survey respondent alone and not from any administrative records.

Blended families are formed when remarriages occur or when children living in a household share only one or no biological parents. The presence of a stepparent, stepsibling, or half-sibling designates a family as blended.

An extended family household is a household where a child lives with at least one parent and someone other than a parent or siblings, either relatives or nonrelatives.
nonrelatives (whose presence may affect a child's development and contribute to the household's economic well-being). It also examines the degree to which children are living in single-parent families or with stepparents, adoptive parents, or no parents while in the care of another relative or guardian.

The statistics in this report are based on national-level estimates of children and their living situations from June through September 2001. The findings pertain to all individuals under age 18 , regardless of their marital or parental status. The estimates represent data on the living arrangements for children averaged over this 4-month period.

Current Population Reports By Rose M. Kreider and Jason Fields

Some major findings of this report include:

- In 2001, 72.5 million children under 18 lived in households. The majority of these children (51.1 million) lived with two parents. Three percent ( 2.1 mil lion) of all children lived with two parents who were not married to each other. ${ }^{4}$
- Among the 18.5 million children living with only one unmarried parent, 2.2 million lived with their father.
- Of the 1.4 million children living in households with at least one adoptive parent, 44 percent lived with two adoptive parents.
- Fifteen percent of children ( 10.6 million) lived in blended families. About half of these children, 5.1 million, lived with at least one stepparent.
- 15.1 million children lived in households with no brothers or sisters present (21 percent).
- 6.2 million children lived with at least one grandparent, and 1.4 million of these children had no parent present.

Various factors influence the diversity of children's living arrangements, including parental death, divorce, remarriage, out-of-wedlock childbearing, cohabitation (of unmarried parents), and multigenerational families. Immigration may also influence the type of household and family in which children grow up, when families provide
${ }^{4}$ The estimates in this report (which may be shown in text, figures, and tables) are based on responses from a sample of the population and may differ from the actual values because of sampling variability or other factors. As a result, apparent differences between the estimates for two or more groups may not be statistically significant. All comparative statements have undergone statistical testing and are significant at the 90-percent confidence level unless otherwise noted.
housing for their immigrant relatives and friends. This factor is evident in the living arrangements of Hispanic children, and Hispanics constitute a large component of new immigrants to the United States. ${ }^{5}$ Cultural factors, demographic characteristics, and family formation patterns underlie differences in current and future family structure. ${ }^{6}$

In 2001, 71 percent of the 72.5 million children under age 18 lived in two-parent households, 26 percent lived in single-parent households, and the remaining 4 percent lived in households without either parent (Table 1 and Figure 1). A large majority of nonHispanic White (78 percent) and Asian and Pacific Islander (83 percent) children lived with two parents, about twice as high as the proportion for Black children (40 percent) and well above the proportion for Hispanic children (69 percent). A much higher proportion of Black children than nonHispanic White or Hispanic children lived with a single parent in 2001: 51 percent compared with 19 percent and 26 percent, respectively.
In 2001, 5.1 million children lived with at least one stepparent. In addition, 2.9 million lived with neither of their parents; this figure included 0.3 million children living with one or more foster parents. Relatives, usually grandparents, often cared for children who were living with neither parent.

[^1]
## Children Living With Two Parents: Biological, Step, and Adoptive

In 2001, of the 51.1 million children who lived with two parents, 88 percent ( 45.1 million) lived with their biological mother and biological father (Table 1). An additional 10 percent ( 4.9 million) lived with a biological parent and a stepparent, usually with a biological mother and a stepfather ( 4.1 million). About 2 percent of children living with two parents ( 1.1 million) lived with either two adoptive parents or a combination of an adoptive parent and a biological or a stepparent.

Families with stepparents or adoptive parents are an increasingly large component of two-parent families. In 2001, 5.4 million children lived with one biological parent and either a stepparent or adoptive parent- 11 percent of all those living with two parents, statistically unchanged from 5.2 million in 1996 ( 10 percent), and up from 4.5 million in 1991 (9 percent). ${ }^{7}$

In 2001, 95 percent of Asian or Pacific Islander children lived with both biological parents, higher than any of the other groups shown in Table 1. Black children had the lowest percentage (82 percent). ${ }^{8}$

In 2001, 536,000 children lived with one adoptive parent and a nonadoptive parent (biological or step). Eighty-three percent of these children were living with their biological mother and an adoptive father; adoptive fathers often were, in all likelihood, initially stepfathers. Often, living arrangements of children are dichotomized by whether

children live with only one or with both parents. The statistics in this report illustrate that even among children raised by two parents, considerable variation exists in the blending of parental types, whether biological, step, or adoptive parents.

## Children Living With Unmarried Parents

Numerous factors, including nonmarital childbearing, death, and divorce, affect whether children live with an unmarried parent for some portion of their childhood. A 1984 study estimated that almost half of
children under 16 would live in a single-parent household at some time before reaching age $16 .{ }^{9}$

[^4]Figure 1.
Percentage of Children Ages 0-17 Living in Various Family Arrangements: 2001

Source: U.S. Census Bureau, Survey of Income and Program Participation, 2001 Panel, Wave 2.

Table 2 shows that in 2001, 20.6 million children ( 28 percent of all children) lived with one or two unmarried parents.

Seventy-nine percent of children with unmarried parents resided only with their mother ( 16.3 million). 2.2 million children ( 11 percent of children living with unmarried parents) lived with their father without their mother present, including 304,000 children who lived with their biological fathers who were cohabiting with an unmarried partner. If fathers who were cohabiting with the children's
mothers are included (2.1 million), 4.3 million children lived with their unmarried fathers in 2001 (21 percent of children living with an unmarried parent).

The overall pattern of living arrangements of children with unmarried parents clearly indicates that women are the primary custodial parents of these children, and that these children usually have unmarried mothers living without a partner present. In the instances where children are living with their unmarried fathers, their mothers are usually also living with them.

In 2001, 18 percent of children lived in families that were below the poverty level. While one-tenth of children living with married parents were below the poverty level, this was the case for one-third of children living with neither parent or one or two unmarried parents. Among children living with 2 unmarried parents, 27 percent were living in poverty. Children living with their unmarried mother only were twice as likely to live in poverty (37 percent) as were children living with their unmarried father only (16 percent).

## Parents by Type of Relationship With Their Coresident Children

Table 3 shows estimates of the number of parents with coresident children in 2001, by the type of relationship with their children. While 96 percent of the 37.1 million mothers with coresident children were living with biological children only, this structure was true for just 86 percent of the 29.1 million fathers with coresident children. A higher percentage of fathers than of mothers lived with both their biological and stepchildren and no other children (5 percent compared with 1 percent). The percentage of
fathers who lived with their stepchildren only (4 percent) was also higher than that of mothers (1 percent). Fathers were more likely to live with any stepchildren (10 percent) or adopted children (4 percent) than were mothers, of whom 2 percent lived with any stepchildren, and 2 percent lived with any adopted children.

## Children With Siblings

Seventy nine percent of children under 18 lived in households with one or more siblings (Table 4): 10 percent lived with a half-sibling, 1 percent with a stepsibling, and another 2 percent with an adopted
sibling. ${ }^{10}$ A larger proportion of children living with two parents had siblings (84 percent) than was the case for children living with their mother only ( 74 percent) or their father only (61 percent). Thirty-eight percent of children living with neither parent lived with siblings.

In 2001, 28.2 million children (39 percent) lived with only one

[^5]sibling; an additional 25.2 million lived with two or three siblings (35 percent).

## Adopted Children

The number of adopted children rose from 1.1 million in 1991, to 1.4 million in 2001, a figure that is not statistically different from the 1996 estimate of 1.5 million. ${ }^{11}$ The number of adopted children is difficult to estimate accurately. SIPP estimates rely on the relationships reported by the respondent-administrative records are not used. This collection method could miss some legalized adoptions and include informal adoptions where no legal adoption exists.

Because of the small number of adopted children and potential difficulties in counting them accurately in the SIPP, only basic information is presented in Table 5. In 2001, 17 percent of adopted children lived with a single parent, compared with 26 percent of all children. The majority (83 percent) of adopted children lived with two parents-44 percent lived with two adoptive parents, 37 percent lived with an adoptive parent and a biological parent, and 3 percent lived with an adoptive parent and a stepparent. ${ }^{12}$ Children who live with an adoptive parent and a

| Any stepchildren | 795 | 139 | 2.1 |
| Any adopted children | 688 | 129 | 1.9 |
| Any foster children | 147 | 60 | 0.4 |

${ }^{1}$ This number, when added to or subtracted from the estimate, represents the 90-percent confidence interval around the estimate.

Note: All of the parents in this table have at least one coresident child under 18. However, some also have coresident children who are 18 and older, and the type of relationship between the parent and these older children is also reflected in the table.

Source: U.S. Census Bureau, Survey of Income and Program Participation, 2001 Panel, Wave 2.
biological parent have likely been adopted by their stepparent. SIPP is one of the few sources of current data that can provide information about the proportion of adopted children who have been adopted by their stepparent rather than by a biological relative or someone who was previously unrelated to them.

## Children in Blended Families

Blended families typically are formed when remarriages occur and parents enter the household
accompanied by their children from previous unions, thus creating stepparents and stepsiblings among the children in the newly formed family. In other instances, blended families are formed when a remarried parent has a child with his or her new spouse, thus producing a new brother or sister who is a half-sibling to a child from a previous union.

Table 6 shows the proportion of children who were in blended families in 2001 by the child's race

[^7]and Hispanic origin. ${ }^{13}$ Five percent of Asian children lived in blended families, compared with 15 percent of all children. Lower rates of out-of-wedlock childbearing and divorce may contribute to lower rates of Asian children living in blended families. ${ }^{14}$
${ }^{13}$ Table 6 differs in several ways from Table 4 in the report on Living Arrangements of Children: 1996 that it updates. In 2001, adopted siblings were not included with stepsiblings as they were in 1996 and 1991, but were coded separately. An additional category for children living with one biological and one adoptive parent and siblings who are the child's step, adopted, or halfsiblings is included. It is likely that these adopted children were first the stepchildren of their adoptive parent, and that the adoption took place following the remarriage of the biological parent with whom they live.
${ }^{14}$ See the National Vital Statistics Reports for data on births and trends in childbearing among unmarried women, teenagers, and the general population. For example, see Joyce A. Martin et al., Births: Final Data for 2001, National Vital Statistics Reports: Vol. 51, No. 2, Hyattsville, MD: National Center for Health Statistics, 2002.

X - Not applicable.
B - Base less than 200,000.
${ }^{1}$ This number, when added to or subtracted from the estimate, represents the 90-percent confidence interval around the estimate. Source: U.S. Census Bureau, Survey of Income and Program Participation, 2001 Panel, Wave 2.

The largest type of blending in children's families is the presence of half-siblings. In 2001, 7.3 million children lived with at least one half-sibling (Table 4), representing 10 percent of all children and 69 percent of children in blended families.

Living with a stepparent is the next largest contributor to children living in a blended family-7 percent of all children and 48 percent of children in blended families lived with a stepparent. In blended families, stepparents were more commonly found living with non-Hispanic White children (52 percent) than
with Black children or Hispanic children (each about 40 percent).

## Children With Grandparents

In 2001, 6.2 million children lived in households with at least one grandparent present ( 9 percent of all children, Table 7). Twelve percent of Hispanic children and 15 percent of Black children lived with a grandparent, while 5 percent of non-Hispanic White children lived with a grandparent. ${ }^{15}$

[^8]The arrangements when grandparents and grandchildren live in the same household vary, such as whether the parents are present and which generation maintains the household. In 2001, 77 percent of children living with a grandparent were also living with a parent in the household, and 55 percent of children living with a parent and grandparent were in a household where their grandparent was the householder. This characteristic differs by the number of parents. Thirty percent of children living with a grandparent and two parents were living in households

- Represents zero or rounds to zero.

B - Base less than 200,000.
${ }^{1}$ This number, when added to or subtracted from the estimate, represents the 90 -percent confidence interval around the estimate. Source: U.S. Census Bureau, Survey of Income and Program Participation, 2001 Panel, Wave 2
maintained by the grandparent, while 75 percent of children living with a single mother and a grandparent were living in the grandparent's household. ${ }^{16}$ Among children

[^9]living in households with grandparents but no parents present (23 percent of all children living with grandparents), the grandparent was the householder 95 percent of the time.

Children living with grandparents were more often living in families in poverty than were children
living in households with no grandparents present (23 percent and 17 percent, respectively). The relationship between children's residence with their grandparent and their poverty level is not simple. A grandchild may live with a grandparent to alleviate financial hardship of a parent, or, alternatively,
of the grandparent. Among children living with their mother only, those living in households with a grandparent present were in poverty 24 percent of the time, less than the percentage of children living with a single mother and no grandparent present (39 percentFigure 2).

## Relatives in Extended Families

Table 8 presents data on the different types of relatives living with children. (The estimates of specific relationship categories are not mutually exclusive-i.e., a person living with a grandmother, an uncle, and an aunt is counted separately in each of those categories. ${ }^{17}$ ) The largest group of children living with an other relative were living with a grandpar-ent-6.2 million children were living with one or both grandparents. Other relatives was the next largest category, which includes more distant relatives and responses that lacked enough specificity to be classified into more distinct categories. Similar to 1991 and 1996, uncles and aunts were represented in similar proportions (4 percent and 3 percent, respectively), as were nieces and nephews (1 percent each).

## Children Whose Coresident Parent's Marital Status Changed in the Last Year

Because the marital history of the child's coresident parents is collected in the SIPP, it is possible to estimate the number of children who lived with a parent who married, divorced, or was widowed in the last year. Table 9 shows that

[^10]Figure 2.
Percentage of Children Below the Poverty Level, for Those Living With Mother Only, by Presence of Grandparents and the Child's Race and Hispanic Origin: $2001^{1}$

${ }^{1}$ These children do not have a father present in the household.
Source: U.S. Census Bureau, Survey of Income and Program Participation (SIPP), 2001 Panel Wave 2.
about 2.3 million children experienced the marriage of their coresident mother or father in the last year. For 836,000 of these children, their biological father and mother married each other, and both were still living with the child at the time of the survey.

Estimates of the number of children whose parents divorced during a year were previously tracked by the National Center for Health Statistics (NCHS) as part of its vital statistics program. Currently, NCHS does not receive information from enough states to make these estimates. Previous NCHS data estimated that the number of children affected by divorce had grown since 1950. Divorce rates increased in the late 1970s and into the 1980s and subsequently
leveled off in the late 1980s and into the 1990s. ${ }^{18}$ An estimated 299,000 children were involved in the divorces finalized in 1950, or a rate of 6.3 per 1,000 children. This number increased to a little over one million children by 1972 (at a rate of 14.7 per 1,000 children), and stayed just over one million through 1984, when the rate was a bit higher, at 17.2 per 1,000 children.

Table 9 shows an estimated 1.5 million children experienced the divorce of their parents in the

[^11]Table 8.

year prior to the SIPP interview in 2001, or a rate of 20.6 per 1,000 children. Eighty percent of these children lived with their mother ( 1.2 million).

## Composition of Households Containing Children: 2001

While most of the tables in this report are shown from the child's point of view, Table 10 shows the living arrangements of children at the household level. In 2001, 38.8 million households included children under 18: 97 percent had at
least one child and his or her biological parent, 8 percent had at least one child and his or her stepparent, and 3 percent had at least one child and his or her adoptive parent. These categories are not mutually exclusive. For example, households can have children with both a biological parent and a stepparent. There were 3.6 million households with blended families, and 1.5 million households with adoptive families.

Eight percent of households with children under 18 (3.2 million) had
three generations present, with 90 percent of these composed of a child, his or her parent(s), and the child's grandparent(s). An additional 2 percent, or 898,000 , included a child and his or her grandparent(s), but not the child's parent(s). Nearly 1 in 5 households with children included nonrelatives or relatives of the child other than his or her parents or siblings.

While 14 percent of all households were below the poverty level, the percentages for blended households and households containing a
child and his or her stepparent were lower, at about 10 percent. This difference likely reflects the fact that stepfamilies are often formed by remarriage, so these households are more likely to have two parents and two earners than households with children and biological parents, which include single parents. Households in which children lived without a parent present had a poverty rate of 27 percent, double the overall poverty rate for households with children. Twenty-nine percent of households with children, their grandparent(s), and no parent(s) were below the poverty level. ${ }^{19}$

Overall, 37 percent of households with children received some type of public assistance (Table 10). ${ }^{20} \mathrm{~A}$ higher percentage of three-generation households and extended households received public assistance (about 65 percent). Among extended households, 80 percent of those that included children living with other relatives and nonrelatives received public assistance.

## Historical Trends

Today's family and household structures may be placed in an historical context by comparing them with family and household structures since the late 19th century. Based on decennial censuses for 1880, 1910, and 1940 using data from the Integrated Public Use Microdata Series, the 1970 and

Source: U.S. Census Bureau, Survey of Income and Program Participation, 2001 Panel, Wave 2.

1990 Current Population Survey, and the 1996 and 2001 SIPP, Figure 3 presents long-term trends in par-ent-child living arrangements. ${ }^{21}$

The data from 1880 to 1970 at 30-year intervals (the approximate length of a generation most closely conforming to census years), show that the distribution of children's living arrangements changed little. The proportion of children who lived without parents declined

[^13]from 6 percent in 1880 to about 3 percent in 1970. During this same period, the proportion of children who lived with their mothers only increased from 8 percent to 11 percent. Between 83 percent and 85 percent of children lived with two parents during this entire period.

Major shifts in living arrangements occurred between 1970 and 1990, when the proportion of children living only with their mother doubled from 11 percent to 22 percent. Since 1990, the changes in children's living arrangements have leveled off. The proportion of children living with only their fathers increased from 1970 to 1990, to levels that do not differ much from those recorded 100 years ago.

## Source of the Data

The population represented (the population universe) in the 2001 Survey of Income and Program Participation (SIPP) is the civilian noninstitutionalized population living in the United States. The institutionalized population, which is excluded from the population universe, is composed primarily of the people in correctional institutions and nursing homes ( 91 percent of the 4.1 million institutionalized people in Census 2000).

The data in this report were collected from June through September of 2001 in the second wave (interview) of the 2001 SIPP. The data highlighted in this report come primarily from the main survey and the household relationship topical module. The SIPP is a longitudinal survey conducted at 4month intervals. Although the main focus of the SIPP is information on labor force participation, jobs, income, and participation in federal assistance programs, information on other topics is also collected in topical modules on a rotating basis.

## Accuracy of the Data

Statistics from surveys are subject to sampling and nonsampling error. All comparisons presented in this report have taken sampling error into account and are significant at the 90-percent confidence level unless otherwise noted. This means the 90-percent confidence interval for the difference between the estimates being compared does not include zero. Nonsampling errors in surveys may be attributed to a variety of sources, such as how the survey was designed, how respondents interpret questions, how able and willing respondents

Figure 3.

## Historical Living Arrangements of Children:

 Selected Years: 1880 to 2001(Percent distribution)

Note: Some percentages do not sum to 100.0 due to rounding.
Source: 1880-1940: Integrated Public Use Microdata Series: Version 2.0 made available by the Historical Census Projects; 1970-1990: U.S. Census Bureau, Current Population Survey; 1996-2001: U.S. Census Bureau, Survey of Income and Program Participation, Wave 2. For 1880-1940, children in group quarters are included (1 percent or less of all children).
are to provide correct answers, and how accurately the answers are coded and classified. The Census Bureau employs quality control procedures throughout the production process, including the overall design of surveys, the wording of questions, review of the work of interviewers and coders, and statistical review of reports to minimize these errors.

The Survey of Income and Program Participation weighting procedure uses ratio estimation, whereby sample estimates are adjusted to independent estimates of the national population by age, race, sex, and Hispanic origin. This weighting partially corrects for bias due to undercoverage, but biases may still be present when
people who are missed by the survey differ from those interviewed in ways other than age, race, sex, and Hispanic origin. How this weighting procedure affects other variables in the survey is not precisely known. All of these considerations affect comparisons across different surveys or data sources.

For further information on the source of the data and accuracy of the estimates including standard errors and confidence intervals, go to <www.sipp.census.gov/sipp /sourceac/S\&A-2_SIPP2001_ w1tow9_20050214.pdf> or contact Dennis Sissel of the Census Bureau's Demographic Statistical Methods Division on the Internet at charles.d.sissel@census.gov.

    ${ }^{8}$ The percentage for Black children is not statistically different from the percentage for American Indians, which was 87 percent.

[^3]:    - Represents zero or rounds to zero.
    ${ }^{1}$ This number, when added to or subtracted from the estimated total number of children under 18 in each category, represents the 90-percent confidence interval around the estimate.
    ${ }^{2}$ In the SIPP, children identify both of their parents regardless of their marital status. This means that both married and unmarried parents are included in this category in this table. This represents a difference from the CPS, where only married parents are recorded in twoparent households. As a result, there are more children in two-parent households in the SIPP, and more in single-parent households in the CPS.
