POC for Sounding Rockets in APD and PS for Balloon Program
Astrophysics Division, Science Mission Directorate

Astrophysics Advisory Committee
October 19, 2020

Suborbital Programs
Low-Cost Rapid Access to Space

In addition to yielding science results, suborbital investigations are also critical in maturing new technologies for future space missions and developing NASA future workforce.

PI led effort,

- PI is in full control of the mission from proposal, instrument development, launch, data analysis, to publication.
- NASA is in control of the platform and launch operations

Suborbital payloads are Microcosm of large-scale Missions

- Students fully engaged in entire mission lifecycle within grad school tenure
  - Define Science Questions
  - Science Requirements Flowdown to Technical Requirements
  - Design and Fabrication
  - Testing, Integration, and Calibration Experiment/Payload
  - Staging, Launch, Recovery, Data Analysis and Presentation

Acceptance of Appropriate Risk and Risk Mitigation

- Value lies in building the instrument and the carrying out the mission
  - Suborbital program is operated under NPR 7120.8
  - New Science is defined. Technology Readiness is raised to Flight Level (TRL-7).
  - Risk of failure is accepted in low cost environment. Lessons are learned.
  - Systems are exercised prior to deployment on more advanced missions
  - Proof of Science and Technical Concepts

Sounding Rocket Program Office

Heliophysics Division manages the Sounding Rocket Program for all NASA.

The Sounding Rocket Program Office at WFF (Code 810) provides implementation:

Led by Giovanni Rosanova
Day-to-day operation of the Sounding Rocket Program
Management/Oversee of the Contractor (NSROC III)
Safety and Mission Assurance (Range, Termination, recovery)

SRPO manages technologies/capabilities development

- Higher Data Rate Telemetry
- Water Recovery
- Higher Performance Vehicles 650-700 seconds above 150 km
- Sub-Payload Technology
- Component and sub-system miniaturization and modernization

SRPO provides reimbursable rocket launch services outside of their core missions, which is SMD science, education, and SRP technology development.

- ~10 flights/year SMD Science (Heliospheric, Solar, Astro, Planetary)
- ~3-4 flight/year SRPO Education + Technology Development
- ~1-4 flight/year Reimbursable flights outside of the Core Mission above

I'm the Sounding Rocket Program Point of Contact within Astrophysics; Valerie Connaughton and Michael R Garcia are the Technical Officers for the High Energy and UV/Visible Portfolios, respectively.

DUST Mission

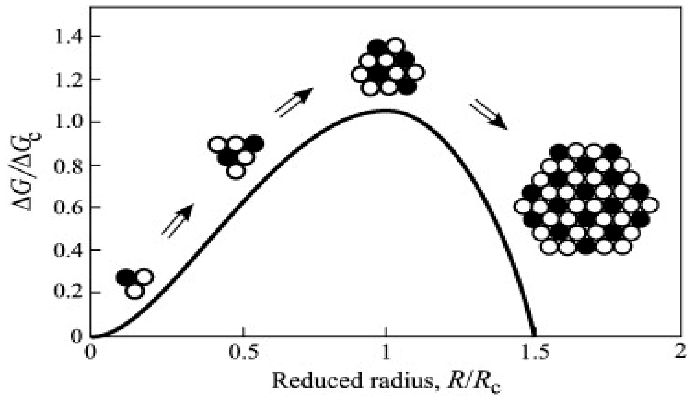
Determining Unknown yet Significant Traits is a Laboratory Astrophysics investigation studying dust grain formation. The Sounding Rocket flight provides the microgravity study environment for this sample return mission.

Led by PI Joseph Nuth, GSFC in collaboration with Hokkaido University.

The gas-solid phase change is unstable at first due to the surface energy of the clusters which must grow large enough to be dominated by internal energy before they grow into dust grains.

Theory assumes that every SiO colliding with an unstable cluster sticks and that every SiO that strikes a stable cluster also sticks and contributes to the growing dust grain.

In practice these processes are much less efficient by several orders of magnitude.



First build stable clusters by addition & loss of SiO.

Objectives of the DUST Payloads

- Use the Interferometer experiments (see next slide) to measure the temperature and pressure at which SiO, Fe-SiO and Mg-SiO nucleate.
- Use the IR Spectrometer experiments to measure the spectrum of freshly condensed amorphous silica, iron silicate and magnesium silicate dust.
- Based on Interferometer data and using Classical Nucleation Theory, calculate the efficiency of cluster growth for unstable clusters.
- Based on the partial pressure of condensates, gas temperature, time and measured particle size distribution, calculate the dust growth efficiency.
- Based on the number density of nucleated dust grains, available time and size of dust aggregates, calculate the aggregation efficiency.
- Determine the effect of background gas [Ar, Ar+O2, Ar+H2] on nucleation, growth, aggregation and particle morphology.

DUST Analysis

The DUST-1 payload arrived in Hokkaido in late December 2019.

TEM analysis of particles began January 2020.

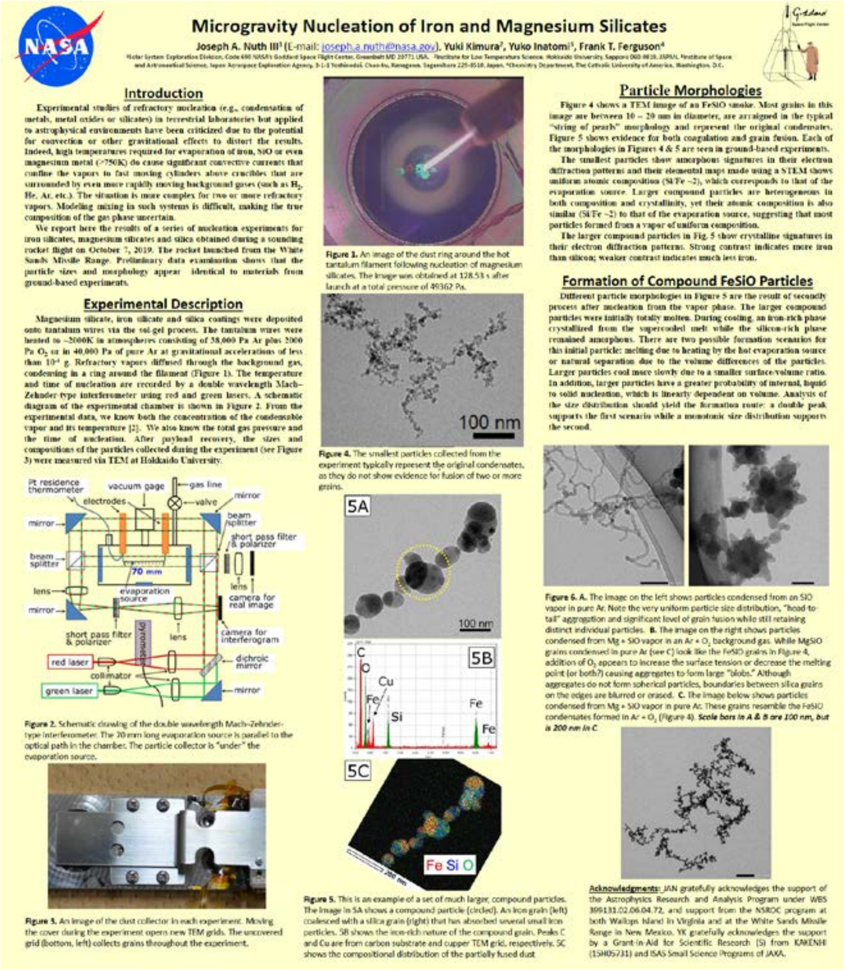
A Science Team meeting in February 2020 resulted in this poster for the LPSC.

COVID shut down Hokkaido University.

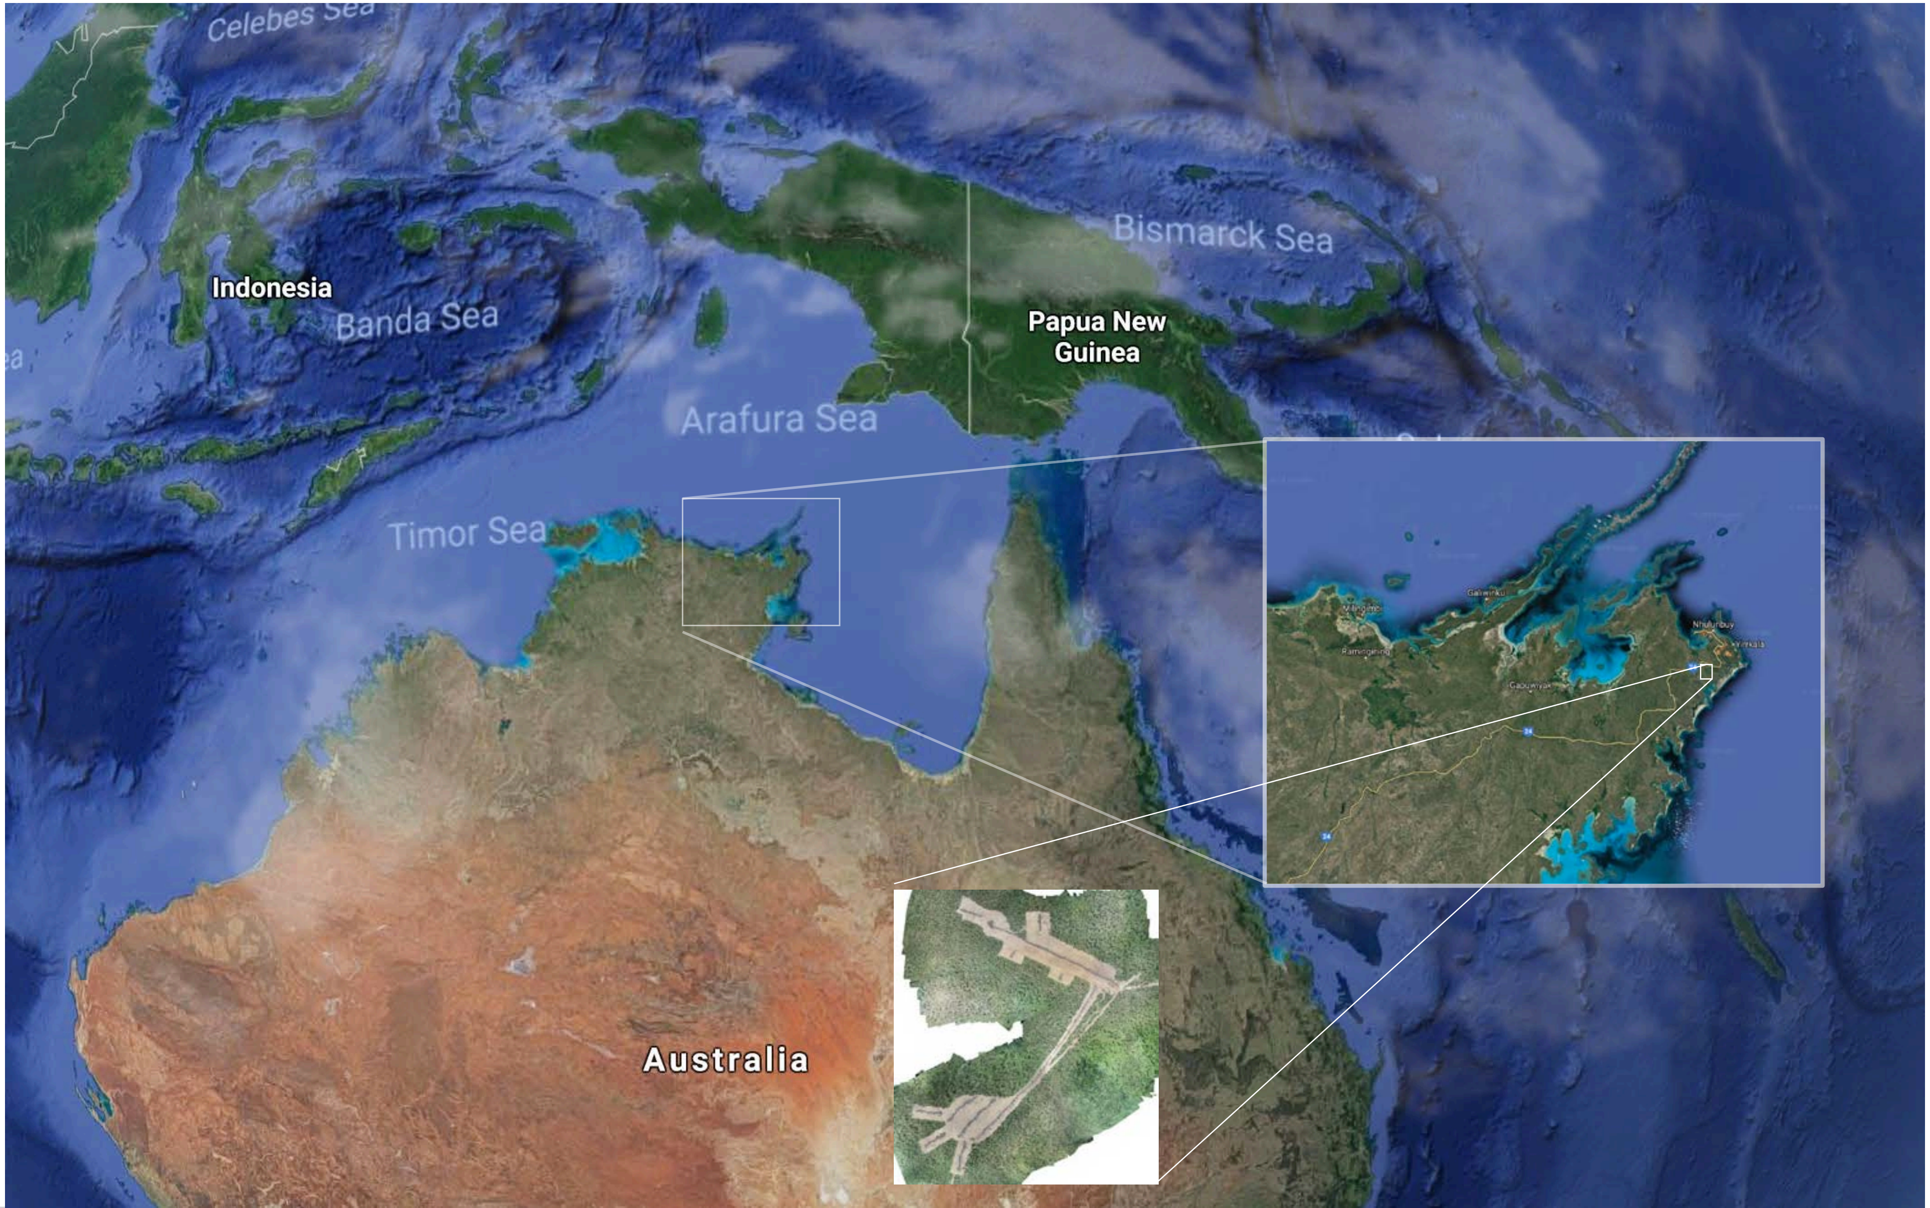
Upon being allowed back in the laboratory the JAXA team worked to refurbish the payload in order to support launch of DUST-2.

DUST-2 successfully launched on 7 September 2020, was recovered and was shipped back to JAXA on September 15, 2020.

Once in Japan, full data analysis will begin.



Equatorial Launch Australia (ELA)



Timing of the APD Australia Campaign

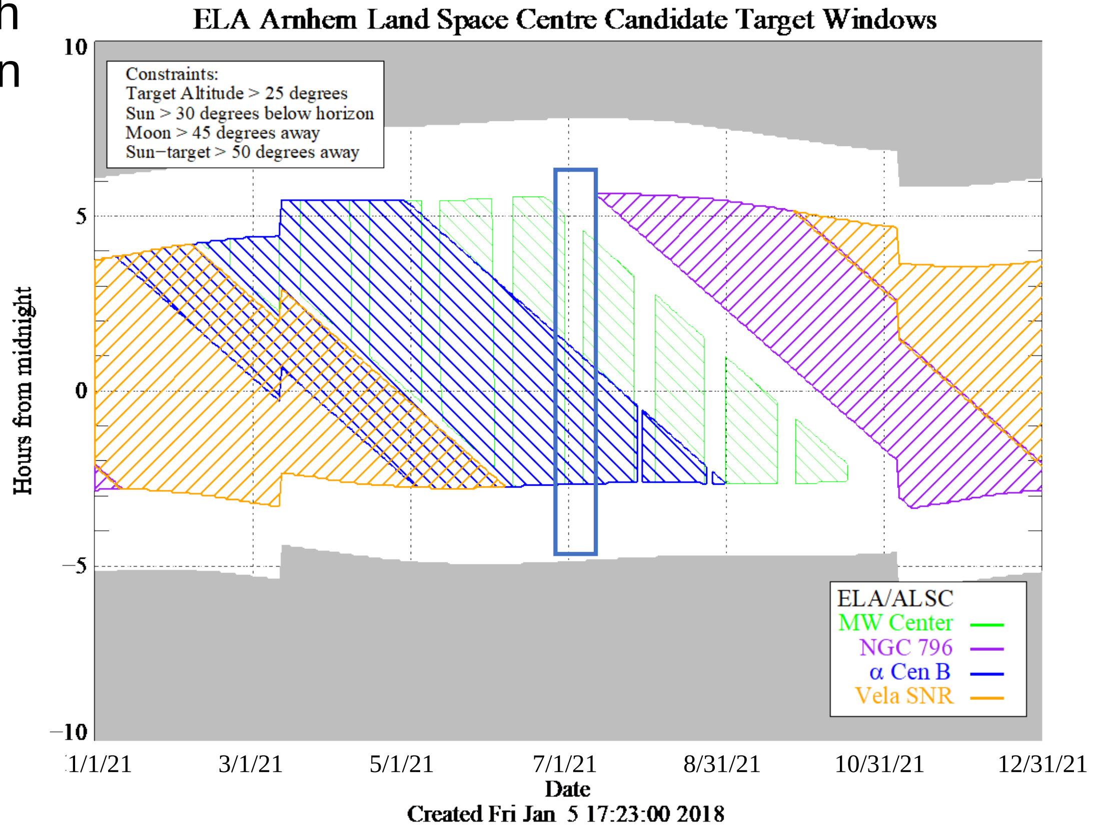
Sounding Rocket Program Office (SRPO) is working with the commercial Equatorial Launch Australia (ELA) site. The plan is to have three (3) payloads launched in the June/July of 2021, which is the maximum number of science teams that can see their targets in a narrow 3-week window.

MW Center: **McCammon**
NGC796: McCandliss
A Cen B: **France, Green**
Vela SNR: McEntaffler

(PI in high lighted above can see prime science target in the June/July time frame)

SRPO anticipates to have an Australia Sounding Rocket campaign every 3 years.

Recently a second commercial launch site further south is presently being explored of potential future use APD Sounding Rocket.



Backup Slides

Suborbital Platforms Overview

Sounding Rockets

- Exoatmospheric > 100 km
- Flight duration of up to 20 min at altitude
- Payload Masses typically 500 kg
- Mature payload sub-systems provided by the SRP (Skins, Doors, TM, Pointing, Guidance, Recovery)
- Fine pointed standard capability < 1”
- Science Disciplines: X-ray, EUV, UV, IR
- Recoverable/re-flyable

Balloons Payloads

- Float altitude 34 km (super pressure) to 39 km (conventional)
- Float time of avg 21 days (conventional) and 60-100 days (super pressure)
- Payload Masses up to 1000 kg (super pressure) to 3600 kg (conventional)
- Experimenter provides gondola
- Fine pointing ~1” is available (WASP)
- Science Disciplines: Particle Astrophysics, γ-ray, hard X-ray, 2100 ± 100 Å window far-IR, sub-mm
- Recoverable/re-flyable

Balloon Program

Balloon Program COVID Impact Timeline

Wanaka, NZ

~ 02/21/20 COSI science team deploys

03/14/20 BPO decision to cancel the Wanaka 2020 Campaign and redeploy teams.

Palestine, TX

04/08/20 BPO decision to move the payload (PIPER) from Palestine to the Ft. Sumner Campaign.

Fort Sumner, NM

For all but one payload (PIPER), the PI have withdrawn from Ft Sumner campaign.

07/09/20 BPO decision to cancel the Ft. Sumner campaign (Nevada the recovery side for Ft. Sumner balloon launches was at the peak of their COVID outbreak).

McMurdo, Antarctica

06/21/20 NSF informed NASA the due to COVID-19 they can not support a 20/21 LBD campaign.

Qualification of the Super-Pressure Balloon

Pre-COVID-19 plan was to conduct two qualification flights of the super-pressure balloon (SPB) design before GUSTO launches on an SPB from Antarctica in December 2021

- Spring 2020 and Spring 2021 from Wanaka NZ

The Spring 2020 balloon campaign was cancelled in March 2020 due to COVID-19 restrictions

Current plan is to conduct one qualification flight of the SPB

- Spring 2021 from Wanaka NZ, if possible within COVID-19 restrictions
- Summer 2021 from Sweden, if New Zealand campaign cannot be conducted; the thermal environment of a Sweden launch, where the Sun is not setting on the balloon, is similar to the initial GUSTO SPB Antarctica launch environment

The use of a zero-pressure balloon (ZPB) for GUSTO is being studied as a backup

- Preliminary meteorological studies indicate that there is a high probability that GUSTO would attain its threshold requirements if launched on a ZPB
- ZPBs have less restrictive weather conditions for launch, so there are more launch opportunities in Antarctica for a ZPB than a SPB

DEUCE/INFUSE, PI Green

The DEUCE and INFUSE Sounding Rocket Program at the University of Colorado Boulder

Principal Investigator: James Green

This program is funded from April 1, 2019 – March 31, 2023 and is a continuation on decades of UV sounding rocket programs at CU Boulder. This is a separate program from the program led by Dr. Kevin France at CU Boulder.

DEUCE and INFUSE

The program has two separate payloads:

The Dual Channel Extreme Ultraviolet Continuum Payload (DEUCE) and The Integral Field Ultraviolet Spectroscopic Experiment (INFUSE)

DEUCE is complete, has flown twice (in 2017 and 2018) and is scheduled to launch in November 2020 from WSMR and in July 2021 from Australia.

INFUSE is in development with a target launch date of early 2023.

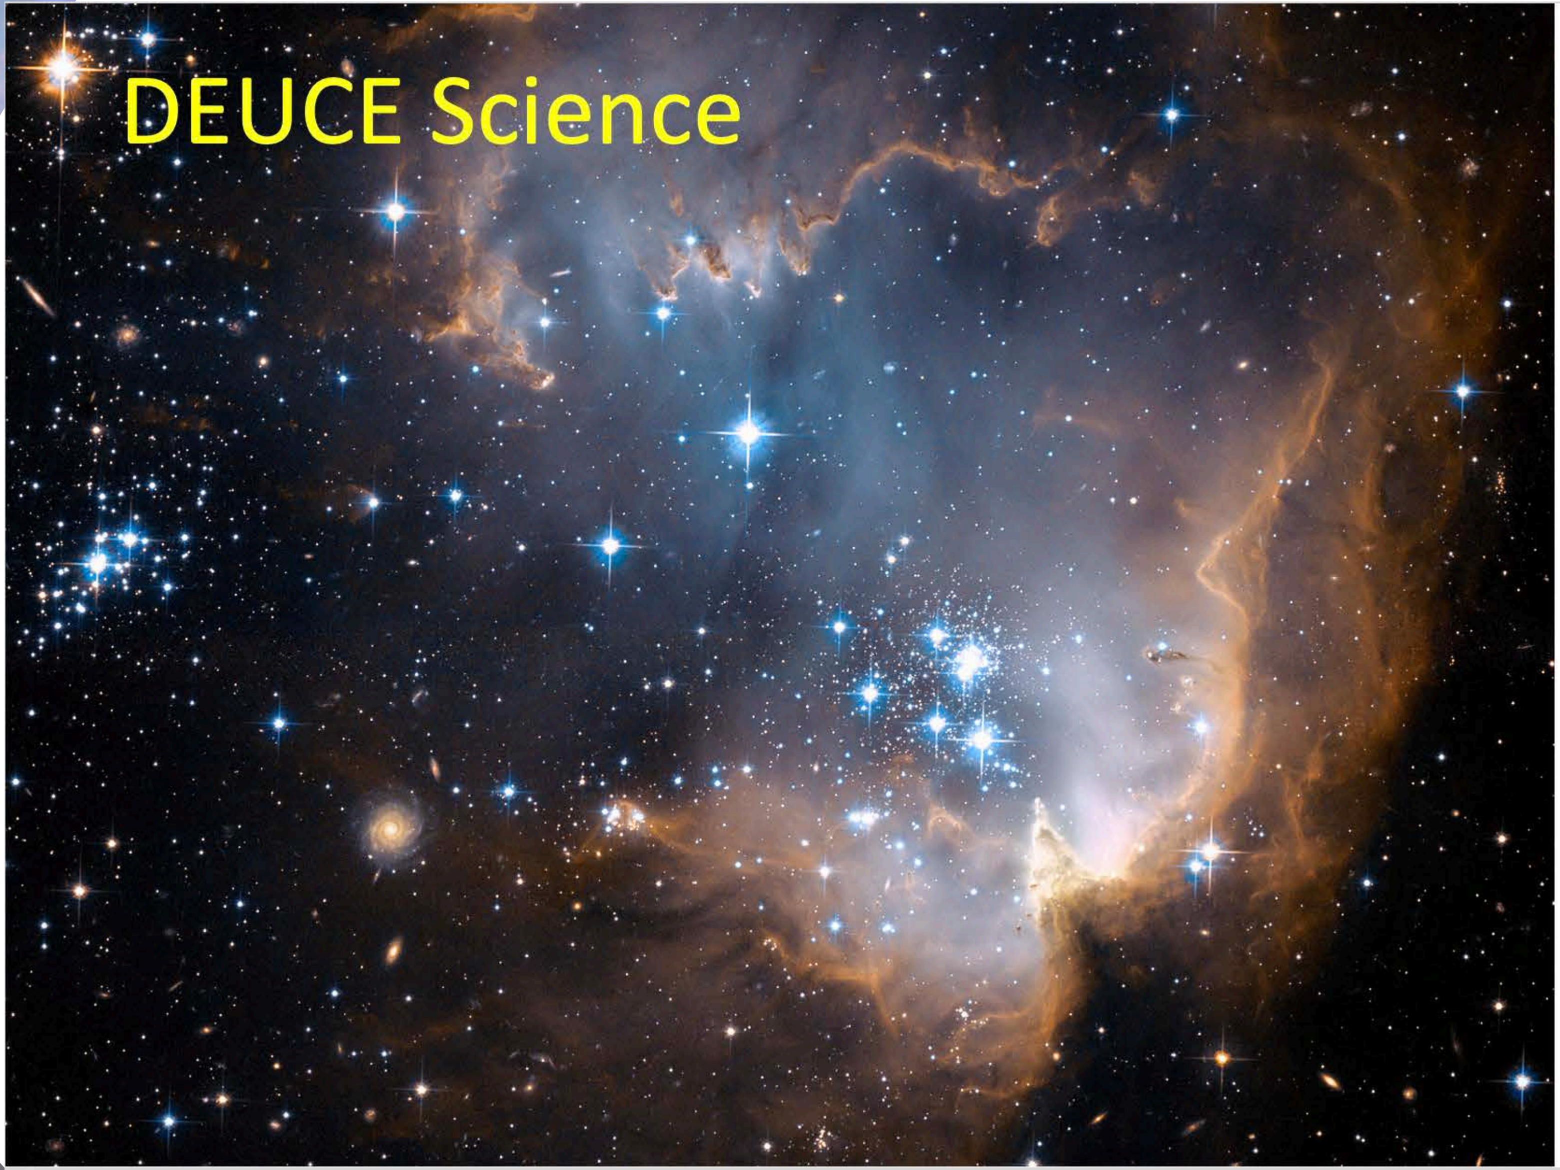
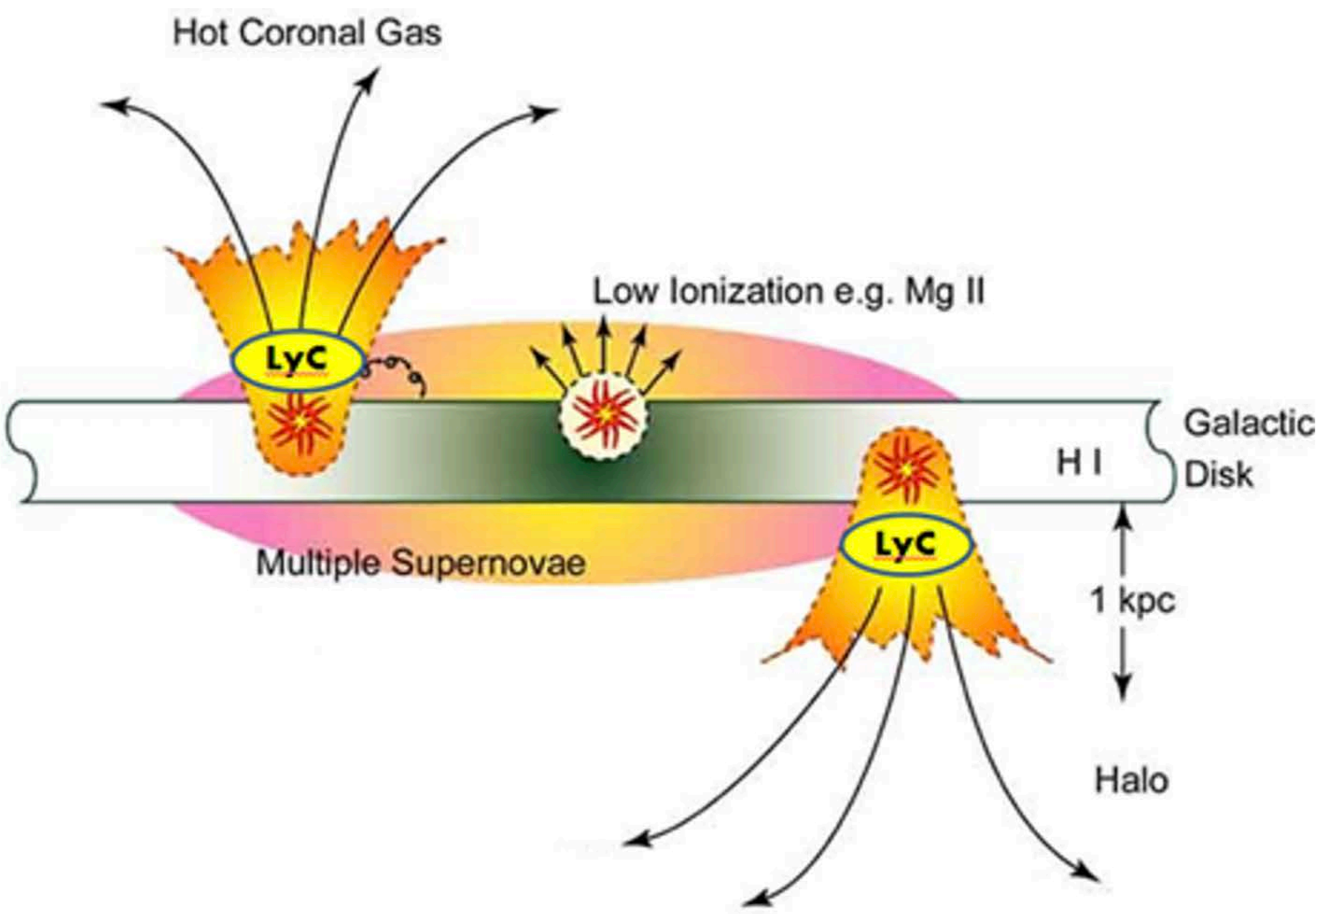
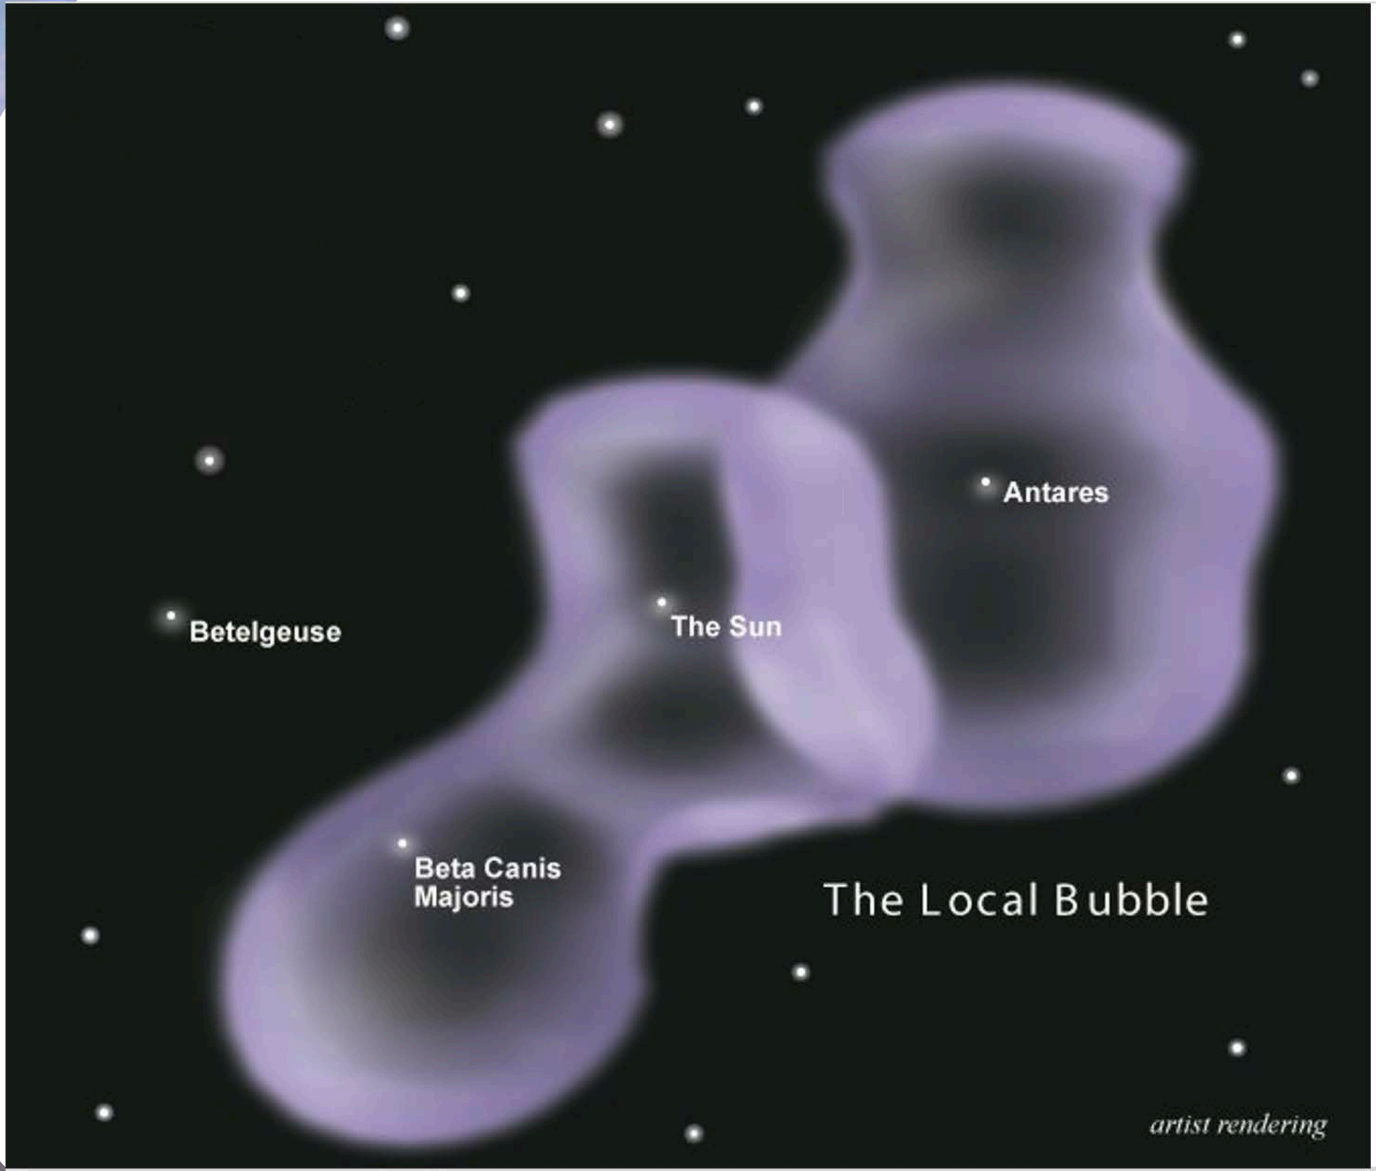
DEUCE Science



Ionizing photons from hot stars must escape from their galaxies in order to ionize hydrogen in the intergalactic medium. Current models assume that only the hottest stars (O stars) can provide the flux needed to maintain the ionization. However, these models also predict that their ionizing radiation will rarely escape from their galaxies.



One possible solution is that longer-lived, but slightly cooler B stars might provide the necessary flux, after the O stars clear a pathway to the intergalactic medium

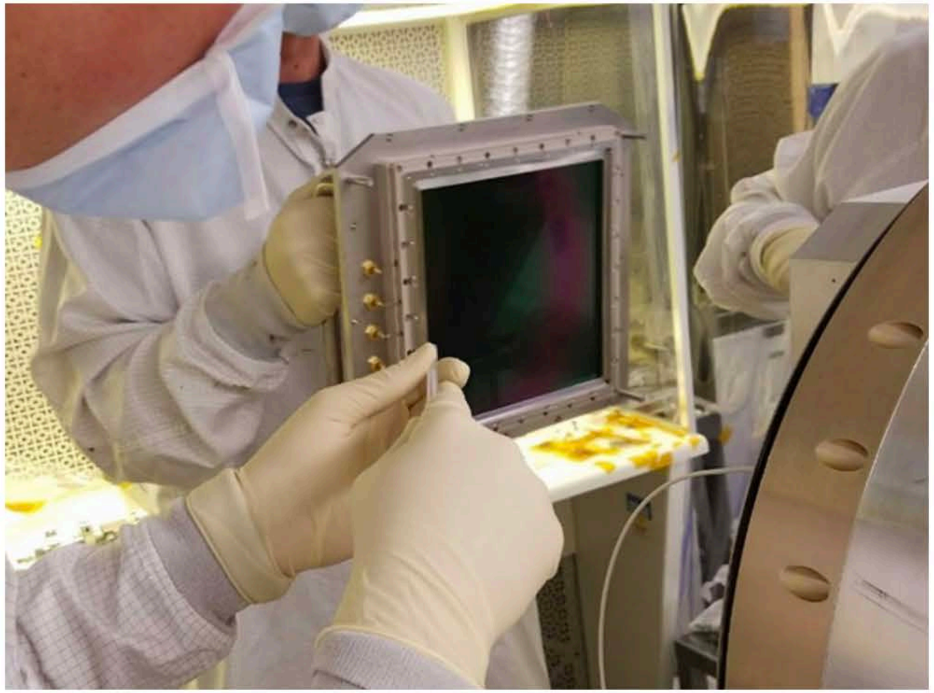


To test this model, we need to observe one or more B stars and measure their ionizing output. However, ionizing radiation is readily absorbed by the interstellar medium of our own galaxy, and there are only 2 B stars (and no O stars) for which this measurement can be made: Epsilon and Beta Canis Majoris

DEUCE Technology Development

DUECE utilizes a novel large format MCP detector (200mm X 200 mm) utilizing ALD (Atomic Layer Deposition) boro-silicate plates. The detector performed as expected on both flights. This is the technology commonly assumed to be incorporated in future UV large missions, e.g. flagship and/or probe.

We are also looking to incorporate an etched silicon diffraction grating for the Australia flight.



DEUCE Launches

Fall 2017: Mission failure due to failure in attitude control system. Target was not acquired, and no scientific data was obtained.

Fall 2018: Mission Success, spectrum of Epsilon CMa obtained. (see next slide)

Fall 2020: Planned observation of Beta CMa.

Summer 2021 (Australia): planned observation of Alpha Centauri to assess the EUV radiation environment of any potential habitable planet in the system.

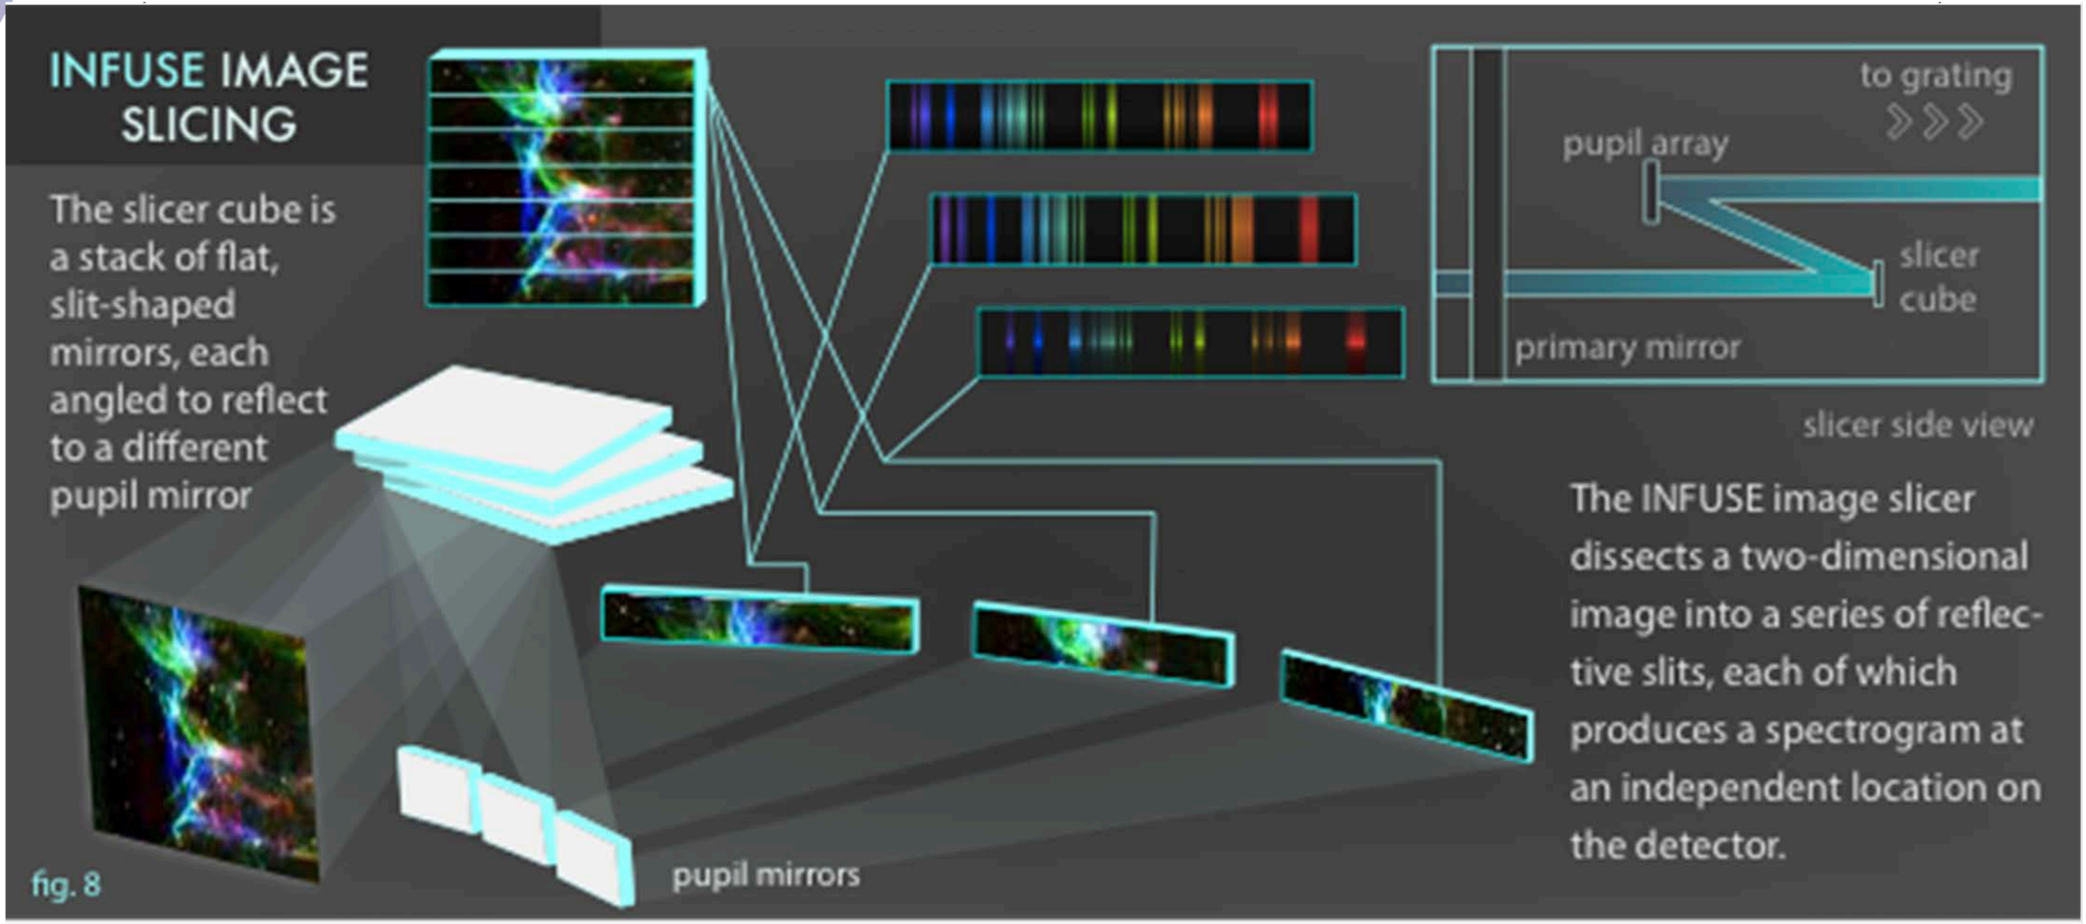
INFUSE Science and Technology

INFUSE will be the first integral field spectrograph in the vacuum ultraviolet. Such capability is essential to support the science objectives on the next generation of UV missions.

INFUSE will observe the Cygnus loop, a nearby supernova remnant, to study the impact of massive stars on their galactic environments by quantifying the shock-velocity distribution of the remnant. Such a study is infeasible with point source or long slit UV spectroscopy (e.g. COS/STIS)



INFUSE IMAGE SLICING

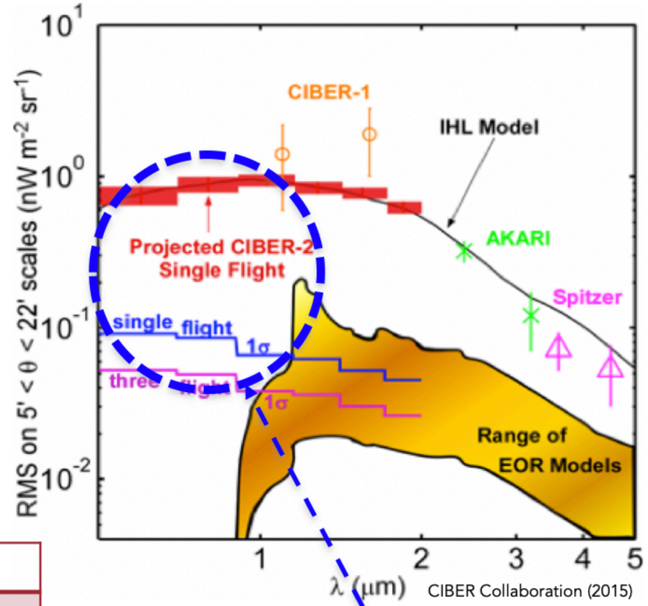
CIBER-2 Science

- Fluctuations in the near-IR background measured at 1.1 and 1.6 μm are unexpectedly bright (Zemcov et al 2014).
- This signal is strongly correlated with *Spitzer*-IRAC measurements.
- These measurements call for some new, significant component of the cosmic near-IR energy budget.
- *But what do the fluctuations do at shorter wavelengths?*



CIBER-2 improves on CIBER-1 with 6 bands and ~5x greater AΩ to maximizes sensitivity to angular scales of interest.

νI_ν (sky)	525	450	400	380	320	224	nW m^{-2} sr^{-1}
$\delta \nu I_\nu$ (1σ/pix)	38	45	34	31	25	23	nW m^{-2} sr^{-1}
δF_ν (3σ)	21.5	21.1	21.0	21.0	21.0	20.9	Vega mag

Coverage into the optical is critical to separate IHL from early galaxies.

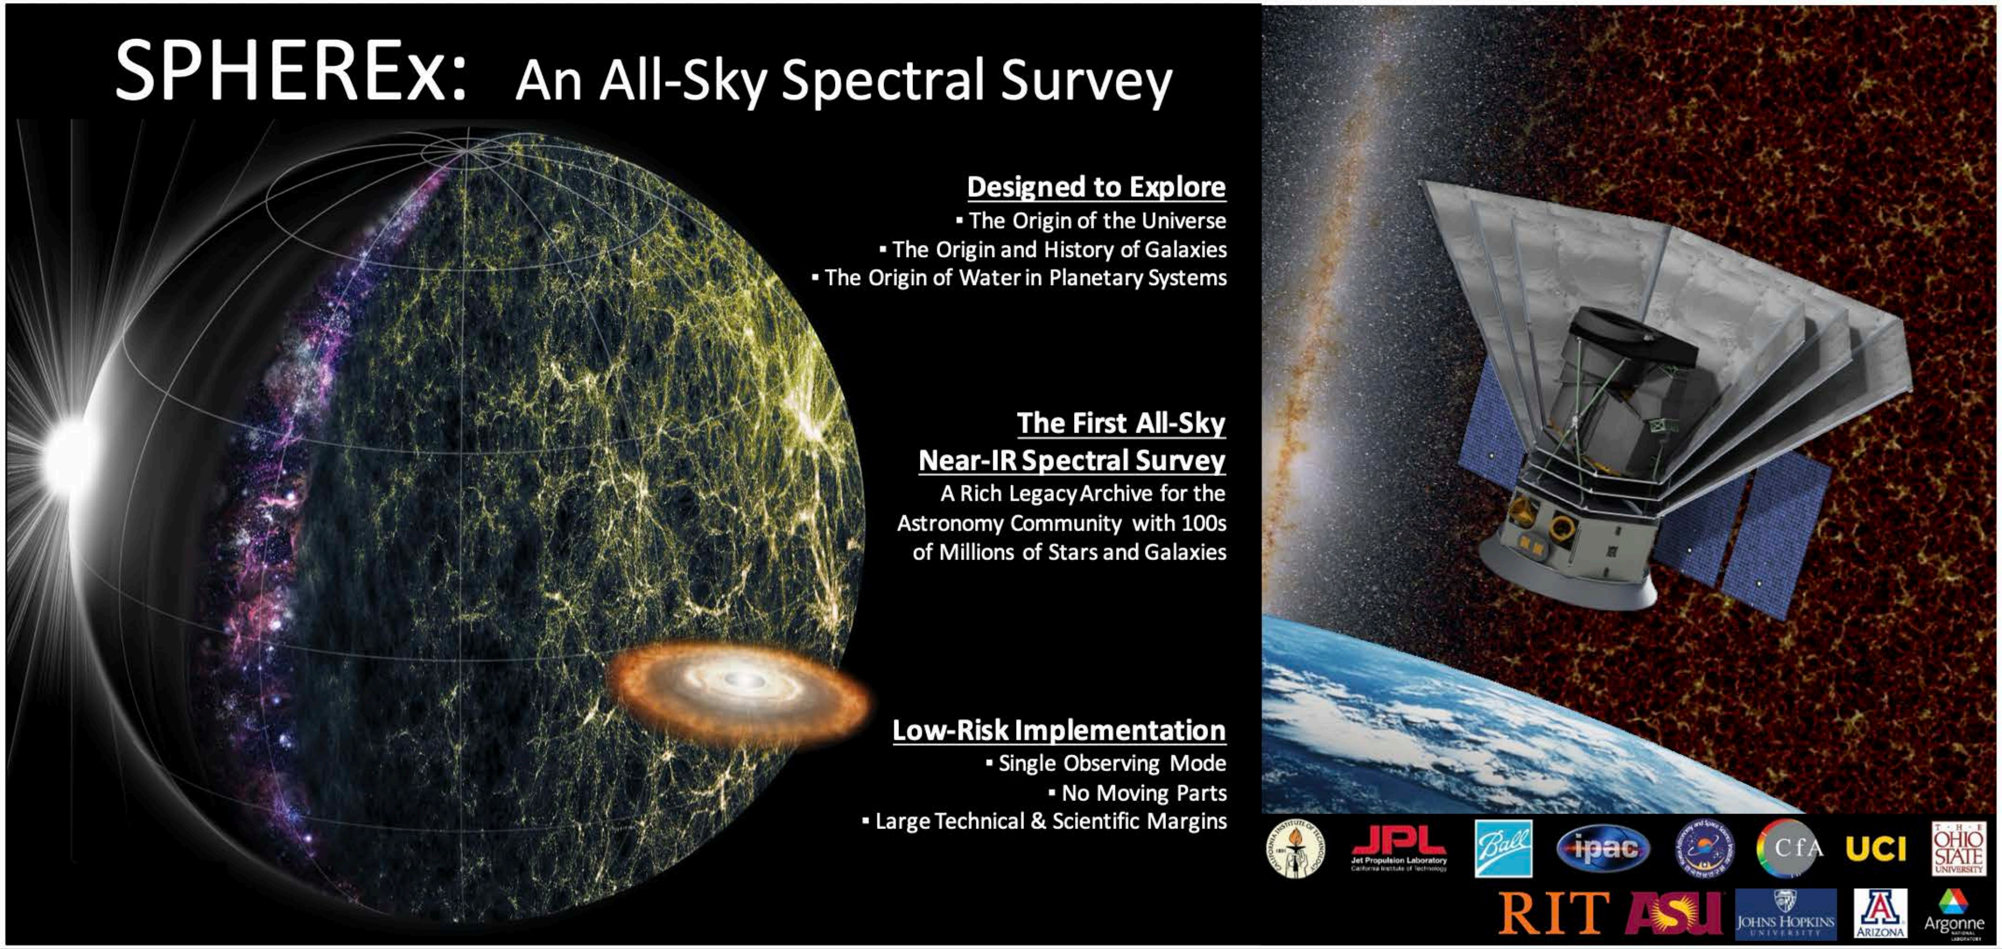
CIBER-2 Recent History and Schedule

Task	Location	Schedule
Experiment System Integration	Caltech	01/2019 - 05/2019
Payload Integration	WFF	06/2019 - 07/2019
Institutional Handoff	Caltech → RIT	08/2019
Pre-flight Calibration and Test	RIT	09/2019 -12/2019
Flight Qualification (Passed)	WFF	01/2020 - 02/2020
~~**Flight Deployment**~~	~~WSMR~~	~~03/2020 - 04/2020~~
Currently Scheduled Launch	WSMR	04:10 MST 2/15/2021

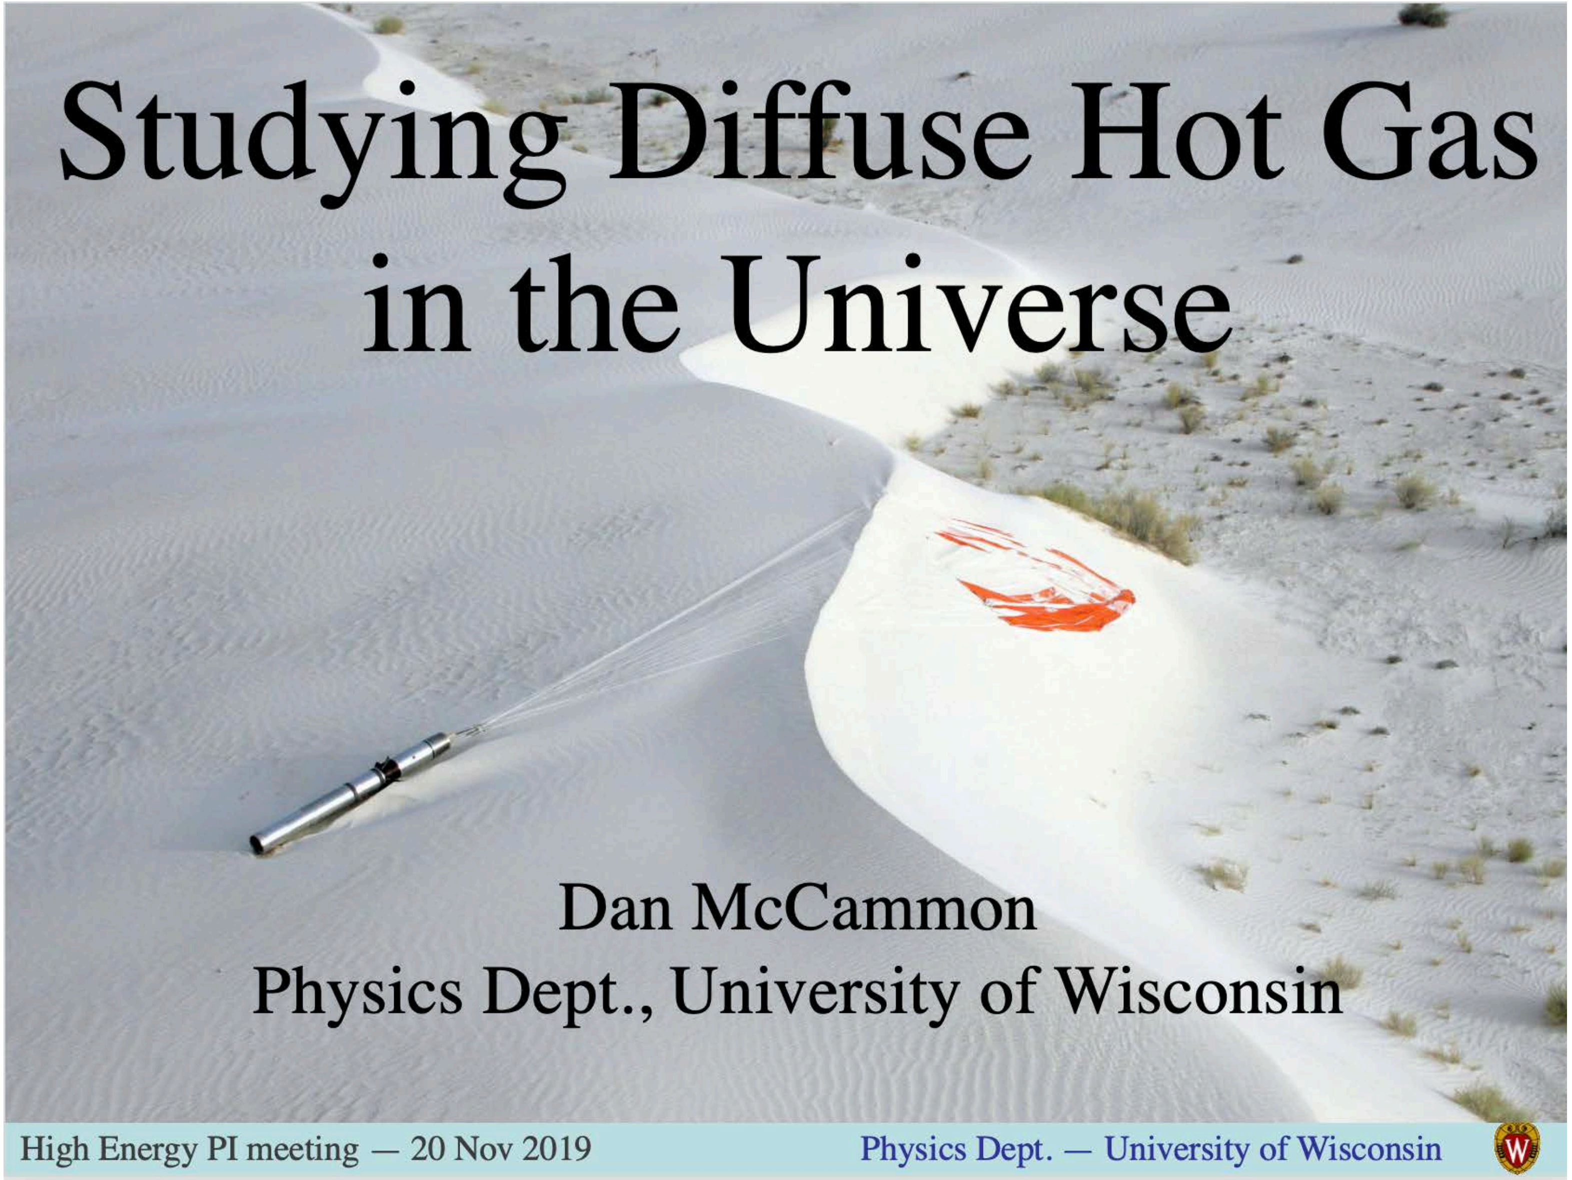
Cancelled Due to Pandemic

We plan for ~4 flights of CIBER-2 over the next 5 years.

CIBER Informs the Development of SPHEREx



XQC, PI McCammon



Studying Diffuse Hot Gas
in the Universe
Dan McCammon
Physics Dept., University of Wisconsin
High Energy PI meeting — 20 Nov 2019
Physics Dept. — University of Wisconsin

Most of the normal matter in the Universe is at temperatures $T \geq 10^6$ K

→it (mostly) only shows up in X-rays

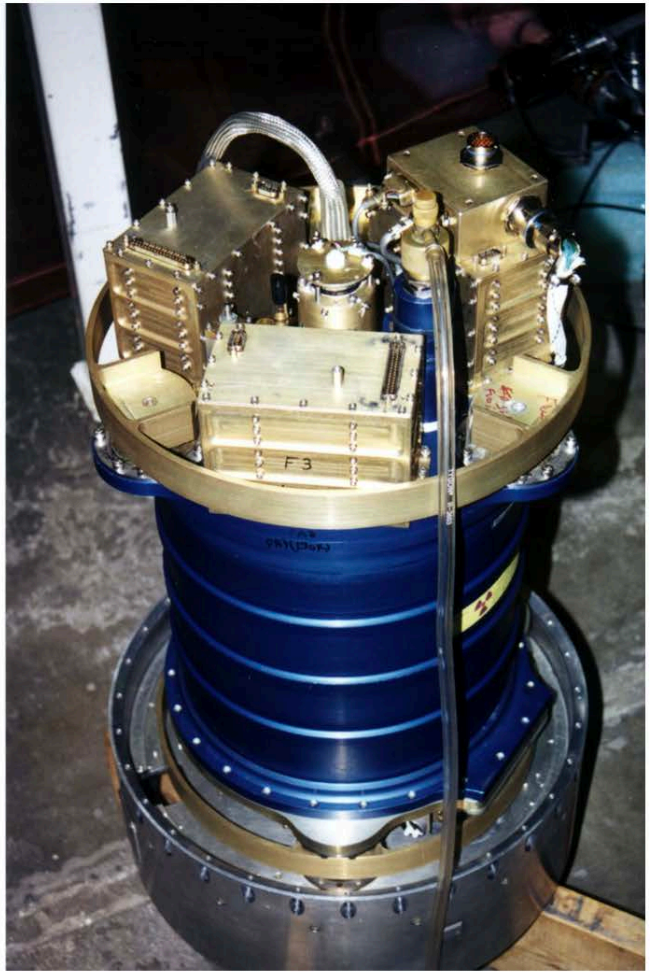
ISM – CGM – IGM

Bad: Cools very slowly, so faint and hard to observe.

Good: At most common temperatures, emission is all in lines — lots of plasma diagnostics.

Problem: Extended source can't use gratings for emission spectroscopy. Need high resolution detectors.

Microcalorimeters to the rescue!



Need 50 mK temperatures

Water Recovery X-ray (WRX) Rocket

A Technology Development payload (launched 4/4/18)

- First use of an X-ray hybrid CMOS detector*, similar to those proposed for Lynx
- First flight of aligned array of large-format, low-profile, high-performance X-ray reflection gratings* produced via nanofabrication
- Designed to test water-recovery tech for upcoming OGRE mission
- First recovered payload at Kwajalein Missile Range
- First astronomical payload at Kwaj (9.4° N Lat)
- First sealed NASA payload section
- Detected astrophysical X-rays, although at low significance

*Both critical NASA technologies co-funded by SAT/APRA

The WRXR team

- Main payload team
  - Dr. Randall L. McEntaffer (PI), Dr. James Tutt (Asst. Research Prof.), Mr. Ted Schultz (Lead Engineer), Mr. Drew Miles (Lead Grad Student), Mr. Benjamin Donovan (Junior Grad Student), Mr. Christopher Hillman (Undergrad Asst.), Bailey Myers (Undergrad Asst.), Mr. Daniel Yastishock (Undergrad. Eng.)

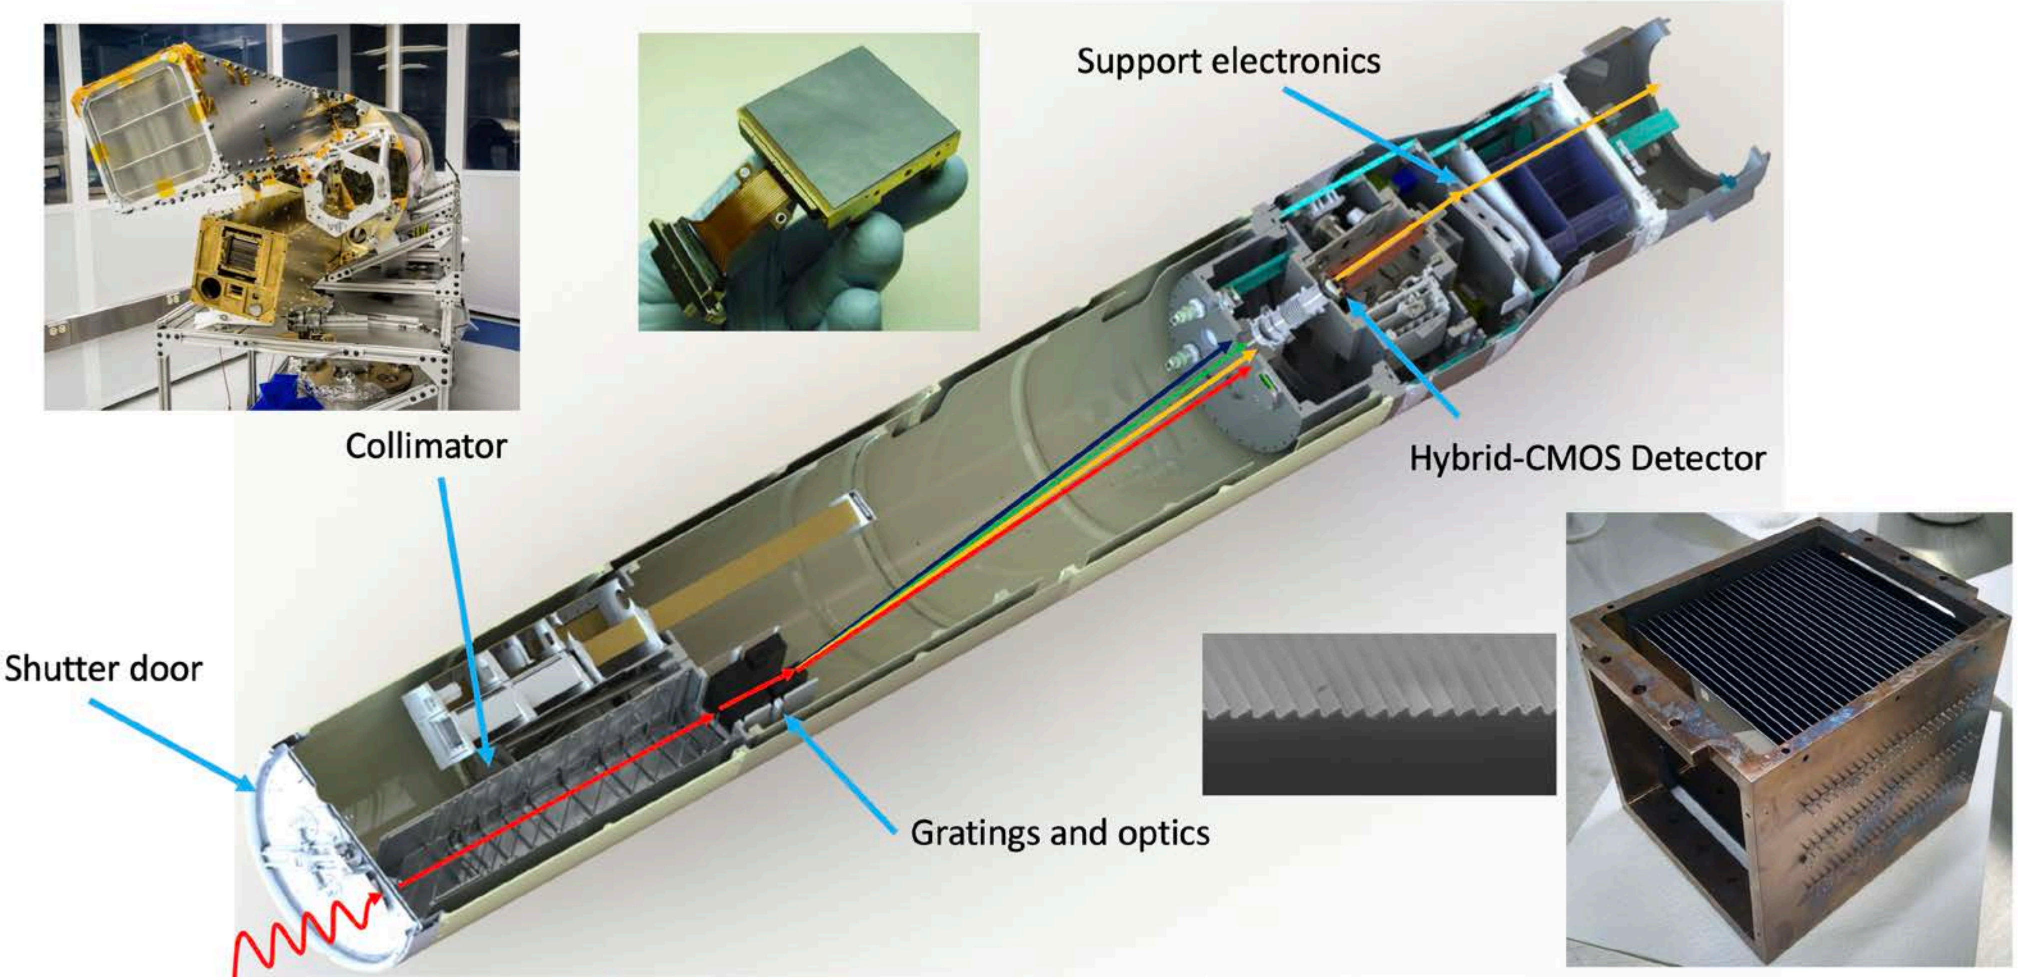
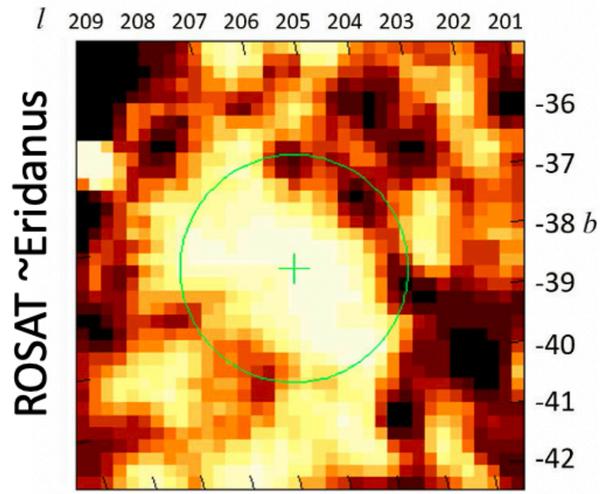
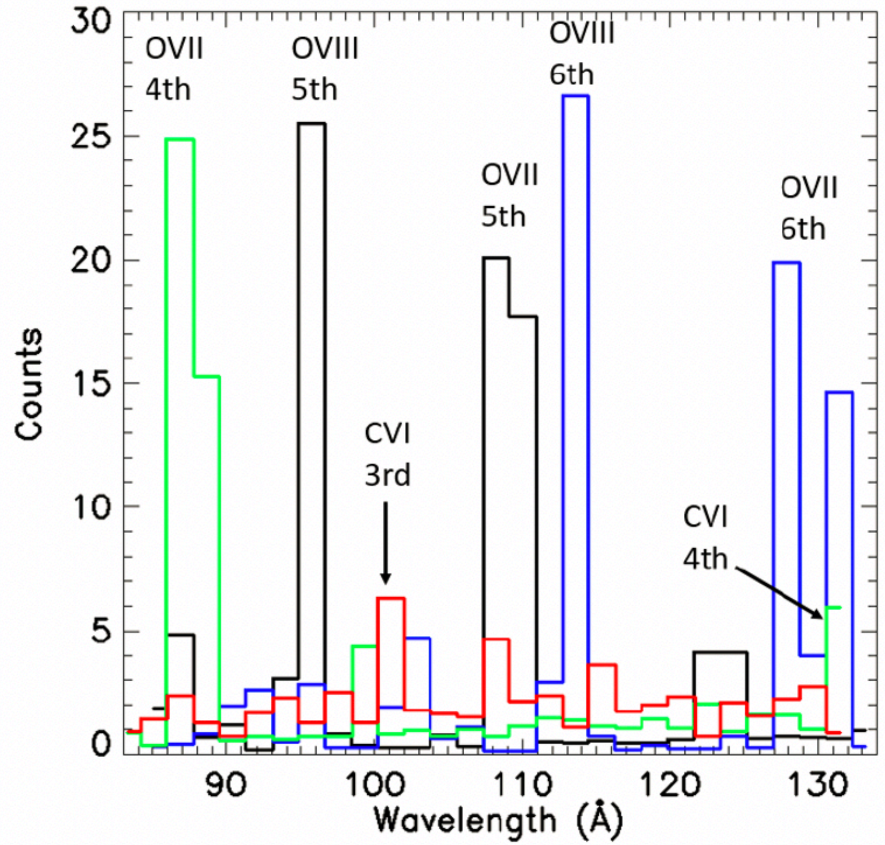
Science payload – Water Recovery X-ray Rocket (WRX)



the Rocket for Extended X-ray Spectroscopy (tREXS)

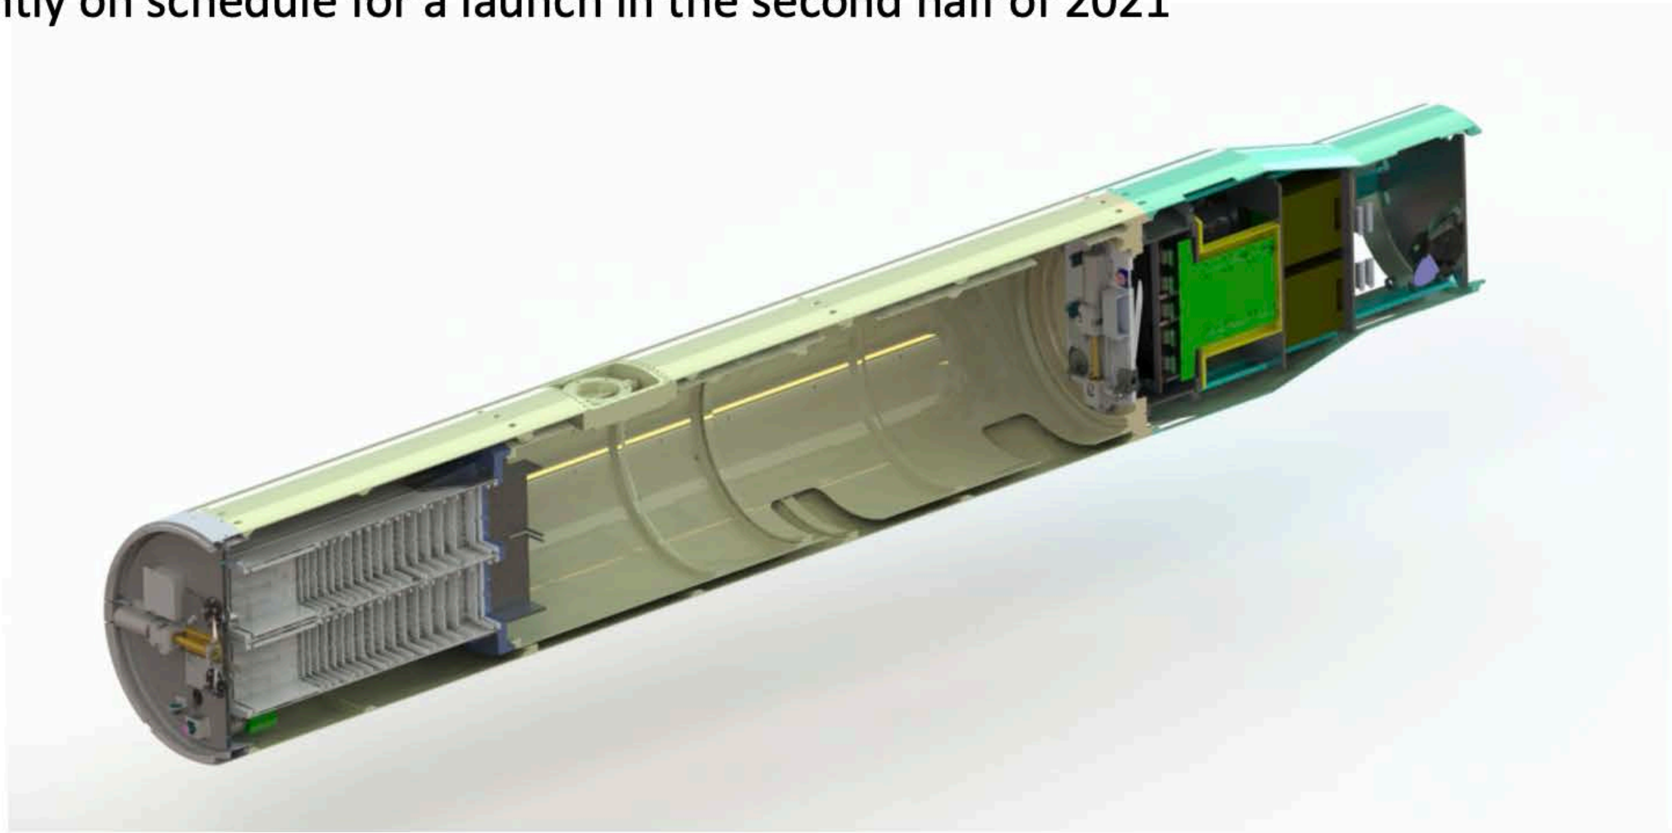
- Launch Q3/Q4 2021 from WSMR
- Spectrally resolve the soft X-ray background
  - High galactic latitude enhancements
  - Draco (REXS-1) and Eridanus (REXS-2)
  - Drive toward resolving OVII triplet
    - Line-sensitive not broadband
  - Do trends in the soft x-ray background hold true at smaller spatial scales with good spectral resolution?
    - Spatial confusion abounds…





tREXS status

- tREXS has passed the Requirements Definition Meeting and is approaching Design Review
- Currently on schedule for a launch in the second half of 2021



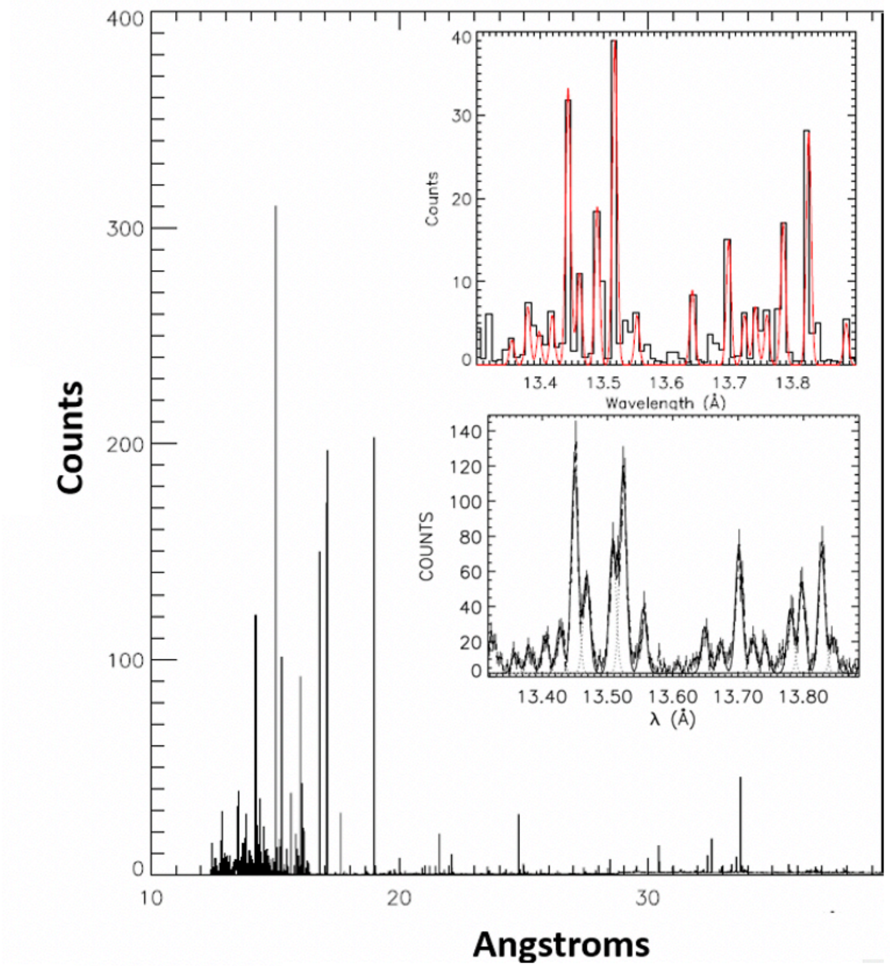
Off-plane Grating Rocket Experiment (OGRE)

Launch window opens in Nov 2022 from Poker Flats Research Range

Science Goals:

- High resolution spectrum of Capella (G8 III and G1 III giant star binary)
- Line emission dominated by Fe XVII, Fe XVIII, and OVIII

- R > 2000, 8-42 Å; peaks at R ~ 3000
- A_{eff} > 20 cm^2, 8-42 Å; >75 cm^2, 9.5-26 Å
- F = 3.5 m



Simulated OGRE observation of Capella. Inset: bottom – Chandra observation of Capella; top – OGRE observation of the same energy range showing less line blending and tighter diagnostic constraints.

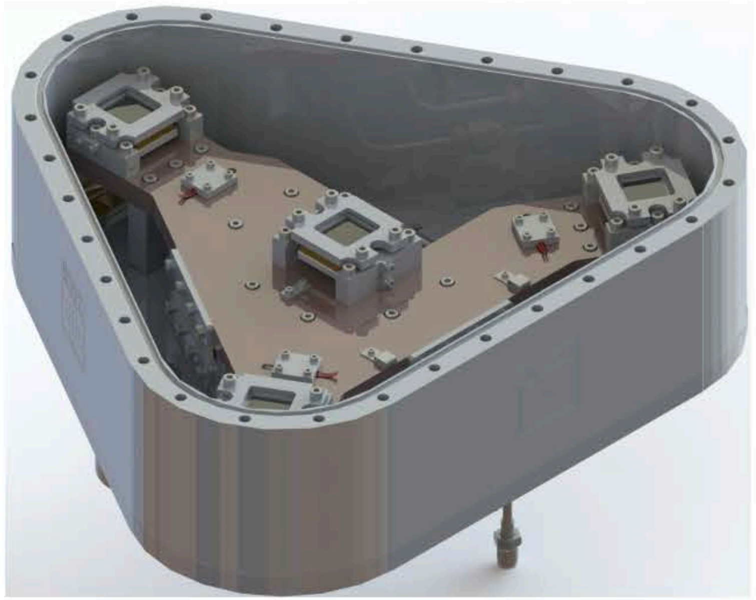
OGRE Technology Development

- OGRE is a mini-Lynx: polished Si optics + high-performance reflection gratings + EMCCDs for high resolution grating spectroscopy

Si mirrors from GSFC

Grating modules from PSU

EMCCD camera from XCAM/OU (UK)



OGRE status

- OGRE mirrors and gratings currently undergoing fabrication
    - Initial mirrors and gratings have tested within OGRE specs
- Design currently concentrating on grating to optic interface and alignment
- Flight camera in production with delivery early next year

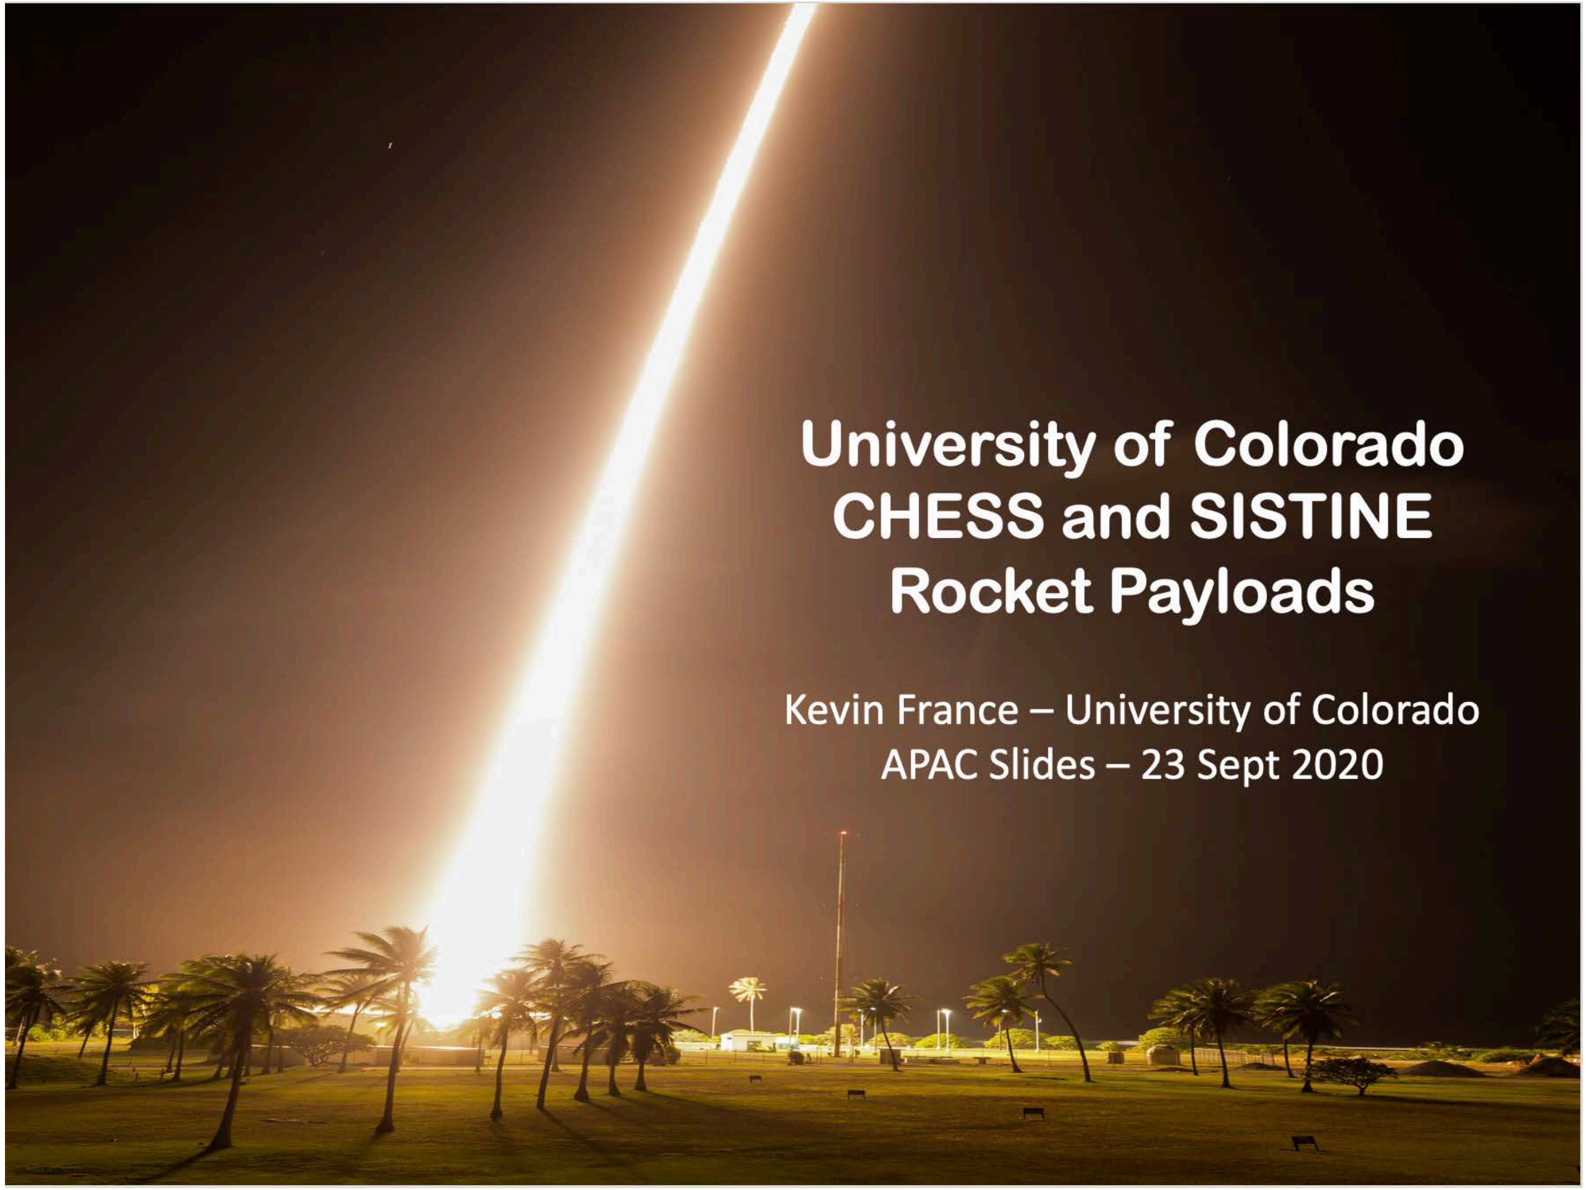
CHESS, SISTINE, PI France



University of Colorado
CHESS and SISTINE
Rocket Payloads
Kevin France – University of Colorado
APAC Slides – 23 Sept 2020

CHESS and SISTINE Rocket Payloads

- **High-resolution spectroscopy of the local interstellar medium (CHESS)**
- **High-energy radiation environments in exoplanet habitable zones (SISTINE)**

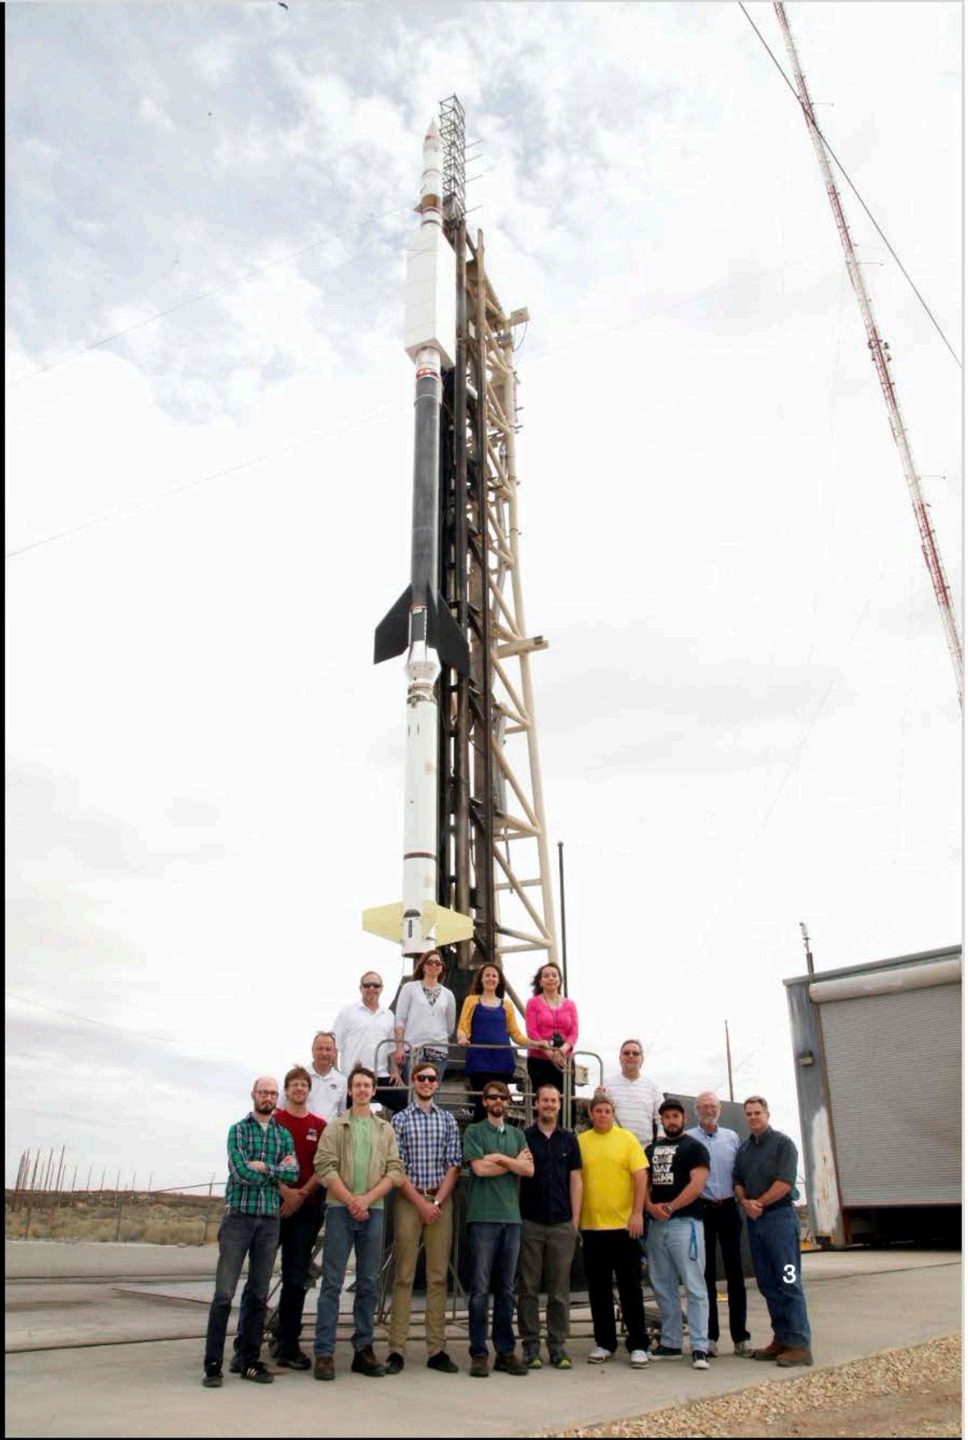
- **Hardware Development:**
1. UV/visible optical coatings
2. UV Detectors
3. Diffraction Grating Technology

- **Student, postdoctoral, and PI Training**

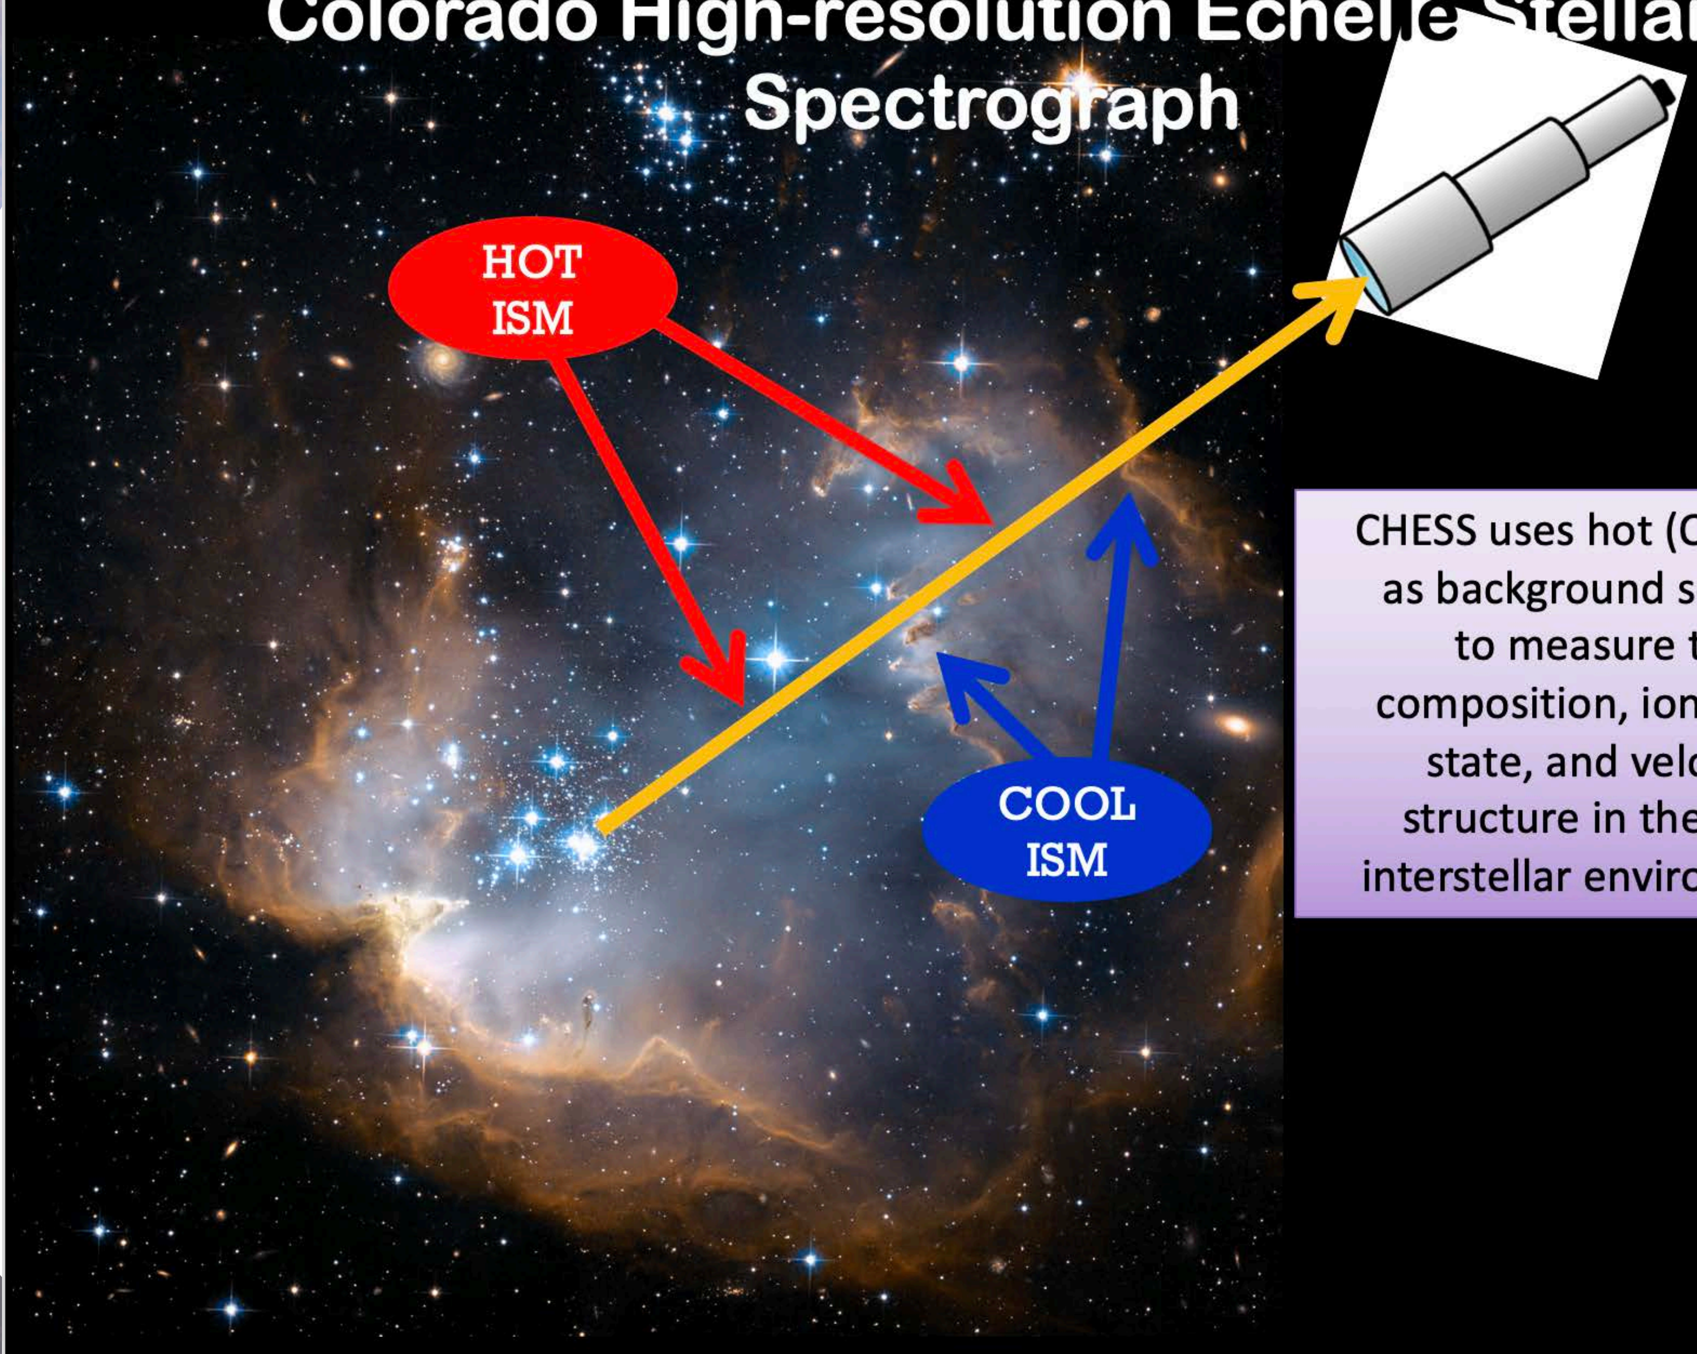
PI – K. France

2

The CHESS Payload
36.285, 36.297, 36.323, 36.333



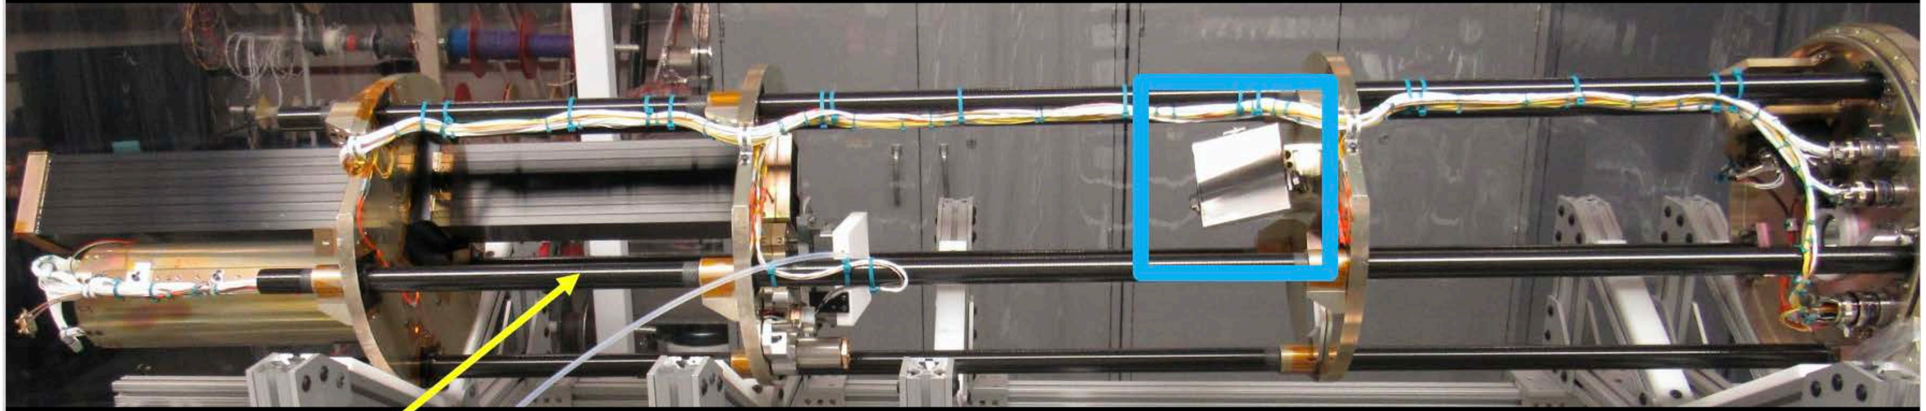
Colorado High-resolution Echelle Stellar Spectrograph



CHESS uses hot (OB) stars as background sources to measure the composition, ionization state, and velocity structure in the local interstellar environment.

CHESS Technology Development: UV Gratings

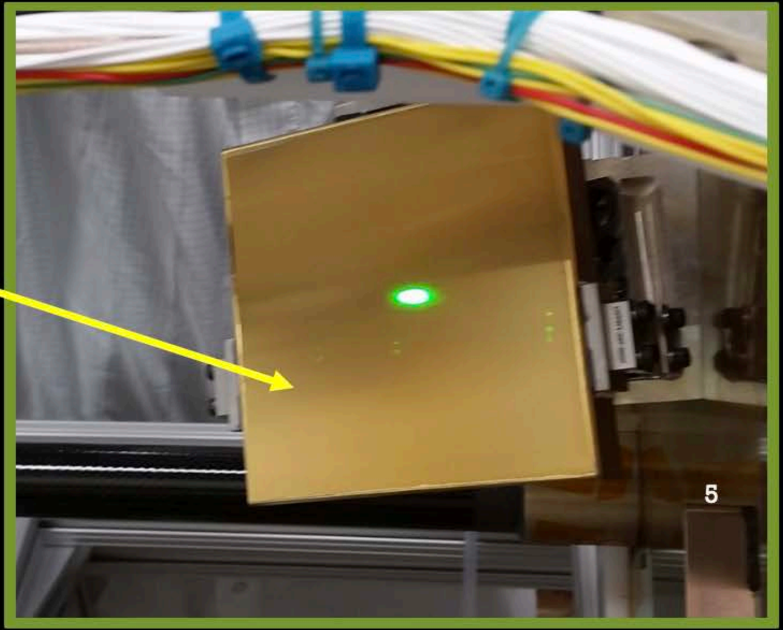
Hoadley et al. 2014, 2016, 2020
France et al. 2016
Kruczek et al. 2017, 2018, 2019

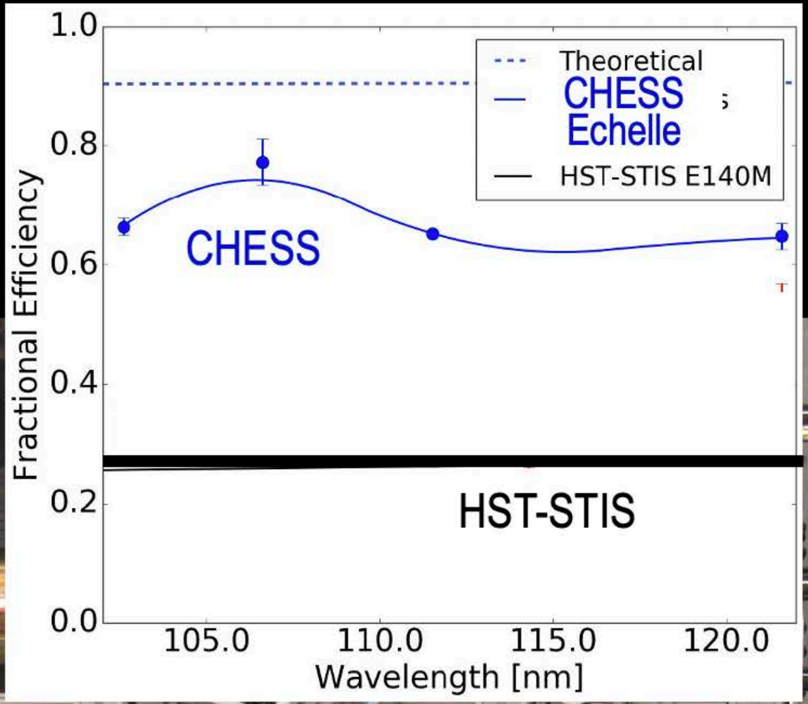


CHESS instrument in Colorado lab

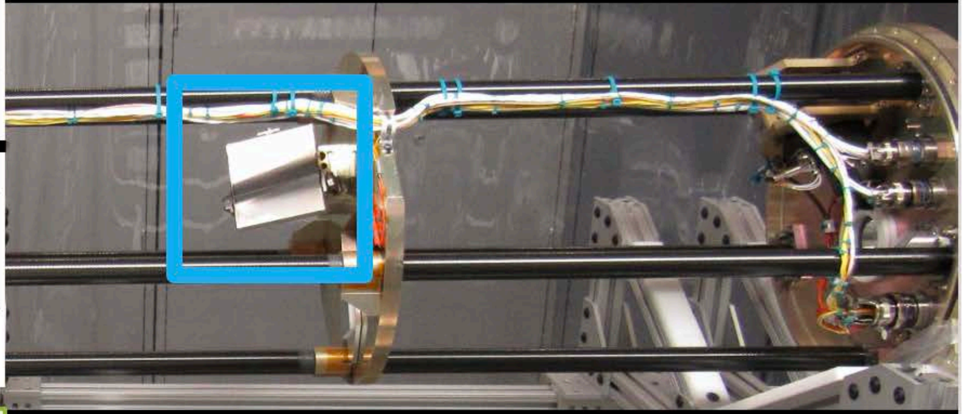
CHESS Echelle gratings:

E-beam lithograph, in collaboration with Penn State University



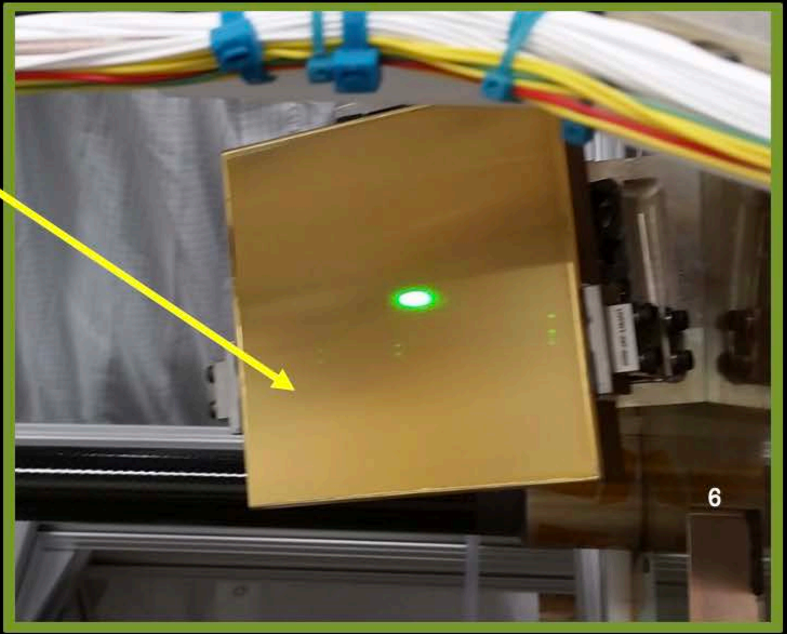


Grisé et al. 2019

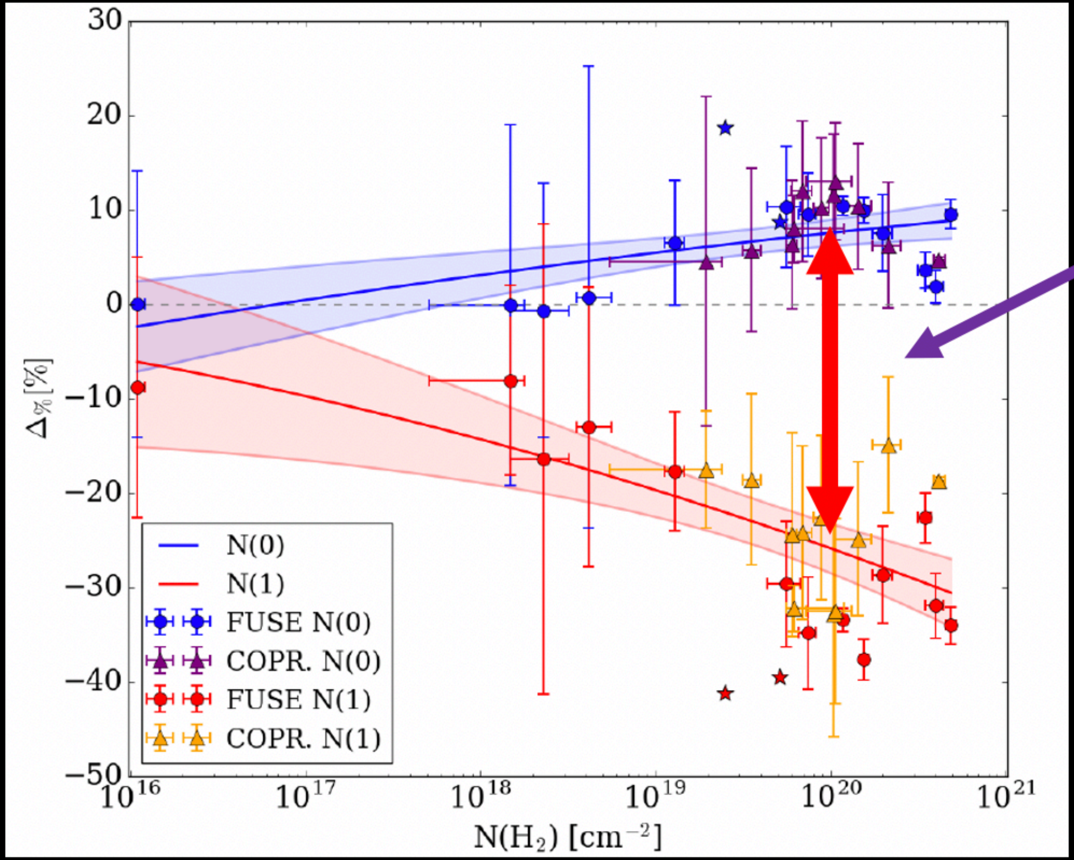


CHESS Echelle (PSU e-beam etching):

- **Factor of ~2-3 higher groove efficiency than state-of-the-art UV echelle gratings**
- **Incorporated into LUVOIR / LUMOS baseline; motivated dedicated SAT program (PI – Fleming)**



CHESS Science Results

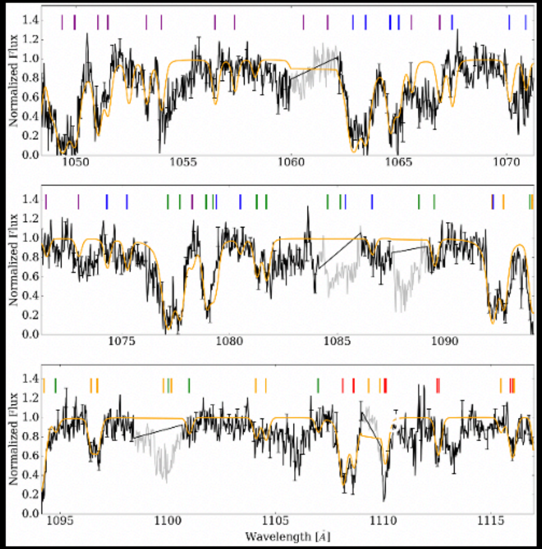


Kruczek+ 2019

H_2 rotational temperatures (T_{01}) systematically lower than previous results: blending of higher-J lines with R(1) absorption lines.

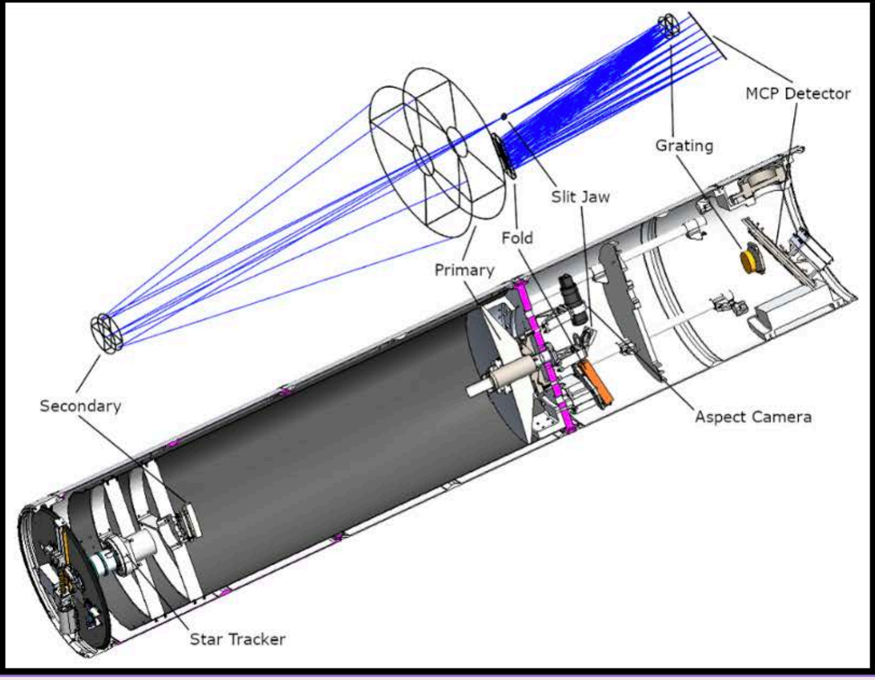
→ Temperature of the diffuse ISM ~20 – 30% lower than canonical 77 K

CHESS Flight Data



Kruczek+ 2019
Hoadley+ 2020

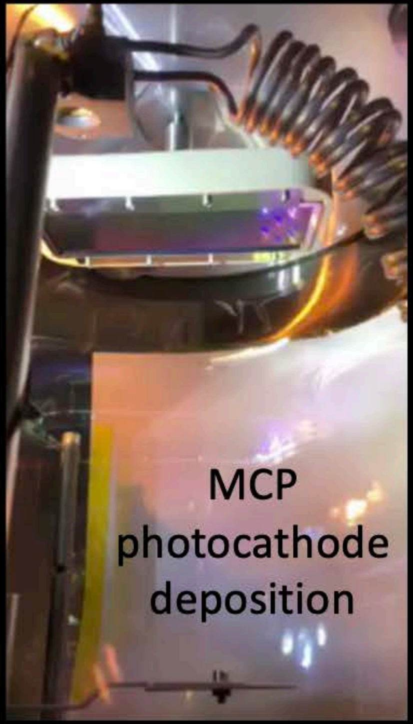
UV Coatings and Large-format Detectors for LUVOIR – Flight Demonstration on the SISTINE Rocket Payload



SISTINE Pathfinder Spectrograph:

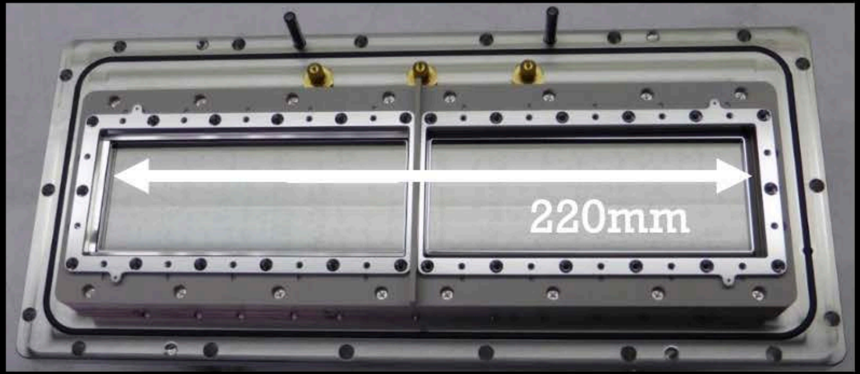
--**Instrument design** leveraging additional reflection to control aberrations over field (high spectral and angular resolution)

Analogous design trades adopted on LUVOIR/LUMOS baseline design



Large format, photon-counting UV detectors.

Baselined for LUVOIR/LUMOS

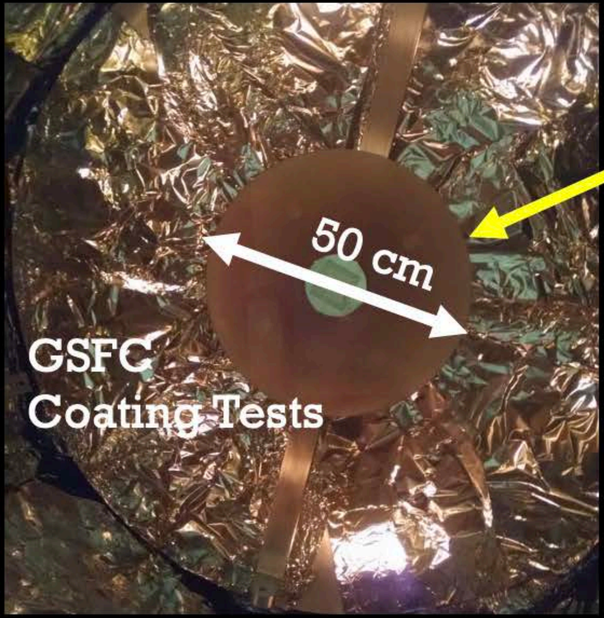


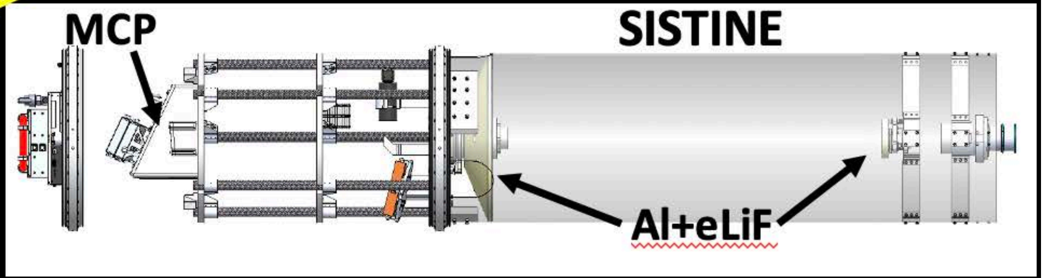
UV Coatings and Large-format Detectors for LUVOIR – Flight Demonstration on the SISTINE Rocket Payload

SISTINE Pathfinder Spectrograph:

--Al+eLiF coatings on shaped mirrors, up to 0.5m

--first time these coatings, baselined for LUVOIR, have been deposited on large (> 2”) and shaped optics, tested as a full instrument





Laboratory for Atmospheric and Space Physics
University of Colorado **Boulder**

UV Coatings and Large-format Detectors for LUVOIR – Flight Demonstration on the SISTINE Rocket Payload

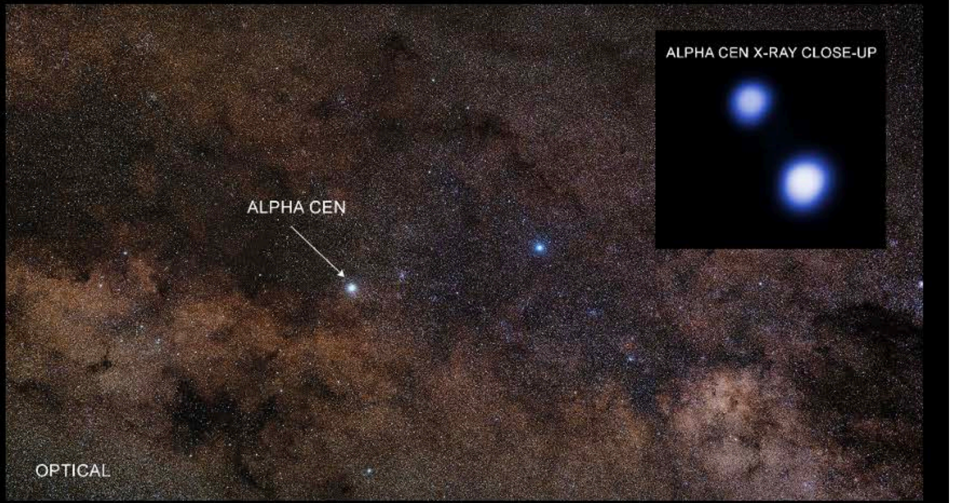
SISTINE Science Mission

36.339 UG / SISTINE-2
Summer 2021

A joint rocket campaign to obtain EUV+FUV radiation fields of representative exoplanet host stars at wavelength inaccessible to HST and X-ray observatories.

Object	Spectral Type	d (pc)	E(B-V)
α Cen A	G2V	1.33	0.71
α Cen B	K1V	1.26	0.88



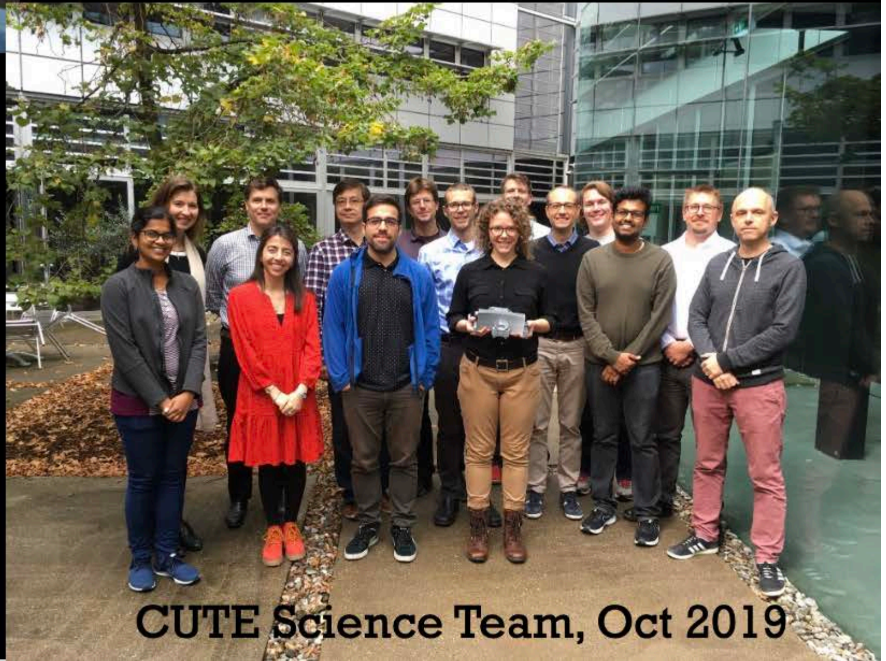
- The UV radiation fields of exoplanet's host stars control the atmospheric heating/stability and photochemical structure of their atmospheres – including atmospheric retention and formation of 'biosignatures' (e.g., O_2, O_3, CO_2, CH_4)

Student Training in the Colorado Suborbital Program
PIs:
Profs. Kevin France, Brian Fleming, Jim Green
(PIs of CUTE, SPRITE cubesats, HST-COS,
and numerous rocket missions)
Research Scientists:
Dr. Ambily Suresh
Dr. Dmitry Vorobiev
Junior Engineers: Ted Schulz, Stefan Ulrich, Nick DeCicco
Ph.D. and M.S. Students:
Arika Egan
Dr. Keri Hoadley
Fernando Cruz-Aguirre
Nico Nell (AE)
Emily Witt
Dr. Nick Kruczek
Dr. Chris Moore
Robert Kane (ME)
Parker Hinton
Nick Erickson
Dr. Allison Youngblood

Student & Postdoctoral Training

CUSP

THE COLORADO ULTRAVIOLET SPECTROSCOPY PROGRAM



CUTE Science Team, Oct 2019

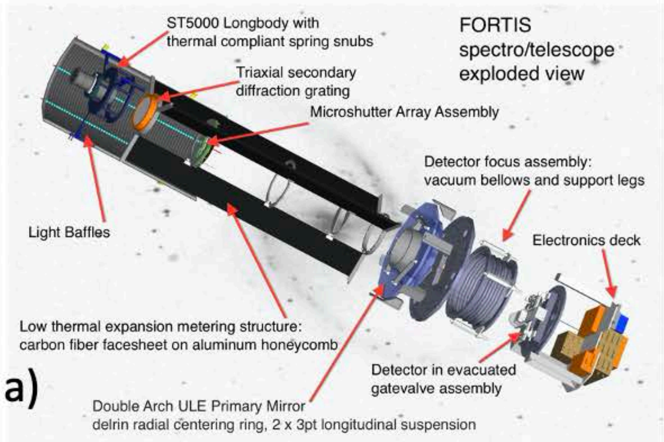
FORTIS, PI McCandliss

Next Generation FORTIS*

*Far-UV Off Rowland-circle Telescope for Imaging and Spectroscopy

PI: Stephan McCandliss, JHU

- ***Objectives:***
  - Demonstrate the scientific utility and feasibility of multi-object spectroscopy over wide angular fields in the far-UV.
  - First Science Investigation:
    - Spectroscopy of Hot Star Clusters in galaxy M33
      - How does matter circulate from Disk to CGM?
  - Other Investigations
    - Blue Stragglers in Globular Clusters
    - Low Metallicity Star Formation in Magellanic Bridge
    - Shocks in SNe Remnants
    - Comets as Targets of Opportunity



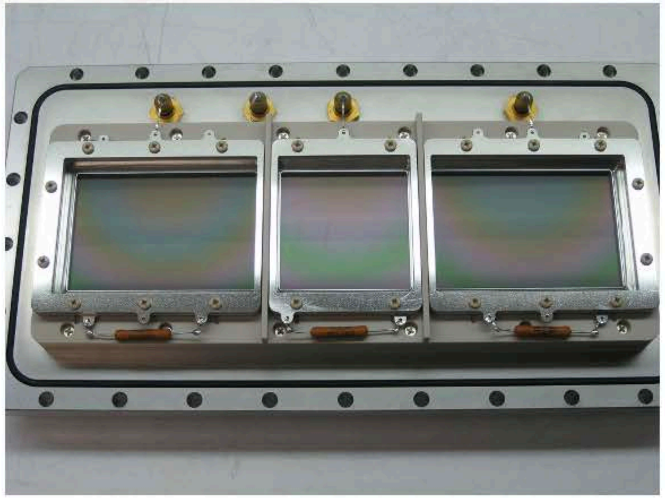
a)

- ***Key Challenges/Innovations:***
  - Pulsed Actuated Next Gen Microshutter Arrays(NGMSA)
  - Low scatter 3D-printed baffles to trap geo-Lyman **α**
  - Longlife, High QE, Large Area Borosilicate MCP's
  - Autonomous Target Acquisitions

- ***Sci and Tech Relevant to LUVOIR, HabEX, CETUS:***

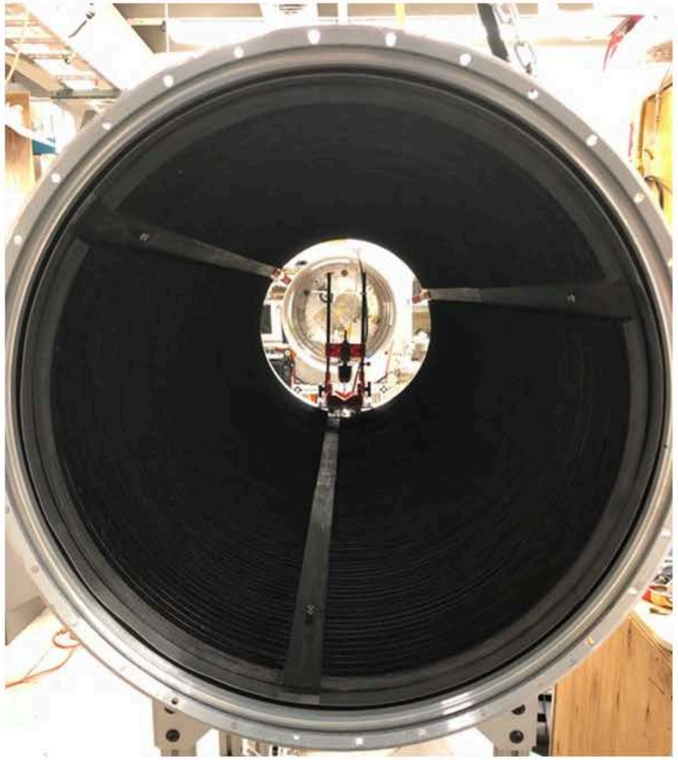
Technical Innovations

Borosilicate MCPs – Developed with Sensor Sciences



Pulsed Next Gen MSA – Developed in Partnership with GSFC

3D Printed Baffles – Stratasys



Rocket Team

- **JHU**

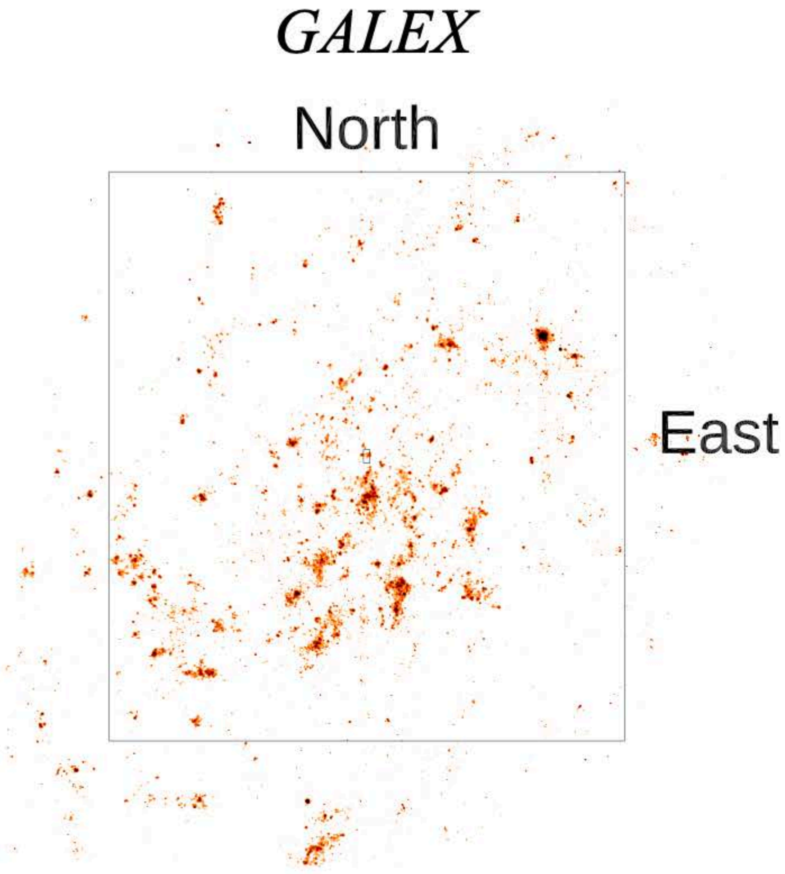
	Stephan McCandliss – PI
	Brian Welch – Grad Student (4th yr)
	Alex Carter – Grad Student (Masters Program)
	Russell Pelton – Systems Engineer
	Isu Ravi – Grad Student (3rd yr)
	Mackenzie Carlson – Grad Student (1st yr)

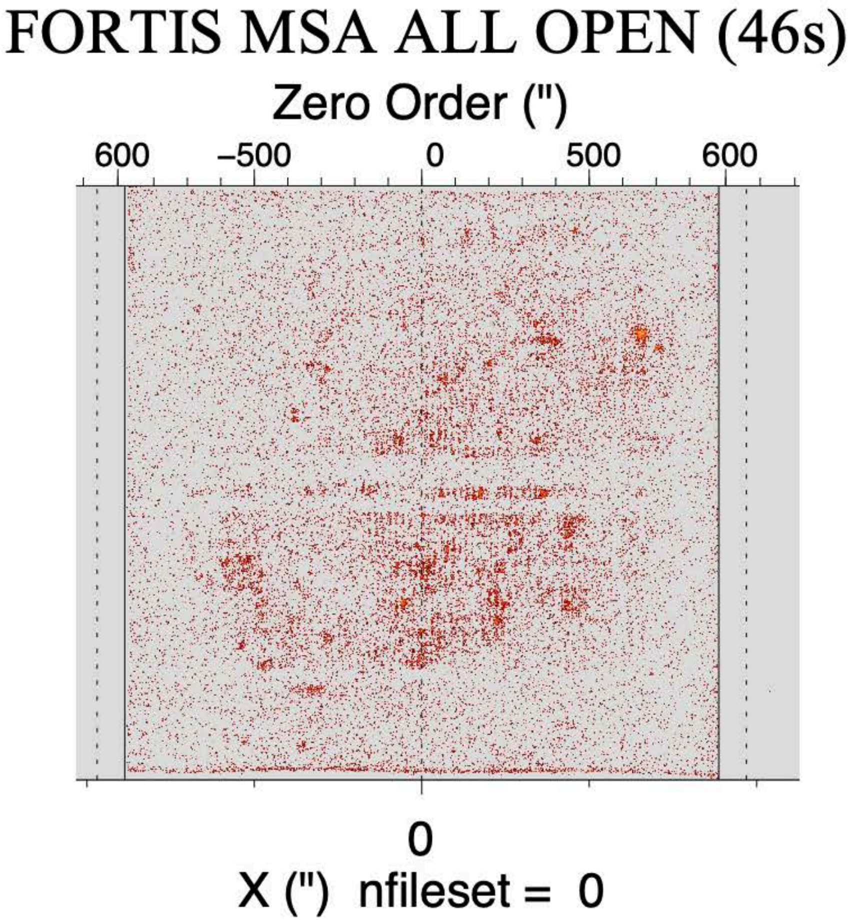
- **GSFC**

Matt Greenhouse – PI
Alexander Kutyrev – CoI
Mary J. Li – CoI
Kyowan Kim – Test Engineer
S. Harvey Moseley – Former PI

APAC

36.352UG Launched on 27 October 2019 Mission to Observe M33





APAC

Results

- **Mission achieved technical success**
  - Opened array and acquired image of M33
  - Successful executed autonomous targeting algorithm, transitioned from all opened to brightest target per row after 46 second integration
    - First successful deployment of Next Gen Microshutter Array!!!
  - Subtle "mirror" error in targeting code frustrated spectral acquisition
- **Scattered geo-Ly α light still an issue**
  - Tests ongoing to reconfigure FORTIS from on-axis to off-axis design
- **Reconfiguration and Redeployment stalled by COVID**

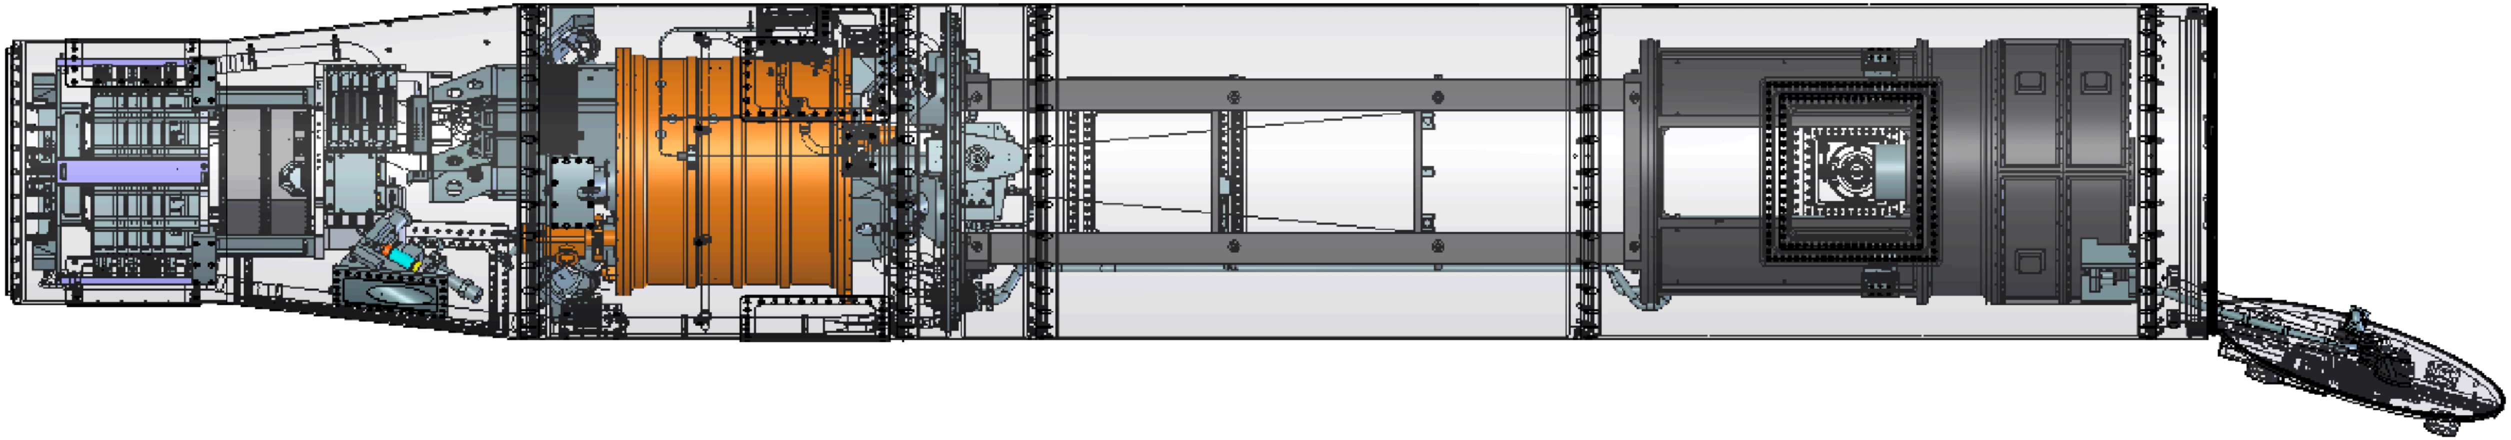
APAC

Micro-X, PI Figueroa

Micro-X

The High-resolution Microcalorimeter X-ray Imaging Rocket

36.355 Figueroa



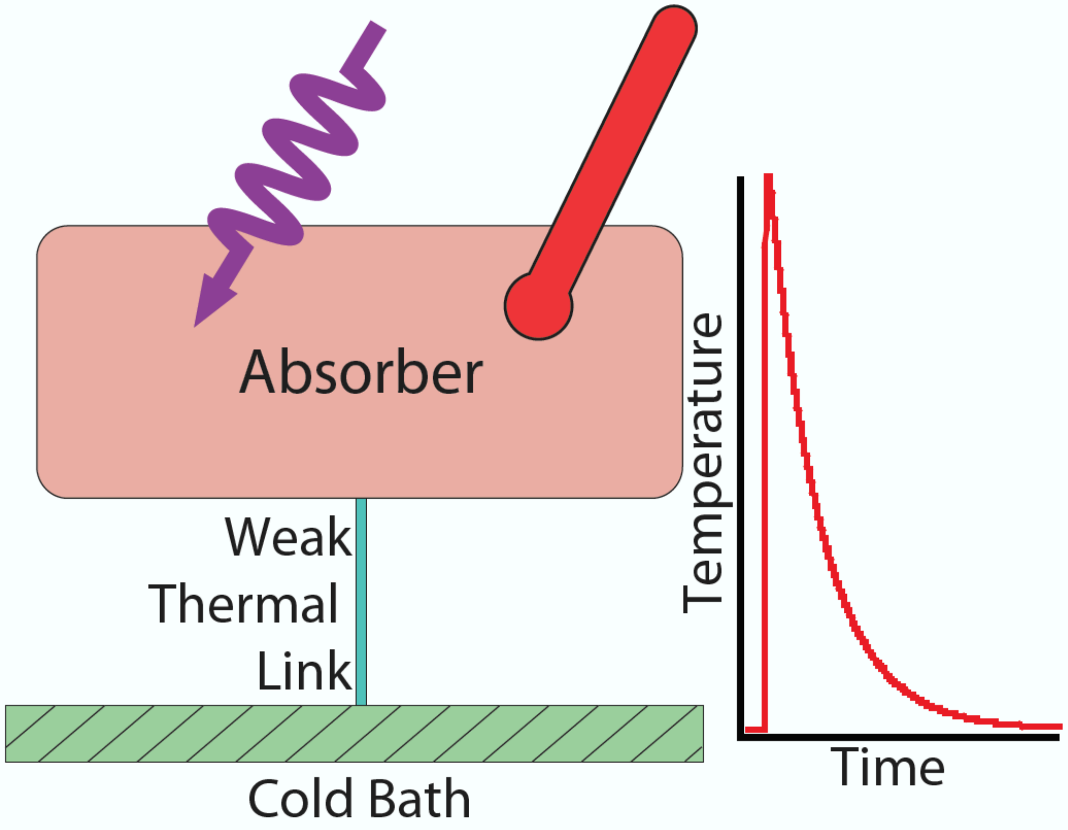
Enectalí Figueroa-Feliciano

Northwestern

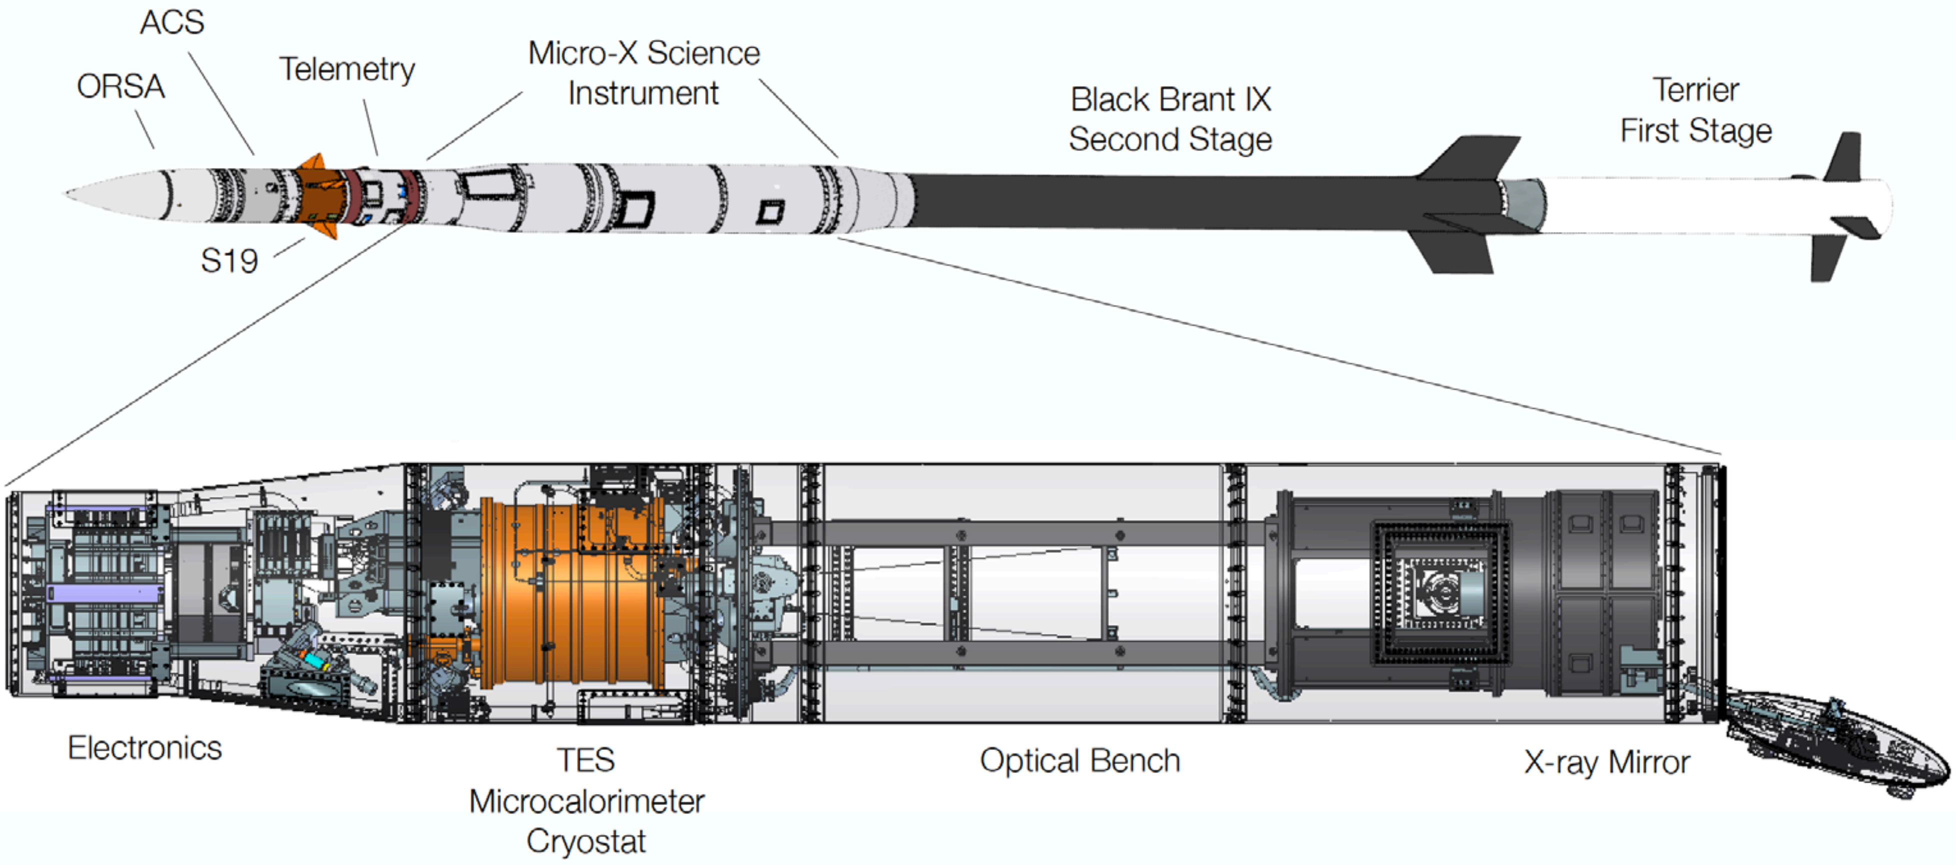
Microcalorimeters: IFUs for the X-ray band

- For high resolution spectra of diffuse and extended sources we need a non-dispersive spectrometer.
- Cryogenic Microcalorimeters are single-photon-counting imaging spectrometers with resolving powers of 500-3000 in the X-ray band.
- Absorber and thermometer are connected to a thermal bath through a weak thermal link.
- Theoretical resolution is a function of T and E_{max}
- Need cryogenic temperatures to reach target resolution!
- Si Thermistors:
  - XQC: 1995-present
  - XRISM: (2021)
- Transition-Edge Sensors (TES):
  - Micro-X: 2018
  - Athena: (2030s); Lynx (2030s)

$$\Delta E_{\mathrm{FWHM}} \simeq 2.35\sqrt{4kTE_{\mathrm{max}}}$$



The Micro-X Sounding Rocket

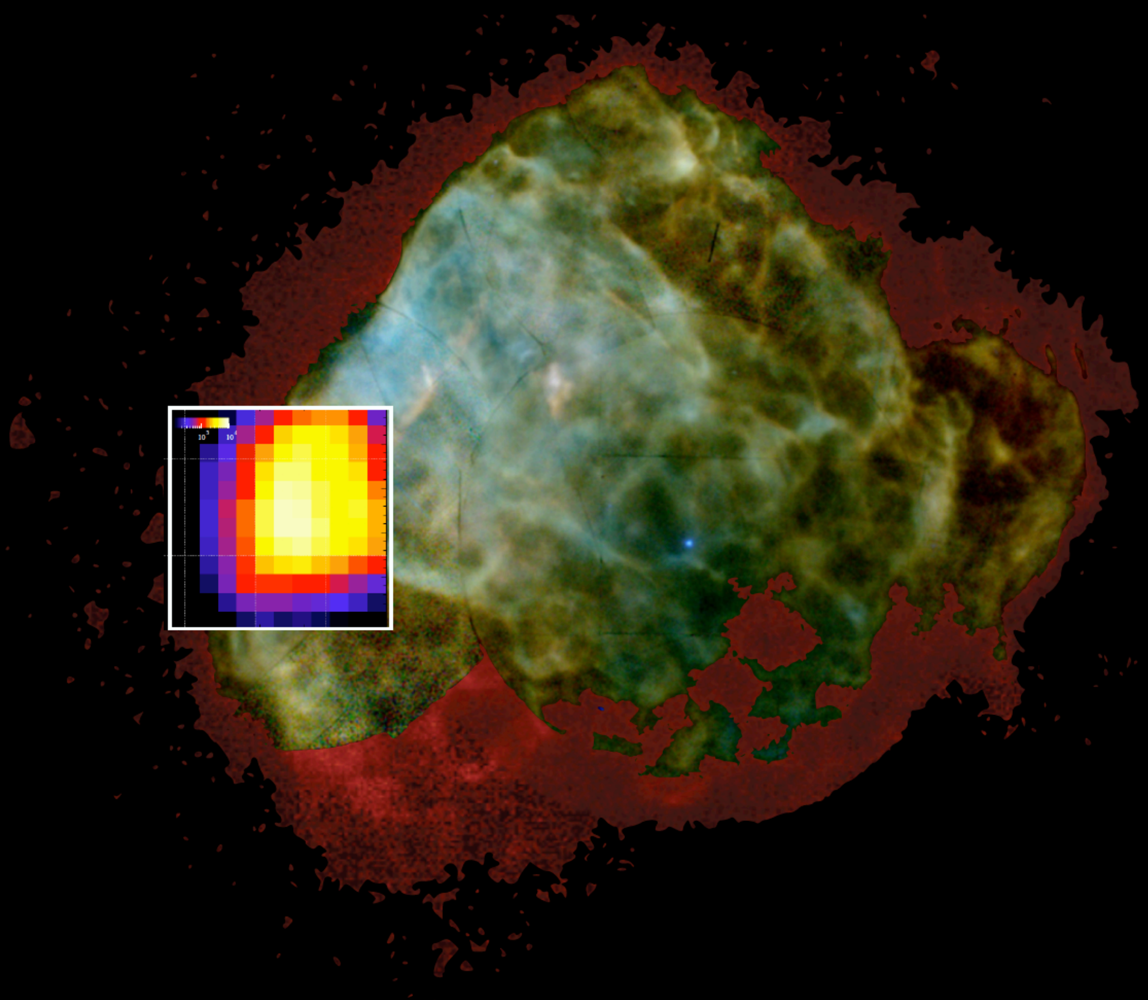


Micro-X Specifications

The Micro-X Instrument	
Science Observation Time (time above 160 km)	~300 sec
Bandpass	0.2 – 2.5 keV (but will see some bright lines at higher energy)
Field of View	11.8 arcmin
X-Ray Optics	Conical approximated Wolter optics Collecting area ~ 300 cm^2 @ 1 keV Focal Length: 2.1 m 2.4' Point Spread Function
Microcalorimeter Array	128 pixels read out by 2 parallel TDM SQUID MUX (2 x 8 columns x 16 rows) Pixel pitch: 600 um = 59 arcsec/pixel 5 - 10 eV energy resolution @ 1 keV

Micro-X Main Science Target - Puppis A

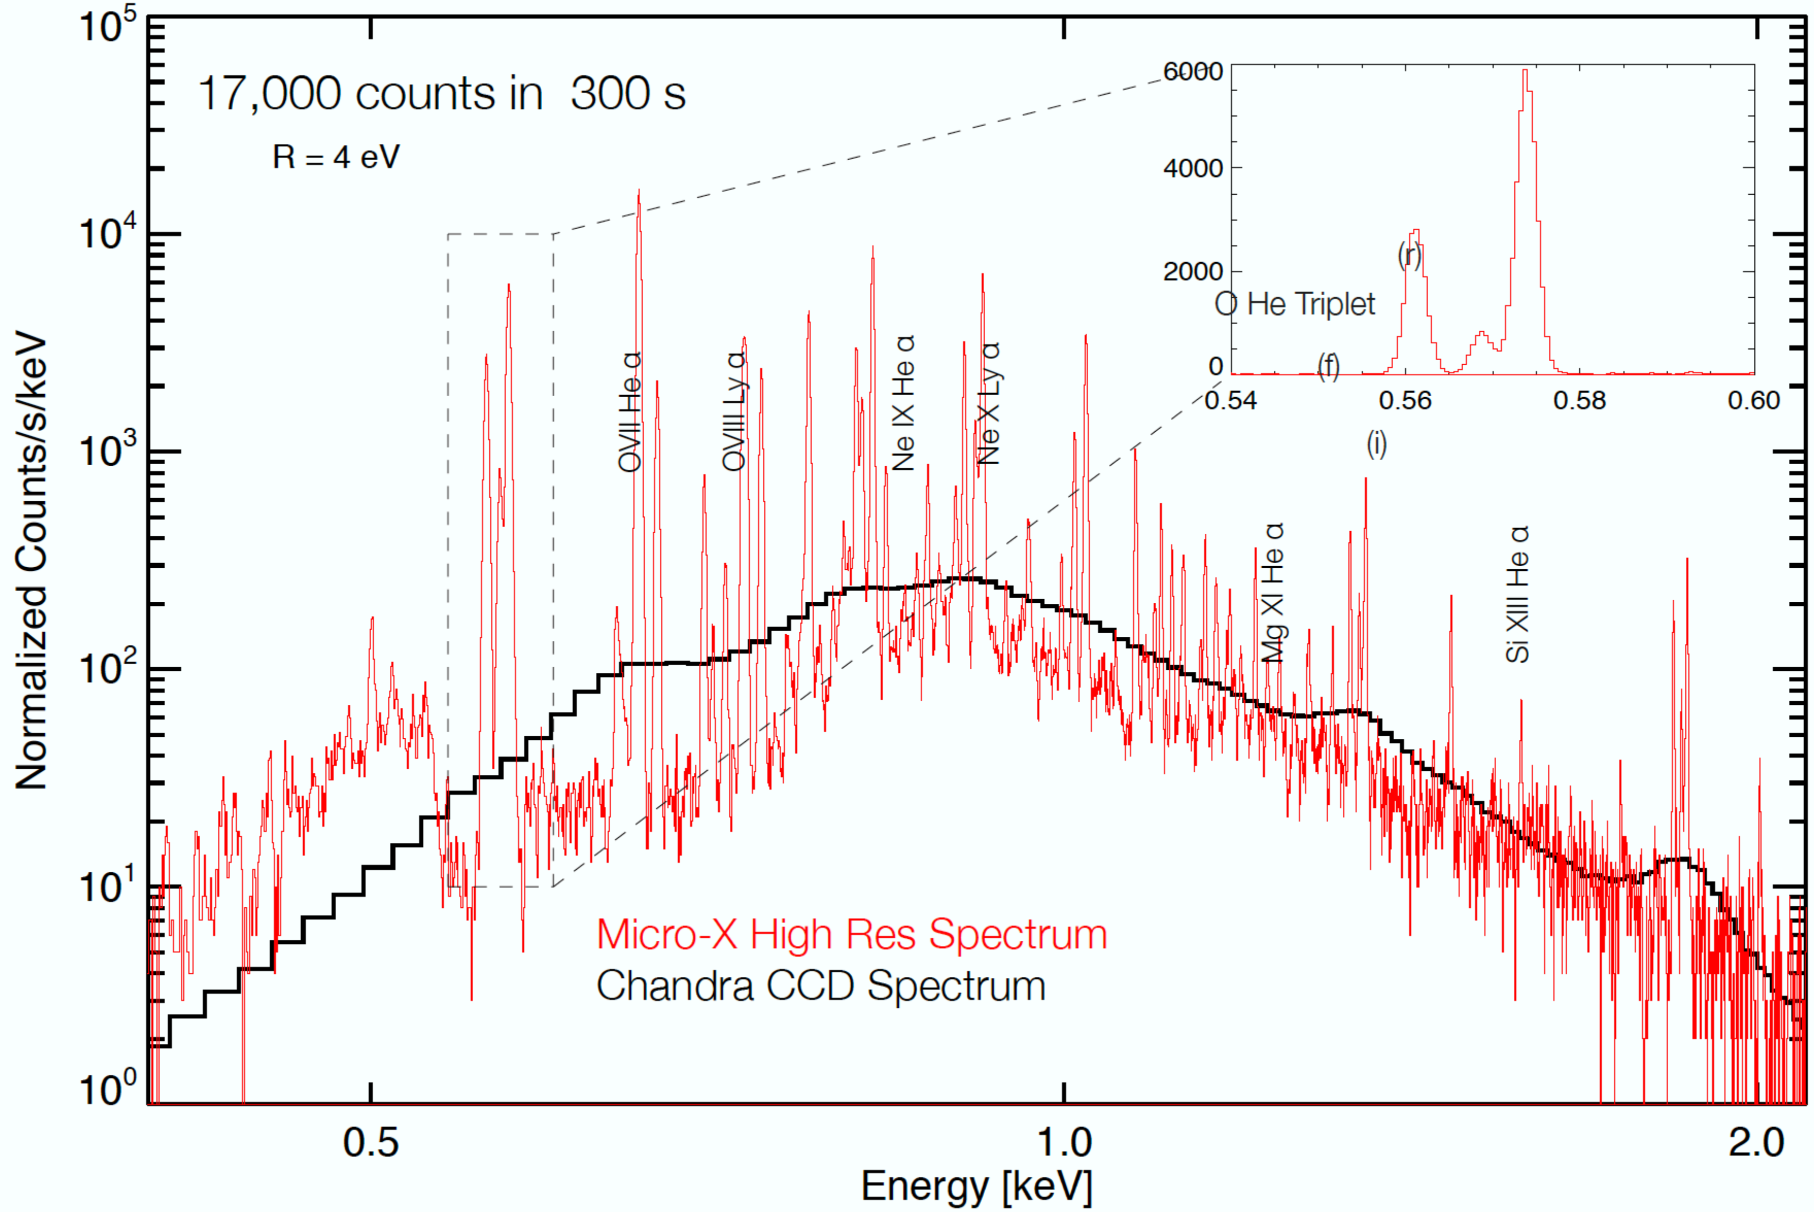
Bright Eastern Knot Observation



Katsuda et al. 2010

- Launch Scheduled for March 19, 2020
- Measure the velocities and line structures of the various emission lines to obtain information about the dynamics and turbulence of the shock and surrounding plasma.
- Perform plasma diagnostics to obtain ion thermodynamic states for individual elements.
- Study the shock physics and look for potential connections to cosmic ray acceleration.

Puppis A Micro-X Simulation



Conclusions

- The maiden flight of Micro-X 36.245 saw the first operation of TES and MUX readout in space. The initial results have been published, a longer instrument paper is in the works.
- The rocket pointing error means this first flight was effectively an engineering flight
  - Issues only observable in flight have been identified, and improvements have been implemented
- 36.355 will launch in November 2021 and target Puppis A.

DXL & DXG, PI Galeazzi

The DXL & DXG programs

Two sounding rocket programs lead by the University of Miami

<u>Collaborators:</u> NASA/GSFC, John Hopkins University, University of Wisconsin, University of Michigan, University of Kansas, LATMOS/IPSL (France), NASA/MSFC, Boston University

<u>Young personnel trained by the mission:</u> one PostDoc (now a scientist at MSFC), 4 graduate students trained directly on the projects (three graduated, one still at Miami), two additional PostDocs and three graduate students worked on the project on data analysis and calibration, >10 undergraduate students, >10 high school students

<u>Technology highlights:</u> Micropore optics (lobster eye optics) were flown for the first time as piggyback experiments onboard of DXL in 2012

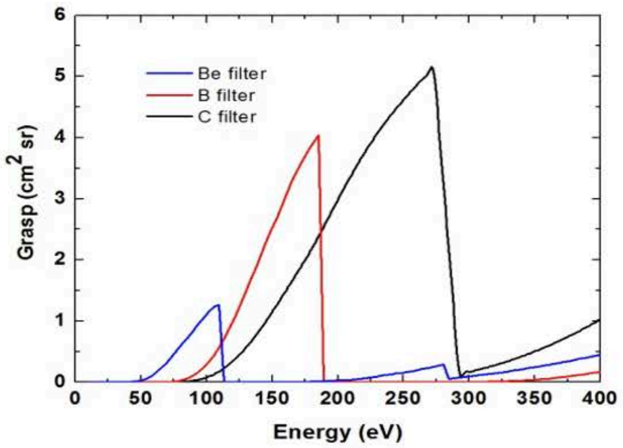
<u>Science highlights:</u> The existence of the Local Hot Bubble was confirmed by the DXL mission. The contribution from Solar Wind Charge eXchange to the Diffuse X-ray Emission was measured.

Diffuse X-rays from the Local galaxy (DXL)

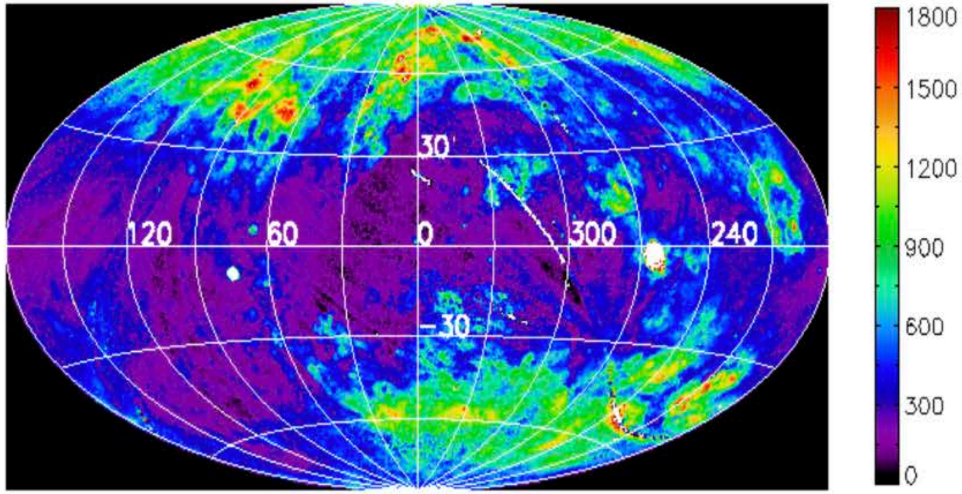
- Sounding rocket mission for the **study of the Local Hot Bubble and SWCX**
- 4 co-aligned X-ray proportional counters
- >1,000 cm^2 effective area, 7.5 deg FOV
- C, B, and Be filters
- High response from 40 eV to 10 keV
- 1-D images generated by rolling the payload
- Launched from WSMR, NM on 12/12/2012 and 12/6/2015 and from PFFF, AK on 1/16/2018
- Flight #4, December 2021 from WFF

DXL Science highlights

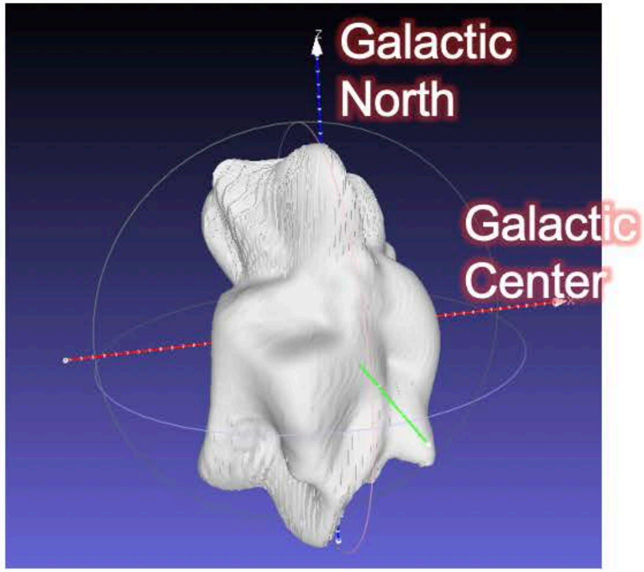
- DXL is the only mission with large grasp in the 1/4 keV band
- Confirmed the existence of the Local Hot Bubble and studied its properties
- Measured the contribution from SWCX to the Diffuse X-ray emission in the ¼ keV and ¾ keV band
- Measured the SWCX cross section with He
- One more flight scheduled in 2021 to measure the SWCX cross section with H



DXL low Energy grasp



ROSAT ¼ keV band cleaned of SWCX using DXL



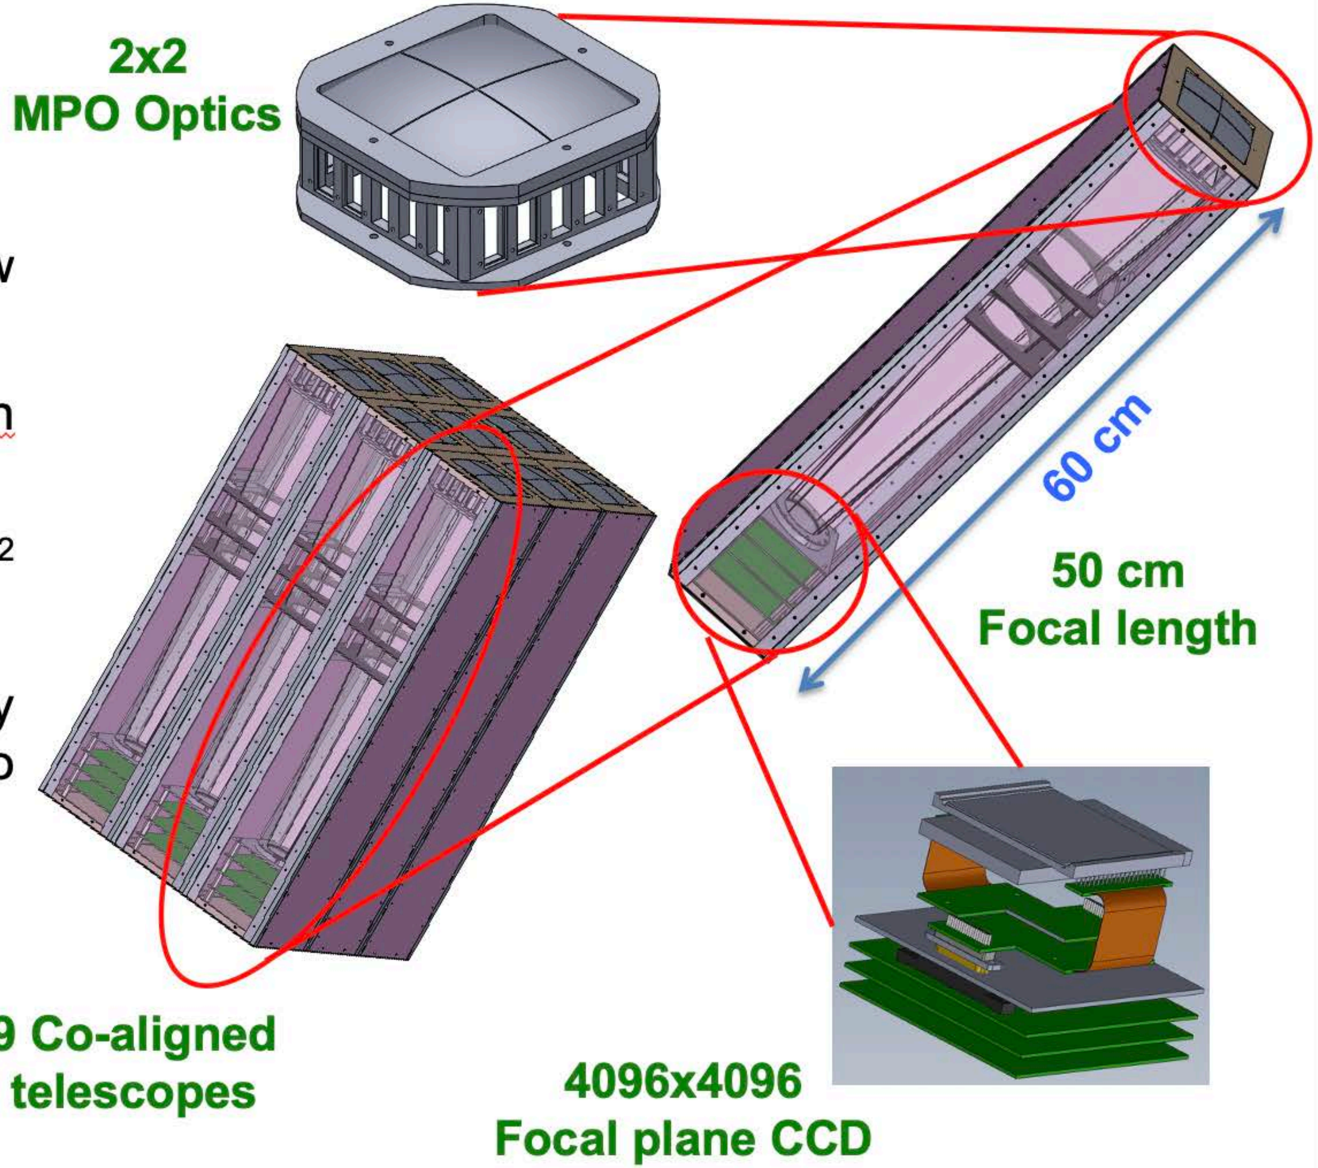
3D representation of the LHB from DXL

UNI OF MIAMI

Diffuse X-rays from the Galaxy (DXG)

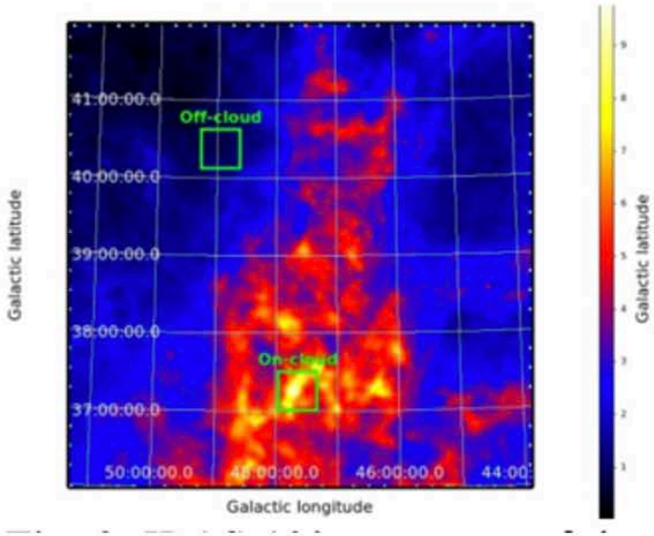
MicroPore Optics (Lobster Eye Optics) coupled to large area CCD detectors

- 5x5 deg^2 field of View (FoV)
- better than 10 armin angular resolution
- effective area >150 cm^2 at 1 keV
- optimized for the energy range from 100 eV to 10 keV.

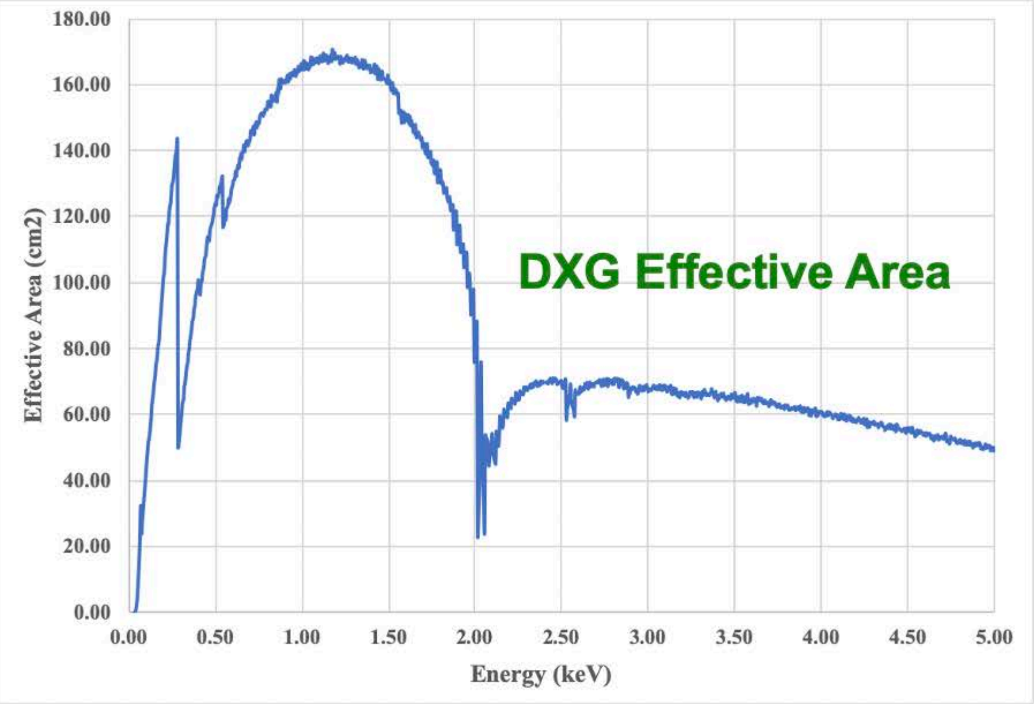


UNIVERSITY OF MIAMI

DXG FOV AND EFFECTIVE AREA



DXG's 5 deg FOV, the Green Boxes represent XMM-Newton FOV for comparison



DXG has been approved in 2017 for instrument development (together with the last DXL flight).

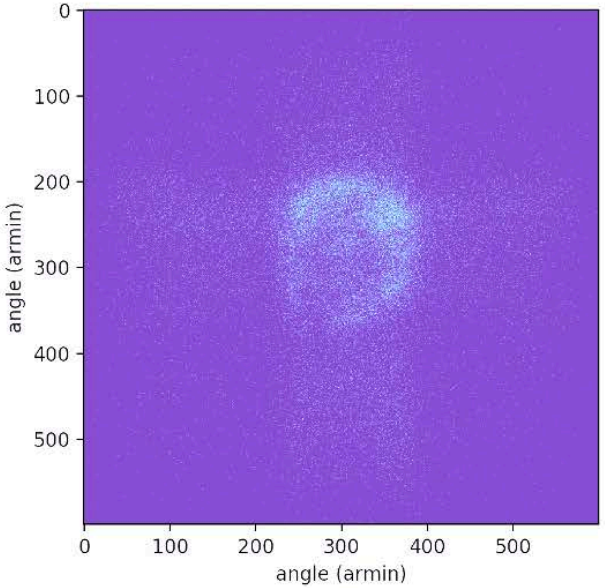
- **The optics have been characterized and calibrated**
- **The optical bench has been designed**
- **The focal plane array has been designed**

UNIVERSITY OF MIAMI

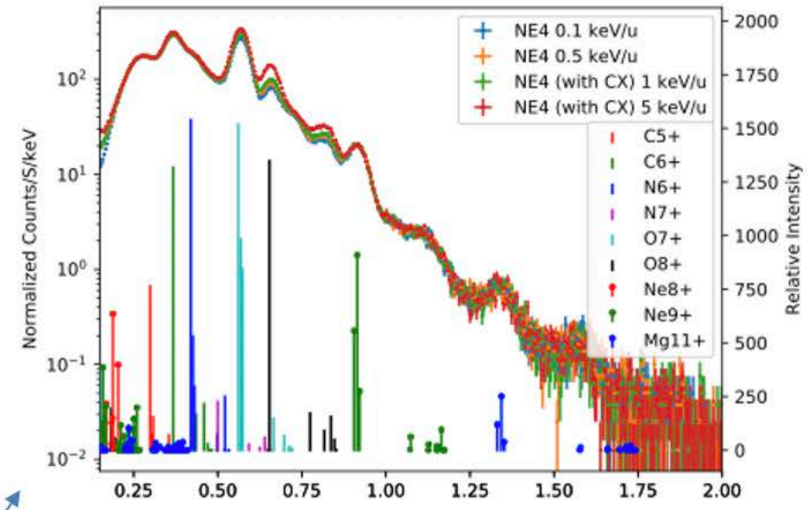
A proposal for a 2-flight campaign will be submitted in December.

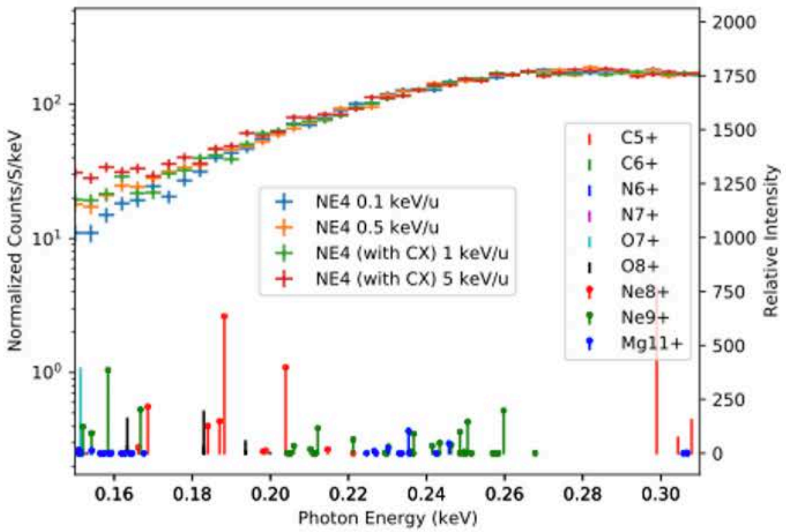
DXG Science

DXG will image the complete Cygnus loop in one single pointing, reducing contamination from SWCX, with CCD energy resolution and angular resolution of <10 arcmin



Simulated DXG Image of the Cygnus loop





Simulated spectrum of the NE4 region of the Cygnus Loop in two different energy bands, including a significant amount of CX at 5 different collision velocities calculated with the Atomdb-CX (ACX2) package.

UNIVERSITY OF MIAMI

Program Spinoffs

- **CuPID** (flown as piggyback in 2015) will launch as a Heliophysics Cubesat in 2021
- **LEXI** (flown as a piggyback in 2012) will be sent to the surface of the moon as part of the Artemis program in 2022
- **STORM** has been approved for Phase A for the Heliophysics Explorer Program
- **AMuLET** (All-sky Multimessenger Lobster Eye Telescope - a standalone version of DXG) is being proposed for the Pioneers program to detect EM counterparts to GW events and for identify fast transients
- **SIBEX** (Shock Interaction/Breakout EXplorer) is being proposed to next Astrophysics Explorer call to study supernova show breakout
