

# Impact of repatriation on genetic variation in the Lake Mohave population of razorback sucker

**Thomas E. Dowling**

**Paul C. Marsh**

**Thomas F. Turner**

**Melody J. Saltzgiver**

**Deborah Adams**

# Objective

**Use molecular markers (microsatellites, mtDNA) to monitor impact of management on genetic diversity**

# Sampling

- 15 years worth of data!!!
- Larvae (1997-2011)
  - 259 collections, 6347 individuals
- Adults
  - 303 wild fish
  - 922 repatriates (stocked 1992 – 2011)

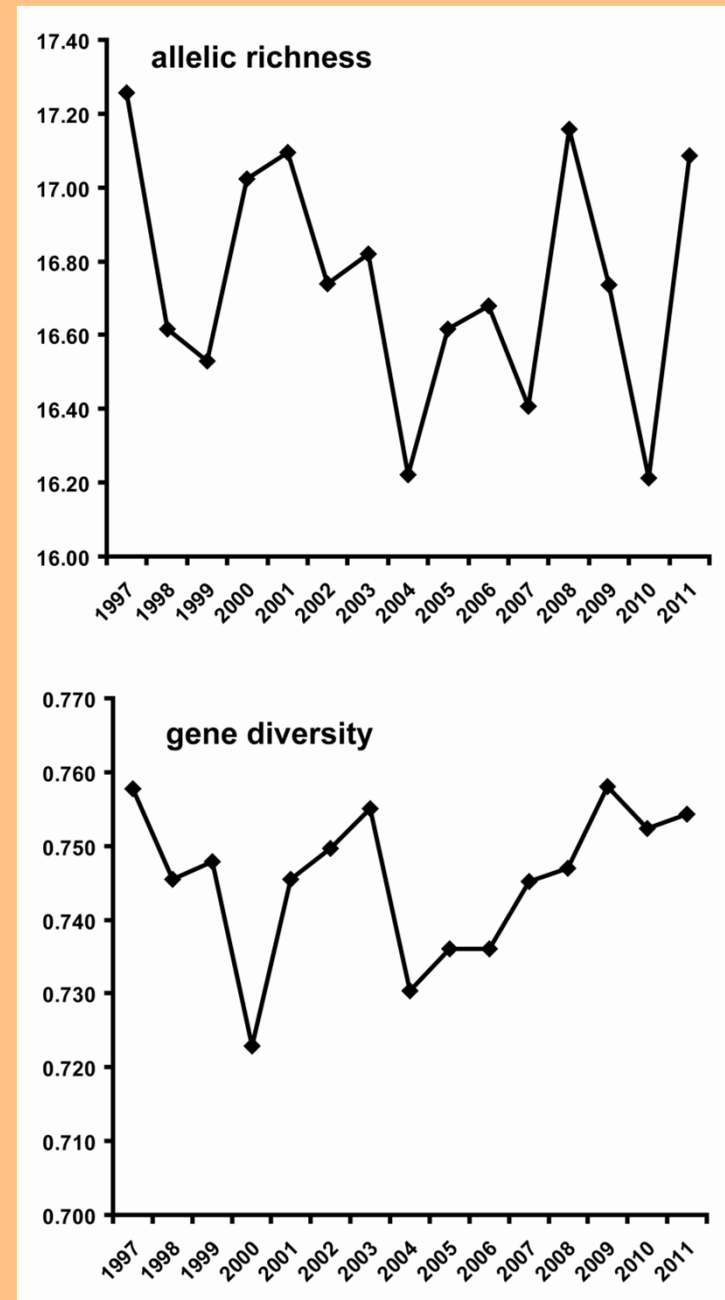

# Statistics

- **Allelic Richness:** The number of alleles per locus corrected for sample size
- **Gene Diversity:** A measure of genetic variation in a population (expected frequency of heterozygous individuals)

# Microsatellite DNA variation within larval samples over time

- Nuclear DNA variation is being maintained by this sampling strategy
- Allelic richness
  - $r = 0.007$ ,  $P = 0.914$
- Gene diversity
  - $r = 0.007$ ,  $P = 0.918$

# mtDNA variation within larval samples over time

- mtDNA variation is actually being increased by this sampling strategy!
- Allelic richness
  - $r = 0.212$ ,  $P = 0.001$
- Gene diversity
  - $r = 0.119$ ,  $P = 0.064$

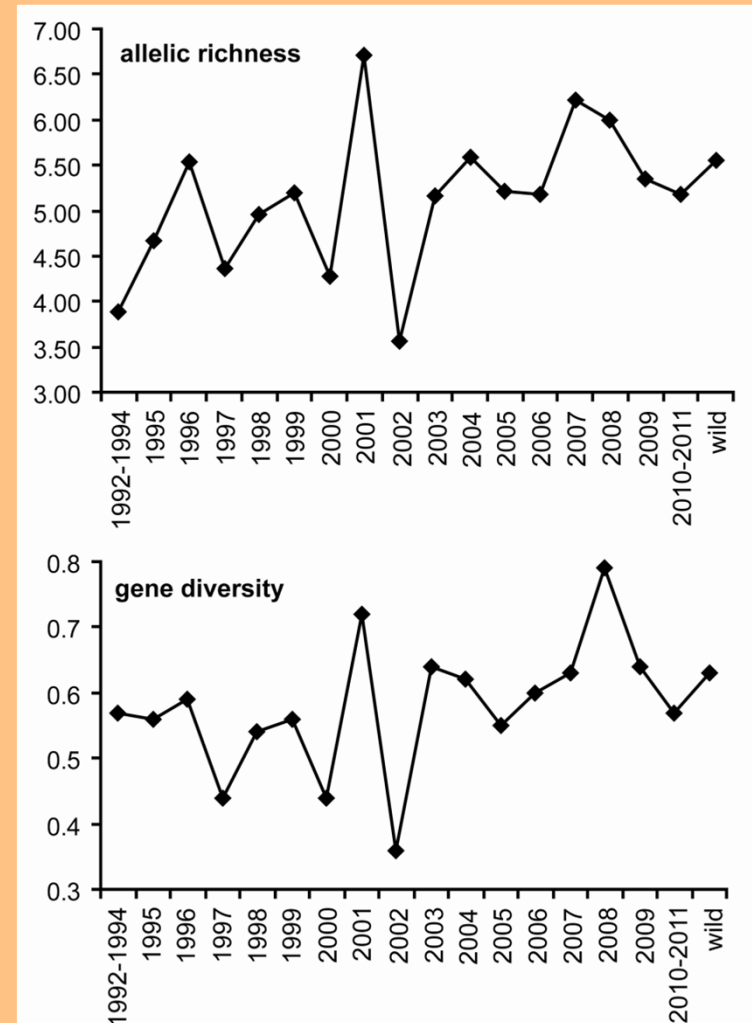

# Microsatellite variation within repatriate samples over time

- Nuclear DNA variation is being maintained by this sampling strategy
- Allelic richness
  - $r = 0.005$ ,  $P = 0.935$
- Gene diversity
  - $r = 0.005$ ,  $P = 0.938$

# mtDNA variation within repatriate samples over time

- mtDNA variation is actually being increased by this sampling strategy!
- Allelic richness
  - $r = 0.449$ ,  $P = 0.071$
- Gene diversity
  - $r = 0.397$ ,  $P = 0.124$

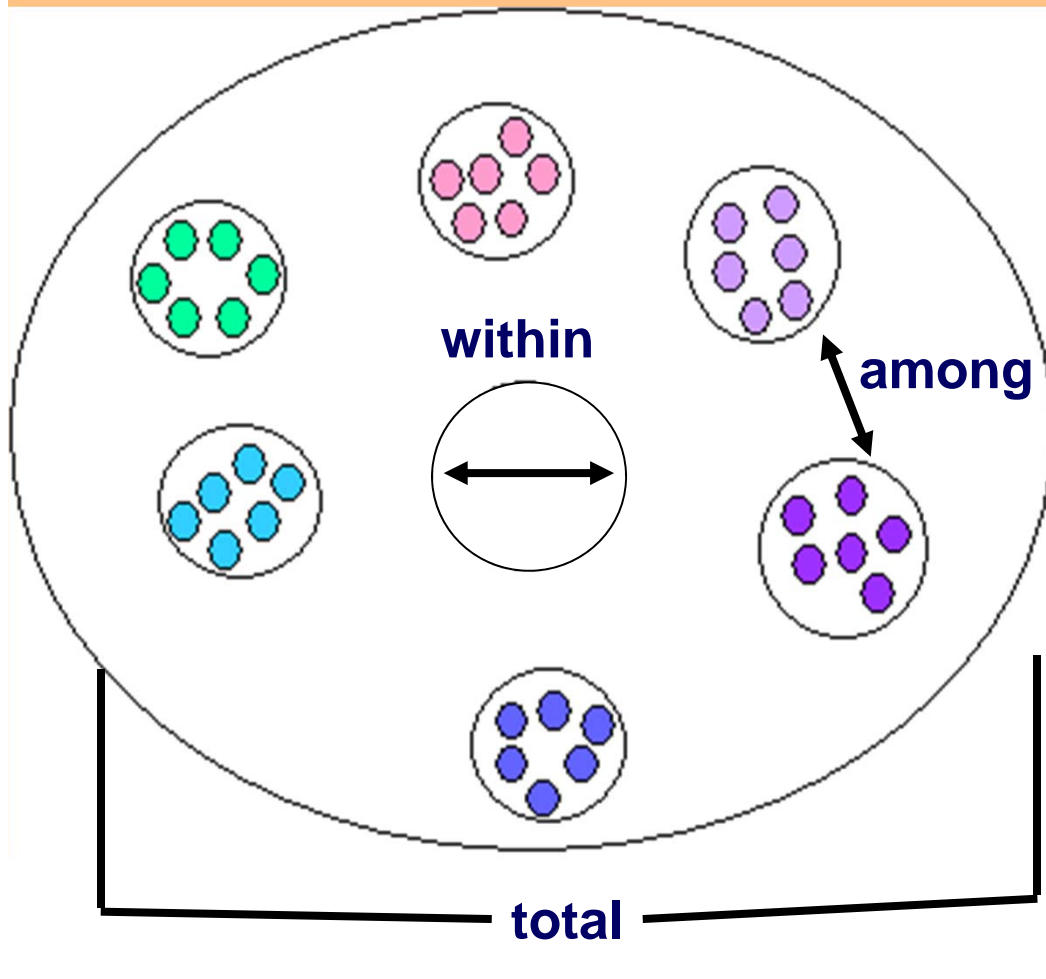

# **Transmission of variation from larvae to repatriates?**

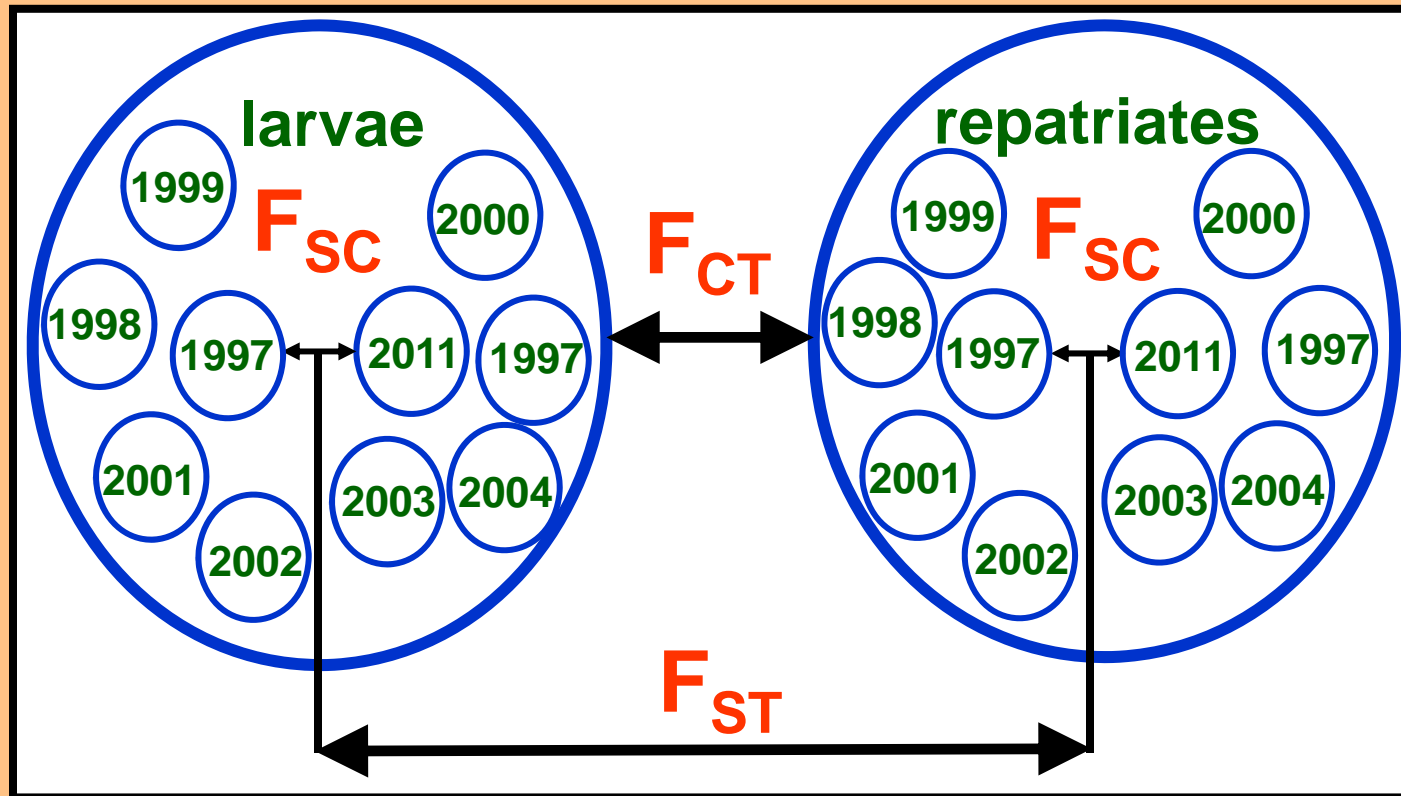

- **Look for differences in allele frequencies among life history stages**
- **Use F-statistics**

# F-statistics

- Subpopulations (S) are made up of individuals (I)
- Can examine several components affecting random mating
  - between individuals within subpopulations (IS)
  - among individuals relative to the total population (IT)
  - among subpopulations (ST)

# Partitioning among sample variation ( $F_{ST}$ )

$F_{ST}$  = divergence among all life stages

$F_{SC}$  = divergence among temporal samples within life stages

$F_{CT}$  = divergence among regions corrected for temporal variation within life stages

# Distribution of mtDNA variation among larvae, adults, and repatriates

## SOURCE

Among groups	$F_{ST} = 0.003$
Among samples within groups	$F_{SC} = 0.004$
Among larvae, repatriates, and adults	$F_{CT} = -0.001$

**No differences among larvae, repatriates, and adults!**

# Conclusions

- All measures of genetic variation consistent among samples of larvae and repatriates
- Variation is being transmitted from larvae to repatriates
- Increasing levels of genetic variation over time

# Still have a problem!!!

Despite all of our efforts, population size continues to decline

At this point, more than 155,500 young fish have been repatriated, with estimated annual survivorship of ca. 1%

# Still have a problem!!!

Genetic variation is increasing because a higher proportion of the population is contributing

- **Problem - ability to maintain genetic variation is constrained by population size**
- **This will lead to a loss of variation, resulting in decreased adaptability and potential issues with inbreeding**

# Still have a problem!!!

**Size matters**

**Difficult to grow up fish to >400 mm in a timely manner**

**Even so, striped bass are large enough to eat even the largest razorback suckers**

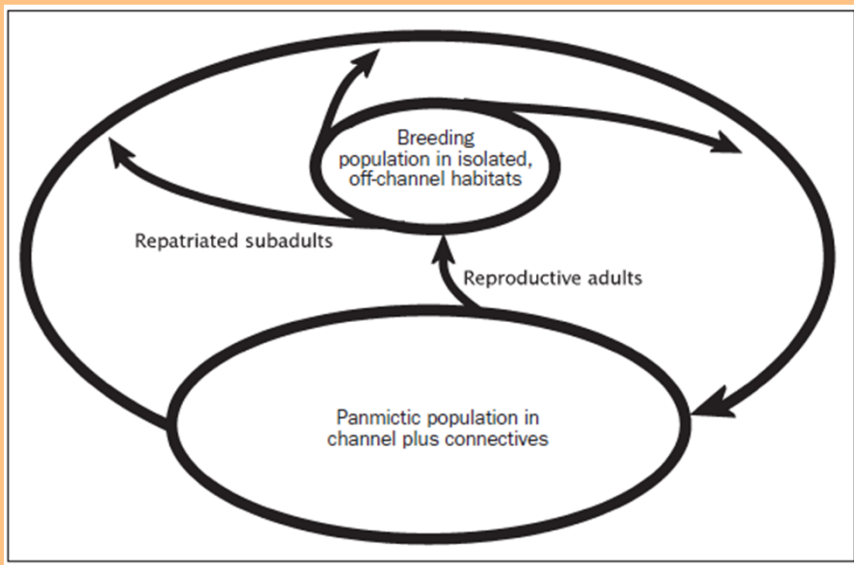

**SOLUTION:** refuges where can develop appropriately age structured populations

# Solution: Off-channel habitats (Minckley et al. 2003)

- Develop isolated off-channel habitats
- Refugia for reproduction
- Interchange individuals with main river

# Off-channel habitats

- **Need some basic life history information**
  - How many individuals do we use in each pond?
  - How often do we exchange them?
  - How does reproductive success vary across individuals and years?
- **Demographic and genetic information is essential for design of and informed management of backwater populations**
