

**Chemicals Evaluated for Carcinogenic Potential
Office of Pesticide Programs
U.S. Environmental Protection Agency**

Annual Cancer Report 2015

BACKGROUND

What is this list?

The following list provides an overview of pesticide chemicals evaluated for carcinogenic potential by EPA's Pesticide Program through September 2015. The evaluation of many of these chemicals is an ongoing process. Therefore, the information in this list may be subject to change as new and/or additional data are submitted to EPA. This list will be updated annually.

How should the information provided in this list be used?

Although this list is available to the public, note that the list represents only the potential carcinogenicity hazard for the chemical with no consideration of exposure information. This list is not intended to be used independent of the full risk assessment for the chemical. When EPA completes a risk assessment on a pesticide, a variety of toxicity information, including potential for noncancer effects (e.g., neurotoxicity, developmental and reproductive toxicity, immunotoxicity, etc) and carcinogenicity, are considered in determining whether to register a pesticide and what requirements for use of the pesticide need to be in place to protect human health. The simple fact of being listed here does not imply that the pesticide poses a significant cancer hazard to the public from use

What does the report date mean?

The date included in the list for each chemical is the date of the most recent review of potential carcinogenicity hazard for that chemical. This date provides a key as to which set of cancer guidelines were used in the review. Note that the classification of potential carcinogenicity generally is not reevaluated unless new data are submitted.

How does EPA review pesticides for potential carcinogenicity?

In evaluating and describing the potential carcinogenicity of a pesticide, EPA's Pesticide Program follows the Agency's Guidelines for Carcinogen Risk Assessment (see <http://epa.gov/cancerguidelines/> for more information). The Health Effects Division of the Pesticide Program performs an independent review of all the available evidence to determine the carcinogenic potential of pesticides.

The results of the independent review are peer-reviewed by the Cancer Assessment Review Committee. This committee recommends a "descriptor" (e.g., likely to be carcinogenic to humans, not likely to be carcinogenic to humans, suggestive evidence of carcinogenic potential) to convey the cancer hazard potential of the compound. This descriptor is also referred to as the cancer classification. The evidence for the human cancer potential and the extent to which a person might be exposed (how much time and to what quantity of the pesticide) will determine how the Agency regulates the pesticide. In some cases, EPA may request a review by the FIFRA Scientific Advisory Panel.

What does EPA consider in its review of cancer risk?

In determining the cancer-causing potential of a chemical, EPA considers the full range of available evidence. This information includes

- laboratory animal findings,
- metabolism studies,
- structural relationships with other carcinogens, and
- if available, mode of carcinogenic action information and epidemiologic findings in humans.

All of the information is considered in a weight-of-the-evidence approach. In this weight-of-evidence evaluation, EPA undertakes a critical analysis of each available study to determine its quality and reliability. Then the entire body of evidence is integrated and examined for consistency (repeatability of findings in studies), cohesiveness (a logical pattern of responses), and for biological plausibility (i.e., are the observed findings consistent with current understanding of carcinogenic processes). How the Agency determines the cancer potential of a compound can be found at: <http://epa.gov/cancerguidelines/>.

Most of the cancer determinations for pesticides are largely based on laboratory animal studies because, under its statutory authority, EPA requires registrants to submit an extensive range of laboratory studies on pesticides including long-term rodent cancer studies. The findings in laboratory animals are generally assumed to be relevant to humans unless there is evidence to the contrary. When human information is available, EPA would consider that information <http://www2.epa.gov/pesticide-registration/data-requirements>.

When does EPA review pesticides for potential carcinogenicity?

EPA reviews studies submitted when a pesticide is proposed for registration. Studies are required in two species (mice and rats) and two sexes (males and females), as well as a battery of mutagenicity assays. These studies are required for all pesticides used on food and some non-food pesticides that could lead to long-term exposures in humans. In future reviews of the pesticide, the cancer classification may be reevaluated if new studies have been submitted.

All existing pesticide tolerances that were in place as of August 1996 were re-assessed for their human health and environmental risks by August 2006 as required by the Food Quality Protection Act of 1996. However, if there was no new information on carcinogenicity, the compound was not re-evaluated simply to determine how it would be described under the 2005 cancer guidelines.

How have the Agency's cancer assessment guidelines changed?

There have been a number of different documents issued by the Agency for cancer evaluation.

- In 1976, EPA issued its first set of principles and interim procedures to guide evaluation of human cancer potential.
- In 1986, EPA issued guidance, which included a letter system (A-E) for designating degree of carcinogenic potential.
 - In the 1986 guidelines, hazard identification and the weight-of evidence process focused on tumor findings.

- See <http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=54933> for a detailed description of this classification system.
- In 1996, EPA released “Proposed Guidelines for Carcinogen Risk Assessment,” which used a weight of evidence narrative and standardized descriptors to replace the 1986 alphanumeric classification to classify carcinogenic potential.
 - In the 1996 proposal, emphasis was placed on available mode of carcinogenic action information and discussing characterization of hazard, dose-response, and exposure assessments.
 - The hazard and weight of evidence process embraced an analysis of all relevant biological information and emphasized understanding the agent's mode of action in producing tumors to reduce the uncertainty in describing the likelihood of harm.
 - See 1996 - <http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=55868>.
- In 1999, EPA issued a revised version of its 1996 proposal that responded to public and peer review comments, which included:
 - a framework approach to evaluate the mode of action in the assessment of potential carcinogenesis.
 - See- <http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=54932>.
- In March, 2005, EPA released its final *Guidelines for Carcinogen Risk Assessment* (EPA/630/P-03/001B). These guidelines represent the culmination of a long development process, replacing EPA’s original cancer risk assessment guidelines (1986) and its interim final guidelines (1999). Key changes included:
 - Five weight of evidence descriptors chosen for use in narratives (“*Carcinogenic to Humans*,” “*Likely to Be Carcinogenic to Humans*,” “*Suggestive Evidence of Carcinogenic Potential*,” “*Inadequate Information to Assess Carcinogenic Potential*,” and “*Not Likely to Be Carcinogenic to Humans*.”)
 - Emphasis on analysis of data will precede use of defaults
 - Improved guidance on modeling and expanded discussions of sensitive subpopulations including children (supplemental guidance)
 - See <http://www2.epa.gov/risk/guidelines-carcinogen-risk-assessment>.

Why are there several different cancer classifications in the list?

As discussed above, EPA’s guidelines for evaluating the potential carcinogenicity of chemicals have been updated over the years to reflect increase transparency in describing the cancer potential of a compound and to reflect the understanding of ways chemicals may cause cancer.

Not all pesticides have been evaluated under EPA’s 2005 Cancer Guidelines. Agency policy states that for risk assessments that were completed before issuance of the 2005 Guidelines, the need for a re-assessment should be determined on a case-by-case basis by the program and that the existing assessment should continue to be considered scientifically sound based on the guidance used when the assessment was completed

(<http://www2.epa.gov/osa/memoranda-about-implementation-cancer-guidelines-and-accompanying-supplemental-guidance-science>.)

How can I find the basis of EPA’s decision regarding the carcinogenicity of a pesticide?

The Reregistration Eligibility Decision for each pesticide contains a discussion of the available data and information used in the human health and environmental risk assessments, which includes a description of the evidence used to determine the cancer potential of the chemical. Also, the Cancer Assessment Review Committee report is available by requesting it through the Freedom of Information Act (FOIA) (<http://www2.epa.gov/foia>).

Thiocyclam hydrogen oxalate	31895-22-4	128868	Group D--Not Classifiable as to Human Carcinogenicity	9/15/1994
Thiodicarb	59669-26-0	114501	Group B--Probable Human Carcinogen	6/10/1996
Thiophanate-methyl	23564-05-8	102001	Likely to be Carcinogenic to Humans	8/24/1999
Thiram	137-26-8	079801	Not Likely to Be Carcinogenic to Humans	4/14/2003
Tolclofos-methyl	57018-04-9	128905	Not Required (nonfood)	3/22/2012
Tolfenpyrad	129558-76-5	090111	Not Likely To Be Carcinogenic To Humans	06/03/2010
Tolyfluanid	731-27-1	309200	Likely to be Carcinogenic to Humans	6/18/2002
Topramezone	210631-68-8	123009	Not Likely to be Carcinogenic to Humans at Doses that Do Not Alter Rat Thyroid Hormone Homeostasis	5/19/2005
Tralkoxydim	87820-88-0	121000	Suggestive Evidence of Carcinogenicity, but Not Sufficient to Assess Human Carcinogenic Potential	6/30/2004

Annual Cancer Report 2015

CHEMICAL	CAS NO.*	PC CODE**	CANCER CLASSIFICATION***	REPORT DATE****
Triadimefon	43121-43-3	109901	Group C--Possible Human Carcinogen	12/4/1996
Triadimenol	55219-65-3	127201	Group C--Possible Human Carcinogen	1/29/1988
Triallate	2303-17-5	078802	Group C--Possible Human Carcinogen	1/12/1994
Triasulfuron	82097-50-5	128969	Group E--Evidence of Non-carcinogenicity for Humans	2/27/1991
Triazamate	112143-82-5	128100	Not Likely to Be Carcinogenic to Humans	12/1/1997
Tribenuron methyl	101200-48-0	128887	Group C--Possible Human Carcinogen	7/14/1989
Tribufos	78-48-8	074801	Likely to be Carcinogenic to Humans (High Doses); Not Likely to be Carcinogenic to Humans (Low Doses)	5/22/1997
Tributyltin maleate	14275-57-1	083118	Group D--Not Classifiable As To Human Carcinogenicity	3/31/2005
Trichlorfon	52-68-6	057901	Likely to be Carcinogenic to Humans (High Doses), Not Likely to be Carcinogenic to Humans (Low Doses)	7/15/1999
Triclopyr	55335-06-3	116001	Group D--Not Classifiable as to Human Carcinogenicity	5/9/1996
Triclosan	3380-34-5	054901	Not Likely To Be Carcinogenic To Humans	1/4/2008
Tricyclazole	41814-78-2	120201	Not Likely to be Carcinogenic to Humans	4/1/2014
Tridiphane	58138-08-2	123901	Group C--Possible Human Carcinogen	4/22/1986
Trifloxystrobin	141517-21-7	129112	Not Likely to Be Carcinogenic to Humans	6/16/1999
Trifloxysulfuron	290332-10-4	119009	Not Likely to Be Carcinogenic to Humans	7/22/2003
Triflumizole	68694-11-1	128879	Group E--Evidence of Non-carcinogenicity for Humans	8/10/1993
Trifluralin	1582-09-8	036101	Group C--Possible Human Carcinogen	4/11/1986

Triflusulfuron-methyl	126535-15-7	129002	Group C--Possible Human Carcinogen	5/28/1996
Triforine	26644-46-2	107901	Suggestive Evidence of Carcinogenicity, but Not Sufficient to Assess Human Carcinogenic Potential	6/29/2004
Trinexapac-Ethyl	95266-40-3	112602	Not Likely To Be Carcinogenic To Humans	9/5/2008
Triphenyltin hydroxide (TPTH)	76-87-9	083601	Group B--Probable Human Carcinogen	5/24/1990
Triticonazole	131983-72-7	125620	Not Likely to be Carcinogenic to Humans	6/15/2006
Troysan polyphase (IPBC)	55406-53-6	107801	Not Likely to Be Carcinogenic to Humans	12/4/1996
UDMH	57-14-7	600018	Group B--Probable Human Carcinogen	7/26/1991
UMP-488 (PAL 6000)	111578-32-6	129025	Group E--Evidence of Non-carcinogenicity for Humans	5/6/1994
Uniconazole	83657-22-1	128976	Group C--Possible Human Carcinogen	10/11/1990
Vinclozolin	50471-44-8	113201	Group C--Possible Human Carcinogen	6/20/2000
Zeta-Cypermethrin	52315-07-8	129064	Group C--Possible Human Carcinogen	9/27/1988
Ziram	137-30-4	34805	Suggestive Evidence of Carcinogenicity, but Not Sufficient to Assess Human Carcinogenic Potential	2/6/2003
Zoxamide	156052-68-5	101702	Not Likely to Be Carcinogenic to Humans	2/7/2001

*CAS No: a chemical identifier designated by the Chemical Abstracts Service

**PC Code: a unique chemical identifier used by the Office of Pesticide Programs

***Cancer Classification: Simple descriptors used to express conclusions regarding the carcinogenic hazard potential of a chemical based on all relevant information, which is usually laboratory studies. These phases changed over time, as the Agency's guidance for carcinogenicity assessment was updated and revised.

****Report: Date of the Carcinogen Assessment Review Committee (CARC) report. The CARC report date does not necessarily reflect the date of the pesticide risk assessment. For example, all existing pesticide tolerances that were in place as of August 1996 were re-assessed for their health risks by August 2006 as required by the Food Quality Protection Act, and if there was no new information on carcinogenicity, the compound was not re-evaluated by the CARC.
