Note To Users

Since 1961, estimates of waterfowl harvest and hunting activity and success in the United States have been derived from the U.S. Fish and Wildlife Service's Waterfowl Harvest Survey. This is a 2-part survey including: 1) a questionnaire survey used to determine hunting activity and success and total harvest; and 2) a waterfowl-parts-collection survey used to apportion harvest by species, age, and sex.

From 1961 to 2001, the questionnaire portion of the survey (termed the "Mail Questionnaire Survey" or MQS) was a mail survey of individuals who purchased duck stamps with the intention of hunting waterfowl. Problems with using duck stamp purchasers as a sampling frame for harvest estimation led to a new survey design in the mid-1990s. This design, called the Harvest Information Program (HIP), was fully implemented in 1999. In this program, the sampling frame is derived from list of those who have registered with state wildlife agencies as migratory bird hunters. The new questionnaire portion of the survey includes some species and groups of migratory game birds other than waterfowl (e.g. woodcock and doves). The parts-collection portion of the survey was expanded to include these species and groups as well.

Because the source of participants and the design of the questionnaire survey in the Harvest Information Program are different from those in the previously used survey, the estimates of waterfowl harvest, hunting activity, and hunter success derived from the 2 surveys ***are not comparable***.

For this reason, the harvest estimates (1961-2001) based on the discontinued MQS were removed from our annually-updated compilation of Atlantic Flyway data entitled "Waterfowl Harvest and Population Survey Data" and placed in a separate compilation entitled "Estimates of Waterfowl Harvest, Hunting Activity, and Success, 1961-2001."

Copies of the final MQS report are available upon request from:

Sheet ABDU

^a Delaware did not conduct the survey in 2006. However, because survey-area estimates are summed from stratum estimates (rather than strata within state estimates), and most plots in the strata that occur in DE (4, 10, and 99) were surveyed, valid estimates are available for the entire survey area.

Breeding pairs estimates (SE) for black ducks from the Atlantic Flyway Breeding Waterfowl Plot Survey, 1993-2016.

Estimates based on the 1993-2002 method of calculating total indicated birds (TIB = 2*(pairs + singles + groups).

C:\Data Book\Atlantic\Other surveys\Pilot survey.xls Sheet CAGO

* Delaware did not conduct the survey in 2006. However, because survey-area estimates are summed from stratum estimates (rather than strata within state estimates), and most plots in the strata that occur in DE (4, 10, and 99) were surveyed, valid estimates are available for the entire survey area.

Population estimates (SE) for Canada geese from the Atlantic Flyway Breeding Waterfowl Plot Survey, 2002-2016.

Sheet MUSW

^a Delaware did not conduct the survey in 2006. However, because survey-area estimates are summed from stratum estimates (rather than strata within state estimates), and most plots in the strata that occur in DE (4, 10, and 99) were surveyed, valid estimates are available for the entire survey area.

Breeding pair estimates (SE) for mute swans from the Atlantic Flyway Breeding Waterfowl Plot Survey, 2003-2016.

^a Because of issues with USFWS aircraft stratum 1, 6, and 50 were not flown. Population estimates for these stratum were imputed from the historical time series.

Breeding population estimates and 95% confidence intervals or credibility intervals (CIs; in thousands) for the 10 most abundant species of ducks in the eastern survey area, 1990-2016 ^a .																				
Year	Mergansers ^b		Mallards		American black ducks		American wigeon ^c		Green-winged teal		Scaup ^{d,e}		Ring-necked duck		Goldeneyes ^d		Bufflehead ^f		Scoters ^{e,f}

^a Estimates for mergansers, mallards, American black ducks, green-winged teal, ring-necked duck, and goldeneyes from Bayesian hierarchical analysis using FWS and CWS data from strata 51, 52, 63, 64, 66-68, 70-72. All others were computed as harmonic means of FWS and CWS estimates for strata 51, 52, 63, 64, 66-68, 70-72.

^b Common, red-breasted, and hooded.

^c Greater and lesser.

^d Common and Barrow's.

^e Black and surf.

^f Estimates were design based and have been dropped starting in 2011

^g Because of issues with USFWS aircraft eastern population estimates were derived solely from the CWS plot survey, strata 51, 52, 63, 64, 66-68, 70-72.

C:\Data book\International\BPpop.xls

Sheet: Eastern

Number of Canada goose breeding pairs estimated for the Ungava Peninsula (regions 1,2 and 3) of northern Quebec.

¹ Estimates = geese observed X 1.4 visibility correction

File: C:\Data Book\International\SJBP breeding.xls

² Survey flown with different aircraft (Aero Commander) and during late incubation and hatching. Estimates biased low due to visibility differences.

³ The mainland survey area was reduced by 20,000 km².

⁴ Four transects were not flown in Stratum II

⁵ Final year of survey designed to estimate populations of SJBP geese. Population designation changed following 2015.

GREATER SNOW GOOSE POPULATION AND PRODUCTIVITY ESTIMATES FROM THE ST. LAWRENCE VALLEY, 1965-2016 (CWS-Quebec Region)

¹ From aerial photo counts

² From visual ground counts

³ Broods accompanied by 2 parents

⁴ No spring survey conducted - the value provided was derived from population model published in Gauvin & Reed (CWS Occas. Pap. No. 64. 1987)

⁵ The estimates in brackets have been corrected to account for flocks not observed during the survey, using data from a telemetry study.

⁶ Estimates calculated with the revised sampling methodology

⁷ The estimate has to be reanalyzed
