ACKNOWLEDGMENTS

This report was prepared under the general direction of **Elinor Champion**, Assistant Division Chief for Special Studies and Program Support. Within the Manufacturing and Construction Division, the preparation of this report was performed under the supervision of **Lee Wentela**, Chief, Manufacturers' Shipments, Inventories, and Orders Branch, assisted by **Anthony Figlioli**, **Derrick Roy**, and **Sandra Sollinger**, Section Chiefs. Other contributing analysts include **Clarissa Edwards**, **Melinda Ford**, **Joe Haurand**, **Patrick Kent**, **Aneta Lukasik**, **Jasmine McDowell**, **Mary McKoy**, **Mary Potter**, **Jessica Young**, **Alice Miller**, **Korrey Blount**, and **Marvella Hicks**. The assistance of **Frances Porter** and **Lisa Feldman** is also appreciated.

Lillie M. Skinner coordinated the various phases of the publication process assisted by **Paula Capoen**, **Enid Winters**, and **Harriet Lee**.

The electronic computer programs were developed under the direction of **Sam Rozenel**, Chief, Manufacturing and Construction Indicators Branch, assisted by **Katherine Evans**, Section Chief.

Paul Hsen, Assistant Division Chief for Research and Methodology Programs, assisted by **Stacey Cole**, Chief, Manufacturing Programs Methodology Branch, and **Gary Kusch**, Section Chief, provided mathematical and statistical assistance. **Bill Ricciardi** and **Dan Tulp Jr.** provided primary staff assistance.

The staff of the National Processing Center, **Judith N. Petty**, Chief, performed the mailout operations.

Kim D. Ottenstein, **Margaret A. Smith**, **Joyce Chamberlain**, and **Laurene V. Qualls** of the Administrative and Customer Services Division, **Walter C. Odom**, Chief, provided publications and printing management, graphics design and composition, and editorial review for print and electronic media. General direction and production management were provided by **Michael G. Garland**, Assistant Chief, and **Gary J. Lauffer**, Chief, Publications Services Branch.

Finally, a special acknowledgment is due to the many businesses whose cooperation was essential to the success of this report.

Summary of Revisions

SUMMARY

The revisions to the historical data from the Manufacturers' Shipments, Inventories, and Orders survey, as shown in this publication, are the result of:

- Retabulating monthly data that were reported under the Standard Industrial Classification (SIC) to be consistent with the new North American Industry Classification System (NAICS),
- Benchmarking the shipments and inventory data to the 1997 Economic Census and the 1998 and 1999 Annual Surveys of Manufactures (ASM),
- Benchmarking unfilled orders to the 1999 MA-300 Unfilled Orders Survey, and adjusting new orders to be consistent with the benchmarked shipments and unfilled orders data,
- Correcting monthly data for late receipts, reclassification of reported data, and revisions to previously reported data,

- Updating the trading day adjustment factors for the shipments series, and
- Updating the seasonal adjustment factors for all series.

DATA AVAILABILITY

The monthly press releases for the M3 survey are issued around the 18th working day of the month following the statistical period for the advance report on durable goods and the 23rd working day for the full report. These monthly reports, as well as this Benchmark report are available the day of issue through STAT-USA/Internet at www.stat-usa.gov or through the Manufacturers' Shipments, Inventories, and Orders Web site at www.census.gov/indicator/www/m3.

In addition to this report, historical SIC data from 1958 through March, 2001 are available on the Internet at www.census.gov/indicator/www/m3.

Description of Survey

The Manufacturers' Shipments, Inventories, and Orders (M3) survey provides broad-based, monthly statistical data on economic conditions in the domestic manufacturing sector. The survey measures current industrial activity and provides an indication of future business trends. Data are used by the Executive Branch of the Government for developing economic, fiscal, and monetary policy; the Bureau of Economic Analysis as components of the gross domestic product estimates; and trade associations, corporate economists, and other members of the business community as an analytical tool for assessing the current and future economic condition of the country.

COMPOSITION OF INDUSTRY CATEGORIES

There are 89 separately tabulated industry categories in the M3 survey. These categories are groupings of the 473 manufacturing industries as defined in the *1997 North American Industry Classification System (NAICS) Manual*. Appendix B lists these categories.

Because companies provide data on a voluntary basis, reporting in many of these 89 categories is not sufficient to warrant separate publication of the data. Consolidated reporting by some large companies also limits the quality of the data in some categories. A company that reports on a consolidated basis (entire company or a division) is included in the M3 category in which the reporting unit as a whole is classified and has no influence on the movement of the other industries which may be included in its combined report.

As a result, it has been necessary to combine the 89 industry categories into 55 publication levels for shipments and total inventories. For new and unfilled orders and inventories by stage of fabrication, it has been necessary to introduce further combinations because of the lower response rates for those items.

COMPOSITION OF THE SURVEY PANEL

The monthly M3 estimates are based on information obtained from most manufacturing companies with \$500 million or more in annual shipments. In order to strengthen the sample coverage in individual industry categories, the survey includes selected smaller companies. The sources from which companies are identified for inclusion in the survey panel are the quinquennial economic censuses, manufacturing sector.

For firms that operate in a single M3 industry category, the reporting unit typically comprises all operations of the

company. Most large, diversified companies, however, file separate reports for divisions with significant activity in different industrial areas.

The composition of each company or reporting unit of a company in the survey usually includes more than one plant or establishment and frequently includes industry activities outside the M3 category in which it is classified. The survey methodology described later in this chapter assumes that the month-to-month changes of the total operations of the reporting units classified in each industry category effectively represent the month-to-month movements of all establishments that make up the category.

In 1962, the initially selected sample for this survey included all companies with more than 1,000 employees and smaller companies selected with probabilities proportional to their employment size within each industry category. As there was some deterioration in response rates for companies with between 100 and 1,000 employees, in January 1975, the staff selected a supplemental sample of approximately 1,000 companies from the universe of companies in this size range in order to strengthen the estimates. Although the response rate was only about 60 percent for this group, beginning in January 1978 these data were added to the panel and included in the calculations of the monthly estimates. Because of poor response rates, the survey no longer included companies with less than 100 employees; instead, data for these companies were estimated by using overall industry month-to-month movements based on data reported by the larger companies.

In recent years, the size of the value of shipments of the company or reporting unit rather than the employment size has influenced the selection of companies to increase response rates. Using this criterion, census staff visit or otherwise contact large companies that did not report in the survey to request their participation or reconsideration of a previous decision not to participate. Also, staff request large diversified reporting companies to provide additional industry categories not previously provided.

Another method used for improving response has been contacting nonreporting companies by letter. Staff send letters on an ongoing basis to companies in industry categories with low response rates. In 1990, staff selected a probability sample and mailed requests to about 400 mid-size companies in the plastics industry. The purpose was to test the viability of probability sampling, especially in industries comprised primarily of smaller, less diversified companies.

As a result of these efforts, we increased response by adding about 45 to 55 percent of the companies contacted to the panel. However, respondent dropouts frequently offset these increases. The current coverage levels in the survey show that reported data represent approximately 60 percent of the shipments estimates at the total manufacturing level, while the individual coverage rates for the 21 three-digit NAICS subsectors vary from about 15 to 95 percent.

LIMITATIONS OF THE DATA

The monthly data presented in this publication are subject to both sampling and nonsampling errors. Sampling errors occur because reports are received from a sample rather than from the complete universe of manufacturing companies. Because the present composition of the panel is not based on a probability sample, the amount of sampling error cannot be quantified. Nonsampling errors, on the other hand, are attributable to many sources. The use of company or divisional reports to estimate the monthly change for establishments is one source of nonsampling error. The use primarily of large companies to represent the month-to-month movement of all companies is another potential source. In addition, response and processing errors may be present, although computer edits and analytical review of the data detect the most significant errors of this kind prior to tabulation.

MONTHLY ESTIMATION PROCEDURE

A link relative procedure derives the monthly universe estimates of shipments, unfilled orders, and total inventories for each industry category. The universe estimate for the previous month is multiplied by the monthly ratio of change tabulated for reporting companies in the current month to arrive at a universe estimate for current month.

When an individual company reports unusually large changes from the previous month, or when a particular company has unique data patterns differing substantially from the movement shown by the rest of the reporting panel in a particular industry category, the company is excluded from the ratio of change calculation but included in the universe estimate of level. The effect of this procedure is to restrict the estimation for nonrespondents and firms not in the survey panel to the general trend of the industry.

The universe estimate of new orders is derived from the monthly estimate of shipments plus the change in unfilled orders between the current and prior period. The estimate includes orders that are received and filled in the same month as well as orders that have not yet been filled. It also includes the effects of cancellations and modifications of previously reported orders.

The standard ratio estimate procedure is not followed for new orders because not all companies report new orders, and some that do report this item limit their

reporting to specific products for which long lead times are required in the production cycle. These companies, in effect, exclude new orders received for products that are shipped from inventory.

A modified procedure also is used to estimate the stage of fabrication inventory data. In this procedure, the total inventory data estimated for each tabulated industry category are retabulated to the appropriate three-digit NAICS subsector levels and serve as control totals for the stage of fabrication data. Initial estimates are made for each of the stages of fabrication at the three-digit NAICS level using the ratio estimation procedure. The differences between the sum of the stage of fabrication detail and total inventories at the three-digit NAICS level are then allocated proportionally to the stage of fabrication figures to form the estimates. The reasoning behind this procedure is that a significant number of companies report total inventories but cannot report inventories by stage of fabrication.

Trading Day Adjustment

Variations in the rate of manufacturing activity resulting from different numbers of trading days in the same month for different years and variations in the length of months can be an important cause of month-to-month fluctuations in the shipments data. For many industries, these irregularities can be identified approximately and removed so that the underlying trend cycle stands out clearly.

Many of the shipments series have trading day factors calculated in the trading day regression analysis routine of the X-12 seasonal adjustment software.¹ However, forty-five of the shipments series did not have identifiable trading day patterns and are only being adjusted for leap year and length of month variations. Appendix G includes a more detailed discussion of the methodology.

Seasonal Adjustment Methodology

The monthly data are adjusted for seasonality at the most detailed level tabulated in the survey, using the X-12 ARIMA version of the Census Bureau's seasonal adjustment program.² The seasonally adjusted estimates for shipments, unfilled orders, and total inventories for M3 industry categories are calculated by dividing the unadjusted estimates by seasonal adjustment factors computed by the X-12 ARIMA seasonal adjustment program. Seasonally adjusted new orders are computed by adding the changes between current and prior period seasonally adjusted unfilled orders to the current month's seasonally adjusted shipments.

The inventory by stage of fabrication data are seasonally adjusted at the three-digit NAICS subsector level for each stage. If the sum of the adjusted stage of fabrication

¹The X-12 ARIMA Seasonal Adjustment is the program used to calculate trading day weights and to seasonally adjust data in this publication.

²*ibid.*

does not equal the major group totals resulting from summing the seasonally adjusted total inventories for the individual industries, the difference is proportionally allocated to the stage of fabrication detail.

Staff calculate seasonal factors concurrently and include the current period observation in the calculation of the seasonal factor for that month. The factors reflected in this report are based on using data from January 1992 through December 2000 for shipments, unfilled orders, and inventories. Appendix H shows reliability measures regarding the adequacy of the seasonal adjustment of specific series. For information on specific measures used in the seasonal adjustment analysis, selection of options within the X-12 program for the individual industry series, and tests for the presence of seasonality, contact the Manufacturing and Construction Division, U.S. Census Bureau, Washington, DC 20233, or call 301-457-4832.

BENCHMARK PROCEDURE

The M3 survey data are benchmarked to reduce both sampling and nonsampling errors. The relatively small monthly sample size as well as the differences that result from collecting the monthly data on a divisional basis as compared to the benchmark data on an establishment basis account for most of the revision. Also, some monthly reports received too late to be included in the monthly publications are added to improve the revised estimates of change of the historical monthly data.

Benchmarking the shipments, inventories, and unfilled orders historical series to the 1997 Economic Census, the 1998 and 1999 Annual Surveys of Manufactures (ASM), and the 1999 MA-300 Unfilled Orders Survey, is of significant importance because it converts the series from the Standard Industrial Classification (SIC) to the new North American Industry Classification System (NAICS). Appendix D describes the process of developing the series of annual NAICS benchmarks for 1992 through 1996 to supplement the 1997 through 1999 benchmarks. Appendix E describes converting the monthly series from the SIC to the NAICS basis and highlights assumptions and limitations.

DEFINITION OF TERMS

Value of Shipments

The value of shipments data in the M3 survey represents net selling values, f.o.b. plant to the customer, after discounts and allowances and excluding freight charges and excise taxes. The ASM uses the same definition. However, the data reported in the two surveys frequently are not equal because of differences, discussed earlier, in the reporting unit. For multiestablishment companies, the M3 reports typically are company- or divisional-level reports that encompass groups of plants or products. The data reported are usually net sales and receipts from customers

and do not include the value of interplant transfers. The reported sales are used to calculate month-to-month changes which bring forward the universe estimates developed from the ASM.

The value of products made elsewhere under contract from materials owned by the plant is also included in shipments as well as receipts for contract work performed for others, resales, miscellaneous activities such as the sale of scrap and refuse, and installation and repair work performed by employees of the plant.

In the shipbuilding industry, the value of work done in a given year may vary considerably from the value of shipments because of the long lead time between the start and completion of a large vessel. In both the annual survey and the M3, the value of work done during the year, rather than the value of shipments, is requested. The same procedure is followed for aircraft that are accounted for on a progress basis. Aircraft and ships for which shipments are recorded upon delivery are reported in the usual manner. Where value of work done is reported in place of shipments, the work-in-process inventories are normally charged to the customer as costs are incurred and are not accumulated as finished goods inventories by the shipyard or the aircraft producer.

The value of shipments figures developed from the ASM contain duplication at the M3 industry category and higher level aggregates, since the products of some six-digit NAICS industries are used as materials by other industries within the same M3 industry aggregate. The significance of the duplication within the specific M3 industry categories varies depending on their six-digit industry composition. It is most pronounced in a few highly integrated industry areas, such as primary metals and motor vehicles and parts.

INVENTORIES

Inventories in the M3 survey are collected on a current cost or pre-LIFO (last in, first out) basis. Because different inventory valuation methods are reflected in the reported data, the estimates differ slightly from replacement cost estimates. Companies using the LIFO method for valuing inventories report their pre-LIFO value; that is, the adjustment to their base-period prices is excluded. In the ASM, inventories are collected according to this same definition.

Inventory data are requested from respondents by stage of fabrication; that is, finished goods, work in process, and raw materials and supplies. There are several limitations to the quality of these data for two reasons. First, response to the stage of fabrication inquiries is lower than for total inventories because some companies do not keep their data monthly at this level of detail; those companies which do maintain monthly detailed records frequently do not have data for all three stages of fabrication or have quantity (physical volume) data only. Second, a product considered to be a finished good in one industry, such as steel mills shapes, may be reported as a raw

material in another industry, such as stamping plants. Therefore, within the three-digit NAICS subsectors, the same type of inventory may be included under different stage of fabrication categories. Like total inventories, stage of fabrication inventories are also benchmarked to the ASM pre-LIFO data, but the stage of fabrication data are benchmarked at the three-digit subsector level.

NEW ORDERS RECEIVED AND UNFILLED ORDERS

New orders, as reported in the monthly survey, are net of order cancellations and include orders received and filled during the month as well as orders received for future delivery. They also include the value of contract

changes which increase or decrease the value of the unfilled orders to which they relate. Orders are defined to include those supported by binding legal documents such as signed contracts, letters of award, or letters of intent, although in some industries this definition may not be strictly applicable. In the case of letters of intent, the full amount of the sales value is included if the parties are in substantial agreement on the amount; otherwise, only the funds specifically authorized to be expended are included.

Unfilled orders include orders (as defined above) that have not been reflected as shipments. Generally, unfilled orders at the end of the reporting period are equal to unfilled orders at the beginning of the period plus net new orders received less net shipments.

Note: The shipments data used in calculating the ratios exclude the following industries with no unfilled orders: wood products; nonmetallic mineral products; cutlery and hand tools; farm machinery; lawn and garden tractors and equipment; computer storage devices; other computer peripheral equipment; audio and video equipment; magnetic and optical media; batteries; automobiles; light trucks and utility vehicles; heavy duty trucks; other furniture related products; medical equipment and supplies; office supplies; and other miscellaneous manufacturing.

Appendix A. Sample of M3 Report Form

Industry category description (see Part G).

Month and year of report

Prompt reporting ensures the timely receipt of your data.

Name and telephone number of person to contact at the Census Bureau regarding this report.

Name and telephone number of person to contact at your company regarding this report.

Mark the box which best describes current accounting period.

Data for new orders and unfilled orders are only requested for some industry categories

FORM M-3(SD)
(6-12-2000)

U.S. DEPARTMENT OF COMMERCE
Economics and Statistics Administration
U.S. CENSUS BUREAU

MANUFACTURERS' SHIPMENTS, INVENTORIES, AND ORDERS
FORM APPROVED: OMB NO. 0607-0008 EXPIRES JULY 31, 2003

NOTICE - This report is authorized by law (Title 13, United States Code). By Section 9 of the same law, your report to the Census Bureau is confidential. It may be seen only by sworn Census employees and may be used only for statistical purposes. The law also provides that copies retained in your files are immune from legal process.

Description: **ELECTRONIC COMPUTER MANUFACTURING**

CENSUS USE RP MC # F FP AI

JANUARY 2001
Please correct any errors in name, address, and ZIP Code.

PLEASE RETURN YOUR COMPLETED FORM WITHIN 15 DAYS:
Fax form to 1-800-272-4096
or
Use VRE on 1-800-428-9659
or
Mail form to:

Remarks: _____

This form is substantially accurate and has been prepared in accordance with the instructions.

Title _____ Date _____

Signature of authorized person _____

Your company's Census File Number, (CFN)

For each item listed, enter the figure in thousands of dollars.

Compare figures for current and previous periods. Correct previous periods if wrong. Explain substantial differences, or large month-to-month fluctuations in the data, in the "Remarks" section.

Appendix B.

Composition of Industry Categories in Terms of the North American Industry Classification System (NAICS)

M3/NAICS code	M3 category title with comparable NAICS titles	M3/NAICS code	M3 category title with comparable NAICS titles
	FOOD PRODUCTS		BEVERAGE AND TOBACCO PRODUCTS—Con.
11A	Grain and Oilseed Milling	12B	Tobacco Manufacturing
311211	Flour	312210	Tobacco Stemming and Redrying
311212	Rice	312221	Cigarettes
311213	Malt	312229	Other Tobacco Products
311221	Wet Corn		
311222	Soybean Processing		
311223	Other Oilseed Processing		
311225	Fats and Oils Refining and Blending		
311230	Breakfast Cereals		
11B	Dairy Product Manufacturing		TEXTILE MILLS
311511	Fluid Milk	13A	Textile Mills
311512	Creamery Butter	313111	Yarn Spinning
311513	Cheese	313112	Yarn Texturing, Throwing, and Twisting
311514	Dry, Condensed, and Evaporated Milk	313113	Thread
311520	Ice Cream and Frozen Desserts	313210	Broadwoven Fabric
		313221	Narrow Fabric
		313222	Schiffli Machine Embroidery
		313230	Nonwoven Fabric
		313241	Weft Knit Fabric
		313249	Other Knit Fabric and Lace
		313311	Broadwoven Fabric Finishing
		313312	Textile and Fabric Finishing (Except Broadwoven Fabric)
		313320	Fabric Coating
11C	Meat, Poultry, and Seafood Product Processing		TEXTILE PRODUCTS
311611	Animal (Except Poultry) Slaughtering	14A	Textile Product Mills
311612	Meat Processed From Carcasses	314110	Carpets and Rugs
311613	Rendering and Meat Byproducts	314121	Curtains and Draperies
311615	Poultry Processing	314129	Other Household Textile Products
311711	Seafood Canning	314911	Textile Bags
311712	Fresh and Frozen Seafood	314912	Canvas and Related Products
		314991	Rope, Cordage, and Twine
		314992	Tire Cord and Tire Fabrics
		314999	All Other Miscellaneous Textile Products
11D	Other Food Manufacturing		APPAREL
311111	Dog and Cat Food	15A	Apparel Manufacturing
311119	Other Animal Food	315111	Sheer Hosiery
311311	Sugarcane	315119	Other Hosiery and Socks
311312	Cane Sugar Refining	315191	Outerwear Knitting
311313	Beet Sugar	315192	Underwear and Nightwear Knitting
311320	Chocolate and Confectionery From Cacao Beans	315211	Men's and Boys' Cut and Sew Apparel Contractors
311330	Confectionery From Purchased Chocolate	315212	Women's, Girls', and Infants' Cut and Sew Apparel Contractors
311340	Nonchocolate Confectionery	315221	Men's and Boys' Cut and Sew Underwear and Nightwear
311411	Frozen Fruits, Juices, and Vegetables	315222	Men's and Boys' Cut and Sew Suits, Coats, and Overcoats
311412	Frozen Specialty Foods	315223	Men's and Boys' Cut and Sew Shirts (Except Work Shirts)
311421	Fruit and Vegetable Canning	315224	Men's and Boys' Cut and Sew Trousers, Slacks, and Jeans
311422	Specialty Canning	315225	Men's and Boys' Cut and Sew Work Clothing
311423	Dried and Dehydrated Foods	315228	Men's and Boys' Cut and Sew Other Outerwear
311811	Retail Bakeries	315231	Women's and Girls' Cut and Sew Lingerie, Loungewear, and Nightwear
311812	Commercial Bakeries	315232	Women's and Girls' Cut and Sew Blouses and Shirts
311813	Frozen Cakes, Pies, and Other Pastries	315233	Women's and Girls' Cut and Sew Dresses
311821	Cookies and Crackers	315234	Women's and Girls' Cut and Sew Suits, Coats, Tailored Jackets, and Skirts
311822	Flour Mixes and Dough From Purchased Flour	315239	Women's and Girls' Cut and Sew Other Outerwear
311823	Dry Pasta	315291	Infants' Cut and Sew Apparel
311830	Tortillas	315292	Fur and Leather Apparel
311911	Roasted Nuts and Peanut Butter	315299	All Other Cut and Sew Apparel
311919	Other Snack Foods	315991	Hats, Caps, and Millinery
311920	Coffee and Tea	315992	Gloves and Mittens
311930	Flavoring Syrups and Concentrates	315993	Men's and Boys' Neckwear
311941	Mayonnaise, Dressing, and Other Prepared Sauces	315999	Other Apparel Accessories and Other Apparel
311942	Spices and Extracts		
311991	Perishable Prepared Foods		
311999	All Other Miscellaneous Foods		
	BEVERAGE AND TOBACCO PRODUCTS		
12A	Beverage Manufacturing		
312111	Soft Drinks		
312112	Bottled Water		
312113	Ice		
312120	Breweries		
312130	Wineries		
312140	Distilleries		

M3/ NAICS code	M3 category title with comparable NAICS titles	M3/ NAICS code	M3 category title with comparable NAICS titles
	LEATHER AND ALLIED PRODUCTS		PETROLEUM AND COAL PRODUCTS
16A	Leather and Allied Product Manufacturing	24A	Petroleum Refineries
316110	Leather and Hide Tanning and Finishing	324110	Petroleum
316211	Rubber and Plastics Footwear		
316212	House Slippers	24B	Asphalt Paving, Roofing, and Saturated Materials Manufacturing
316213	Men's Footwear (Except Athletic)		Asphalt Paving Mixtures and Blocks
316214	Women's Footwear (Except Athletic)	324121	Asphalt Shingle and Coating Materials
316219	Other Footwear	324122	
316991	Luggage		
316992	Women's Handbags and Purses	24C	Other Petroleum and Coal Products Manufacturing
316993	Personal Leather Goods (Except Women's Handbags and Purses)	324191	Petroleum Lubricating Oils and Greases
316999	All Other Leather Goods	324199	All Other Petroleum and Coal Products
	WOOD PRODUCTS		BASIC CHEMICALS
21A	Wood Building and Mobile Home Manufacturing	25A	Pesticide, Fertilizer, and Other Agricultural Chemical Manufacturing
321991	Manufactured Homes (Mobile Homes)	325311	Nitrogenous Fertilizer
321992	Prefabricated Wood Buildings	325312	Phosphatic Fertilizer
		325314	Fertilizer (Mixing Only)
		325320	Pesticides and Agricultural Chemicals
21B	Other Wood Product Manufacturing	25B	Pharmaceutical and Medicine Manufacturing
321113	Sawmills	325411	Medicinals and Botanicals
321114	Wood Preservation	325412	Pharmaceutical Preparations
321211	Hardwood Veneer and Plywood	325413	In-Vitro Diagnostic Substances
321212	Softwood Veneer and Plywood	325414	Biological Products (Except Diagnostic)
321213	Engineered Wood Members (Except Trusses)		
321214	Trusses	25C	Paint, Coating, and Adhesive Manufacturing
321219	Reconstituted Wood Products	325510	Paints and Coatings
321911	Wood Windows and Doors	325520	Adhesives
321912	Cut Stock, Resawing Lumber, and Planing		
321918	Other Millwork (Including Flooring)		
321920	Wood Containers and Pallets		
321999	All Other Miscellaneous Wood Products	25D	Other Chemical Manufacturing
		325110	Petrochemicals
		325120	Industrial Gases
		325131	Inorganic Dyes and Pigments
		325132	Synthetic Organic Dyes and Pigments
		325181	Alkalies and Chlorines
		325182	Carbon Black
		325188	All Other Basic Inorganic Chemicals
		325191	Gum and Wood Chemicals
		325192	Cyclic Crudes and Intermediates
		325193	Ethyl Alcohol
		325199	All Other Basic Organic Chemicals
		325211	Plastics Material and Resins
		325212	Synthetic Rubber
		325221	Cellulosic Organic Fibers
		325222	Noncellulosic Organic Fibers
		325611	Soaps and Detergents
		325612	Polish and Other Sanitation Goods
		325613	Surface Active Agents
		325620	Toilet Preparations
		325910	Printing Inks
		325920	Explosives
		325991	Custom Compounding of Purchased Resins
		325992	Photographic Film, Paper, Plates, and Chemicals
		325998	All Other Miscellaneous Chemical Products and Preparations
			PLASTICS AND RUBBER PRODUCTS
		26A	Tire Manufacturing
		326211	Tires (Except Retreading)
		326212	Tire Retreading
		26B	Other Plastics and Rubber Product Manufacturing
23A	Printing and Related Support Activities	326111	Unsupported Plastics Bags
323110	Commercial Lithographic	326112	Unsupported Plastics Packaging Film and Sheets
323111	Commercial Gravure	326113	Unsupported Plastics Film and Sheets (Except Packaging)
323112	Commercial Flexographic	326121	Unsupported Plastics Profile Shapes
323113	Commercial Screen	326122	Plastics Pipe and Pipe Fitting
323114	Quick	326130	Laminated Plastics Plate, Sheet, and Shapes
323115	Digital	326140	Polystyrene Foam Products
323116	Manifold Business Forms	326150	Urethane and Other Foam Products (Except Polystyrene)
323117	Books	326160	Plastics Bottles
323118	Blankbook, Looseleaf Binders, and Devices	326191	Plastics Plumbing Fixtures
323119	Other Commercial	326192	Resilient Floor Coverings
323121	Tradebinding and Related Work	326199	All Other Plastics Products
323122	Prepress Services	326220	Rubber and Plastics Hoses and Belting

Appendix D. Developing Annual NAICS Benchmarks for Shipments, Inventories, and Unfilled Orders: 1992-2000

The benchmarking process for 1992-2000 converted the M3 series to the North American Industry Classification System (NAICS) from the historic Standard Industrial Classification (SIC). For this conversion, the first step in the benchmarking process was to establish annual estimates for M3 publication level categories defined in terms of the NAICS.

Annual estimates for new M3 NAICS-based publication level categories were readily available from the 1997 Economic Census, the first year in which the NAICS was introduced for data collection, and the 1998 and 1999 Annual Surveys of Manufactures (ASM). To establish a longer series for trend analysis and to develop patterns to adjust for seasonal variation required estimates for the NAICS categories before 1997.

VALUE OF SHIPMENTS

Annual estimates for 1992 through 1997 for the NAICS categories were developed by allocating value of shipments of four-digit SIC industries to six-digit NAICS industries. To do this, detailed products defined for the economic census were assigned to six-digit NAICS industry codes. From the 1992 and 1997 censuses product tables, we calculated the proportion each product represented of the value of products primary to a four-digit industry. The percentage allocations representing the products in an industry were applied to the total value of shipments from plants classified in the four-digit industry. The component values of shipments were aggregated into the assigned six-digit NAICS industries. This procedure assumes (1) all products primary to an industry are shipped from plants classified in the industry and (2) plants only manufacture products primary to the industry in which the plants are classified.

In the absence of product detail, *product classes* for 1993 through 1996 were assigned to six-digit NAICS industries. We calculated the proportion of shipments that each *product class* represented of the total value of shipments of products primary to a four-digit SIC industry. Once again, the percentage allocations representing the product classes in an industry were applied to the total value of shipments from *plants* classified in the four-digit industry and the component values of shipments were aggregated into the assigned six-digit NAICS industries. Again, this procedure assumes (1) all products primary to an industry are shipped from plants classified in the industry and (2) plants only manufacture products primary to the industry in which the plants are classified.

The values of shipments for six-digit NAICS industries were aggregated to M3 publication level categories for 1992 through 1997. Since the NAICS data were available for 1997 from the economic census, we compared them to the shipments values for 1997 derived from the allocation process. The differences determined from this comparison were used to adjust the allocated category estimates for 1992 through 1996. Since the industry shipments values represent shipments of all products from plants classified in an industry, the adjustment corrects for some of the error associated with the assumptions.

INVENTORIES

Inventory data are collected in the ASM and the economic census, but not for products or product classes needed for an allocation. Thus, the same allocations determined from the product shipments series were used to allocate inventories data from four-digit SIC industries to six-digit NAICS industries for 1992 through 1997. These six-digit values were then summed to M3 category levels. As we did with shipments, 1997 NAICS data were analyzed to determine differences from our derived data, and adjustments were made to our category estimates for 1992 to 1996.

UNFILLED ORDERS

Unfilled orders are not collected in the ASM or the economic census. The only data available were the monthly survey estimates of unfilled orders for M3 publication categories based on the SIC. To convert the unfilled orders series to a NAICS basis, we first allocated the company data reported on an SIC basis to the NAICS categories using 1997 census product shipments data. This method is further explained in Appendix E. These allocations, based on the distribution of shipments, were applied to the M3 total unfilled orders values to distribute them into NAICS categories. The NAICS distribution of unfilled orders in December of each year, 1992 through 1999, became the initial benchmark values.

To provide a more accurate measure of the levels of unfilled orders, we conducted a special survey of unfilled orders for 1999. The sample for this survey was selected to represent the NAICS publication level categories. The survey measures gave us a comparison to evaluate the derived values from the allocation process. However, rather than assume the difference in the 1999 values could be used uniformly to adjust the benchmarks for

1992 through 1998, we instead assumed that the unfilled orders estimates for 1986, the last benchmark survey measure, were true values. We used a wedging process to distribute the difference in the 1999 estimates from 1992 through 1998 proportionally closer to that seen in 1999. The unfilled orders at the end of each year, 1992 through 1999, became the annual benchmark values.

SUMMARY

The 1998 and 1999 Annual Surveys of Manufactures and the 1997 Economic Census provided the NAICS-based benchmarks for shipments and inventories. The 1999 Unfilled Orders Survey provided NAICS-based benchmarks for unfilled orders. The aforementioned allocation process was the basis for developing NAICS-based benchmarks for shipments and inventories for 1992 through 1996 and for unfilled orders for 1992 through 1998.

To apply the benchmarks to the monthly series requires a starting point. The starting point is usually the last month of the year last benchmarked. However, all previous benchmark processes resulted in series benchmarked to SIC categories. To develop a starting point, the same allocation of SIC categories to NAICS categories based on shipments data and developed for unfilled orders, was applied to shipments, inventories, and unfilled orders estimates from the M3 survey for January 1992. These derived estimates were the starting points for the benchmarking application and for the initial conversion of the monthly series to the NAICS categories.

ASSUMPTIONS AND LIMITATIONS

Below we expand on some of the details and we list important limiting assumptions and other caveats relative to the development of the series. We are unable to quantify to what degree the series are affected by these limitations.

- To develop annual shipments benchmarks for the NAICS categories, we attempted to identify the SIC products that belonged to each NAICS industry. This was done on

the basis of product descriptions and the NAICS code descriptions. For most product codes this was straightforward, but for many we cannot be certain that we included them in the correct NAICS industry. This affected the levels of the NAICS allocations and the corresponding benchmark levels for NAICS categories. Also, in some instances, products were split among multiple NAICS industries. We made arbitrary decisions (usually equal allocations) in splitting the data among the multiple codes. If the multiple codes fell within the same M3 NAICS category, then the arbitrary split had no effect. If the multiple codes were **not** contained within the same M3 NAICS category, then the levels of the NAICS benchmarks were affected. These problems were compounded in ASM years where less detailed product class data were used to develop the allocation factors.

- The allocations of industry shipments from SIC to NAICS industries were based on the distribution of products defined in an industry. The allocation factors were based on **all** contributors to the product shipment data including secondary producers, i.e., establishments classified in industries other than the primary industry. To the extent that manufacturers produce multiple products, the allocation does not represent the product shipments from an industry. When secondary producers contribute significantly to the product data, the allocation factors may be less reliable. Again, this problem was more pronounced for ASM years, where less detailed product class tables were used in the same manner.
- Inventory data are not collected by product or product classes that allow reallocation into NAICS industries. To allocate total inventory data for an SIC industry among the constituent NAICS industries, we assumed the same allocation factors as for shipments.
- Unfilled orders data are not collected by products or product classes that allow reallocation into NAICS industries. We assumed the same allocation factors as for shipments. Furthermore, the allocations were applied to monthly M3 unfilled orders data since no annual unfilled orders data are collected in the census or ASM.

Appendix E.

Converting Monthly Estimates to NAICS Categories

Although companies in the M3 survey reported according to arrangements to provide data for SIC categories, we were able to compare their M3 reports for 1997 with company data reported in the 1997 Economic Census. Based on the comparison, we assigned some companies to North American Industry Classification System (NAICS) categories. For others, we used the economic census product data to allocate company data into NAICS categories. We applied these reassignments and allocations to the history of company data. We then calculated monthly ratios of change from the aggregated company data for shipments, inventories, and unfilled orders for each NAICS category. Using the same link-relative methodology as in the monthly survey and the new ratios of change, we began with the January 1992 values distributed into NAICS categories to develop the initial monthly NAICS series.

The resultant series of shipments, inventories, and unfilled orders were benchmarked to the annual estimates. Appendix F describes the benchmarking procedures. Monthly new orders series were derived from the benchmarked values of shipments and unfilled orders series.

ASSUMPTIONS AND LIMITATIONS

Below we expand on some of the details and we list important limiting assumptions and other caveats relative to the development of the series. We are unable to quantify to what degree the series are affected by these limitations.

- The monthly data are benchmarked in part to derived annual levels for NAICS categories (see Appendix F). Thus, for 1992-1996 all of the limitations of the annual benchmarks also affect the monthly series.
- To develop the monthly NAICS series, the allocation of product data for 1997 was used to allocate company data into NAICS categories for *all years*, 1992 through 2000. This application assumes that a company's product mix does not change over time. We have less confidence in this assumption the further away we move from 1997. For the years after 1997, we have reported ASM company data to validate our allocations and make necessary adjustments.

Appendix F.

Benchmarking Procedures Used in Revising Monthly M3 Timeseries

The mathematical technique used in benchmarking data in the M3 survey generally follows a trend revision minimization approach with constraints determined by annual benchmarks. The objective function F

$$F = \sum_{i=0}^{n-1} [(Y_{i+1}/Y_i) - (X_{i+1}/X_i)]^2$$

defines the sum of squared differences in the month-to-month trend between the original and revised data.

where $i = 0$ = January 1992

$i = n$ = December 2000

Y_{i+1}/Y_i = revised ratio of change from month_i to month_{i+1}

X_{i+1}/X_i = original ratio of change from month_i to month_{i+1}

For shipments, inventories, and unfilled orders, monthly data for the 89 M3 industry categories are benchmarked using the trend minimization function F.

Constraints for shipments are:

$$\sum Y_i = 1992 \text{ Benchmark; } i \in 1992$$

$$\sum Y_i = 1993 \text{ Benchmark; } i \in 1993$$

$$\sum Y_i = 1994 \text{ Benchmark; } i \in 1994$$

$$\sum Y_i = 1995 \text{ Benchmark; } i \in 1995$$

$$\sum Y_i = 1996 \text{ Benchmark; } i \in 1996$$

$$\sum Y_i = 1997 \text{ Benchmark; } i \in 1997$$

$$\sum Y_i = 1998 \text{ Benchmark; } i \in 1998$$

$$\sum Y_i = 1999 \text{ Benchmark; } i \in 1999$$

Constraints for inventories and unfilled orders are:

$$Y_{11} = \text{December 1992 Benchmark}$$

$$Y_{23} = \text{December 1993 Benchmark}$$

$$Y_{35} = \text{December 1994 Benchmark}$$

$$Y_{47} = \text{December 1995 Benchmark}$$

$$Y_{59} = \text{December 1996 Benchmark}$$

$$Y_{71} = \text{December 1997 Benchmark}$$

$$Y_{83} = \text{December 1998 Benchmark}$$

$$Y_{95} = \text{December 1999 Benchmark}$$

Stage of fabrication inventories are tabulated and benchmarked at the three-digit NAICS subsector level using the procedure described for total inventories.

Any imbalances between the sum of the three stages of fabrication and the total inventory data at the three-digit NAICS subsector level are corrected by the following raking procedure:

$$MI_J^A = MI_J^O [TI_J / (MI_J^O + WI_J^O + FI_J^O)]$$

$$WI_J^A = WI_J^O [TI_J / (MI_J^O + WI_J^O + FI_J^O)]$$

$$FI_J^A = FI_J^O [TI_J / (MI_J^O + WI_J^O + FI_J^O)]$$

for $J = 0$ through n

where 0 = January 1992

n = December 2000

MI_J^O and MI_J^A are materials and supplies original and as raked.

WI_J^O and WI_J^A are work in process original and as raked

FI_J^O and FI_J^A are finished goods original and as raked

TI_J = Benchmarked total inventories

Monthly new orders estimates are derived consistent with the benchmarked shipments and unfilled orders monthly data using the following formula:

$$X_J = S_J + (Y_J - Y_{J-1})$$

for $J = 1$ through n

$J = 1$ = February 1992

$J = n$ = December 2000

X_J = Benchmarked new orders

S_J = Benchmarked shipments

Y_J = Benchmarked unfilled orders

Note: The benchmark constraints used for shipments and total inventories consist of two distinct parts. The first is the NAICS data collected for the 1997 Economic Census and 1998 and 1999 Annual Surveys of Manufactures (ASM). The second part, the 1992 through 1996

benchmark constraints, were derived using the processes explained in Appendix D. Accordingly, we have greater confidence in the constraints that were developed from NAICS surveys than those that were derived. Similarly, the unfilled orders constraints consist of only one data point, December 1999, that was developed

from a NAICS survey, while all other constraints were derived and are therefore considered less reliable. The constraints that were developed from the 1997 Economic Census, 1998 and 1999 ASMs, and the 1999 Unfilled Orders Survey are presented in Tables F-1, F-2, and F-3.

Table F-1. **Benchmark Data for Shipments and Total Inventories for M3 Industry Categories: 1997-1999**

[Million dollars]

Industry category	Shipments			Inventories

Note: The 1999 MA-300 Unfilled Orders Survey is probability based and, therefore, subject to sampling error. A sample of 9,055 companies was selected. Estimated relative standard errors are displayed. For more information, contact the Manufacturing Programs Methodology staff at 301-457-4771.

Appendix G.

Notes on Trading Day Adjustment Methodology

The shipments data in the M3 survey are adjusted for calendar month variations, both length of month and number of trading days per month. The selection of these adjustment factors is based primarily on recognition of patterns contained in the data using the regression and spectral analysis capabilities of the X-12 seasonal adjustment software.

Factors are considered optimal when the daily weights assigned to the industry eliminate or diminish

the peaks in the spectral plots, which are based on calendar frequencies, and lower the absolute value of the month-to-month change in the residual irregular component (I) of the data series.

New orders data in this publication are implicitly trading day adjusted by using the trading day adjusted shipments as input to their derivation. The change in unfilled orders is not trading day adjusted.

NT Not trading day adjusted. T Trading day adjusted.

¹The Chi-Square value measures the presence of identifiable trading day patterns.

Note: For all industry categories including those that are not trading-day adjusted, we adjust for leap year effects and for length of month.

Appendix H.

Summary Measures for Evaluating the Quality of the Seasonal Adjustment of M3 Series

The measures shown in the following tables were used in evaluating the current seasonal adjustment procedure. Brief descriptions of the measures follow.

The "O" is the average month-to-month percentage change, without regard to sign, in the original series. The "CI" is the same for the seasonally adjusted series. The "I" is the same for the irregular component, which is obtained by dividing the trend-cycle component into the seasonally adjusted series. The "C" is the same for the trend-cycle component which is a smoothed version of the seasonally adjusted series obtained by means of a moving average.

The "I/C" is the average relative month-to-month change, without regard to sign, of the irregular component divided by the average relative month-to-month change, without regard to sign, of the trend-cycle component. It serves as an indication of the series' relative irregularity.

The M7 value is a function of the F-test assessing the significance of stable seasonality and the F-test assessing the significance of moving seasonality. A value between 0 and 1 is an indicator that the amount of moving seasonality is acceptable relative to the amount of stable seasonality.

The F value presented here measures the presence of stable seasonality. It is the quotient of two variances: (1) the between months variance, which is mainly due to seasonal, and (2) the residual variance, which is mainly due to irregular. A value of 7.0 or greater is used as an indicator of the presence of stable seasonality.

The Q value is a weighted average of 11 different quality control statistics from X-12-ARIMA. It is an indicator of the overall quality of the adjustment. A value greater than 1.2 is unacceptable; whereas, values less than 0.8 often indicate an acceptable adjustment. With values between 0.8 and 1.2, other measures must be consulted to determine if the seasonal movement in the series can be adequately quantified by the X-12 program.

For series which are not seasonally adjusted in this publication, the original unadjusted values are included in both the seasonally adjusted and unadjusted totals.

Table H-1. Shipments (Seasonal Factors)

Industry	Average percent changes				Ratio of irregular trend-cycle (\bar{I}/\bar{C})	Ratio of moving to stable seasonality M7	F-value	Q-value	Seasonal adjustment indicator
	Original series (\bar{O})	Seasonally adjusted series (\bar{CI})	Irregular series (\bar{I})	Trend-cycle series (\bar{C})

Appendix I.

Description of the M3 Benchmark Data for Shipments and Inventories

GENERAL

The estimates for the 1998 and 1999 Annual Surveys of Manufactures (ASM) are based on reports from a representative sample of approximately 55,000 manufacturing establishments and administrative-record information for small employers and new businesses. These estimates represent the portion of the manufacturing population accounted for by establishments with paid employees. Nonemployers are defined as out-of-scope of the ASM. The 1999 tables provide 1999, 1998, and 1997 estimates for employment, plant hours, payrolls, value added by manufacture, capital expenditures, cost of materials, inventories, value of industry shipments, and fuels and electric energy consumed for most manufacturing industries. Establishments are classified in manufacturing industries by industry definitions described in the 1997 North American Industry Classification System (NAICS) manual.¹

SCOPE AND USE OF ANNUAL SURVEY

The 1999 ASM is the 41st survey of this type conducted by the U.S. Census Bureau to provide the key measures of manufacturing activity for industry groups and important industries for intercensal years. These key measures, as well as other detailed statistics for manufacturing, were collected in the economic censuses; the three most recent censuses covered the years 1997, 1992, and 1987. An annual survey was conducted for each of the years between censuses starting with 1949.

During intercensal periods, these annual surveys provide a continuous series of basic statistics for industries and furnish benchmarks for current business indicators and for measures of industrial production and productivity. The survey also provides significant data in connection with planning for industrial mobilization.

DESCRIPTION OF THE SURVEY SAMPLE

The 1997 Economic Census included approximately 380,000 manufacturing establishments. For 1998 and 1999, we conducted mail-out/mail-back surveys of 55,000 selected establishments and administrative data for small employers and new businesses. The mail survey represents all establishments that received a form in the previous economic census. Some 25,000 large establishments

(all establishments of multiunit companies with shipments of at least \$500 million, manufacturers of selected computer products, and all remaining establishments with at least 250 employees) are selected with certainty, and some 30,000 other establishments (generally with the equivalent of 20 to 250 employees) are selected with probability proportional to a composite measure of establishment size. Selected establishments receive a long form; except that, to reduce burden, about 5,000 single-establishment firms from industries with large numbers of small firms (that have between 5 to 20 employees) receive a short form.

The mail survey universe is updated annually from three sources; Internal Revenue Service Administrative records are used to include new single-unit manufacturers, the company organization survey identifies new establishments of multiunit firms, and a manufacturers classification survey identifies kinds of business.

To represent census nonmail cases, small single-establishment firms (generally with 1 to 5 employees) and new establishments, annual estimates are made based on information from Internal Revenue Service individual and business income tax records.

COMPARABILITY WITH HISTORIC DATA

The adoption of the North American Industry Classification System (NAICS) in the 1997 Economic Census has had a major impact on the comparability of current and historic data. Approximately half of the industries in the manufacturing sector of NAICS do not have comparable industries in the Standard Industrial Classification (SIC) that was used in the past.

While most of the change affecting the manufacturing sector was change within the sector, some industries left manufacturing and others came into manufacturing. Prominent among those that left manufacturing are logging and portions of publishing. Prominent among the industries that came into the manufacturing sector are bakeries, candy stores where candy is made on the premises, custom tailors, makers of custom draperies, and tire retreading. The net effect of the classification changes are such that if the 1997 value of shipments data for all manufacturers were tabulated on an SIC basis, it would be approximately 3 percent higher.

QUALIFICATIONS OF THE DATA

The estimates developed from the sample are apt to differ somewhat from the results of a survey covering all

¹North American Industry Classification System (NAICS) United States, 1997. To order the 1250 page manual in print or on CD-ROM, call 800-553-6847.

companies in the sample lists but otherwise conducted under essentially the same conditions as the actual sample survey. The estimates of the magnitude of the sampling errors (the difference between the estimates obtained and the results theoretically obtained from a comparable, complete-coverage survey) are provided by the standard errors of estimates.

The particular sample selected for the ASM is one of many similar probability samples that, by chance, might have been selected under the same specifications. Each of the possible samples would yield somewhat different sets of results, and the standard errors are measures of the variation of all the possible sample estimates around the theoretical, comparable, complete-coverage values.

Estimates of the standard errors have been computed from the sample data for selected statistics in this report. They are represented in the form of relative standard errors (the standard errors divided by the estimated values to which they refer).

In conjunction with its associated estimate, the relative standard error may be used to define confidence intervals (ranges that would include the comparable, complete-coverage value for specified percentages of all the possible samples).

The complete coverage value would be included in the range:

1. From one standard error below to one standard error above the derived estimate for about two-thirds of all possible samples.
2. From two standard errors below to two standard errors above the derived estimate for about 19 out of 20 of all possible samples.
3. From three standard errors below to three standard errors above the derived estimate for nearly all samples.

An inference that the comparable, complete-survey result would be within the indicated ranges would be correct in approximately the relative frequencies shown. Those proportions, therefore, may be interpreted as defining the confidence that the estimates from a particular sample would differ from complete-coverage results by as much as one, two, or three standard errors, respectively.

For example, suppose an estimated total is shown at 50,000 with an associated relative standard error of 2 percent, that is, a standard error of 1,000 (2 percent of 50,000). There is approximately 67 percent confidence that the interval 49,000 to 51,000 includes the complete-coverage total, about 95 percent confidence that the interval 48,000 to 52,000 includes the complete-coverage total, and almost certain confidence that the interval 47,000 to 53,000 includes the complete-coverage total.

In addition to the sample errors, the estimates are subject to various response and operational errors: errors of collection, reporting, coding, transcription, imputation for

nonresponse, etc. These operational errors also would occur if a complete canvass were to be conducted under the same conditions as the survey. Explicit measures of their effects generally are not available. However, it is believed that most of the important operational errors were detected and corrected during the Census Bureau's review of the data for reasonableness and consistency. The small operational errors usually remain. To some extent, they are compensating in the aggregated totals shown. When important operational errors were detected too late to correct the estimates, the data were suppressed or were specifically qualified in the tables.

As derived, the estimated standard errors included part of the effect of the operational errors. The total errors, which depend upon the joint effect of the sampling and operational errors, are usually of the order of size indicated by the standard error, or moderately higher. However, for particular estimates, the total error may considerably exceed the standard errors shown. Any figures shown in the tables in this publication having an associated standard error exceeding 15 percent may be combined with higher level totals, creating a broader aggregate, which then may be of acceptable reliability.

DESCRIPTION OF IMPUTATION PROCEDURE

The need for imputation in the ASM arises from several sources. Complete nonresponse, partial nonresponse, inconsistent reported data, and the Bureau's desire to reduce the reporting burden for small manufacturers are the primary factors contributing to the need for imputation.

For purposes of the ASM, an item is considered to be an impute if the value was not directly reported on the questionnaire, directly other reported items, directly available from supplemental sources, or obtained from the respondent during the analytical review phase.

In imputing records for nonrespondents, two basic approaches are followed. For most larger establishments, operational information is available from the prior-year ASM. Imputation for 1999 data for establishments with 1998 data available involves adjusting the corresponding 1998 data by estimates of the year-to-year relative change. These estimates are developed based on employment and payroll data from the Bureau of Labor Statistics at the industry group (four-digit NAICS) level and are then applied to the 1998 prior-year establishment values for employment and payroll. The remaining data for the establishment are developed based on their prior-year relationship to these two control items. For nonrespondents that have no prior-year record available including establishments not included in the mail portion of the survey, administrative-record data for annual payroll and employment are used. For all other items, industry average relationships between these control items and the item to be imputed are used.

EXPLANATION OF TERMS

Value of Shipments

This item covers the received or receivable net selling values, f.o.b. plant (exclusive of freight and taxes), of all products shipped, both primary and secondary, as well as all miscellaneous receipts, such as receipts for contract work performed for others, installation and repair, sales of scrap, and sales of products bought and resold without further processing. Included are all items made by or for the establishments from materials owned by it, whether sold, transferred to other plants of the same company, or shipped on consignment. The net selling value of products made in one plant on a contract basis from materials owned by another was reported by the plant providing the materials.

In the case of multiestablishment companies, the manufacturer was requested to report the value of products transferred to other establishments of the same company at full economic or commercial value, including not only

the direct cost of production but also a reasonable proportion of "all other costs" (including company overhead) and profit. (See discussion of duplication of data below.)

End-of-Year Inventories

Respondents were asked to report their end-of-year inventories at cost or market.

When using inventory data by stage of fabrication for "all industries" and at the three-digit subsector level, it should be noted that an item treated as a finished product by an establishment in one industry may be reported as a raw material by another establishment in a different industry. For example, the finished-product inventories of a steel mill would be reported as raw materials by a stamping plant. Such differences are present in the inventory figures by stage of fabrication shown for individual industries, industry groups, and manufacturing totals, which are aggregates of figures reported by establishments in specified industries.
