

Public Use Data Set Documentation

Mortality for ICD-10, 1999

# **DOCUMENTATION FOR THE MORTALITY PUBLIC USE DATA SET, 1999**

## **SPECIAL NOTICE**

EFFECTIVE WITH 1999 DATA, CAUSE-OF-DEATH INFORMATION IS CLASSIFIED  
ACCORDING TO THE TENTH REVISION OF THE INTERNATIONAL  
CLASSIFICATION OF DISEASES (ICD-10)

EFFECTIVE WITH 1998 DATA, COMMONWEALTH OF THE NORTHERN  
MARIANAS' RECORDS ARE INCLUDED IN THE TERRITORIES'S  
PUBLIC USE DATA SET

This tape documentation was prepared in the Division of Vital Statistics. Gail Parr and Vanetta Harrington of the Systems, Programming, and Statistical Resources Branch were responsible for developing the mortality documentation. Sherry Murphy of the Mortality Statistics Branch coordinated preparation of the Technical Appendix. The Registration Methods Staff and the Data Acquisition and Evaluation Branch provided consultation to the State vital statistics offices regarding collection of death certificate data.

Questions concerning the documentation or general questions concerning the mortality data set should be directed to the Systems, Programming, and Statistical Resources Branch, Division of Vital Statistics, NCHS, 3311 Toledo Road, Room 7318, Hyattsville, MD 20782 (301-458-4420).

Questions concerning the introductory text, Technical Appendix or substantive questions concerning the mortality data should be directed to the Mortality Statistics Branch, Division of Vital Statistics, NCHS, 3311 Toledo Road, Room 7318, Hyattsville, MD 20782 (301-458-4666).

# **Documentation for the Mortality Public Use Data Set, 1999**

## **I. Introduction**

This document provides guidance in accessing and using the mortality public use data set for 1999. It also provides information on the classification structure and coding rules used to create each variable on the data set such that the user can readily access information at varying levels of detail to his/her own particular research. Additionally, it presents the characteristics of the underlying and multiple cause data to guide the user in analyzing and interpreting the data. The user is alerted to certain pitfalls of interpretation. The appropriateness of multiple cause data to given applications is also discussed. Tabular underlying and multiple cause data are provided (Control Total Tables in the back of the documentation) for comparison with user-generated counts for 1999 data.

**New variables.** Beginning in 1989 a number of variables were added to the data set as a result of the revision of the U.S. Standard Certificate of Death, recommended for State use beginning on January 1, 1989. A new item on educational attainment was added. Also, changes were made to improve the medical certification of cause of death. For the first time, the U.S. Standard Certificate of Death included a question on the Hispanic origin of the decedent. (Previously some States had included an Hispanic-origin identifier on their certificates.) The format of the item to obtain information on type of place of death was changed from an open-ended question to a checkbox.

**Geographic classification.** The Office of Management and Budget revised its designation of metropolitan statistical areas based on figures from the 1990 Census. For 1990 through 1993 data, the National Center for Health Statistics (NCHS) uses the revised definitions and codes as indicated in the listing of 320 Metropolitan Statistical Areas (MSAs), Primary Metropolitan Statistical Areas (PMSAs), and New England County Metropolitan Areas (NECMAs) (see documentation for those years). There are also 20 Consolidated Metropolitan Statistical Areas (CMSAs) which are made up of PMSAs. Because other geographic changes based on the 1990 Census became effective with 1994 data, the metropolitan statistical area designations were updated as well. Effective with 1994 data, there are 311 MSA's, PMSA's, and NECMA's; and 18 CMSA's as indicated in the listing included with this documentation.

**Data release policy.** Effective with vital events occurring in 1989, NCHS implemented a policy on the release of vital statistics unit record data to prevent the inadvertent disclosure of individuals and institutions. As a result, public use data sets for 1989 and later years do not contain the decedent's actual day of death or date of birth. Geographic detail is also restricted: only counties and cities of 100,000 or more population (based on the 1990 census), and metropolitan areas of 100,000 or more population (based on the 1990 census) are identified.

**Sample data.** With the exception of calendar years 1972, 1981 and 1982, all deaths occurring annually in the United States were processed. Due to resource constraints, in 1972, underlying and multiple cause data were coded and processed for 50 percent of the deaths occurring in each State. In 1981 and 1982, multiple cause data were coded on a 50-percent sample basis for deaths occurring in 19 registration areas which are identified in the documentation of the 1981 and 1982 data sets. For the remaining 33 registration areas, multiple cause data were processed on a 100-percent basis. In 1981 and 1982, underlying cause, demographic, and geographic data were processed for every death occurring in every State; however the multiple cause data contain only those records where the multiple cause field is also coded.

**Change in cause-of-death classification.** Effective with data year 1999, a revised classification system for coding causes of death was implemented in the United States: the Tenth Revision of the International Classification of Diseases (ICD-10) (1). Information about the new revision can be obtained at the following address:  
<http://www.cdc.gov/nchs/about/major/dvs/icd10des.htm>

## II. Underlying Cause of Death Data

Mortality statistics by cause of death are compiled from entries on the medical certification portion of the death certificate that follows the World Health Organization (WHO) format (1). Causes of death include "all those diseases, morbid conditions or injuries which either resulted in or contributed to death and the circumstances of the accident or violence which produced any such injuries" (1). The medical certification of death is divided into two sections. In Part I, the certifier is asked to provide the causal chain of morbid conditions that led to death, beginning with the condition most proximate to death on line (a) and working backwards to the initiating condition. The lines (a) through (d) in Part I are connected by the phrase "due to, or as a consequence of." They were designed to encourage the certifier to provide the causally related sequence of medical conditions that resulted in death. Thus, the condition on line (a) should be due to the condition on line (b), and the condition on line (b) should be a consequence of the condition on line (c), etc., until the full sequence is described back to the originating or initiating condition. If only one step in the chain of morbid events is recorded, a single entry on line (a) is adequate. Part I of the medical certification is designed to facilitate the selection of the underlying cause of death when two or more causes are recorded on the certificate. The underlying cause of death is defined as "(a) the disease or injury which initiated the train of morbid events leading directly to death, or (b) the circumstances of the accident or violence which produced the fatal injury" (1) and is generally considered the most useful cause from a public health standpoint. Part II solicits other conditions that the certifier believed contributed to death, but were not in the causal chain. Figure 1 shows the U.S. Standard Certificate of Death, 1989 Revision. While some details of the death certificate vary by State, all States use the same general format for medical certification outlined in the U.S. Standard Certificate. The U.S. Standard Certificate, in turn, closely follows the format recommended by the WHO.

Figure 1. U.S. Standard Certificate of Death, 1989 Revision

U.S. STANDARD CERTIFICATE OF DEATH					
LOCAL FILE NUMBER			STATE FILE NUMBER		
1. DECEDENT'S NAME (First, Middle, Last)      2. SEX      3. DATE OF DEATH (Month, Day, Year)					
4. SOCIAL SECURITY NUMBER      5a. AGE—Last Birthday (Years)      5b. UNDER 1 YEAR      5c. UNDER 1 DAY      6. DATE OF BIRTH (Month, Day, Year)      7. BIRTHPLACE (City and State or Foreign Country)					
8. WAS DECEDENT EVER IN U.S. ARMED FORCES? (Yes or no)      9a. PLACE OF DEATH (Check only one; see instructions on other side)      9b. FACILITY NAME (If not institution, give street and number)      9c. CITY, TOWN, OR LOCATION OF DEATH      9d. COUNTY OF DEATH					
10. MARITAL STATUS—Married, Never Married, Widowed, Divorced (Specify)      11. SURVIVING SPOUSE (If wife, give maiden name)      12a. DECEDENT'S USUAL OCCUPATION (Give kind of work done during most of working life. Do not use retired.)      12b. KIND OF BUSINESS/INDUSTRY					
13a. RESIDENCE—STATE		13b. COUNTY	13c. CITY, TOWN, OR LOCATION	13d. STREET AND NUMBER	
13e. INSIDE CITY LIMITS? (Yes or no)		13f. ZIP CODE	14. WAS DECEDENT OF HISPANIC ORIGIN? (Specify No or Yes—if yes, specify Cuban, Mexican, Puerto Rican, etc.) <input type="checkbox"/> No <input type="checkbox"/> Yes      Specify:	15. RACE—American Indian, Black, White, etc. (Specify)	16. DECEDENT'S EDUCATION (Specify only highest grade completed)      Elementary/Secondary (0-12)      College (1-4 or 5+)
17. FATHER'S NAME (First, Middle, Last)			18. MOTHER'S NAME (First, Middle, Maiden Surname)		
19a. INFORMANT'S NAME (Type/Print)			19b. MAILING ADDRESS (Street and Number or Rural Route Number, City or Town, State, Zip Code)		
20a. METHOD OF DISPOSITION <input type="checkbox"/> Burial <input type="checkbox"/> Cremation <input type="checkbox"/> Removal from State <input type="checkbox"/> Donation <input type="checkbox"/> Other (Specify)			20b. PLACE OF DISPOSITION (Name of cemetery, crematory, or other place)		20c. LOCATION—City or Town, State
21a. SIGNATURE OF FUNERAL SERVICE LICENSEE OR PERSON ACTING AS SUCH			21b. LICENSE NUMBER (of licensee)	22. NAME AND ADDRESS OF FACILITY	
Complete items 23a-c only when certifying physician is not available at time of death to certify cause of death.      23a. To the best of my knowledge, death occurred at the time, date, and place stated.      23b. LICENSE NUMBER      23c. DATE SIGNED (Month, Day, Year) Signature and Title ►					
24. TIME OF DEATH      M		25. DATE PRONOUNCED DEAD (Month, Day, Year)			26. WAS CASE REFERRED TO MEDICAL EXAMINER/CORONER? (Yes or no)
27. PART I. Enter the diseases, injuries, or complications that caused the death. Do not enter the mode of dying, such as cardiac or respiratory arrest, shock, or heart failure. List only one cause on each line. <b>IMMEDIATE CAUSE (Final disease or condition resulting in death)</b> → a.      DUE TO IDR AS A CONSEQUENCE OF: b.      DUE TO IDR AS A CONSEQUENCE OF: c.      DUE TO IDR AS A CONSEQUENCE OF: d.					
Approximate Interval Between Onset and Death					
28. PART II. Other significant conditions contributing to death but not resulting in the underlying cause given in Part I.      28a. WAS AN AUTOPSY PERFORMED? (Yes or no)      28b. WERE AUTOPSY FINDINGS AVAILABLE PRIOR TO COMPLETION OF CAUSE OF DEATH? (Yes or no)					
29. MANNER OF DEATH <input type="checkbox"/> Natural <input type="checkbox"/> Pending Investigation <input type="checkbox"/> Accident <input type="checkbox"/> Could not be Determined <input type="checkbox"/> Suicide <input type="checkbox"/> Homicide		30a. DATE OF INJURY (Month, Day, Year)	30b. TIME OF INJURY	30c. INJURY AT WORK? (Yes or no)	30d. DESCRIBE HOW INJURY OCCURRED M
30e. PLACE OF INJURY—At home, farm, street, factory, office building, etc. (Specify)      30f. LOCATION (Street and Number or Rural Route Number, City or Town, State)					
31a. CERTIFIER (Check only one) <input type="checkbox"/> CERTIFYING PHYSICIAN (Physician certifying cause of death when another physician has pronounced death and completed Item 23) To the best of my knowledge, death occurred due to the cause(s) and manner as stated.  <input type="checkbox"/> PRONOUNCING AND CERTIFYING PHYSICIAN (Physician both pronouncing death and certifying to cause of death) To the best of my knowledge, death occurred at the time, date, and place, and due to the cause(s) and manner as stated.  <input type="checkbox"/> MEDICAL EXAMINER/CORONER On the basis of examination and/or investigation, in my opinion, death occurred at the time, date, and place, and due to the cause(s) and manner as stated.					
31b. SIGNATURE AND TITLE OF CERTIFIER ►			31c. LICENSE NUMBER	31d. DATE SIGNED (Month, Day, Year)	
32. NAME AND ADDRESS OF PERSON WHO COMPLETED CAUSE OF DEATH (ITEM 27) (Type/Print)					
33. REGISTRAR'S SIGNATURE ►			34. DATE FILED (Month, Day, Year)		

PHS-T-003

## INSTRUCTIONS FOR SELECTED ITEMS

**Item 9. — Place of Death**

If the death was pronounced in a hospital, check the box indicating the decedent's status at the institution (inpatient, emergency room/outpatient, or dead on arrival (DOA)). If death was pronounced elsewhere, check the box indicating whether pronouncement occurred at a nursing home, residence, or other location. If other is checked, specify where death was legally pronounced, such as a physician's office, the place where the accident occurred, or at work.

**Items 13-a-f. — Residence of Decedent**

Residence of the decedent is the place where he or she actually resided. This is not necessarily the same as "home State," or "legal residence." Never enter a temporary residence such as one used during a visit, business trip, or a vacation. Place of residence during a tour of military duty or during attendance at college is not considered as temporary and should be considered as the place of residence.

If a decedent had been living in a facility where an individual usually resides for a long period of time, such as a group home, mental institution, nursing home, penitentiary, or hospital for the chronically ill, report the location of that facility in Items 13a through 13f.

If the decedent was an infant who never resided at home, the place of residence is that of the parent(s) or legal guardian. Do not use an acute care hospital's location as the place of residence for any infant.

**Items 23 and 31 — Medical Certification**

The PRONOUNCING PHYSICIAN is the person who determines that the decedent is legally dead but who was not in charge of the patient's care for the illness or condition which resulted in death. Items 23a through 23c are to be completed only when the physician responsible for completing the medical certification of cause of death (Item 27) is not available at time of death to certify cause of death. The pronouncing physician is responsible for completing only items 23 through 26.

The CERTIFYING PHYSICIAN is the person who determines the cause of death (Item 27). This box should be checked only in those cases when the person who is completing the medical certification of cause of death is not the person who pronounced death (Item 23). The certifying physician is responsible for completing items 27 through 32.

The PRONOUNCING AND CERTIFYING PHYSICIAN box should be checked when the same person is responsible for completing items 24 through 32; that is, when the same physician has both pronounced death and certified the cause of death. If this box is checked, items 23a through 23c should be left blank.

The MEDICAL EXAMINER/CORONER box should be checked when investigation is required by the Post Mortem Examination Act and the cause of death is completed by a medical examiner or coroner. The Medical Examiner/Coroner is responsible for completing items 24 through 32.

**Item 27. — Cause of Death**

The cause of death means the disease, abnormality, injury, or poisoning that caused the death, not the mode of dying, such as cardiac or respiratory arrest, shock, or heart failure.

In Part I, the immediate cause of death is reported on line (a). Antecedent conditions, if any, which gave rise to the cause are reported on lines (b), (c), and (d). The underlying cause, should be reported on the last line used in Part I. No entry is necessary on lines (b), (c), and (d) if the immediate cause of death on line (a) describes completely the train of events. ONLY ONE CAUSE SHOULD BE ENTERED ON A LINE. Additional lines may be added if necessary. Provide the best estimate of the interval between the onset of each condition and death. Do not leave the interval blank; if unknown, so specify.

In Part II, enter other important diseases or conditions that may have contributed to death but did not result in the underlying cause of death given in Part I.

See examples below.

SEE INSTRUCTIONS ON OTHER SIDE		<b>27. PART I.</b> Enter the disease, injury, or complications that caused the death. Do not enter the mode of dying, such as cardiac or respiratory arrest, shock, or heart failure. List only one cause on each line. <b>IMMEDIATE CAUSE (Final)</b> Disease or condition resulting in death →				a. <b>Rupture of myocardium</b> <small>DUE TO IOR AS A CONSEQUENCE OF:</small> b. <b>Acute myocardial infarction</b> <small>DUE TO IOR AS A CONSEQUENCE OF:</small> c. <b>Chronic ischemic heart disease</b> <small>DUE TO IOR AS A CONSEQUENCE OF:</small> d.		Approximate Interval Between Onset and Death  Mins.  6 days  5 years	
CAUSE OF DEATH		<b>PART II.</b> Other significant conditions contributing to death but not resulting in the underlying cause given in Part I. Diabetes, Chronic obstructive pulmonary disease, smoking				28a. WAS AN AUTOPSY PERFORMED? (Yes or no) Yes		28b. WERE AUTOPSY FINDINGS AVAILABLE PRIOR TO COMPLETION OF CAUSE OF DEATH? (Yes or no) Yes	
SEE INSTRUCTIONS ON OTHER SIDE		<b>29. MANNER OF DEATH</b> <input checked="" type="checkbox"/> Natural <input type="checkbox"/> Pending Investigation <input type="checkbox"/> Accident <input type="checkbox"/> Could not be Determined <input type="checkbox"/> Suicide <input type="checkbox"/> Homicide		30a. DATE OF INJURY (Month, Day, Year) 11/15/85	30b. TIME OF INJURY 1 p.m.	30c. INJURY AT WORK? (Yes or no) No	30d. DESCRIBE HOW INJURY OCCURRED 2-car collision—driver		
CAUSE OF DEATH		30e. PLACE OF INJURY—At home, farm, street, factory, office building, etc. (Specify) Street				30f. LOCATION (Street and Number or Rural Route Number, City or Town, State) Route 4, Raleigh, North Carolina			

SEE INSTRUCTIONS ON OTHER SIDE		<b>27. PART I.</b> Enter the disease, injury, or complications that caused the death. Do not enter the mode of dying, such as cardiac or respiratory arrest, shock, or heart failure. List only one cause on each line. <b>IMMEDIATE CAUSE (Final)</b> Disease or condition resulting in death →				a. <b>Cerebral laceration</b> <small>DUE TO IOR AS A CONSEQUENCE OF:</small> b. <b>Open skull fracture</b> <small>DUE TO IOR AS A CONSEQUENCE OF:</small> c. <b>Automobile accident</b> <small>DUE TO IOR AS A CONSEQUENCE OF:</small> d.		Approximate Interval Between Onset and Death  10 mins.  10 mins.  10 mins.	
CAUSE OF DEATH		<b>PART II.</b> Other significant conditions contributing to death but not resulting in the underlying cause given in Part I.				28a. WAS AN AUTOPSY PERFORMED? (Yes or no) No		28b. WERE AUTOPSY FINDINGS AVAILABLE PRIOR TO COMPLETION OF CAUSE OF DEATH? (Yes or no) No

CAUSE OF DEATH		30e. PLACE OF INJURY—At home, farm, street, factory, office building, etc. (Specify) Street				30f. LOCATION (Street and Number or Rural Route Number, City or Town, State) Route 4, Raleigh, North Carolina			

If the death certificate is properly completed, the disease or condition listed on the lowest used line in Part I is usually accepted as the underlying cause of death. This is an application of “The General Principle” (1). The General Principle is applied unless it is highly improbable that the condition on the lowest line used could have given rise to all of the diseases or conditions listed above it. In some cases, the sequence of morbid events entered on the death certificate is not specified correctly. A variety of errors may occur in completing the medical certification of death. Common problems include the following: The causal chain may be listed in reverse order; the distinction between Part I and Part II may have been ignored so that the causal sequence in Part I is simply extended into Part II; or the reported underlying cause is unlikely, in an etiological sense, to have caused the condition listed above it. In addition, sometimes the certifier attributes the death to uninformative causes such as “cardiac arrest” or “pulmonary arrest.”

To resolve the problems of incorrect or implausible cause-of-death statements, the WHO designed standardized rules to select an underlying cause of death from the information on the death certificate that is most informative from a public health perspective. The rules for the Tenth Revision, as updated by WHO since the publication of ICD-10 (1), are described in Part 2a of the NCHS Vital Statistics Instruction Manual Series, Instructions for Classifying the Underlying Cause of Death, 1999 (2). Coding rules beyond the General Principle are invoked if the cause-of-death section is completed incorrectly or application of the rules can improve the specificity and characterization of the cause of death in a manner consistent with the ICD. The rules are applied in two steps: selection of a tentative underlying cause of death, and modification of the tentative underlying cause in view of the other conditions reported on the certificate in either Part I or Part II. Modification involves several considerations by the medical coder: determining whether conditions in Part II could have given rise to the underlying cause, giving preference to specific terms over generalized terms, and creating linkages of conditions that are consistent with the terminology of the ICD.

Use of multiple-cause data requires an understanding of the content and structure of the death certificate (Figure 1). The cause-of-death section (Items 27 through 30f) provides the underlying cause of death, coded according to the ICD, and the multiple causes of death coded according to the algorithm developed by NCHS.

For a given death, the underlying cause is selected from the condition or conditions recorded by the certifier in the cause-of-death section of the death certificate. NCHS is bound by international agreement to use the ICD-10 classification structure, selection rules, and modification rules, in determining the underlying cause of death. These rules are incorporated in a computer software program called ACME (Automated Classification of Medical Entities). ACME does exactly what a coder would do to select the underlying cause of death. The ACME program has been used for final mortality data since 1968.

The WHO selection rules take into account the certifier’s ordering of conditions and their causal relationships to systematically identify the underlying cause of death. The intent

of these rules is to improve the usefulness of mortality statistics by giving preference to certain classification categories over others and consolidating two or more conditions on the certificate into a single classification category. Additional information on the history of cause-of-death statistics can be found in *History and organization of the vital statistics system* (3).

### **III. Multiple Cause-of-Death Data**

The limitations of the underlying cause concept and the need for more comprehensive data suggested the need for coding and tabulating all conditions listed on the death certificate. Coding all listed conditions on the death certificate was designed with two objectives in mind. The first objective was to facilitate studies of the relationships among conditions reported on the death certificate. This requires presenting each condition and its location on the death certificate in the exact manner given by the certifier. The second objective was to ensure that underlying cause-of-death would be coded according to WHO rules.

To develop multiple-cause data, two fields were created: 1) entity axis and 2) record axis. For entity axis, NCHS suspends the provisions of the ICD that create linkages between conditions for the purpose of coding each individual condition, or entity, with minimum regard to other conditions present on the death certificate. Record axis is designed for the generation of person-based multiple-cause statistics. Person-based analysis requires that each condition be coded within the context of every other condition on the same death certificate and modified or linked to such conditions as provided by ICD-10. By definition, the entity data cannot meet this requirement since the linkage provisions modify the character and placement of the information originally recorded by the certifier. Essentially, the axis of the classification has been converted from an entity basis to a record (or person) basis. The record axis codes are assigned in terms of the set of codes that best describe the overall medical certification portion of the death certificate.

This conversion is accomplished by a computer system called TRANSAX (Translation of Axis). TRANSAX selectively uses the traditional linkage and modification rules for mortality coding. Underlying cause linkages which simply prefer one code over another for purposes of underlying-cause selection are not included. Each entity code on the record is examined and modified or deleted as necessary to create a set of codes that are as precise and free of contradictions as possible within the constraints of ICD-10 and medical information on the record. Repetitive codes are deleted. The process may 1) combine two entity axis categories together to create a new category thereby eliminating a contradiction or standardizing the data; or 2) eliminate one category in favor of another to promote specificity of the data or resolve contradictions. The following examples from ICD-10 illustrate the effect of this translation:

Case 1: When reported on the same record as separate entities, "cirrhosis of liver" and "alcoholism" are coded to K74.6 (Other and unspecified cirrhosis of

liver) and F10.2 (Mental and behavioral disorders due to use of alcohol; dependence syndrome), respectively. Tabulation of records with K74.6 would imply that such records had no mention of alcohol. A preferable code would be K70.3 (Alcoholic cirrhosis of liver) in lieu of both K74.6 and F10.2.

Case 2: If “gastric ulcer” and “bleeding gastric ulcer” are reported on a record they are coded to K25.9 (Gastric ulcer, unspecified as acute or chronic, without mention of hemorrhage or perforation) and K25.4 (Gastric ulcer, chronic or unspecified with hemorrhage), respectively. A more concise code is K25.4 which shows both the gastric ulcer and the bleeding.

## A. Entity Axis Codes

The original conditions coded for selection of the underlying cause of death are reformatted and edited prior to creating the public use data set. The following paragraphs describe the format and application of entity axis data.

1. Format. Each entity-axis code is displayed as an overall seven byte code with subcomponents as follows:

1. Line indicator: The first byte represents the line of the death certificate on which the code appears. Six lines (1-6) are allowable with the fourth and fifth denoting an additional condition was written in beyond the four lines provided in Part I of the U.S. Standard Certificate of Death. Line "6" represents Part II of the death certificate.
2. Position indicator: The next byte indicates the position of the code on the line, i.e., it is the first (1), second (2), third (3) .... eighth (8) code on the line.
3. Cause category: The next four bytes represent the ICD-10 cause code.
4. The last byte is blank.

For multiple cause purposes, as many as twenty (20) seven byte codes are captured across all lines on a record with up to eight (8) codes on any given line. Codes may be omitted from one or more lines, e.g., line 1 with one or more codes, line 2 with no codes, line 3 with one or more codes.

In writing out these codes, they are ordered as follows: line 1 first code, line 1 second code, etc. ---- line 2 first code, line 2 second code, etc. ---- line 3 ---- line 4 ---- line 5 --- line 6. Any space remaining in the field is left blank. The specifics of locations are contained in the record layout given later in this document.

**2. *Edit.*** The original conditions are edited to remove invalid codes, reverify the coding of certain rare causes of death, and ensure age/cause and sex/cause compatibility. Detailed information on the edit criteria and sets of cause codes valid with underlying cause coding and multiple cause coding are provided in Part 11 of the NCHS Vital Statistics Instruction Manual Series, Computer Edits for Mortality Data, Effective 1999 (4). Control Total Table 1, *Number of Resident Deaths Tabulated by Mention of an Underlying Cause, Record Axis Multiple Cause, or Entity Axis Multiple Cause of Death by ICD-10 Category*, provides a summary list of valid underlying and multiple cause of death codes. The Control Total Tables are included in this documentation package.

**3. *Entity Axis Applications.*** The entity axis multiple cause data are appropriate for analyses that require each condition to be coded as an independent entity without linkage to other conditions and/or require information regarding the placement of such conditions on the death certificate. Within this framework, the entity data can be used to examine relationships among conditions and the validity of traditional assumptions in underlying cause selection. Additionally, the entity data provide, in certain categories, a more detailed code assignment than record axis data may not provide. Where such detail is needed, entity data should be used. Finally, the researcher may not wish to be bound by the assumptions used in the axis translation process.

The main limitation of entity axis data is that it may not reflect the best code for a condition when considered within the context of the medical certification as a whole. As a result, certain entity codes can be misleading or even contradict other codes in the record. For example, category K80.2 is titled “Calculus of gallbladder without cholecystitis.” Within the framework of entity codes this is interpreted to mean that cholecystitis was not mentioned in the codable entity rather than that cholecystitis was not mentioned anywhere on the record. Therefore, tabulation of records with K80.2 would not accurately reflect the number of decedents having Calculus of gallbladder without cholecystitis. This illustrates the fact that under entity coding the ICD-10 titles cannot be taken literally. Data users should study the rules for entity coding as they relate to his/her research prior to using entity data. Users are further cautioned that inclusion notes in ICD-10 which relate to modifying and combining categories are seldom applicable to entity coding (except where provided in Part 2b of the Vital Statistics Instruction Manual Series, Instructions for Classifying Multiple Cause-of-Death, 1999) (5).

Entity axis data can be tabulated by 1) counting codes using an individual code to represent the number of times the condition(s) appears in the data set. In this kind of tabulation, counts among categories may be added together to produce counts for groups of codes. 2) Counting persons having mention of the disease represented by a code or codes. This method is subject to the aforementioned limitations and counts for individual codes cannot be added to create counts for groups of codes. Since more than one code of interest may appear on the certificate, summing of codes must account for higher order interactions among codes. Up to 20 codes may be assigned on a record; therefore, a 20-way interaction is theoretically possible. All summing of codes must be based on mention of one or more of the categories under investigation.

## B. Record Axis Codes

The following paragraphs describe the format and application of record-axis data. Part 2f of the Vital Statistics Instruction Manual Series (ICD-10 TRANSAX Disease Reference Tables for classifying Multiple Causes-of-Death, 1999) (6) describes the TRANSAX process for creating record axis data from entity axis data.

**1. Format.** Each record (or person) axis code is displayed in five bytes. Location information is not relevant. The code consists of the following components:

1. Cause category: The first four bytes represent the ICD-10 cause code.
2. The last byte is blank.

Again, a maximum of 20 codes are captured on a record for multiple cause purposes. The codes are written in a 100-byte field in ascending order according to code number (5 bytes) with any unused bytes left blank.

**2. Edit.** The record axis codes are edited for rare causes and age/cause and sex/cause compatibility. Likewise, individual code validity is checked. The set of codes valid for record axis coding is the same as it is for entity coding.

**3. Record Axis Applications.** The record axis multiple cause data are the basis for NCHS core multiple cause tabulations. Location of codes is not relevant to this data, and conditions have been linked into the most meaningful categories for the certification. As a result, codes on the record already represent mention of a disease assignable to that particular ICD-10 category. This is in contrast to the entity code which is assigned each time such a disease is reported on different lines of the certification. The linkage implies that, within the constraints of ICD-10, the most meaningful code has been assigned. The translation process generates a data set that has been edited for contradictions, duplicate codes, and imprecisions. In contrast to entity axis data, record axis data are classified in a manner comparable to underlying cause-of-death classification thereby facilitating joint analysis of these variables. A potential disadvantage of record axis data is that some detail is sacrificed in a number of the linkages.

The record axis codes literally represent the information conveyed in ICD-10 category titles. While knowledge of the rules for combining, linking and coding conditions is useful, it is not a prerequisite to meaningful analysis of the data as long as one is willing to accept the assumptions of the axis translation process. Users are cautioned, however, that because of special rules in mortality coding, not all linkage notes in ICD-10 are used. (See Part 2f of the Vital Statistics Instruction Manual Series) (6).

Data users should proceed with caution in using record axis data to count conditions as opposed to people with conditions, since linkages have been invoked and duplicate codes have been eliminated. As with entity data, person-based tabulations that combine

individual cause categories must take into account the possible interaction of up to 20 codes on a single certificate.

#### **IV. Data Set Characteristics**

Each record on the annual data set contains underlying cause (coded using ICD-10), demographic, and geographic detail and two multiple cause-of-death fields coded using ICD-10. The data sets contain the complete level of detail coded by NCHS except where precluded by confidentiality restrictions or lack of data reliability. Specifications for the 1999 data set are as follows:

File Organization: Multiple files  
Record Type: Blocked, fixed format  
Record Length: 440  
Blocksize: 26400

#### **U.S. DATA SET:**

1. Record count:	2,394,871
2. Data counts:	a. By occurrence: 2,394,871
	b. By residence: 2,391,399
	c. To foreign residents: 3,472

#### **PUERTO RICO, VIRGIN ISLANDS, GUAM, AMERICAN SAMOA AND NORTHERN MARIANAS DATA SET:**

1. Record count:	30,931
------------------	--------

#### **PUERTO RICO:**

2. Data counts:	a. By occurrence: 29,145
	b. By residence: 28,967

#### **VIRGIN ISLANDS:**

2. Data counts:	a. By occurrence: 654
	b. By residence: 659

#### **GUAM:**

2. Data Counts:	a. By occurrence: 724
	b. By residence: 693

**AMERICAN SAMOA:**

2. Data Counts:	a. By occurrence:	246
	b. By residence:	246

**NORTHERN MARIANAS:**

2. Data Counts:	a. By occurrence:	162
	b. By residence:	162

1. The data were processed using the PL/1 language on an IBM 3090-200J.
2. The last block for the data year may be a short block.
3. The data are recorded in IBM/EBCDIC 8-bit code for each character.
4. Codes may be numeric, alphabetic, or blank (Hex 40).
5. A code "z" is the EBCDIC code for the letter "z".
6. A code "&" is the EBCDIC code for an ampersand (a punched card code 12).

**V. Tape Format and Variable Definition**

The attached record layout provides documentation of variables, variable categories, and variable location on the mortality public use data sets. It is noted that the following material, while used in the processing of mortality data, is not included in this package:

International Statistical Classification of Diseases and Related Health Problems, Tenth Revision (ICD-10) (1)

NCHS Instruction Manual Part 2a, Instructions for Classifying the Underlying Cause-of-Death, 1999 (2)

NCHS Instruction Manual Part 2b, Instructions for Classifying Multiple Cause-of-Death, 1999 (5)

NCHS Instruction Manual Part 2c, ICD-10 ACME Decision Tables for Classifying Underlying Causes-of-Death, 1999 (7)

NCHS Instruction Manual Part 2d, NCHS Procedures for Mortality Medical Data System File Preparation and Maintenance, Effective 1999 (8)

NCHS Instruction Manual Part 2f, ICD-10 TRANSAX Disease Reference Tables for Classifying Multiple Causes-of-Death, 1999 (6)

NCHS Instruction Manual Part 4, Demographic Classification and Coding Instructions for Death Records, 1999 (9)

NCHS Instruction Manual Part 11, Computer Edits for Mortality Data, Effective 1999 (4)

These documents describe in detail the rules employed for demographic and medical classification on death records. Volumes 1, 2 and 3 of the ICD-10 may be purchased from the World Health Organization (WHO) Publication Center USA, 49 Sheridan Avenue, Albany, New York, 12210 (<http://www.who.int/whosis/icd10/index.html>). An electronic version of WHO's ICD-10 can be found at

<http://www3.who.int/icd/vol1htm2003/fr-icd.htm> The remaining documents, while not absolutely essential to the proper interpretation of the data for a number of general applications, should nevertheless be studied carefully prior to any detailed analysis of demographic or medical data variables. In particular, there are a number of exceptions to the ICD rules in multiple cause-of-death coding which, if not treated properly, may result in faulty analysis of the data.

Users who do not already have access to these documents may request them from the Chief, Mortality Medical Classification Branch, Division of Vital Statistics, National Center for Health Statistics, P.O. Box 12214, Research Triangle Park, North Carolina 27709.

In addition, the user should refer to the Technical Appendices of the Vital Statistics of the United States for information on the source of data, coding procedures, quality of the data, etc. Technical Appendix information is enclosed and can also be found at the following address: <http://www.cdc.gov/nchs/about/major/dvs/mortdata.htm>

## **VI. Additional Information**

In using the NCHS mortality public use data set, the user is urged to review the information in this document and its references. The instructional material changes from year to year and from ICD revision to ICD revision. The user is cautioned that coding of specific ICD-10 categories should be checked in the appropriate instruction manual. What may appear on the surface to be the correct code by ICD-10 may, in fact, not be correct as given in the instruction manuals.

If, on the surface, it is not obvious whether entity axis or record axis data should be employed in a given application, detailed examination of Part 2f of the Vital Statistics Instruction Manual Series and its attachments will probably provide the necessary information to make a decision. Part 2f will enable the user to determine the extent of the trade-offs between the two sets of data in terms of specific categories and the assumption of axis translation. In certain situations, a combination of entity and record axis data may be the more appropriate alternative.

Several basic tabulations of data from selected variables contained on this data set have been produced and are included with this document as an aid to the user in determining if his/her own tabulations are correct. For verification of multiple cause-of-death data at the “each cause” level of detail, Control Total Table 1 provides counts of the number of deaths for which a given ICD-10 category is mentioned as the underlying cause-of-death, a record axis multiple cause-of-death, and an entity axis multiple cause-of-death, respectively. The counts for the record axis multiple cause-of-death field are divided into two distinct subtotals: 1) “total mention” and 2) “secondary”. Secondary is defined as any code which is present in the record axis field but is not the underlying cause-of-death. Control Total Tables 2-5 provide additional control totals for the three cause-of-death fields by age, race, and sex. Control Total Tables 1-5 are based on resident deaths in the United States (excludes deaths to non-residents). Control Total Table 6 is based upon deaths occurring in the United States (includes deaths to foreign residents).

For help with questions concerning multiple cause-of-death analysis, please refer to references 10-13.

When further analytical assistance is needed, contact the Mortality Statistics Branch, Division of Vital Statistics, NCHS, 3311 Toledo Road, Room 7318, Hyattsville, Maryland 20782, Telephone (301) 458-4666. For technical assistance pertaining to the creation of the mortality public use data set, contact Chief, Mortality Medical Classification Branch, Division of Vital Statistics, NCHS, P.O. Box 12214, Research Triangle Park, North Carolina 27709.

## VI. List of File Data Elements and Tape Locations

Data Items	Tape Locations
1. General	
a. Record Type	19
b. Resident status	20
c. Place of death and decedent=s status	75
d. Day of week of death	83
e. Date of data receipt	110-114
f. Data year	115-118
g. <b>Manner of death</b>	<b>139</b>
h. <b>Activity code</b>	<b>140</b>
i. <b>Place of injury</b>	<b>141</b>
2. Occurrence	
a. Reporting Area	3
b. State	21-22,28
c. Expanded State	29-30
d. County	23-25
e. County Population size	49
f. Region	26
g. Division	27
h. FIPS State	119-120
i. FIPS County	121-123
3. Residence	
a. State	31-32,43
b. Expanded State	44-45
c. County	33-35
d. County Population size	50
e. City	36-38
f. City Population size	39
g. Met/Nonmet county	40
h. Region	41
i. Division	42
j. PMSA/MSA	46-48
k. PMSA/MSA Population size	51
l. FIPS State	124-125
m. FIPS County	126-128
n. FIPS Place	97-101
o. FIPS PMSA/MSA	129-132
p. FIPS CMSA	134-135
4. The Decedent	
a. Month of Death	55-56
b. Sex	59
c. Race	60-63
d. Age	64-74
e. Marital status	77
f. State of birth	78-79
g. Hispanic origin	80-81,82
h. Kind of Business or Industry	85-87
i. Usual Occupation	88-90

j. Education 52-53,54  
Data Items-Con.

5.	Underlying Cause	
a.	<b>ICD-10 code</b>	142-145
b.	<b>358 cause recode</b>	<b>146-148</b>
c.	<b>113 cause recode</b>	151-153
d.	<b>130 cause recode</b>	154-156
e.	<b>39 cause recode</b>	<b>157-158</b>
f.	<b>Place of injury</b>	141
g.	Injury at work	136

6. Multiple Conditions

a.	Entity-Axis conditions	
1.	Number of	160-161
2.	The conditions	162-301
h.	Record-Axis conditions	
1.	Number of	338-339
2.	The conditions	341-440

## **Vital Statistics Geographic Code Outline for the United States**

The following pages show in detail the geographic codes used by the Division of Vital Statistics in the processing of vital event data occurring in the United States. When an event occurs to a nonresident of the United States, residence data are coded only to the "State" level; several western hemisphere countries or the remainder of the world are uniquely identified. Along with the Division of Vital Statistics codes, the Federal Information Processing Standards (FIPS) codes are shown for several items. Both sets of codes appear on the vital event public-use files. Codes are effective with the 1998 data year and are based on the 1990 Census.

To aid the user in interpreting the geographic codes, a brief explanation of the codes and of the column headings/abbreviations shown on the following pages are:

**State (St):** Each State and the District of Columbia are numbered alphabetically. In addition, several unique codes are used to identify nonresidents of the U.S.

**County (Cnty):** Counties and county equivalents (independent and coextensive cities) are numbered alphabetically within each state.

**P/MSA:** Primary metropolitan statistical areas and metropolitan statistical areas are those established by the U.S. Office of Management and Budget (OMB) using 1990 Census population counts. For New England, the New England County Metropolitan Areas (NECMA) are used.

**M/NM:** Metropolitan counties (code 1) are component counties of P/MSA's. Nonmetropolitan counties (code 2) are not part of any P/MSA.

**City or Place:** Cities/Places are numbered alphabetically within each State and identify each city with a population of 10,000 or more in 1990.

**P/S:** Population size code for city/place of residence based on the 1990 Census. Refer to the code outline given earlier in this document for specific codes and meanings.

**Name:** Each State, county, and city name is listed along with its respective code. In addition, places used to identify nonresidents of the U.S. are also listed along with their codes.

**FIPS:** For an explanation of FIPS codes, reference should be made to various National Institute of Standards and Technology (NIST) publications.

So! How do I find Yavapai county, Arizona; or Tupelo city, Mississippi?

Since counties and cities/places are numbered within State, the State and county or the State and city/places codes must be used to select these areas. It is most helpful if the county is known when looking for a particular city since areas are shown by State, county, and city/place.

Yavapai county, Arizona - State and county codes NCHS: 03 014; FIPS: 04 025.

Tupelo, Mississippi - State and city/place codes NCHS: 25 032; FIPS: 28 74840; or State, county, city/place codes NCHS: 25 041 032; FIPS: 28 081 74840.

**Vital Statistics Geographic Code Outline for Puerto Rico, Virgin Islands, Guam, American Samoa and Northern Marianas**

The following pages show in detail the geographic codes used by the Division of Vital Statistics in the processing of vital event data occurring in Puerto Rico, Virgin Islands, Guam, American Samoa or Northern Marianas. When an event occurs to a nonresident of these areas, residence data are coded only to the "State" level; each U.S. state, several western hemisphere countries or the remainder of the world are uniquely identified. Along with the Division of Vital Statistics codes, the Federal Information Processing Standards (FIPS) codes are shown for several items. Both sets of codes appear on the vital event public-use files. Codes are effective with the 1998 data year and are based on results of the 1990 Census.

To aid the user in interpreting the geographic codes, a brief explanation of the codes and of the column headings/abbreviations shown on the following pages are:

**Puerto Rico:**

State (St): Puerto Rico has its own unique code. In addition, several unique codes are used to identify nonresidents of Puerto Rico.

County (Cnty): Each municipio (county equivalent) is numbered alphabetically.

P/MSA: Primary metropolitan statistical areas and metropolitan statistical areas are those established by the U.S. Office of Management and Budget (OMB) using 1990 Census population counts.

M/NM: Metropolitan counties (code 1) are component counties of P/MSA's Nonmetropolitan counties (code 2) are not part of any P/MSA.

City or Place: No city/places in Puerto Rico are identified.

Name: Puerto Rico and each municipio are listed along with their respective codes. In addition, places used to identify nonresidents of Puerto Rico are also listed along with their codes.

FIPS: For an explanation of FIPS codes, reference should be made to various National Institute of Standards and Technology (NIST) publications.

**Virgin Islands:**

State (St): The Virgin Islands has its own unique code. In addition, several unique codes are used to identify nonresidents of the V.I.

County (Cnty): Several Islands (county equivalent) are numbered alphabetically.

P/MSA: None are identified in the Virgin Islands.

M/NM: No metropolitan areas are identified for the Virgin Islands.

City or Place: City/places are numbered alphabetically and identify each city with a population of 10,000 or more in 1990.

P/S: Population size code for city of residence based on the 1990 Census. Refer to the code outline given earlier in this document for specific codes and meanings.

Name: The Virgin Islands as a whole and several islands are listed along with their respective codes. In addition, places used to identify nonresidents of the V.I. are also listed along with their codes.

**Vital Statistics Geographic Code Outline for Puerto Rico,  
Virgin Islands, Guam, American Samoa and Northern Marianas- Con.**

**Guam:**

State (St): Guam has its own unique code. In addition, several unique codes are used to identify nonresidents of Guam.

County (Cnty): None are identified in Guam.

P/MSA: None are identified in Guam.

M/NM: No metropolitan areas are identified for Guam.

City or Place: None are identified in Guam.

P/S: No population size groups are identified for Guam.

Name: Guam as a whole is listed along with its respective code. In addition, places used to identify nonresidents of Guam are also listed along with their codes.

**American Samoa:**

State (St): American Samoa has its own unique code. In addition, several unique codes are used to identify nonresidents of American Samoa.

County (Cnty): None are identified in American Samoa.

P/MSA: None are identified in American Samoa.

M/NM: No metropolitan areas are identified for American Samoa.

City or Place: None are identified in American Samoa.

P/S: No population size groups are identified for American Samoa.

Name: American Samoa as a whole is listed along with its respective code. In addition, places used to identify nonresidents of American Samoa are also listed along with their codes.

**Northern Marianas:**

State (St): Northern Marianas has its own unique code. In addition, several unique codes are used to identify nonresidents of Northern Marianas

County (Cnty): None are identified in Northern Marianas.

P/MSA: None are identified in Northern Marianas.

M/NM: No metropolitan areas are identified for Northern Marianas.

City or Place: None are identified in Northern Marianas.

P/S: No population size groups are identified for Northern Marianas.

Name: Northern Marianas as a whole is listed along with its respective code. In addition, places used to identify nonresidents of Northern Marianas are also listed along with their codes.

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

## ACKNOWLEDGMENTS

The technical appendix preparation was coordinated by Sherry L. Murphy in the Division of Vital Statistics under the general direction of Harry M. Rosenberg, Special Assistant for International Mortality Statistics. The vital statistics computer files on which it is based were prepared by staff from the Division of Vital Statistics, Division of Data Processing, Division of Data Services, and the Office of Research and Methodology.

The Division of Vital Statistics, Mary Anne Freedman, Director, and James A. Weed, Deputy Director, managed the Vital Statistics Cooperative Program, through which the vital registration offices of all States, the District of Columbia, New York City, Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands provided the data to the National Center for Health Statistics. This Division also received and processed the basic data file, processed computer edits, designed and programmed the tabulations, reviewed the data, and prepared documentation for this publication. The following staff provided overall direction: Ronald F. Chamblee, George A. Gay, Donna E. Glenn, Nicholas F. Pace, and Harry M. Rosenberg. Important contributors were Tyringa L. Ambrose, Robert N. Anderson, Rosalyn R. Anderson, Elizabeth Arias, Judy M. Barnes, Joyce L. Bius, Brenda L. Brown, Frances E. Carter, Shirley Carter, Faye Cavalchire, Celia Dickens, Linda P. Currin, Thomas D. Dunn, Brenda A. Green, Connie M. Gentry, Lillian M. Guettler, James Herndon, Donna L. Hoyert, Christina K. Jarman, Millie B. Johnson, David W. Justice, Virginia J. Justice, Kenneth D. Kochanek, Julia L. Kowaleski, Mary Susan Lippincott, Denise Little, Jeffrey D. Maurer, Susan L. McBroom, Arialdi M. Minino; Sherry L. Murphy, Gail A. Parr, Rodney Pierson, Tanya Pitts, Seth J. Preslar, Barbara Porterfield, Phyllis Powell-Hobgood, Julia E. Raynor, Adrienne L. Rouse, Charles E. Royer, Jordan Sacks, Eldora Smith, Pamela A. Stephenson, Leslie J. Stewart, Betsy B. Thompson, George C. Tolson, Mary M. Trotter, Teresa M. Watkins, Faye L. Webster, Francine D. Winter, Mary Whitley, Dora B. Wilkerson, Cynthia Williams, and James G. Williams.

The Office of Research and Methodology was responsible for the application of mathematical statistics methods to the development and implementation of quality assurance procedures. Important contributions in this area were made by Van L. Parsons.

The National Center for Health Statistics acknowledges the essential role of the vital registration offices of all States and territories in maintaining the system through which vital statistics data are obtained and for their cooperation in providing the information on which this publication is based.

A copy of the technical appendix may be obtained by contacting the National Center for Health Statistics, Mortality Statistics Branch at 301-458-4666.

**TECHNICAL APPENDIX**

## Sources of data

### Mortality statistics

Mortality statistics for 1999 are, as for all previous years except 1972, based on information from records of all deaths occurring in the United States.

The death-registration system of the United States encompasses the 50 States, the District of Columbia, New York City (which is independent of New York State for the purpose of death registration), Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands (Northern Marianas). In statistical tabulations, United States refers only to the aggregate of the 50 States (including New York City) and the District of Columbia. Data for Guam, Puerto Rico, Virgin Islands, American Samoa, and Northern Marianas are presented separately from data for the United States.

The Virgin Islands was admitted to the registration area for deaths in 1924; Puerto Rico, in 1932; and Guam, in 1970. Tabulations of death statistics for Puerto Rico and the Virgin Islands were regularly shown in *Vital Statistics of the United States* from the year of their admission through 1971 except for the years 1967-69, and tabulations for Guam were included for 1970 and 1971. Death statistics for Puerto Rico, the Virgin Islands, and Guam were not included in *Vital Statistics of the United States* for 1972 but have been included each year since 1973. Information for 1972 for these three areas was published in the respective annual vital statistics reports of the Department of Health of the Commonwealth of Puerto Rico, the Department of Health of the Virgin Islands, and the Department of Public Health and Social Services of the Government of Guam. Death statistics are available for American Samoa beginning with data year 1997 and for Northern Marianas beginning with data year 1998.

Procedures used by NCHS to collect death statistics have changed over the years. Before 1971 tabulations of deaths were based solely on information obtained by NCHS from copies of the original certificates. The information from these copies was edited, coded, and tabulated. For 1960-70 all mortality information taken from these records was transferred by NCHS to magnetic tape for computer processing.

Beginning with 1971 an increasing number of States have provided NCHS, via the Vital Statistics Cooperative Program (VSCP), with electronic files of data coded according to NCHS specifications. The year in which State-coded demographic data were first transmitted in electronic data files to NCHS is shown below for each of the States, New York City, the District of Columbia, Puerto Rico, and the Virgin Islands, all of which now furnish demographic or nonmedical data in electronic data files.

1971	Florida	1972	Maine Missouri New Hampshire Rhode Island Vermont	1973	Colorado Michigan New York (except New York City)
1974	Illinois Iowa Kansas Montana Nebraska Oregon South Carolina	1975	Louisiana Maryland North Carolina Oklahoma Tennessee Virginia Wisconsin	1976	Alabama Kentucky Minnesota Nevada Texas West Virginia

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

1977	1978	1979
Alaska	Indiana	Connecticut
Idaho	Utah	Hawaii
Massachusetts	Washington	Mississippi
New York City		New Jersey
Ohio		Pennsylvania
Puerto Rico		Wyoming
1980	1982	1985
Arkansas	North Dakota	Arizona
New Mexico		California
South Dakota		Delaware
		Georgia
		District of Columbia
1994		
Virgin Islands		

For Guam, American Samoa, and Northern Marianas, mortality statistics are based on information obtained directly by NCHS from copies of the original certificates received from the registration office of each respective territory.

In 1974 States began coding medical (cause-of-death) data in electronic data files according to NCHS specifications. The year in which State-coded medical data were first transmitted to NCHS is shown below for the 43 States now furnishing such data. In 1999 Maine and Montana contracted with a private company to provide precoded medical data to NCHS. The remaining 7 VSCP States, New York City, the District of Columbia, Puerto Rico, the Virgin Islands, Guam, American Samoa, and Northern Marianas submitted copies of the original certificates from which NCHS coded the medical data.

1994 Oklahoma Rhode Island	1995 New Mexico	1996 Utah
1998 Tennessee		

For 1999 and previous years except 1972, NCHS coded the medical information from copies of the original certificates received from the registration offices for all deaths occurring in those States that were not furnishing NCHS with medical data coded according to NCHS specifications. For 1981 and 1982, these procedures were modified because of a coding and processing backlog resulting from personnel and budgetary restrictions. To produce the mortality files on a timely basis with reduced resources, NCHS used State-coded underlying cause-of-death information supplied by 19 States for 50 percent of the records; for the other 50 percent of the records for these States as well as for 100 percent of the records for the remaining 21 registration areas, NCHS coded the medical information. Mortality statistics for 1972 were based on information obtained from a 50-percent sample of death records instead of from all records as in other years. The sample resulted from personnel and budgetary restrictions. Sampling variation associated with the 50-percent sample is described in "Estimates of errors arising from 50-percent sample for 1972" under "Quality control procedures."

### **Standard certificate**

For many years, the U.S. Standard Certificate of Death, issued by the Department of Health and Human Services, has been used as the principal means to attain uniformity in the contents of documents used to collect information on these events. It has been modified by each State to the extent required by the particular needs of the State or by special provisions of State vital statistics laws. However, the certificates of most States conform closely in content and arrangement to the standards.

The first issue of the U.S. Standard Certificate of Death appeared in 1900. Since then, it has been revised periodically by NCHS and its predecessors through consultation with State health officers and registrars; Federal agencies concerned with vital statistics; national, State, and county medical societies; and others working in such fields as public health, social welfare, demography, and insurance. This revision procedure has ensured careful evaluation of each item in terms of its current and future usefulness for legal, medical and health, demographic, and research purposes. New items have been added when necessary, and old items have been modified to ensure better reporting; or in some cases, items have been dropped when their usefulness appeared to be limited.

The current version of the U.S. Standard Certificate of Death was recommended for State use beginning on January 1, 1989. The U.S. Standard Certificate of Death is shown in figure 1 on page 44 (1).

### **History**

The first death statistics published by the Federal Government concerned events in 1850 and were based on statistics collected during the decennial census of that year. In 1880 a national "registration area" was created for deaths. Originally, this area consisted of Massachusetts, New Jersey, the District of Columbia, and several large cities that had efficient systems for death registration. The death-registration area continued to expand until 1933, when it included for the first time the entire United States. Tables showing data for death-registration States include the District of Columbia for all years; registration cities in nonregistration States are not included. For more details on the

## VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999

### TECHNICAL APPENDIX

history of the death-registration area, see *U.S. Vital Statistics System: Major Activities and Developments, 1950-95* (2).

## Classification of data

Vital statistics data is presented in terms of both frequencies and rates which are classified according to demographic variables such as geographic area, age, sex, and race. Since the calculation of rates requires population data, both vital statistics and population data must be classified and tabulated in comparable groups. The general rules used in the classification of geographic and personal items for deaths for 1999 are set forth in the NCHS instruction manual, Part 4 (3). A discussion of the classification of certain important items is presented below.

### Classification by occurrence and residence

Tabulations for the United States and specified geographic areas are classified by place of residence unless stated as by place of occurrence. Before 1970 resident mortality statistics for the United States included all deaths occurring in the States and the District of Columbia, with deaths of nonresidents assigned to place of death. Then beginning in 1970, deaths of nonresidents of the United States were excluded from resident mortality data for the United States.

For 1999, deaths of nonresidents for the United States (50 States and the District of Columbia) refers to deaths that occur in the 50 States and the District of Columbia of nonresident aliens; nationals residing abroad; and residents of Puerto Rico, the Virgin Islands, Guam, American Samoa, Northern Marianas, and other territories of the United States. Similarly, for Puerto Rico, Virgin Islands, American Samoa, and Northern Marianas, deaths of nonresidents refers to deaths that occurred to a resident of any place other than Puerto Rico, Virgin Islands, American Samoa, and Northern Marianas, respectively. For Guam, however, deaths of nonresidents refers to deaths that occurred to a resident of any place other than Guam or the United States. Beginning with 1970, deaths of nonresidents are not included in tables by place of residence. If place of residence is not stated or unknown on the death certificate, then place of residence is assigned to the place where the death occurred.

Deaths by place of occurrence, on the other hand, include deaths of both residents and nonresidents of the United States. Consequently, for each year beginning with 1970, the total number of deaths in the United States by place of occurrence was somewhat greater than the total by place of residence. For 1999 this difference amounted to 3,472 deaths.

Before 1970, except for 1964 and 1965, deaths of nonresidents of the United States occurring in the United States were treated as deaths of residents of the exact place of occurrence, which in most instances was an urban area. In 1964 and 1965, deaths of nonresidents of the United States occurring in the United States were allocated as deaths of residents of the balance of the county in which they occurred.

*Residence error*--Results of a 1960 study showed that the classification of residence information on the death certificates corresponded closely to the residence classification of the census records for the decedents whose records were matched (4).

A recent review of infant mortality rates for major urban areas suggests that the problem of residence error persists in vital statistics data despite the presence of an item on the U.S. Standard certificates of birth and death that asks whether residence was inside or outside city limits. Full resolution of this problem may require the application of automated systems for assigning addresses to geopolitical units.

### Geographic classification

The rules followed in the classification of geographic areas for deaths are contained in NCHS instruction manual, Part 4 (3). The geographic codes assigned by NCHS on birth and death records are given in NCHS instruction manual Part 8 (5). Beginning with 1994 data, the geographic codes were modified to reflect results of the 1990 census. For 1982-93 codes are based on the results of the 1980 census and for 1970-81 on the 1970 census.

*Metropolitan statistical areas*--The Metropolitan statistical areas (MSA's) and Primary metropolitan statistical areas (PMSA's) are those established by the U.S. Office of Management and Budget as of April 1, 1990, and used by the U.S. Bureau of the Census (6), except in the New England States.

Outside the New England States, an MSA has either a city with a population of at least 50,000 or a U.S. Bureau of the Census urbanized area of at least 50,000 and a total MSA population of at least 100,000. A PMSA consists of a

## VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999

### TECHNICAL APPENDIX

large urbanized county or cluster of counties that demonstrate very strong internal economic and social links and has a population over one million. When PMSA's are defined, the larger area of which they are component parts is designated a Consolidated Metropolitan Statistical Area (CMSA) (7).

In the New England States, the U.S. Office of Management and Budget uses towns and cities rather than counties as geographic components of MSA's and PMSA's. However, NCHS cannot use this classification for these States because its data are not coded to identify all towns. Instead, NCHS uses New England County Metropolitan Areas (NECMA's). Made up of county units, these areas are established by the U.S. Office of Management and Budget (8).

*Metropolitan and nonmetropolitan counties*--Independent cities and counties included in MSA's and PMSA's or in NECMA's are included in data for metropolitan counties; all other counties are classified as nonmetropolitan.

*Population-size groups*--Beginning with the 1994 data year, vital statistics data for cities and certain other urban places were classified according to the population enumerated in the 1990 Census of Population. Data are available for individual cities and other urban places of 10,000 or more population. As a result of changes in the enumerated population between 1980 and 1990, some urban places are no longer identified separately and other urban places have been added. Data for the remaining areas not separately identified appear under the heading "balance of area" or "balance of county." For the years 1982-93 classification of areas was determined by the population enumerated in the 1980 Census of Population and for the years 1970-81 in the 1970 Census of Population.

Urban places other than incorporated cities include the following:

- Each town in New England, New York, and Wisconsin and each township in Michigan, New Jersey, and Pennsylvania that had no incorporated municipality as a subdivision and had either 25,000 inhabitants or more, or a population of 10,000 to 25,000 and a density of 1,000 persons or more per square mile.
- Each county in States other than those indicated above that had no incorporated municipality within its boundary and had a density of 1,000 persons or more per square mile. (Arlington County, Virginia, is the only county classified as urban under this rule.)
- Each place in Hawaii with a population of 10,000 or more. (There are no incorporated cities in the State.)

Before 1964 places were classified as "urban" or "rural." Technical appendixes for earlier years discuss the previous classification system.

### **State or country of birth**

Mortality statistics by State or country of birth became available beginning with 1979. State or country of birth of a decedent is assigned to 1 of the 50 States or the District of Columbia; or to Puerto Rico, the Virgin Islands, Guam, American Samoa, or Northern Marianas--if specified on the death certificate. The place of birth is also tabulated for Canada, Cuba, Mexico, and for the remainder of the world. Deaths for which information on State or country of birth was unknown, not stated, or not classifiable accounted for a small proportion of all deaths in 1999, about 0.6 percent.

Early mortality reports published by the U.S. Bureau of the Census contained tables showing nativity of parents as well as nativity of decedent. Publication of these tables was discontinued in 1933. Mortality data showing nativity of decedent were again published in annual reports for 1939-41 and for 1950.

### **Age**

The age recorded on the death certificate is the age at last birthday, the same as the age classification used by the U.S. Bureau of the Census. For 1999 data, 356 resident death records (0.01 percent) contained not-stated age. For computation of age-specific and age-adjusted death rates, deaths with age not stated are excluded. For life table computation, deaths with age not stated are distributed proportionately among age categories.

### **Race**

For vital statistics in the United States in 1999, deaths are classified by race--white, black, American Indian, Chinese, Hawaiian, Japanese, Filipino, and Other Asian or Pacific Islander. Beginning with 1992 data, an expanded code structure was used for seven States--California, Hawaii, Illinois, New Jersey, New York, Texas, and Washington--showing five additional Asian or Pacific Islander groups. These groups are Asian Indian, Korean, Samoan, Vietnamese, and Guamanian. In 1990, at least two-thirds of the U.S. population of each of these groups lived

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

in this seven-State reporting area: Asian Indian, Korean, and Vietnamese, 63-66 percent; Guamanian, 74 percent; and Samoan, 84 percent (9). Minnesota was added to the list of States reporting expanded race codes in 1995, and Missouri and West Virginia were added in 1999. This additional race detail is available on the mortality public-use data set (10). Beginning with 1992 data, all records coded to "Other races" (0.02 percent of the total deaths in 1999) were assigned to the specified race of the previous record rather than to a separate category called "Other races." Mortality data for Filipino and Other Asian or Pacific Islander were shown for the first time in 1979.

The white category includes, in addition to persons reported as white, those reported in the race item on the death certificate as Hispanic, Mexican, Puerto Rican, Cuban, and all other Caucasians. The American Indian category includes North, Central, and South American Indian, Eskimo, and Aleut. If the racial entry on the death certificate indicates a mixture of Hawaiian and any other race, the entry is coded to Hawaiian. If a mixture of races is given (except Hawaiian), the entry is coded to the first race listed. This procedure has been used since 1990. From 1969 through 1989, if the race was given as a mixture of white and any other race, the entry was coded to the appropriate nonwhite race. If a mixture of races other than white was given (except Hawaiian), the entry was coded to the first race listed. Before 1969 if the entry for race was a mixture of black and any other race except Hawaiian, the entry was coded to black.

*Multi-racial*--Death certificates for some States have a checkbox for multi-racial. Some States are mandated by law to code multi-racial as a separate category. For these States, death records with an entry of multi-racial but without a specified racial entry or entries were assigned to the specified race of the previous record. States not mandated to code multi-racial may code multi-racial in the same way as mandated States or may code multi-racial to "Other entries." For death records where race is coded to "Other entries", if origin is Hispanic and the place of birth is Puerto Rico, Cuba or Mexico, the race is assigned as White. Otherwise, except for Puerto Rico, death records with race coded to "Other entries" were assigned to the specified race of the previous record with known race. For Puerto Rico, if race is coded to "Other entries", race is assigned to "Other races."

*Race not stated*--For 1999 the number of death records for which race was unknown, not stated, or not classifiable was 2,818 or 0.1 percent of the total deaths. Beginning in 1992 death records with race not stated were assigned to the specified race of the previous record with known race. From 1965 to 1991 death records with race entry not stated were assigned to a racial designation as follows: If the preceding record was coded white, the code assignment was made to white; if the code was other than white, the assignment was made to black. Before 1964 all records with race not stated were assigned to white except records of residents of New Jersey for 1962-64.

*New Jersey, 1962-64*--New Jersey omitted the race item from its certificates of live birth and death in the beginning of 1962. The item was restored during the latter part of 1962. However, the certificate revision without the race item was used for most of 1962 as well as 1963. Therefore, figures by race for 1962 and 1963 exclude New Jersey. For 1964, 6.8 percent of the death records used for residents of New Jersey did not contain the race item.

Adjustments made in vital statistics to account for the omission of the race item in New Jersey for part of the certificates filed during 1962-64 are described in the Technical Appendix of *Vital Statistics of the United States* for each of those data years.

*Quality of race data*--A number of studies have been conducted on the reliability of race reported on the death certificate. These studies compare race reported on the death certificate with that reported on another data collection instrument such as the census or a survey. Race information on the death certificate is reported by the funeral director as provided by an informant, often the surviving next of kin, or, in the absence of an informant, on the basis of observation. In contrast, race on the census or the Current Population Survey (CPS) is obtained while the individual is still alive and is self-reported or reported by a member of the household familiar with the individual and, therefore, may be considered more valid. A high level of agreement between the death certificate and the census or survey report is essential to ensure unbiased death rates by race.

In one study a sample of approximately 340,000 death certificates was compared with census records for a 4-month period in 1960 (11). Percent agreement was 99.8 percent for white decedents, and 98.2 percent for black decedents; but less for the smaller minority groups (table A); the net difference in the number of deaths between the census records and death certificates can be expressed as a ratio of the census to the death certificate. A ratio of 1.00 for both white and black decedents (table A) indicates that the number of deaths for these race groups was essentially the same for these two sources.

In another study, the National Longitudinal Mortality Study (NLMS), a total of 59,000 death certificates were compared with responses to the race questions from a total of 9 CPS's conducted by the U.S. Bureau of the Census for the years 1979-89 (12). The NLMS ratio of CPS deaths to death certificate deaths for white and black decedents was 1.00 as in the earlier study; however, the ratio for American Indian was 1.37 indicating that 37 percent more

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

decedents were identified as American Indian in the CPS as compared to the death certificate. The ratio for Asians was 1.13 (table A).

Problems of validity and reliability of race-reporting can also arise from errors in population counts and estimates that comprise the denominator of death rates. Based on the 1990 Post-Enumeration Survey (13), net census undercount ratios may be computed. The census undercount ratio is based on the ratio of the 1990 resident census-level population to the resident population adjusted for the census undercount. A ratio of less than 1.00 indicates a net census undercount. The undercount ratios for non-Hispanic white and Other was 0.99; for the black population, 0.95; for the Asian or Pacific Islander population, 0.98; and the American Indian population, 0.88 (12).

Generally, misclassification in the numerator data (deaths), taken alone, results in death rates that are too small. In contrast, the undercoverage problem in the denominator data (population) tends to have the opposite effect: it biases rates upward. Thus biases from misclassification of race in the numerator and denominator work in opposite directions, one tending to deflate rates, the other to inflate them. Consequently, a comprehensive estimate of death rates by race should take into account the offsetting reporting biases in the numerator and denominator. The approximate effects of reporting bias and undercoverage for the race groups may be estimated by multiplying the NLMS ratio by the census undercount ratio forming a "combined ratio." The approximate "combined ratio" for the white population was 0.99 (1.00 x 0.99); for the black population, 0.95 (1.00 x 0.95); for the American Indian population, 1.21 (1.37 x 0.88); and for the Asian or Pacific Islander population, 1.11 (1.13 x 0.98). Multiplying a death rate by the "combined ratio" produces an estimated rate that takes into account both reporting bias and undercoverage (table B) (12).

In 1986 the National Mortality Followback Survey, conducted by NCHS, listed a question about the race of decedents 25 years old and over. The total sample was 18,733 decedents (14). The rates of agreement were similar to those observed in the other studies.

All of these studies show that persons self-reported as American Indian or Asian on census and survey records (and by informants in the Followback Survey) were sometimes reported as white on the death certificate. The net effect of misclassification is an underestimation of deaths and death rates for races other than white and black.

### **Hispanic deaths**

Mortality statistics for the Hispanic population are based on information for the entire United States. Data year 1997 was the first year that mortality data for the Hispanic population were available for all 50 States and the District of Columbia.

Hispanic mortality data were collected from reporting States and published by NCHS for the first time in 1984. The number of reporting States increased over time as did the quality of reporting. The number of States whose Hispanic data was considered of sufficient quality for analysis and publication by NCHS is shown by year from 1984-1999 in table C. Also shown in table C is the estimated percent of the Hispanic population in the United States accounted for by the reporting States for each year from 1984 to 1999. Table D shows the years in which Hispanic origin information was first collected from a State and the year the data was considered to be of sufficiently good quality for analysis and publication. From 1984-1991, Hispanic origin data was considered to be of good quality for use in analysis if it was sufficiently comparable across States and was at least 90 percent complete on a place-of-occurrence basis. In 1992, the criterion was changed to 80 percent complete on a place-of-occurrence basis. In 1984, the percent of deaths for which Hispanic origin was missing or unknown varied widely among reporting States, ranging from less than one percent in Hawaii to 34.8 percent in Tennessee. Over time the completeness of mortality data by Hispanic origin has increased dramatically. In 1999, the percent varied little by State, and was low for all States, the District of Columbia, and New York City, ranging from zero percent in seven States (Idaho, Iowa, Maryland, Oklahoma, South Dakota, West Virginia, and Wisconsin) to 3.0 percent in North Dakota and 3.5 percent in New York City.

## VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999

### TECHNICAL APPENDIX

Generally, reporting States have used items similar to one of two basic formats recommended by NCHS. The first format is directed specifically toward the Hispanic population and appears on the U.S. Standard Certificate of Death as follows:

- WAS DECEDENT OF HISPANIC ORIGIN?  
(Specify No or Yes--If Yes, specify Cuban, Mexican, Puerto Rican, etc.)  
No  Yes  
Specify:

The second format is a more general ancestry item and appears as follows:

- ANCESTRY--Mexican, Puerto Rican, Cuban, African, English, Irish, German, etc., (*specify*)

*Death rates*--Death rates for the total Hispanic population and race for non-Hispanic origin utilize demographically-derived population estimates produced by the Bureau of the Census (15). These estimates are based on 1990 census level counts; however, revised populations for 1999 that are consistent with the 2000 census levels are available on the NCHS website at <http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm>.

Population estimates for Mexicans, Puerto Ricans, Cubans, and Other Hispanics are based in part on the Current Population Survey and have not been revised (16). Rates using the Current Population Survey are subject to sampling variation as well as random variation (see "Random variation and sampling errors").

In 1990 and 1991, data for New York City were excluded because of the large proportion of deaths (in excess of 10 percent) occurring in New York City for which Hispanic origin was not stated or was unknown. Because New York City accounts for about a third of the deaths to Puerto Ricans, the resulting mortality data was not comparable with previous years. In 1994 New York City instituted the use of a revised death certificate where the race and ethnic items were to be completed by the funeral director. Previously these items were completed by the physician or medical examiner. From 1994-99, only 3-4 percent of the deaths occurring annually in New York City were coded to Unknown origin; whereas 23 percent were coded to Unknown origin in 1993. Between 1993 and 1994 the number of deaths occurring in New York City decreased 69 percent for Other and unknown Hispanic and 83 percent for Unknown origin. As a result of increased specificity in reporting ethnic origin, the number of deaths increased substantially in 1994 for Non-Hispanic and for each of the specified Hispanic subgroups.

*Quality of data on Hispanic deaths*--The NLMS examined the reliability of Hispanic origin reported on 43,520 death certificates with that reported on a total of 12 CPS's conducted by the U.S. Bureau of the Census for the years 1979-85 (17). The NLMS ratio of deaths for CPS's divided by deaths for death certificate was 1.07 indicating net underreporting of Hispanic origin on death certificates as compared with self-reports on the surveys of 7 percent (table A). The NLMS ratios for specified Hispanic groups are shown in table A.

Problems of validity and reliability of Hispanic origin-reporting can also arise from errors in population counts and estimates that comprise the denominator of death rates. Based on the 1990 Post-Enumeration Survey, the undercount ratio for the total Hispanic population was 0.95 (13).

As was the case for race-reporting, a comprehensive estimate of death rates by Hispanic origin should take into account the offsetting reporting biases in the numerator and denominator. The approximate effects of reporting bias and undercoverage for the total Hispanic population may be estimated by multiplying the NLMS ratio by the census undercount ratio forming a "combined ratio." The approximate "combined ratio" for the total Hispanic population was 1.02 (1.07 x 0.95). Multiplying a death rate by the "combined ratio" produces an estimated rate that takes into account both reporting bias and undercoverage (table B) (12).

### Marital status

Mortality statistics by marital status have been published annually since 1979. They were previously published in *Vital Statistics of the United States* for 1949-51 and 1959-61. Mortality data by marital status is generally of high quality. A study of death certificate data using the 1986 National Mortality Followback Survey showed a high level of consistency in reporting marital status (14). Several earlier reports analyzing mortality by marital status have also been published, including the special study based on 1959-61 data (18). Reference to other earlier reports is given in the appendix of part B of the 1959-61 special study.

Mortality statistics by marital status are tabulated separately for never married, married, widowed, and divorced. Deaths for which the marriage is specified as being annulled are classified as never married. Marital status specified

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

as separated or common-law marriage is classified as married. Of the 2,350,262 resident deaths 15 years of age and over in 1999, 9463 certificates (0.4 percent) had marital status not stated.

*Death rates* -- Death rates for marital status use population estimates produced by the Bureau of the Census based on the Current Population Survey (16). Because these population estimates are subject to sampling variation, death rates based on them are subject to both sampling variation as well as random variation (see "Random variation and sampling errors").

### **Educational attainment**

Deaths by educational attainment have been included on the public use data sets since 1989. These data were obtained from information reported on the death certificate using the following item:

- DECEDENT'S EDUCATION (*Specify only highest grade completed*)  
Elementary/Secondary (0-12)  
College (1-4 or 5+)

It is recommended for 1999 that analyses of educational attainment data include deaths to residents of 46 States and the District of Columbia whose data were approximately 80 percent or more complete on a place-of-occurrence basis. Although data for Kentucky are included on the data set, they would be excluded from analyses because more than 20 percent of their death certificates were classified to "unknown educational attainment." Data for Georgia, Rhode Island, and South Dakota are excluded from the data set because their death certificates did not include an educational attainment item.

Death rates for educational attainment are based on population estimates derived from the U.S. Bureau of the Census' Current Population Survey (CPS) and adjusted to resident population control totals. As a result, the rates are subject to the variability of the denominator as well as the numerator. For a discussion concerning computing the relative standard errors, 95-percent confidence intervals, and statistical tests, refer to the Technical notes of the National Vital Statistics Reports (19).

Death rates for educational attainment may be biased for the following reasons: 1) inconsistencies in reporting between the death certificates and the CPS for decedents; 2) changes in the basic item used to collect data about education in the CPS; and 3) possible under-enumeration of the population estimates by educational attainment (there have been no studies evaluating this potential bias).

In the National Longitudinal Mortality Survey (NLMS) a total of 9,257 death certificates were compared with responses to educational attainment questions from a total of 12 CPS's conducted by the U.S. Bureau of the Census for data year 1989 (20). Based on the results of this study and after proportionally allocating the "unknown education" on the death certificate, the ratio of CPS deaths having reported less than a high school education (grades 0-11) to death certificate deaths having reported less than high school education was about 1.37. This indicates that the number of deaths and death rates for decedents having less than high school education are biased downward in the vital statistics data by about 37 percent. Similarly, the corresponding ratios for having completed high school (grade 12) and having completed more than high school (grades 13 and more) are 0.70 and 0.87 respectively.

In the CPS, the item used to collect education information was changed in 1992 from:

- 23a) What is the highest grade or year of regular school ... has ever attended?;  
23b) Did ... complete that grade (year?); Yes, No

to:

- 23) What is the highest level of school ... has completed or the highest degree ... has received?

Based on a Bureau of the Census study (21), the ratio of population estimates derived from the "old" educational attainment definition for less than a high school education (grades 0-11) to population estimates derived from the "new" definition for less than high school education was about 0.99. This indicates that the death rates for decedents having less than high school education are biased upward in the vital statistics data by about 1 percent. Similarly, the

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

corresponding ratios for having completed high school (grade 12) and having completed more than high school (grades 13 and more) were 1.15 and 0.93 respectively.

Accounting for both the inconsistency in reporting between the death certificates and the CPS for decedents and the change in the definition of education population estimates may be accomplished simultaneously by combining the above ratios. The combined ratio for less than high school is about 1.36 ( $1.37 \times .99$ ), for high school about 0.81 ( $0.70 \times 1.15$ ), and for more than high school about 0.81 ( $0.87 \times .93$ ). These ratios may vary by age, sex, race/Hispanic origin, cause of death, and geographic area.

### **Injury at work**

Deaths for "Injury at work" were included on the 1993 public-use data sets for the first time. These data were obtained from the following item that appears on the U.S. Standard Certificate of Death:

- INJURY AT WORK?  
(*Yes or no*)

All States have this item on their death certificates.

### **Occupation and industry**

Deaths by occupation and industry are included on the 1999 public-use data sets and CD-ROM. These data have been included since 1985 and were obtained from the following items that appear on the U.S. Standard Certificate of Death:

- DECEDENT'S USUAL OCCUPATION  
(*Give kind of work done during most of working life.*  
*Do not use retired.*)
- KIND OF BUSINESS/INDUSTRY

For 1999, the occupation and industry mortality data were included for the following 18 reporting States:

Colorado	New Jersey
Georgia	New Mexico
Hawaii	North Carolina
Idaho	Rhode Island
Kansas	South Carolina
Kentucky	Utah
Nebraska	Vermont
Nevada	West Virginia
New Hampshire	Wisconsin

Data for 1993-99 were coded using the revised NCHS Part 19 instruction manual (22) and the Bureau of the Census 1990 occupation and industry titles and three-digit codes, which are shown in the 1990 Census of Population and Housing (23).

Occupation and industry mortality data for 1984-92 were based on the 1980 Bureau of the Census occupation and industry classifications. For a listing of the changes between the 1980 and the 1990 classification systems, see Appendix D of the NCHS Part 19 instruction manual (22).

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

In addition to the codes shown in the Bureau of the Census publication (23), the following special codes were created:

<u>Occupation</u>	<u>Industry</u>
913 Retired	961 Own Home/At Home
914 Housewife/ Homemaker	970 Retired
915 Student	990 Blank, Unknown, NA
916 Volunteer	
917 Unemployed, never worked, disabled, child, infant	
999 Blank, Unknown, NA	

### **Place of death and status of decedent**

Mortality statistics by type of place of death have been shown annually in *Vital Statistics of the United States* since 1979. Before that year they were published in 1958 (tables 1-30--1-32). In addition, mortality data also were available for the first time in 1979 for the status of decedent when death occurred in a hospital or medical center. The 1999 data were obtained from the following two items appearing on the revised U.S. Standard Certificate of Death (1):

- PLACE OF DEATH (*check only one*)

HOSPITAL:       Inpatient     ER/Outpatient     DOA

OTHER:       Nursing Home     Residence     Other (*specify*)

- FACILITY NAME (*If not institution, give street and number*)

Before the 1989 revision of the Standard Certificate of Death, information on place of death and status of decedent could be determined if hospital or institution indicated Inpatient, Outpatient, ER, or DOA, and if the name of the hospital or institution, which was used to determine the kind of facility, appeared on the certificate. The change to a checkbox format in many States for this item may affect the comparability of data for 1989 and subsequent years with data for years before 1989.

All of the States (including New York City) and the District of Columbia have this item (or its equivalent) on their certificates. For all reporting States and the District of Columbia in the VSCP, NCHS accepts the State definition, classification, or code for hospitals, medical centers, nursing homes, or other institutions.

Effective with data for 1980, the coding of place of death and status of decedent was modified. A new coding category was added: "Dead on arrival--hospital, clinic, or medical center." Had the 1979 coding categories been used, these deaths would have been coded to "Place unknown."

*California*--For the first 5 months of data year 1989, California coded "Place of death" to "other" rather than "residence".

### **Mortality by month and date of death**

Deaths by month have been tabulated regularly and are available for each year since 1900. Deaths from selected causes by date of death have been published each year since 1972 and are available for 1962.

Numbers of deaths by date of death are produced for the total number of deaths and for the numbers of deaths for the following causes, for which the greatest interest in date of occurrence of death has been expressed: Motor vehicle accidents, Intentional self-harm (suicide), Assault (homicide), Influenza and pneumonia, Pedestrian involved in collision with motor vehicle, and Falls. (See NCHS websites <http://www.cdc.gov/nchs/products/pubs/pubd/vsus/vsus.htm> and <http://www.cdc.gov/nchs/datawh/statab/unpubd/mortabs.htm#general>.)

## VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999

### TECHNICAL APPENDIX

These data show the frequency distribution of deaths for selected causes by day of week. They also make it possible to identify holidays with peak numbers of deaths from specified causes.

#### **Report of autopsy**

Beginning with the 1995 data year, mortality data on autopsy are no longer collected due to budgetary constraints.

#### **Cause of death**

*Cause-of-death classification*--Since 1949 cause-of-death statistics have been based on the underlying cause of death, which is defined as "(a) the disease or injury which initiated the train of events leading directly to death, or (b) the circumstances of the accident or violence which produced the fatal injury" (24).

For each death the underlying cause is selected from an array of conditions reported in the medical certification section on the death certificate. This section provides a format for entering the cause of death sequentially. The conditions are translated into medical codes through use of the classification structure and the selection and modification rules contained in the applicable revision of the *International Classification of Diseases* (ICD), published by the World Health Organization (WHO). Selection rules provide guidance for systematically identifying the underlying cause of death. Modification rules are intended to improve the usefulness of mortality statistics by giving preference to certain classification categories over others and/or to consolidate two conditions or more on the certificate into one classification category.

As a statistical datum, underlying cause of death is a simple, one-dimensional statistic; it is conceptually easy to understand and a well-accepted measure of mortality. It identifies the initiating cause of death and is therefore most useful to public health officials in developing measures to prevent the onset of the chain of events leading to death. The rules for selecting the underlying cause of death are included in ICD as a means of standardizing classification, which contributes toward comparability and uniformity in mortality medical statistics among countries.

*Tabulation lists*--Beginning with data year 1999, the cause-of-death statistics published by NCHS are classified according to the Tenth Revision of the *International Classification of Diseases* (ICD-10) (24).

Eight lists of causes have been developed by NCHS from ICD-10 for tabulation and publication of mortality data--the Each-Cause List, List of 358 Selected Causes of Death, List of 113 Selected Causes of Death, List of 130 Selected Causes of Infant Death, List of 39 Selected Causes of Death, List of 124 Selected Causes of Fetal Death, List of Motor Vehicle Accident Deaths, and List of Injury, Poisoning and Certain Other Consequences of External Causes. Seven of the lists are used for both underlying and multiple causes of death, and one for multiple causes of death only. These lists were designed to be as comparable as possible with the NCHS lists used under the Ninth Revision of the *International Classification of Diseases* (ICD-9) (25). The lists were developed to separately identify causes of death specified by the WHO in its recommended mortality tabulation lists; to the extent possible, to maintain continuity with past lists for historic continuity and to facilitate trend analysis; and to separately identify causes of death that are of public health and medical importance. With the exception of the Each-Cause List, these lists are published in the NCHS Instruction Manual, Part 9, ICD-10 Cause-of-Death Lists for Tabulating Mortality Statistics, Effective 1999 (26). The Each-Cause List is available in electronic form on the Internet at <http://www.cdc.gov/nchs/about/major/dvs/icd10des.htm> or upon request from NCHS.

The Each-Cause List is made up of each four-character alphanumeric code in ICD-10 that is to be used for underlying cause-of-death classification. This list is used for the tabulation of data for the entire United States, Puerto Rico, Virgin Islands, Guam, American Samoa, and Northern Marianas.

The List of 358 Selected Causes of Death contains, either directly or by combining titles, the 103 categories in the WHO Mortality Tabulation List 1 and the 80 categories in the WHO Mortality Tabulation List 2 (24). The List of 358 Selected Causes of Death is comparable to the List of 282 Selected Causes of Death in ICD-9.

The List of 113 Selected Causes of Death was, in part, constructed by combining titles in the List of 358 Selected Causes of Death. It is used for the general analysis of mortality and for ranking leading causes of death excluding infants (see "Cause-of-death ranking"). It is comparable to the List of 72 Selected Causes of Death in ICD-9. The figure in the name of the list refers to the number of mutually exclusive categories in the list. The 113-cause list contains a total of 135 cause-of-death categories, 113 of which are mutually exclusive.

The List of 130 Selected Causes of Infant Death shows more detailed titles for Certain conditions originating in the perinatal period and Congenital malformation, deformation and chromosomal abnormalities than any other list except the Each-Cause List. It is used for the analysis of infant mortality and for ranking leading causes of infant

## VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999

### TECHNICAL APPENDIX

death (see "Cause-of-death ranking"). It is comparable to the List of 61 Selected Causes of Death in ICD-9. The 130-cause list contains a total of 158 cause-of-death categories, 130 of which are mutually exclusive.

The List of 39 Selected Causes of Death was created by combining titles in the List of 113 Selected Causes of Death. This list is used for tabulating data by detailed geographic area. It is comparable to the List of 34 Selected Causes of Death in ICD-9.

The newly-introduced List of 124 Selected Causes of Fetal Death is used to tabulate causes of fetal death. The structure of the list parallels that of the List of 130 Selected Causes of Infant Death.

A special List of Motor Vehicle Accident Deaths was developed out of necessity because the ICD-10 categories for motor vehicle accidents differ substantially from those in ICD-9. In ICD-9 the focus of the motor vehicle accident section was on the nature of the accident, whereas in ICD-10, the focus is on the victim and the type of vehicle involved in the accident. This list is designed to maximize comparability with ICD-9 lists for trend comparison.

The List of Injury, Poisoning and Certain Other Consequences of External Causes is used for tabulating the ICD-9 equivalent of Nature-of-Injury codes. It is derived from Chapter XIX of ICD-10, *Injury, Poisoning and Certain Other Consequences of External Causes*. These categories are used for tabulating multiple causes of death, NOT underlying cause of death. For Chapters I to XVIII and Chapter XX of ICD-10, the same tabulation lists are used for both underlying and multiple causes of death.

*Effect of ICD revisions*--The International Classification of Diseases (ICD), used in the United States since 1900, has been revised approximately every 10 years, with the exception of the Ninth Revision which was used for 20 years, so that disease classifications may be consistent with advances in medical science and with changes in diagnostic practice. Each revision of the ICD has produced some break in comparability of cause-of-death statistics. However, revisions are essential to stay current with advances in medical science and to ensure the international comparability of health statistics. For the first five revisions the continuity in the mortality trends is not considered a problem of great concern. Van Buren described some of the major shifts in the cause-of-death statistics up to the Fifth Revision (1938) due to changes in the classification of causes of death (27). Dunn and Shackley measured the change in mortality statistics by cause due to the Fifth Revision (28). This was done by coding mortality records for 1940 by the 1929 and 1938 revisions. The results of the study have been useful in evaluating the effects of the Fifth Revision and changes in the joint-cause selection procedure.

*Comparability*--Studies of the comparability between revisions of the ICD have been carried out and published at least since the Fifth Revision. Comparability studies -- also called bridge-coding studies -- involve dual classification of a single year of mortality data, i.e., classifying the underlying cause of death on mortality records by both the new revision and the previous revision (29). The key element of a comparability study is the comparability ratio, which is derived from the dual classification. It is calculated by dividing the number of deaths for a selected cause of death classified by the new revision by the number of deaths classified to the most nearly comparable cause of death by the previous revision. The resulting ratio represents the net effect of the new revision on statistics for this cause and can be used as a factor to adjust mortality statistics for causes of death classified by a previous revision to be comparable to those for the same cause classified by the new revision.

*Sixth Revision*--The Sixth Revision of the International Lists of Diseases and Causes of Death was adopted by the World Health Organization in July 1948 and used for mortality data in the United States from 1949 through 1957. This revision represented a more sweeping change than any previous revision. The classification scheme was expanded considerably to provide specific categories for nonfatal diseases and injuries to provide a classification which could be used for coding morbidity as well as mortality records.

In addition to the expanded scope of the Sixth Revision of the International Classification, there was a major change in the method of selection of the cause of death for primary tabulation. A large proportion of death certificates filed annually in the United States reports two or more diseases or conditions as causes of death. General statistical practice requires that cases involving more than one cause of death be assigned to a single cause, making it necessary to select the one cause to which the death will be assigned. The method of selection has an important effect upon the resulting statistics.

In 1948 the World Health Assembly adopted, along with the Sixth Revision of the International Lists, a form of medical certification and rules for classification of the underlying cause of death for international use. The form of medical certification in the Standard Certificate of Death was designed to facilitate the selection of the underlying cause of death when two or more causes were recorded. In general, if the certification was completed properly, the underlying cause of death entered by the physician was the cause to be tabulated. This procedure, used in the United

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

States beginning with deaths in 1949, differed markedly from that used in previous years. Formerly, definite priority relationships were set up for combinations of causes reported on the death certificate. The single cause to be tabulated was chosen according to these fixed rules.

*Comparability between the Sixth and Fifth Revision*--To maintain a time series of mortality rates for comparable causes, the International Conference for the Sixth Revision of the International Lists recommended that deaths for a country as a whole in 1949 and 1950 be coded according to both the Sixth and Fifth Revisions. In the United States, 1950 mortality data were used for the dual coding. The differences resulting from the use of the two revisions are expressed by a factor termed the comparability ratio. This is the number of deaths assigned to a particular cause under the Sixth Revision divided by the number of deaths assigned to that cause using the Fifth Revision. Results of the comparability study and comparability ratios are published in *Comparability of mortality statistics for the Fifth and Sixth Revisions, United States, 1950*, and *Comparability ratios based on mortality statistics for the Fifth and Sixth Revisions, United States, 1950* (30,31).

*Seventh Revision*--Changes in the Seventh Revision were held to a minimum because of the relatively short experience with the Sixth Revision. In compliance with a recommendation of the Expert Committee on Health Statistics, the changes were limited to essential ones and amendments of errors and inconsistencies. Provisions previously contained in an addendum (32) were integrated into the manual (33). Since these provisions had been used with the Sixth Revision, they did not represent classification changes. The only change made in three-digit categories consisted of rewording a few titles. In a few cases the rewording included redefining morbid conditions classifiable to these categories and transferring certain terms from one category to another. The three-digit categories which were affected are listed in section 1, volume I, of *Vital Statistics of the United States*, 1958. There were also a number of changes in four-digit subcategories, consisting mostly of the addition of subdivisions to provide more detailed classification of malignant neoplasms of specified sites. The three-digit categories for which there were additions, deletions, or changes in the four-digit subcategories are also listed in section 1 of the 1958 report.

The international rules for selecting the cause of death for primary mortality classification were recast for use with the Seventh Revision to simplify them and to organize them from the viewpoint of the coder making the cause-of-death assignment. The intent of the rules remains the same, that is, to code the cause which the medical certifier judged to be the underlying cause starting the train of events leading directly to death. In recasting the rules, some interpretations were modified--mainly those involving selection of the underlying cause for improperly completed certifications. In adapting coding procedures to reporting practices in the United States, some additional changes in interpretations were made.

In the majority of cases, application of the rules for the Sixth and Seventh Revisions resulted in the same code assignment. There were some differences in individual assignments affecting a number of categories. Many of these individual assignments were compensatory and resulted in no detectable discontinuity of trends for various causes of death; the comparability of a number of categories was affected to a limited extent.

*Comparability between the Seventh and Sixth Revisions*--To estimate the magnitude of the effect of the Seventh Revision upon the comparability of mortality trends for various causes, a 10-percent sample of deaths in 1958 was classified using both the Sixth and Seventh Revisions. The comparability ratios for selected causes and a discussion of the results of this study are published in "Comparability of Mortality Statistics for the Sixth and Seventh Revisions, United States, 1958" (34).

*Eighth Revision*--During the data years 1968-78 the cause-of-death statistics published by the National Center for Health Statistics were classified in accordance with the *Eighth Revision International Classification of Diseases, Adapted for Use in the United States* (ICDA) (35) which was based on the 1965 Revision of the International Classification of Diseases (ICD) (36). The ICDA gave greater detail and specificity in some categories than was provided by the Eighth Revision of the ICD. Complete correspondence between these two classifications was maintained at the three-digit level, but new four-digit subdivisions were created in various parts of the ICDA. Where necessary, existing four-digit subdivisions were renumbered to accommodate the additional subcategories in logical sequence. In the ICDA, subdivisions which did not correspond exactly with the ICD were identified by asterisks. In *Vital Statistics of the United States* for each of the years 1968-78 those four-digit subcategory numbers which differed from those in the ICD were also shown with asterisks.

The Eighth Revision contained major modifications in several sections of the mortality tabulation lists. Also, the international rules for selecting the underlying cause were simplified. In addition, changes were introduced in the special rules and decisions which adapted the coding procedures to reporting practices in the United States. The

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

important changes are summarized for each of these sections in the introduction to the ICDA, pages xxiv-xxviii. Following are some of the many changes made:

*Infective and parasitic diseases*--In the Seventh Revision, list titles for diarrheal conditions were scattered over several sections of the classification. In the Eighth Revision all the Seventh Revision subdivisions for these conditions, including those for infants, were brought together under one category, Diarrheal disease (009).

*Diseases of the nervous system and sense organs*--Vascular lesions affecting central nervous system (330-334) in the Seventh Revision were transferred in the Eighth Revision to "section VII, Diseases of the circulatory system," where they appeared as Cerebrovascular diseases (430-438).

*Certain causes of perinatal morbidity and mortality*--This section represented an integration of "Section XV, Certain diseases of early infancy" and Classification of causes of stillbirth (Y30-Y39) in the Seventh Revision. The age qualifications used in previous revisions to classify the same conditions in or outside this section were deleted. For example, Pneumonia of newborn (763) of the Seventh Revision was no longer in this section. Instead, it was included in the Eighth Revision with Pneumonia (480-486), to which pneumonias are assigned without regard to age.

*Accidents, poisonings, and violence*--A new subsection (E980-E989) was introduced for the classification of deaths where it was not possible for the certifier to determine whether the injuries were accidentally or purposely inflicted.

*Comparability between the Eighth and Seventh Revisions*--To measure the degree of discontinuity in cause-of-death statistics resulting from the introduction of the Eighth Revision, provisional estimates of selected comparability ratios based on dual coding of a stratified sample of 1966 death certificates by the Seventh and Eighth Revisions of the International Classification of Diseases were computed. These ratios appeared in the *Monthly Vital Statistics Report* of the National Center for Health Statistics, Volume 17, Number 8, Supplement; and in Comparability of Mortality Statistics for the Seventh and Eighth Revisions of the International Classification of Diseases, United States, *Vital and Health Statistics*, Series 2, No. 66, DHEW Pub. No. (HRA) 76-1340.

*Significant coding changes during the Eighth Revision*--Beginning with 1969 a special four-digit subcategory, Chronic obstructive lung disease (\*519.3), was added to obtain the number of certificates on which medical certifiers had entered this more general term rather than a more specific diagnosis of chronic bronchitis, emphysema, or asthma. The number of certificates assigned to (\*519.3) increased from 2,704 for 1969 to 28,613 for 1978. It is necessary to add together the number of deaths assigned to this new four-digit category and the number of deaths assigned to Bronchitis, emphysema, and asthma (ICDA Nos. 490-493) to obtain a measure of mortality from all chronic obstructive lung diseases.

To provide that deaths would not be assigned to Chronic obstructive lung disease (\*519.3) if a more specific diagnosis such as chronic bronchitis, emphysema, or asthma also appeared on the death certificate, the coding procedures were updated for 1971 and 1972 data years in accordance with the following linkages:

\*519.3 Chronic obstructive lung disease without mention of asthma, bronchitis, or emphysema

*Excludes* conditions in \*519.3 with conditions in:

- 490 Bronchitis (491) (Chronic bronchitis)
- 491 (Chronic bronchitis) (491)
- 492 (Emphysema) (492)
- 493 (Asthma) (493)

But the limitation imposed by these linkage provisions did not alter the upward trend in the number of deaths assigned to Chronic obstructive lung disease without mention of asthma, bronchitis, or emphysema (\*519.3). The number of deaths assigned to (\*519.3) increased from 6,321 for 1971 to 8,210 for 1972.

Under the Eighth Revision of the ICDA, deaths assigned to chronic obstructive lung disease or chronic obstructive pulmonary disease were assigned to Other diseases of lung (ICDA No. 519.2). Despite the transfer of these deaths from this category to the new category Chronic obstructive lung disease (No. \*519.3), the number of

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

deaths assigned to Other diseases of lung (ICDA No. 519.2) also continued to increase--from 1,306 deaths for 1969 to 2,318 for 1978.

Also beginning with 1971 a special four-digit subcategory (\*E854.8) was added to identify Acute narcotism, not otherwise specified, whether or not the circumstances were undetermined. Also, a preference was given to Drug dependence (ICDA No. 304) when a statement of drug dependence or a synonymous term appeared on the certificate with mention of poisoning by certain addictive drugs.

In addition, beginning with 1971 the term "cerebral sclerosis (general)" was classified to Generalized ischemic cerebrovascular disease (ICDA No. 437) rather than to Other demyelinating diseases of central nervous system (ICDA No. 341). As a result of this transfer, the number of deaths assigned to this latter category decreased from 569 for 1970 to 96 for 1971.

For 1973 the significant coding changes were concerned with the sudden infant death syndrome (SIDS). NCHS modified the ICDA and the procedures for classifying information recorded on the death certificate to facilitate the identification and analysis of data related to known and suspected cases of SIDS. Three fourth-digit subdivisions were created under ICDA category 795 (Sudden death). These subdivisions together with the inclusion terms are as follows:

\*795.0 Sudden infant death syndrome, under 1 year of age

Acute fatal infant syndrome  
Cause unknown  
Cot or crib death  
Died without sign of disease, so stated  
Found dead (in bed, cot, cradle, crib, etc.) (infant)  
Infant found in bed  
Other unknown and unspecified causes, so stated  
SDII, SID, SIDS, SUDI, SUID  
Sudden death (in infancy) (infant) (syndrome) (unattended) (unexpected) (unexplained)  
Undetermined (cause) (in infancy) (infant)  
Unexpected death (in infancy) (infant)  
Unexplained death (in infancy) (infant)  
Unknown (cause)

\*795.1 Sudden death syndrome, 1 year of age

The same terms under \*795.0 when age is 1 year

\*795.2 All other sudden deaths, age 2 years and over

Died suddenly	Fell dead
Dropped dead	Sudden death

*Ninth Revision*--From 1979-98 cause of death statistics were classified by NCHS in accordance with the Ninth Revision (25). The Classification in the Ninth Revision, as in the Eighth Revision, was arranged in 17 main sections or chapters. The first chapter dealt with diseases caused by well-defined infectious and parasitic agents. The next two chapters dealt with categories for Neoplasms and for Endocrine, nutritional and metabolic diseases and immunity disorders. Most of the remaining chapters were arranged according to the principal anatomical sites of diseases with special chapters for Mental disorders; Complications of pregnancy, childbirth, and the puerperium; Congenital anomalies; Certain conditions originating in the perinatal period; and a chapter for Symptoms, signs, and ill-defined conditions.

The last chapter (XVII), Injury and poisoning, represented a decided departure from the corresponding chapter in previous revisions. The role of the E code for external causes was changed. In the Sixth, Seventh, and Eighth Revisions, chapter XVII-Accidents, poisonings, and violence-consisted of two alternative classifications, one according to the nature of the injury (the N code), and the other according to the external cause (the E code). In the Ninth Revision, chapter XVII consists only of titles for nature of injury as part of the main classification. The N prefix that was used before the category numbers for these titles in the Eighth Revision was dropped. In the Ninth Revision the E code was a supplementary classification. For underlying cause of death, where both an E code and another code were applicable, the E code was still used when the other code was from chapter XVII. When the other code was from chapters I-XVI, that code and not the E code was used.

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

In many ways, the Ninth and the Eighth Revisions are similar. The essential basis of the Eighth Revision was retained as much as possible (37). Thus, overall blocks of classification numbers previously allocated to each chapter were retained. The Ninth Revision is, however, more specific. Thus, many Eighth Revision category numbers were split into more fourth-digit subcategories. In addition, categories and subcategories not found in the Eighth Revision were added to the Ninth Revision.

Following are some of the major changes between the Eighth and Ninth Revisions, applicable to underlying cause coding in the United States. They are arranged according to the chapters in the Ninth Revision of the ICD.

I. *Infectious and parasitic diseases*--Under the Ninth Revision, colitis, diarrhea, enteritis, and gastroenteritis, without further specification, were assumed to be of noninfectious origin and are classified to chapter IX, Diseases of the digestive system. In the Eighth Revision, unless stated to be noninfectious or due to a noninfectious condition, they were assumed to be of infectious origin and were coded to chapter I, Infective and parasitic diseases. This change transferred deaths that were assigned by the Eighth Revision to Diarrheal diseases (ICDA No. 009) to the Ninth Revision title Other noninfective gastroenteritis and colitis (ICD No. 558).

A section pulling together all late effects of infectious and parasitic diseases was added to chapter I in the Ninth Revision. In the Eighth Revision a few conditions had special late effects codes; for certain other conditions late effects were coded to the resulting chronic condition; for the remaining conditions in chapter I, late effects were coded to the regular code for the infectious or parasitic disease.

II. *Neoplasms*--A new section, Neoplasms of uncertain behavior (ICD Nos. 235-238), was added to this chapter.

III. *Endocrine, nutritional, and metabolic diseases and immunity disorders*--A separate category for Alzheimer's disease (ICD No. 331.0)--was added to this chapter.

VII. *Diseases of the circulatory system*--According to the Ninth Revision, Cardiovascular disease, unspecified (ICD No. 429.2) was separated from Ischemic heart disease (ICD Nos. 410-414).

The Ninth Revision transferred Heart failure, unspecified (ICD No. 428.9) to this chapter--Diseases of the circulatory system--from the Eighth Revision chapter XVI, Symptoms and ill-defined conditions (ICDA Nos. 780-796), where it appeared as Acute heart failure, undefined (ICDA No. 782.4).

VIII. *Diseases of the respiratory system*--New titles were added for respiratory conditions including Pneumonitis due to solids and liquids (ICD No. 507); and Chronic airways obstruction, not elsewhere classified (ICD No. 496).

The deaths assigned by the Eighth Revision to Chronic obstructive lung disease without mention of asthma, bronchitis, or emphysema (\*519.3), a subtitle first introduced by NCHS for deaths occurring in 1969, were transferred to the Ninth Revision title Chronic airways obstruction, not elsewhere classified (ICD No. 496).

XV. *Certain conditions originating in the perinatal period*--This chapter was extensively revised, including the change in title.

XVI. *Symptoms, signs, and ill-defined conditions*--Many inclusion terms for this chapter were transferred to chapters I-XV.

*Comparability between the Ninth and Eighth Revisions*--As between the Eighth and the Seventh Revisions, a dual coding study was undertaken between the Ninth and the Eighth Revisions to measure the extent of discontinuity in cause-of-death statistics resulting from introducing the new Revision. An initial study was published for the list of 72 causes and the list of 10 infant causes, both of which appear in the *Monthly Vital Statistics Report* (38).

*Significant coding changes under the Ninth Revision*--Following the implementation of ICD-9 in data year in 1979, several coding changes were introduced that are described in detail in *Vital Statistics of the United States* for the years in which they were introduced (see NCHS website <http://www.cdc.gov/nchs/datawh/statab/pubd/ta.htm>). The more important changes were: In early 1983 a change that affected data from 1981 to 1986 was made in the coding of Acquired immunodeficiency syndrome and HIV infection. Also effective with data year 1981 was a coding change for Poliomyelitis. For data year 1982, the definition of child was changed (which affects the classification of deaths to a number of categories, including Child battering and other maltreatment), and guidelines for coding deaths to the category Child battering and other maltreatment (ICD-9 No. E967) were changed also. During the calendar year 1985, detailed instructions for coding Motor vehicle accidents involving all-terrain vehicles were implemented to

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

ensure consistency in coding these accidents. Effective with data year 1986, "Primary" and "Invasive" tumors, unspecified, were classified as "Malignant"; these neoplasms had been classified to Neoplasms of unspecified nature (ICD-9 No. 239).

Beginning with data for 1987, NCHS introduced new category numbers \*042-\*044 for classifying and coding HIV infection, formerly referred to as Human T-cell lymphotropic virus-III/lymphadenopathy associated virus (HTLV-III/LAV) infection. The asterisks appearing before the categories indicated that the codes were not part of ICD-9. Also changed effective with data year 1987 were coding rules for the conditions "dehydration" and "disseminated intravascular coagulopathy." Effective with data year 1988, minor content changes were made to the classification for HIV infection. Detailed discussion of these changes may be found in the Technical Appendix from Vital Statistics of the United States, 1988.

*Tenth Revision--* Cause-of-death statistics beginning with 1999 are classified by NCHS in accordance with the Tenth Revision (24). The Tenth Revision has many changes from the Ninth Revision, including considerably greater detail, shifts of inclusion terms and titles from one category, section, or chapter to another; regroupings of diseases; new titles and sections; and modifications in coding rules.

The Tenth Revision uses a four-character alphanumeric coding scheme compared with the four-digit numeric codes used in the Ninth Revision. Each of the 21 chapters of the Tenth Revision is classified to a letter or letters of the alphabet (29). The four-character alphanumeric coding scheme used with the Tenth Revision allows a larger number of codes than the four-digit numeric scheme used with Ninth Revision. Chapters of the ICD have been added and rearranged. Diseases of the nervous system and sense organs in chapter VI of the Ninth Revision was divided into three chapters in the Tenth Revision: chapter VI, Diseases of the nervous system; chapter VII, Diseases of the eye and adnexa; and chapter VIII, Diseases of the ear and mastoid process. Also, External causes of morbidity and mortality and Factors influencing health status and contact with health services, which were supplementary classifications in the Ninth Revision, have been assigned as chapters XX and XXI, respectively, in the Tenth Revision. Chapters III (Endocrine, nutritional and metabolic diseases and immunity disorders) and IV (Diseases of the blood and bloodforming organs) in the Ninth Revision are exchanged in the Tenth Revision. Chapter IV now contains the endocrine, nutritional and metabolic diseases, and chapter III contains the diseases of blood and blood-forming organs. Immune disorders remain in chapter III. Diseases of the genitourinary system (previously chapter X) and Complications of pregnancy, childbirth, and the puerperium (previously chapter XI) have become chapters XIV and XV, respectively, in the Tenth Revision. Cause-of-death titles have been changed and regrouped. Examples of title changes include the title Chronic obstructive pulmonary diseases and allied conditions in the Ninth Revision which became Chronic lower respiratory diseases in the Tenth Revision. Suicide in the Ninth Revision became Intentional self-harm, and Homicide became Assault in the Tenth Revision.

Notable regroupings include some cerebrovascular disorders, specifically transient cerebral ischemic attacks, which have been moved from Diseases of the circulatory system (ICD-9 code 435) to Diseases of the nervous system (ICD-10 codes G45.8 and G45.9). Septic shock, classified in the Ninth Revision as Shock without mention of trauma (785.5) in Symptoms, signs, and ill-defined conditions, is classified in the Tenth Revision as Unspecified septicemia (A41.9) in chapter I (Certain infectious and parasitic diseases). Respiratory failure (799.1) was moved from Symptoms, signs, and ill-defined conditions to Diseases of the respiratory system (J96). Myelodysplastic syndromes were moved from Diseases of the blood and blood-forming organs (289.8) to Neoplasms of uncertain behavior (D46). End stage renal disease, classified under Other disorders of kidney and ureter in ICD-9 (593.9), has been reclassified in the Tenth Revision as Renal failure (N18.0). Transport accidents have been regrouped by the characteristics of the injured person (e.g., pedestrian, pedal cyclist, motorcycle rider, car occupant). In ICD-9, transport accidents were grouped by the type of vehicle involved in the accident.

*Comparability between the Tenth and Ninth Revisions--* Discontinuities between the Ninth and Tenth Revisions of the ICD for selected causes of death are measured using comparability ratios. Comparability ratios for the List of 113 Selected Causes of Death and the List of 130 Selected Causes of Infant Death are shown in tables E and F, respectively. Interpretation of comparability ratios is problematic for some causes because the ratio does not accurately account for differences in the coding and classification system and thus does not adequately reflect the degree of discontinuity. Causes of death from the List of 113 Selected Causes of Death and the List of 130 Selected Causes of Infant Death that have been determined to have problematic comparability issues include Alzheimer's disease, Nephritis, nephrotic syndrome and nephrosis and Renal failure, Pregnancy, childbirth and the puerperium, Motor vehicle accidents and Other land transport accidents, Diarrhea and gastroenteritis of infectious origin, Birth trauma, Atelectasis, and Sudden infant death syndrome. For a detailed explanation of the problems in applying

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

comparability ratios to selected causes, refer to *Comparability of cause of death between ICD-9 and ICD-10: Preliminary estimates* (29) and *Deaths: Final data for 1999* (19).

*Medical certification*--The use of a standard classification list, although essential for State, regional, and international comparison, does not ensure strict comparability of the tabulated figures. A high degree of comparability among areas could be attained only if all records of cause of death were reported with equal accuracy and completeness. The medical certification of cause of death can be made only by a qualified person, usually a physician, a medical examiner, or a coroner. Therefore, the reliability and accuracy of cause-of-death statistics are, to a large extent, governed by the ability of the certifier to make the proper diagnosis and by the care with which he or she records this information on the death certificate.

A number of studies have been undertaken on the quality of medical certification on the death certificate. In general, these have been for relatively small samples and for limited geographic areas. A bibliography prepared by NCHS (39), covering 128 references over 23 years, indicates no definitive conclusions have been reached about the quality of medical certification on the death certificate. No country has a well-defined program for systematically assessing the quality of medical certifications reported on death certificates or for measuring the error effects on the levels and trends of cause-of-death statistics.

One index of the quality of reporting causes of death is the proportion of death certificates coded to the Tenth Revision, Chapter XVIII, Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (ICD-10 codes R00-R99). Although some deaths occur for which it is impossible to determine the underlying cause, this proportion generally indicates the care and consideration given to the certification by the medical certifier. This proportion also may be used as a rough measure of the specificity of the medical diagnoses made by the certifier in various areas. In 1999, 1.12 percent of all reported deaths in the United States were assigned to this category. The percent of deaths assigned to the comparable ICD-9 category was fairly stable from 1990 through 1999, between 1.08 and 1.18 percent; but was higher in earlier years, 1.25 percent in 1989 and between 1.43 and 1.51 percent from 1979 to 1988.

*Automated selection of underlying cause of death*--Before data for 1968, mortality medical data were based on manual coding of an underlying cause of death for each certificate in accordance with WHO rules. Effective with data year 1968, NCHS converted to computerized coding of the underlying cause and manual coding of all causes (multiple causes) on the death certificate. In this system, called Automated Classification of Medical Entities (ACME) (40), the multiple cause codes serve as inputs to the computer software that employs WHO rules to select the underlying cause. The ACME system applies the same rules for selecting the underlying cause as would be applied manually by a nosologist; however, under this system, the computer consistently applies the same criteria, thus eliminating inter-coder variation in this step of the process.

The ACME computer program requires the coding of all conditions shown on the medical certification. These codes are matched automatically against decision tables that select the underlying cause of death for each record according to the international rules. The decision tables provide the comprehensive relationships among the conditions classified by ICD when applying the rules of selection and modification.

The decision tables were developed by NCHS staff on the basis of their experience in coding underlying causes of death under the earlier manual coding system and as a result of periodic independent validations. These tables periodically are updated to reflect additional new information on the relationship among medical conditions. For data year 1988, these tables were amended to incorporate minor changes to the previously mentioned classification for HIV infection (\*042-\*044) that originally had been implemented with data year 1987. Coding procedures for selecting the underlying cause of death by using the ACME computer program, as well as by using the ACME decision tables, are documented in NCHS instruction manuals (41-43).

Beginning with data year 1990, another computer system was implemented for automating cause-of-death coding. This system, called Mortality Medical Indexing, Classification, and Retrieval (MICAR) (44,45), automates coding multiple causes of death. Because MICAR automates multiple-cause coding rules, errors in recognizing terms, applying coding rules, and using the ICD index are eliminated. The use of the MICAR system ensures consistent application of multiple-cause coding rules, which is especially important for rules that are complex and infrequently applied. In addition, MICAR can provide more detailed information on the conditions reported on death certificates than is available through the ICD category structure (46). At the same time MICAR was developed, a complementary data entry system was also developed, referred to as PC-MICAR. In the first year of implementation, only about 5 percent of the Nation's death records were coded using PC-MICAR and MICAR with subsequent processing of all records through ACME. The percentage of death records coded using MICAR and PC-MICAR increased to 26 percent in 1991 and to 35 percent in 1992.

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Beginning with data year 1993, another computer system was implemented for automating cause-of-death coding. This system, called Super-MICAR, is an enhancement of the PC-MICAR data entry system, which allows for total literal entry of the multiple cause-of-death text as reported by the certifier. This information is automatically coded by the MICAR and ACME computer systems. In the first year of implementation, about 9 percent of the Nation's death records were coded using Super-MICAR and 59 percent were coded using PC-MICAR, all with subsequent processing through MICAR and ACME. These percentages increased to 12 and 72 percent, respectively, in 1994; to 14 and 74 percent in 1995; and to 27 and 73 percent in 1996. Thus by 1996, 100 percent of the nation's records were coded using MICAR programs with subsequent processing through ACME. In each of the following years, the percentage of records coded using Super-MICAR increased, while the percentage of records coded using PC-MICAR decreased. Super-MICAR was used to code 29 percent of the records in 1997, 36 percent in 1998, and 52 percent in 1999. PC-MICAR was used to code 71 percent of the records in 1997, 64 percent in 1998, and 48 percent in 1999.

States whose data were coded by PC-MICAR in 1999 included Arizona, District of Columbia, Florida, Georgia, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maryland, Missouri, Nebraska, New Jersey, New York (excluding New York City), New York City, North Carolina, North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Texas, Vermont, Washington, and West Virginia. For these States, MICAR processed about 88 percent of the mortality records with an average system error rate of 0.23 on an underlying cause basis and 0.46 on a multiple-cause basis. Records that MICAR was unable to process were coded manually and then processed using ACME.

States using Super-MICAR in 1999 included Alabama, Alaska, Arkansas, California, Colorado, Connecticut, Delaware, Hawaii, Idaho, Iowa, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nevada, New Hampshire, New Mexico, Oklahoma, Oregon, Rhode Island, Tennessee, Utah, Virginia, Wisconsin, and Wyoming. For these States, Super-MICAR processed about 75 percent of the mortality records with an average system error rate of 0.37 on an underlying cause basis and 0.74 on a multiple-cause basis. Records that Super-MICAR was unable to process were coded manually and then processed using ACME.

### **Codes for firearm deaths**

Causes of death attributable to firearm mortality include ICD-10 codes W32-W34, Accidental discharge of firearms; X72-X74, Intentional self-harm (suicide) by discharge of firearms; X93-X95, Assault (homicide) by discharge of firearms; Y22-Y24, Discharge of firearms, undetermined intent; and Y35.0, Legal intervention involving firearm discharge. Deaths from injury by firearms exclude deaths due to explosives and other causes indirectly related to firearms.

### **Codes for drug-induced deaths**

Causes of death attributable to drug-induced mortality include selected codes from the ICD-10 title Mental and behavioral disorders due to psychoactive substance use, specifically, ICD-10 codes F11.0-F11.5, F11.7-F11.9, F12.0-F12.5, F12.7-F12.9, F13.0-F13.5, F13.7-F13.9, F14.0-F14.5, F14.7-F14.9, F15.0-F15.5, F15.7-F15.9, F16.0-F16.5, F16.7-F16.9, F17.0, F17.3-F17.5, F17.7-F17.9, F18.0-F18.5, F18.7-F18.9, F19.0-F19.5, and F19.7-F19.9; Accidental poisoning by and exposure to drugs, medicaments and biological substances, X40-X44; Intentional self-poisoning (suicide) by and exposure to drugs, medicaments and biological substances, X60-X64; Assault (homicide) by drugs, medicaments and biological substances, X85; and Poisoning by and exposure to drugs, medicaments and biological substances, undetermined intent, Y10-Y14. Drug-induced causes exclude accidents, homicides, and other causes indirectly related to drug use. Also excluded are newborn deaths associated with mother's drug use.

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

### **Codes for alcohol-induced deaths**

Causes of death attributable to alcohol-induced mortality include ICD-10 codes F10, Mental and behavioral disorders due to alcohol use; G31.2, Degeneration of nervous system due to alcohol; G62.1, Alcoholic polyneuropathy; I42.6, Alcoholic cardiomyopathy; K29.2, Alcoholic gastritis; K70, Alcoholic liver disease; R78.0, Finding of alcohol in blood; X45, Accidental poisoning by and exposure to alcohol; X65, Intentional self-poisoning by and exposure to alcohol; and Y15, Poisoning by and exposure to alcohol, undetermined intent. Alcohol-induced causes exclude accidents, homicides, and other causes indirectly related to alcohol use. This category also excludes newborn deaths associated with maternal alcohol use.

### **Maternal deaths**

Maternal deaths are those for which the certifying physician has designated a maternal condition as the underlying cause of death. Maternal conditions are those assigned to Complications of pregnancy, childbirth, and the puerperium (ICD-10 codes O00-O95, O98-O99, and A34).

"Maternal deaths" are defined by the World Health Organization as "the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and the site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management, but not from accidental or incidental causes" (24).

Maternal mortality rates are computed on the basis of the number of live births. The maternal mortality rate indicates the likelihood of a pregnant woman dying of maternal causes. The number of live births used in the denominator is an approximation of the population of pregnant women who are at risk of a maternal death.

Changes were made in the classification and coding of maternal deaths between ICD-9 and ICD-10, effective with mortality data for 1999. Some State death certificates include a separate question regarding pregnancy status. A positive response to the question is interpreted as "pregnant" being reported in Part II of the cause-of-death section of the death certificate. If a specified length of time is not provided by the medical certifier, it is assumed that the pregnancy terminated 42 days or less prior to death. Further, if only indirect maternal causes of death (i.e. a previously existing disease or a disease that developed during pregnancy which was not due to direct obstetric causes but was aggravated by physiologic effects of pregnancy) are reported in Part I and pregnancy is reported in either Part I or Part II, ICD-10 classifies this as a maternal death. ICD-9 only classified the death as maternal if pregnancy was reported in Part I.

Under the Eighth Revision, maternal deaths were assigned to the category "Complications of pregnancy, childbirth, and the puerperium" (*Eighth Revision International Classification of Diseases, Adapted for Use in the United States* (ICDA-8) Nos. 630-678). Although WHO did not define maternal mortality, an NCHS classification rule existed that limited the definition of a maternal death to a death that occurred within a year after termination of pregnancy from any "maternal cause," that is, any cause within the range of ICDA-8 Nos. 630-678. This rule applied only if a duration was given for the condition. If no duration was specified and the underlying cause of death was a maternal condition, the duration was assumed to be within a year and the death was coded by NCHS as a maternal death. The change from an under-1-year limitation for duration used in the Eighth Revision to an under-42-days limitation used in the Ninth Revision did not have much effect on the comparability of maternal mortality statistics. However, comparability was affected by the following classification change: Under the Ninth Revision, maternal causes of death were expanded to include Indirect obstetric causes (ICD-9 Nos. 647-648). These causes included Infective and parasitic conditions as well as other conditions present in the mother and classifiable elsewhere but that complicate pregnancy, childbirth, and the puerperium, such as Syphilis, Tuberculosis, Diabetes mellitus, Drug dependence, and Congenital cardiovascular disorders.

*Race*--Beginning with the 1989 data year, NCHS changed the method of tabulating live birth data by race from race of child, which was determined from the race of the parents, to race of mother. This resulted in a discontinuity in maternal mortality rates by race between 1989 to present and previous years; see "Change in tabulation of race data for live births," under "Infant deaths" in the Technical Appendix from *Vital Statistics of the United States, 1990*, or the series report, "Effect on Mortality Rates of the 1989 Change in Tabulating Race" (47).

### **Infant deaths**

*Age*--Infant death is defined as a death under 1 year of age. The term excludes fetal deaths. Infant deaths usually are divided into two categories according to age, neonatal and postneonatal. Neonatal deaths are those that occur during the first 27 days of life; postneonatal deaths are those that occur between 28 days and 1 year of age. Generally,

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

it has been believed that different factors influencing the child's survival predominate in these two periods: Factors associated with prenatal development, heredity, and the birth process were considered dominant in the neonatal period; environmental factors, such as nutrition, hygiene, and accidents, were considered more important in the postneonatal period. Recently, however, the distinction between these two periods has blurred due in part to advances in neonatology, which have enabled more very small premature infants to survive the neonatal period.

*Rates*--Infant mortality rates are the most commonly-used indices for measuring the risk of dying during the first year of life; they are calculated by dividing the number of infant deaths in a calendar year by the number of live births registered for the same period and are presented as rates per 1,000 or per 100,000 live births. Infant mortality rates use the number of live births in the denominator to approximate the population at risk of dying before the first birthday. This measure is an approximation because some live births will not have been exposed to a full year's risk of dying and some of the infants who die during a year will have been born in the previous year. The error introduced in the infant mortality rate by this inexactness is usually small, especially when the birth rate is relatively constant from year to year (48,49). Other sources of error in the infant mortality rate have been attributed to differences in applying the definitions for infant death and fetal death when registering the event (50-52).

In contrast to infant mortality rates based on live births, infant death rates are based on the estimated population under 1 year of age. Infant death rates, which appear in tabulations of age-specific death rates, are calculated by dividing the number of infant deaths in a calendar year by the estimated midyear population of persons under 1 year of age and are presented as rates per 100,000 population in this age group. Patterns and trends in the infant death rate may differ somewhat from those of the more commonly used "infant mortality rate," mainly because of differences in the nature of the denominator and in the time reference. Whereas the population denominator for the infant death rate is estimated using data on births, infant deaths, and migration for the 12-month period of July-June, the denominator for the infant mortality rate is a count of births occurring during the 12 months of January-December. The difference in the time reference can result in different trends between the two indices during periods when birth rates are moving up or down markedly.

The infant death rate also is subject to greater imprecision than is the infant mortality rate because of problems of enumerating and estimating the population under 1 year of age (51).

*Change in tabulation of race data for live births*--Beginning with the 1989 data year, NCHS changed the method of tabulating live-birth data by race from race of child, which was determined from the race of the parents, to race of mother. As in previous years, race for infant and maternal deaths (the numerator of the rate) is tabulated by the race of the decedent. Because live births comprise the denominator of infant and maternal mortality rates, this change resulted in a discontinuity in rates between 1989 to present, and those for previous years. For additional information, see the Technical Appendix from *Vital Statistics of the United States, 1990*, or the series report, "Effect on Mortality Rates of the 1989 Change in Tabulating Race" (47).

*Comparison of race data from birth and death certificates*--Regardless of whether vital events are tabulated by race of mother or by race of parents, studies in which race on the birth and death certificates for the same infant were compared find inconsistencies in reporting race between birth and death certificates (53).

These reporting inconsistencies can result in systematic biases in infant mortality rates by specified race, in particular, underestimates for specified races other than white or black. In the computation of race-specific infant mortality rates, the race item for the numerator comes from the death certificate, and for the denominator, from the birth certificate. Biases in the rates may arise because of possible inconsistencies in reporting race on these two vital records. Race of the mother and father is reported on the birth certificate by the mother at the time of delivery; whereas race of the deceased infant is reported on the death certificate by the funeral director based on observation or on information supplied by an informant, such as a parent. Previous studies have noted the race for an infant who died and was of a smaller minority race group is sometimes reported as white on the death certificate but is reported as the minority race group on the birth certificate, resulting, in the aggregate, in understatement of infant mortality for smaller race groups, for example, American Indian (12).

Estimates can be made of the degree of bias in race-specific infant mortality rates by comparing rates for which race is based on the death certificate of the infant with rates in which race is based on race of mother from the birth certificate. In table G these comparisons are made for the years 1995 and 1996 combined. A measure of reliability is the ratio of race reported on the linked file (race of mother from the birth certificate) to the race of the child reported on the death certificate. The ratio for white infants is 1.00; for black 0.97 indicating a good net correspondence in race from the two sources. However, for American Indians the ratio is 1.14 indicating that rates where race is based on the birth certificate are 14 percent higher than those based on the death certificate. Ratios among specific populations groups of Asian Americans varied greatly. Understatement was greatest for Japanese infants with a ratio of 2.04, indicating that infant mortality rates based on birth certificate information are over twice as high as those based on

## VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999

### TECHNICAL APPENDIX

death certificates. The ratios for Filipinos were 1.68, and for Chinese, 1.21. The ratio for Hawaiians was 0.85, indicating a higher rate based on death certificates, possibly because on death records on which Hawaiian was reported in combination with another race, coding procedures always give preference to Hawaiian (12).

*Hispanic origin*—For 1999, infant mortality rates for the Hispanic-origin population are based on numbers of resident infant deaths reported to be of Hispanic origin (see “Hispanic origin”) and numbers of resident live births by Hispanic origin of mother for the 50 States and the District of Columbia. In computing infant mortality rates, deaths and live births of unknown origin are not distributed among the specified Hispanic and non-Hispanic groups. Because the percent of infant deaths of unknown origin for 1999 was 1.7 percent and the percent of live births of unknown origin was 1.2 percent, infant mortality rates by specified Hispanic origin and race for non-Hispanic origin may be slightly underestimated.

Small numbers of infant deaths for specific Hispanic-origin groups can result in infant mortality rates subject to relatively large random variation (see “Random variation and sampling errors”).

Table H shows comparisons for infant mortality rates for Hispanic origin where Hispanic origin is based on death certificate identification of the infant or on birth certificate information on the Hispanic origin of the mother (the linked file) for 1996. For total Hispanic origin infants, the ratio was 1.05 indicating that rates are about 5 percent higher using the race of mother from the birth certificate (linked file). For Mexican and Cuban, the rates were about the same (ratios of 1.00 and 1.02, respectively), but rates for Puerto Rican infants were 12 percent higher when Hispanic origin was based on the birth certificate (12).

*Tabulation list*--Causes of death for infants are tabulated according to a list of causes that is different from the list of causes for the population of all ages, except for the Each Cause List. (See “Cause-of-death classification” under “Cause of death.”)

## Quality of data

### Completeness of registration

All States have adopted laws requiring the registration of births and deaths. It is believed that more than 99 percent of the births and deaths occurring in this country are registered.

*Massachusetts data*--The 1964 statistics for deaths exclude approximately 6,000 deaths registered in Massachusetts, primarily to residents of that State. Microfilm copies of these records were not received by NCHS. Figures for the United States and the New England Division are affected also.

### Quality control procedures

*Demographic items on the death certificate*--As previously indicated, for 1999 the mortality data for these items were obtained from two sources--photocopies of the original certificates furnished by Guam, American Samoa, and Northern Marianas, and electronic data records furnished by the 50 States, the District of Columbia, New York City, Puerto Rico, and the Virgin Islands. For Guam, American Samoa, and Northern Marianas, which sent only copies of the original certificates, the demographic items were coded for 100 percent of the death certificates. The demographic coding for each of these certificates was independently verified.

For areas sending electronic data records, a sample of 50 - 100 records per month for each registration area is used to monitor quality of coding. Under this procedure, each sample record is independently coded by NCHS staff and compared to the State code assignments. NCHS/State differences are adjudicated to ascertain the source of the error and need for corrective action. The estimated average outgoing error rate for all demographic items in 1999 was 0.25 percent. The error rate is a combined measure of State coding, key entry and processing errors made in the process of preparing the statistical file. These types of errors are not necessarily randomly distributed in the file and may therefore escape detection through sample verification. To reduce some systematic errors other NCHS procedures such as detailed computer edits, tabular evaluation, and procedure review are used.

*Medical items on the death certificate*--The same procedures used for demographic data are used for the medical items except that a larger sample, 100 – 175 records per month, is used to monitor the quality of coding medical items. For Arizona, Illinois, Kentucky, Missouri, New Jersey, Ohio, West Virginia, District of Columbia, New York City, Puerto Rico, Virgin Islands, Guam, American Samoa, and the Northern Marianas, which sent only copies of the

## VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999

### TECHNICAL APPENDIX

original certificates, the medical data were coded for 100 percent of the death certificates using either PC-MICAR or Super-MICAR. The death entry is independently verified for 10 percent of the file using a three-way comparison. For the 43 registration areas sending electronic files and for the files entered at NCHS, the average outgoing error rate in 1999 was estimated at 2.50 percent for underlying cause data, and 4.70 percent for multiple cause-of-death data.

*Rare causes of death*--Selected causes of death considered to be of public health concern are routinely confirmed by the States according to agreed upon procedures between the State vital statistics programs and the National Center for Health Statistics. These causes, termed "Infrequent and Rare Causes of Death," are listed in the NCHS instruction manuals Parts 2a, 11, and 20 (41,54,55).

As a consequence of the major effort involved in implementing a new revision of the ICD, a number of States did not provide complete confirmation of deaths from Infrequent and rare causes for 1999. These States include the following: California, Florida, Illinois, Indiana, Kentucky, Maine, Michigan, Missouri, New Jersey, New York City, North Carolina, Ohio, Pennsylvania, Rhode Island, Washington, and West Virginia.

*Other control procedures*--After coding and data entry are completed, record counts are balanced against control totals for each shipment of records from a registration area. Editing procedures ensure that records with inconsistent or impossible codes are modified. Inconsistent codes are those, for example, indicating a contradiction between cause of death and age or sex of the decedent. Records so identified during the computer editing process are either corrected by reference to the source record or adjusted by arbitrary code assignment (54). All subsequent operations in tabulating and in preparing tables are verified during the computer processing or by statistical clerks.

*Estimates of errors arising from 50-percent sample for 1972*--Death statistics for 1972 are based on a 50-percent sample of all deaths occurring in the 50 States and the District of Columbia. A description of the sample design and a table of the percent errors of the estimated numbers of deaths by size of estimate and total deaths in the area are shown in the Technical Appendix from *Vital Statistics of the United States, 1972*.

## Computation of rates and other measures

### Population bases

Population bases from which death rates are computed are prepared by the U.S. Bureau of the Census. Rates for 1940, 1950, 1960, 1970, 1980, and 1990 are based on the population enumerated as of April 1 in the censuses for those years. Rates for all other years use the estimated midyear (July 1) population. Death rates for the United States, individual States, and metropolitan areas are based on the total resident populations of the respective areas. Except as noted, these populations exclude the Armed Forces abroad but include the Armed Forces stationed in each area.

The resident populations of the birth- and death-registration States for 1900-32, and of the United States for 1900-99 are shown in table I. In addition, the population including Armed Forces abroad is shown for the United States. Table J lists the sources for these populations.

*Populations for 1999*--Population estimates of the United States by age, race, and sex for 1999 are shown in table K (15). Population estimates for each State by age for 1999 are shown in table L (56). The population estimates shown in tables I and J are based on the 1990 census and are consistent with those for 1990-98. Since these population estimates are based on demographic analysis, they are not subject to sampling variability.

In addition the following estimates are shown:

- Estimated population by 5-year age groups, specified Hispanic origin, race for non-Hispanic origin, and sex: United States, 1999 (see table M) (15,16)
- Estimated population for ages 15 years and over by 5-year age groups, marital status, race, and sex: United States, 1999 (see table N) (16)
- Estimated population for ages 15 years and over, by 5-year age groups, marital status, Hispanic origin, race for non-Hispanic origin, and sex: United States, 1999 (see table O) (16)
- Estimated population for ages 25-64 years, by 10-year age groups, educational attainment and sex: Total of 46 States and the District of Columbia, 1999 (see table P) (16)

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Population estimates by specified Hispanic origin, marital status, and educational attainment are based on the Bureau of the Census' Current Population Survey (a sample-based survey) adjusted to control totals. As a result, these estimates are subject to sampling variation (see "Random variation and sampling errors").

Revised populations estimates for 1999 that are consistent with the 2000 census levels are available for the United States and each State on the NCHS website at

<http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm>. Population estimates based on the CPS are consistent with 1990 census levels and have not been revised.

*Population for 1990*--In the 1980 and 1990 censuses, a substantial number of persons did not specify a racial group that could be classified as any of the white, black, American Indian, Eskimo, Aleut, Asian, or Pacific Islander categories on the census form (57). In 1980 the number of persons of "Other" race was 6,758,319; in 1990, it was 9,804,847. In both censuses the large majority of these persons were of Hispanic origin (based on responses to a separate question on the form), and many wrote in their Hispanic origin (for example, Mexican and Puerto Rican) as their race. In 1980 and 1990 persons of unspecified race were allocated to one of the four tabulated racial groups (white, black, American Indian, Asian or Pacific Islander) based on their response to the Hispanic origin question. These four race categories conform with OMB Directive 15 (the standards for recordkeeping, collection, and presentation of data on race and ethnicity in Federal statistical activities and program administrative reporting) (58) and are more consistent with the race categories in vital statistics.

In 1980 the allocation of unspecified race was determined using cross-tabulations of age, sex, race, specified Hispanic origin, and county of residence. Persons of Hispanic origin and unspecified race were allocated to either white or black based on their specific Hispanic origin. Persons of "Other" race and Mexican origin were categorically assumed to be white, while persons in other Hispanic categories were distributed to white and black pro rata within the county-age-sex group. For "Other race-not-specified" persons who were not Hispanic, race was allocated to white, black, or Asian or Pacific Islander based on proportions gleaned from sample data. The 20-percent sample (respondents who were enumerated on the longer census form) provided a highly detailed coding of race, which allowed identification of otherwise unidentifiable responses with a specified race category. Thus, allocation proportions were established at the State level and were used to distribute the non-Hispanic persons of "Other" race in the 100-percent tabulations.

In 1990 the race modification procedure was implemented using individual census records. Persons whose race could not be specified were assigned to a racial category using a pool of "race donors" that consisted of persons of specified race who had the identical responses to the Hispanic origin question and who were within the auspices of the same census district office. As in the 1980 census, it appeared that the underlying assumption made in the 1990 census was that the Hispanic origin response was the major criterion for allocating race. Unlike those responding to the 1980 census who could be assigned only to the racial group white or black, persons of Hispanic origin, including Mexicans, responding to the 1990 census could be assigned to any racial group. Also, in the 1990 census, the non-Hispanic component of "Other" race was allocated primarily on the basis of geography (district office), rather than detailed characteristic.

The means by which respondent's age was determined were fundamentally different for the two censuses; therefore, the problems that necessitated the modification were different. In 1980 respondents reported year of birth and quarter of birth (within year) on the census form. When census results were tabulated, persons born in the first quarter of the year (before April 1) had age equal to 1980 minus year of birth, while persons born in the last three quarters had age equal to 1979 minus year of birth.

In 1990 quarter year of birth was not reported on the census form, so direct determination of age from year of birth was not possible. In 1990 census publications, age is based on respondents' direct reports of age at last birthday. This definition proved inadequate for postcensal estimates as it was apparent that many respondents had reported their age at time of either completion of the census form or interview by an enumerator that could occur several months after the April 1 reference date. As a result, age was biased upward. For most respondents, modification was based on a respecification of age, by year of birth, with allocation to first quarter (persons aged 1990 minus year of birth) and last three quarters (aged 1989 minus year of birth) based on a historical series of registered births by month. This process partially restored the 1980 logic for assignment of age. It was not considered necessary to correct for age overstatement and heaping in 1990, because the availability of age and year of birth on the census form had provided for the elimination of spurious year-of-birth reports in the census data before modification occurred.

*Population estimates for 1981-89*--Death rates for 1981-89 are based on revised populations that are consistent with the 1990 census level (57). They are, therefore, not comparable with death rates published in *Vital Statistics of*

## VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999

### TECHNICAL APPENDIX

*the United States* for 1981-89, and in other NCHS publications for those years. The 1990 census counted approximately 1.5 million fewer persons than had been estimated earlier for April 1, 1990.

*Populations for 1980*--Death rates for 1980 are based on the population enumerated as of April 1 in the 1980 census (59). The figures by race have been modified as described.

*Population estimates for 1971-79*--Death rates for 1971-79 used revised population estimates that are consistent with the 1980 census levels. The 1980 census enumerated approximately 5.5 million more persons than had been estimated for April 1, 1980 (60). These revised estimates for the United States by age, race, and sex are published by the U.S. Bureau of the Census in *Current Population Reports*, Series P-25, Number 917. Unpublished revised estimates for States were obtained from the U.S. Bureau of the Census. For Puerto Rico, the Virgin Islands, and Guam, revised estimates are published in *Current Population Reports*, Series P-25, Number 919.

*Population estimates for 1961-69*--Death rates for 1961-69 are based on revised estimates of the population and thus may differ slightly from rates published before 1976. Rates, life table values, and population estimates for each year during 1961-69 have been revised to reflect modified population bases as published in the U.S. Bureau of the Census, *Current Population Reports*, Series P-25, Number 519.

*New Jersey*--As previously indicated, data by race are not available for New Jersey for 1962 and 1963. Therefore, for 1962 and 1963, NCHS estimated a population by age, race, and sex that excluded New Jersey for rates shown by race. The methodology used to estimate the revised population excluding New Jersey is discussed in the Technical Appendixes of the 1962 and 1963 volumes.

*Rates and ratios based on live births*--Infant and maternal mortality rates are computed on the basis of the number of live births. Counts of live births are published annually in *Vital Statistics of the United States*.

### Net census undercount

Errors can be introduced into the annual rates as a result of underenumeration of deaths and the misreporting of demographic characteristics. Errors in rates can also result from enumeration errors in the latest decennial census. This is because annual population estimates for the postcensal interval, which are used in the denominator for calculating death rates, are computed using the decennial census count as a base (57). Net census undercount results from the miscounting and misreporting of demographic characteristics such as age. Age-specific death rates are affected by the net census undercount and the misreporting of age on the death certificate (61). To the extent that the net undercount is substantial and that it varies among subgroups and geographic areas, it may have important consequences for vital statistics measures.

Because death rates based on a population adjusted for net census undercount may be more accurate than rates based on an unadjusted population, the possible impact of net census undercount on death rates must be considered. This can be done on a national basis using results of studies conducted by the U.S. Bureau of the Census on the completeness of coverage of the U.S. population (including underenumeration and misstatement of age, race, and sex). Such studies were conducted in the last five decennial censuses--1950, 1960, 1970, 1980, and 1990. From this work have come estimates of the national population that were not counted by age, race, and sex (62-65). The reports for 1990 (unpublished data from the U.S. Bureau of the Census) include estimates of net underenumeration and overenumeration for age, sex, and racial subgroups of the national population modified for race consistency with previous population counts as described in the section "Population bases." These studies indicate that, although coverage was improved over previous censuses, there was differential coverage among the population subgroups; that is, some age, race, and sex groups were more completely counted than others.

Because estimates of net census undercount are not available by age, race, and sex for individual States and counties, it is not feasible to adjust for net census undercount when presenting rates in routine tabulations. Nevertheless, it is important to be aware that net census undercounts can affect levels of observed vital rates.

*Age, race, and sex*--If adjustments were made for net census undercount, the size of denominators of the death rates generally would increase and the rates, therefore, would decrease. The adjusted rates for 1999 can be computed by multiplying the reported rates by ratios of the census-level resident population to the resident population adjusted for the estimated net census undercount (table Q). A ratio of less than 1.0 indicates a net census undercount and, when applied, results in a corresponding decrease in the death rate. A ratio greater than 1.0--indicating a net census overcount--when multiplied by the reported rate results in an increase in the death rate.

Coverage ratios for all ages show that, in general, females were more completely enumerated than males and the white population more completely enumerated than the black population in the 1990 Census of Population. Underenumeration varied by age group for the total population, with the greatest differences found for persons aged 85 years and over. All other age groups were overcounted or undercounted by less than 4.0 percent. Among the

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

age-sex-race groups, underenumeration was highest (13.3 percent) for black males aged 25-34 years. In contrast, white females in this age group were underenumerated by 2.5 percent.

If vital statistics measures were calculated with adjustments for net census undercounts for each population subgroup, the resulting rates would be differentially reduced from their original levels; that is, rates for those groups with the greatest estimated undercounts would show the greatest relative reductions due to these adjustments. Similar effects would be evident in the opposite direction for groups with overcounts. Consequently, the ratio of mortality between the rates for males and females and between the rates for the white population and the black population usually would be reduced.

Similarly, the differences between the death rates among subgroups of the population by cause of death would be affected by adjustments for net census undercounts. For example, in 1990 for the age group 35-39 years, the ratio of the unadjusted death rate for Homicide and legal intervention for black males to that for white males is 7.54, whereas the ratio of the death rates adjusted for net census undercount is 6.92. For Ischemic heart disease for males aged 40-44 years, the ratio of the death rate for the black population to that for the white population is 1.38 using the unadjusted rates, but it is 1.26 when adjusted for estimated underenumeration.

*Summary measures*-The effect of net census undercount on age-adjusted death rates and life table values depends on the underenumeration of each age group and on the distribution of deaths by age. Thus, the age-adjusted death rate in 1990 for All causes would decrease from 520.2 to 512.7 per 100,000 population if the age-specific death rates were corrected for net census undercount (table R). For Diseases of heart, the age-adjusted death rate for white males would decrease from 202.0 to 198.2 per 100,000 population, a decline of 2.0 percent. For black males, the change from an unadjusted rate of 275.9 to an adjusted rate of 256.7 would amount to a decrease of 7.0 percent. For HIV infection, the rate for black males would decrease from 44.2 to 39.0 and for white males from 15.0 to 14.4.

If death rates by age were adjusted, the corresponding life expectancy at birth computed from these rates would change. When calculating life expectancy, the impact of an undercount or overcount is greatest at the younger ages. In general, the effect of correcting the death rates is to increase the estimate of life expectancy at birth. For example, adjustment for net census undercount would increase life expectancy in 1990 by an estimated 0.2 years, from 75.4 years to 75.6 years for the total U.S. population.

Adjustment for differential underenumeration among race-sex groups would lead to greater changes in life expectancy for some groups than for others. For males and females, increases would be 0.3 and 0.1 years, respectively; for the black population and white population, 0.6 and 0.2 years, respectively. The largest increase would be for black males, 1.2 years, followed by white males (0.3 years), black females (0.2 years), and white females (0.2 years).

### **Age-adjusted death rates**

Age-adjusted death rates are used to control for differences and changes in age composition and thus, compare relative mortality risk across groups and over time. However, they should be viewed as constructs or indexes rather than as direct or actual measures of mortality risk. Statistically, they are weighted averages of the age-specific death rates, where the weights represent the fixed population proportions by age (66). Age-adjusted death rates were computed by the direct method, that is, by applying age-specific death rates for a given cause of death to the U.S. standard population. It is important not to compare age-adjusted death rates with crude rates.

Beginning with the 1999 data year, a new population standard was adopted by NCHS for use in age-adjusting death rates. Based on the projected year 2000 population of the United States, the new standard replaces the 1940 standard population that had been used for over 50 years. The new population standard affects levels of mortality and to some extent trends and group comparisons. Of particular note are the effects on race comparison of mortality. For detailed discussion see *Age Standardization of Death Rates: Implementation of the Year 2000 Standard* (67).

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

The year 2000 standard population and corresponding weights ( $w_i$ ), used beginning with data year 1999, for computing age-adjusted rates and relative standard errors (RSE), excluding those by marital status, education, injury at work, and the U.S. territories, are shown in the following table:

Age	Number	Weights ( $w_i$ )
All ages.....	1,000,000	1.000000
Under 1 year.....	13,818	0.013818
1-4 years.....	55,317	0.055317
5-14 years.....	145,565	0.145565
15-24 years.....	138,646	0.138646
25-34 years.....	135,573	0.135573
35-44 years.....	162,613	0.162613
45-54 years.....	134,834	0.134834
55-64 years.....	87,247	0.087247
65-74 years.....	66,037	0.066037
75-84 years.....	44,842	0.044842
85 years and over.....	15,508	0.015508

The 1940 standard population and corresponding weights ( $w_i$ ), used prior to data year 1999, for computing age-adjusted rates and relative standard errors (RSE), excluding those by marital status, education, injury at work, and the U.S. territories, are shown in the following table:

Age	Number	Weights ( $w_i$ )
All ages.....	1,000,000	1.000000
Under 1 year.....	15,343	0.015343
1-4 years.....	64,718	0.064718
5-14 years.....	170,355	0.170355
15-24 years.....	181,677	0.181677
25-34 years.....	162,066	0.162066
35-44 years.....	139,237	0.139237
45-54 years.....	117,811	0.117811
55-64 years.....	80,294	0.080294
65-74 years.....	48,426	0.048426
75-84 years.....	17,303	0.017303
85 years and over.....	2,770	0.002770

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Age-adjusted death rates by marital status are computed using the age groups 25 years and over. Therefore, based on the year 2000 standard population, the United States standard population aged 25 years and over and corresponding weights ( $w_i$ ) are as follows:

Age	Number	Weights ( $w_i$ )
25 years and over.....	646,654	1.000000
25-34 years.....	135,573	0.209653
35-44 years.....	162,613	0.251468
45-54 years.....	134,834	0.208510
55-64 years.....	87,247	0.134921
65-74 years.....	66,037	0.102121
75 years and over.....	60,350	0.093327

Age-adjusted death rates by educational attainment are computed using the age groups 25-64 years. Therefore, based on the year 2000 standard population, the United States standard population aged 25-64 years and corresponding weights ( $w_i$ ) are as follows:

Age	Number	Weights ( $w_i$ )
25-64 years.....	520,267	1.000000
25-34 years.....	135,573	0.260584
35-44 years.....	162,613	0.312557
45-54 years.....	134,834	0.259163
55-64 years.....	87,247	0.167697

Age-adjusted death rates for injury at work are computed using the age groups 15 years and over. Therefore, based on the year 2000 standard population, the United States standard population aged 15 years over and corresponding weights ( $w_i$ ) are as follows:

Age	Number	Weights ( $w_i$ )
15 years and over.....	785,300	1.000000
15-24 years.....	138,646	0.176552
25-34 years.....	135,573	0.172638
35-44 years.....	162,613	0.207071
45-54 years.....	134,834	0.171697
55-64 years.....	87,247	0.111100
65-74 years.....	126,387	0.160941

Age-adjusted death rates for Puerto Rico, Virgin Islands, Guam, American Samoa, and Northern Marianas are computed using the age groups 75 years and over. Therefore, based on the year 2000 standard population, the United States standard population aged 75 years and over and corresponding weights ( $w_i$ ) are as follows:

Age	Number	Weights ( $w_i$ )
All ages.....	1,000,000	1.000000
Under 1 year.....	13,818	0.013818
1-4 years.....	55,317	0.055317
5-14 years.....	145,565	0.145565
15-24 years.....	138,646	0.138646
25-34 years.....	135,573	0.135573
35-44 years.....	162,613	0.162613
45-54 years.....	134,834	0.134834
55-64 years.....	87,247	0.087247
65-74 years.....	66,037	0.066037
75 years and over.....	60,350	0.060350

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

## Life tables

The current or period life table provides a comprehensive measure of the effect of current mortality on life expectancy. It is composed of sets of values showing the mortality experience of a hypothetical group of infants born at the same time and subject throughout their lifetime to the age-specific death rates of a particular time period, usually a given year. Beginning with final data reported for 1997, the life table methodology was changed from previous annual reports. Previously, U.S. life tables were abridged and constructed by reference to a standard table (68). In addition, the age range for these life tables was limited to 5-year age groups ending with the age group 85 years and over.

Beginning with 1997 mortality data, a revised life table methodology was used to construct complete life tables by single years of age that extend to age 100 (69) using a methodology similar to that of the decennial life tables (70). The advantages of the new over the previous methodology are its comparability with decennial life table methodology, greater accuracy, and greater age detail. A comparison of the two methods shows small differences in resulting values for life expectancy (69). To calculate the probability of dying at each age, the revised methodology uses vital statistics death rates for ages under 85 years and mortality data from the Medicare program for ages over 85 years. Medicare data were used to model the probability of dying at ages 85 and over because the data are shown to be significantly more reliable than vital statistics data at the oldest ages (71).

Life tables for the decennial period 1979-81 are used as the standard life tables in constructing the 1980-96 abridged life tables. Life table values for 1981-89 are based on revised intercensal estimates of the populations for those years. Therefore, these life table values may differ from life table values of those years published previously.

Life tables for the decennial period 1969-71 are used as the standard life tables in constructing the 1970-79 abridged life tables. Life table values for 1970-73 were first revised in *Vital Statistics of the United States, 1977*; before 1977, life table values for 1970-73 were constructed using the 1959-61 decennial life tables. In addition, life table values for 1951-59, 1961-69, and 1971-79 are based on revised intercensal estimates of the populations for those years. As such, these life table values may differ from life table values previously published.

The annual abridged life table series was initiated for selected race-sex groups in 1945. Because of the increased interest in the average length of life ( $\bar{e}_0$ ) for years prior to 1945, estimates were prepared for the following race and sex groups and data years (72).

Years	Race and sex groups
1900-45.....	Total
1900-47.....	Male
1900-47.....	Female
1900-50.....	White
1900-44.....	White, male
1900-44.....	White, female
1900-50.....	All other
1900-44.....	All other, male
1900-44.....	All other, female

The geographic areas covered in life tables before 1929-31 were limited to the death-registration areas. Life tables for 1900-02 and 1909-11 were constructed using mortality data from the 1900 death-registration States--10 States and the District of Columbia, and for 1919-21, from the 1920 death-registration States--34 States and the District of Columbia. The tables for 1929-31 through 1958 cover the conterminous United States. Decennial life table values for the 3-year period 1959-61 were derived from data that include Alaska and Hawaii for each year. Data for each year include Alaska beginning in 1959 and Hawaii beginning in 1960. It is believed that the inclusion of these two States does not materially affect life table values.

## Causes of death contributing to changes in life expectancy

Causes of death contributing to changes in life expectancy were estimated using a life table partitioning technique. The method partitions changes into component additive parts. This method identifies the causes of death having the greatest influence, positive or negative, on changes in life expectancy (73,74).

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

### **Random variation and sampling errors**

*Deaths*--The number of deaths reported for an area represent complete counts of such events (except for 1972 when the data were based on a 50-percent sample because of resource constraints). As such, they are not subject to sampling error, although they are subject to non-sampling errors in the registration process. However, when the figures are used for analytical purposes, such as the comparison of rates over time or for different areas, the number of events that actually occurred may be considered as one of a large series of possible results that could have arisen under the same circumstances (75). The probable range of values may be estimated from the actual figures according to certain statistical assumptions.

In general, distributions of vital events, because they are relatively infrequent, may be assumed to follow a Poisson distribution. As a result, the numbers of deaths, death rates, and mortality rates are subject to random variation. Estimates of relative standard errors (RSE)--a measure of variability--95-percent confidence intervals, and tests of statistical significance under this assumption are shown below. When the number of events is large, the relative standard error is usually small. When the number of events is small (perhaps less than 100) and the probability of such an event is small, considerable caution must be observed in interpreting the data.

*Populations*--Population estimates of the United States and for each State by age, race, total Hispanic origin, and sex for 1999 are based on demographic methods and, therefore, are not subject to sampling variability. However, population estimates by specified Hispanic origin (Mexicans, Puerto Ricans, Cubans, and Other Hispanics), by specified marital status groups (never married, married, widowed, and divorced), and by specified educational attainment groups (under 12 years, 12 years, and 13 or more years) are based on the Bureau of the Census' Current Population Survey (CPS) adjusted to control totals and, therefore, are subject to sampling variation. As a result, death rates based on the CPS-based population estimates are subject to both random variation of the deaths and sampling error of the population estimates. Estimates of relative standard errors, 95-percent confidence intervals, and tests of statistical significance under these assumptions are shown below. All population estimates may also be subject to non-sampling errors.

*Computation of population-based death rates*--Death rates for a single calendar year are computed by dividing the number of deaths for a class for that year by the population of a similarly-defined class for the same year and multiplying that result by 100,000 (or 1,000). Rates thus computed are per 100,000 (or 1,000) estimated population residing in selected areas of the United States. The 3-year average death rates are computed by dividing the total number of deaths for a class for a three-year period by the sum of the population estimates of a similarly defined class for the same period and multiplying that result by 100,000 (or 1,000).

*Computation of live birth-based mortality rates*--Maternal mortality rates and infant mortality rates are computed by dividing the number of deaths for a class for a specified year by the number of live births of a similarly defined class for that year and multiplying that result by 100,000 (or 1,000). Rates thus computed are per 100,000 (or 1,000) live births residing in selected areas of the United States.

*Relative Standard Errors and 95% Confidence Intervals*--Formulas for computing approximate RSE's and confidence intervals (CI's) for crude, age-specific death rates, age-adjusted death rates, and infant and maternal mortality rates are shown below.

Beginning with 1989 data, an asterisk has been shown in place of a rate based on fewer than 20 deaths, which is the equivalent of an RSE of 22.94 percent or more. An RSE of this magnitude is considered statistically unreliable. That procedure has been used for mortality data except death rates based on CPS-based population estimates, for which sampling variation must be considered in addition to random variation. Formulas for computing RSE's for CPS population-based rates are presented below and an asterisk is shown in place of a rate when the RSE is 22.94 percent or more. RSE's for CPS population-based rates were introduced beginning with specified Hispanic-origin data for 1994 and subsequently for rates by marital status and educational attainment.

The formulas below are shown separately for rates based on demographically estimated populations, sample-based populations, and rates based on live births. Further, separate discussions are provided for rates based on less than 100 events, and rates based on 100 events or more. Specific examples are given to illustrate the use of the formulas.

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

The following formulas are used for demographically-estimated population-based death rates for all races, white, black, American Indian, Asian or Pacific Islander, all origins, total Hispanic, total non-Hispanic, non-Hispanic white, and non-Hispanic black for **all** marital status groups combined:

Age-specific and crude death rates--

$$RSE(R) = RSE(D) = 100 \sqrt{\frac{I}{D}}$$

Approximate 95% Confidence Interval: 100 or more deaths

Lower:  $R - 1.96 * S(R)$

Upper:  $R + 1.96 * S(R)$

Approximate 95% Confidence Interval: 1-99 deaths

Lower:  $R * L(1-\alpha=.95, D)$

Upper:  $R * U(1-\alpha=.95, D)$

where

$R$  = rate (deaths per 100,000 population)

$D$  = total number of deaths upon which rate is based

$$S(R) = R * \frac{RSE(R)}{100} = \text{standard error of rate}$$

$L(1-\alpha=.95, D)$  and  $U(1-\alpha=.95, D)$  are lower and upper 95% confidence limit factors and are shown in table S

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Age-adjusted death rates--

$$RSE(R'') = 100 \frac{\sqrt{\sum \left\{ w_i^2 R_i^2 \left( \frac{1}{D_i} \right) \right\}}}{R''}$$

Approximate 95% Confidence Interval: 100 or more deaths

Lower:  $R'' - 1.96 * S(R'')$

Upper:  $R'' + 1.96 * S(R'')$

Approximate 95% Confidence Interval: 1-99 deaths

Lower:  $R'' * L(1-\alpha=.95, D_{adj})$

Upper:  $R'' * U(1-\alpha=.95, D_{adj})$

where

$R''$  = age-adjusted rate (per 100,000 population) =  $\sum w_i R_i$

$w_i$  =  $i^{th}$  age-specific Standard Population such that  $\sum (w_i) = 1.0$

$R_i$  = age-specific rate (per 100,000) for the  $i^{th}$  age group

$D_i$  = total number of deaths for the  $i^{th}$  age group upon which age-specific rate is based

$$S(R'') = R'' * \frac{RSE(R'')}{100} = \text{standard error of age-adjusted rate}$$

$L(1-\alpha=.95, D_{adj})$  and  $U(1-\alpha=.95, D_{adj})$  are lower and upper 95% confidence limit factors and are shown in table S

$$D_{adj} = \frac{1}{\left( \frac{RSE(R'')}{100} \right)^2} = \text{adjusted number of deaths rounded to nearest integer}$$

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

The following formulas are used for CPS population-based death rates for all races, white, black, American Indian, Asian or Pacific Islander, all origins, total Hispanic, total non-Hispanic, non-Hispanic white, non-Hispanic black by **specified** marital status group (never married, married, widowed, and divorced) and by specified educational attainment groups

OR

for Mexican, Puerto Rican, Cuban, Other Hispanic for **all** marital status (or all educational attainment) groups combined and by **specified** marital status group (never married, married, widowed, and divorced) and specified educational attainment groups:

Age-specific and crude death rates--

$$RSE(R) = 100 \sqrt{\left(\frac{1}{D}\right) + f \left(a + \frac{b}{P}\right)}$$

Approximate 95% Confidence Interval: 100 or more deaths

Lower:  $R - 1.96 * S(R)$

Upper:  $R + 1.96 * S(R)$

Approximate 95% Confidence Interval: 1-99 deaths

$$Lower : R * L(1 - \alpha = .96, D) * \sqrt{1 - 2.576 \left(f \left(a + \frac{b}{P}\right)\right)}$$

$$Upper : R * U(1 - \alpha = .96, D) * \sqrt{1 + 2.576 \left(f \left(a + \frac{b}{P}\right)\right)}$$

where

$R$  = rate (deaths per 100,000 population).

$D$  = total number of deaths upon which rate is based

$f$  = factor that depends on whether the population estimate is based on demographic analysis or CPS and the number of years used (see below)

$a$  and  $b$  factors are CPS standard error parameters (see below)

$P$  = total estimated population upon which rate is based (if rate is based on a 3-year average, then an approximate  $P$  would be three times the population for the most recent year)

$$S(R) = R * \frac{RSE(R)}{100} = \text{standard error of rate}$$

$L(1 - \alpha = .96, D)$  and  $U(1 - \alpha = .96, D)$  are lower and upper 96% confidence limit factors and are shown in table S

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Age-adjusted death rates--

$$RSE(R'') = 100 \frac{\sqrt{\sum \left( w_i^2 * R_i^2 \left( \frac{1}{D_i} + f \left( a + \frac{b}{P} \right) \right) \right)}}{R''}$$

Approximate 95% Confidence

Interval: 100 or more deaths

Lower:  $R'' - 1.96 * S(R'')$

Upper:  $R'' + 1.96 * S(R'')$

Approximate 95% Confidence Interval: 1-99 deaths

Lower:  $R'' * L(1 - \alpha = .96, D_{adj}) * (1 - 2.576 * RSE(P_{adj}))$

Upper:  $R'' * U(1 - \alpha = .96, D_{adj}) * (1 + 2.576 * RSE(P_{adj}))$

where

$R''$  = age-adjusted rate (per 100,000 population) =  $\sum w_i R_i$

$w_i$  =  $i^{th}$  age-specific Standard Population such that  $\sum (w_i) = 1.0$

$R_i$  = age-specific rate (per 100,000) for the  $i^{th}$  age group

$D_i$  = total number of deaths for the  $i^{th}$  age group upon which age-specific rate is based

$f$  = factor that depends on whether the population estimate is based on demographic analysis or CPS and the number of years used (see below)

$a$  and  $b$  factors are CPS standard error parameters (see below)

$P_i$  = total estimated population for the  $i^{th}$  age group upon which the rate is based (if rate is based on 3-year average, then combined  $P_i$  would be three times the population for the most recent year)

$$S(R'') = R'' * \frac{RSE(R'')}{100} = \text{standard error of age-adjusted rate}$$

$L(1 - \alpha = .96, D_{adj})$  and  $U(1 - \alpha = .96, D_{adj})$  are lower and upper 96% confidence limit factors and are shown in table S

$P_{adj} = \sum (w_i * P_i)$  = adjusted estimated population rounded to nearest integer

$$RSE(P_{adj}) = \frac{\sqrt{\sum \left( w_i^2 * P_i^2 * f \left( a + \frac{b}{P_i} \right) \right)}}{P_{adj}}$$

$$D_{adj} = \text{smaller of } \Sigma(D_i) \text{ or } \frac{1}{RSE(R'')^2 - RSE(P_{adj})^2} = \begin{array}{l} \text{adjusted number of deaths} \\ \text{rounded to the} \\ \text{nearest integer} \end{array}$$

If  $D_{adj}$  is negative, set  $D_{adj}$  to  $\Sigma(D_i)$

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Shown below are the “*a*”, “*b*”, and “*f*” factors for various race, origin, marital status, and educational attainment classifications, by whether the population-based rate was based on a single year (76) or 3-year average (76-78):

<u>Race, origin, and marital status</u>	<u>Rate based on 1 year</u>	<u>Rate based on 3 years</u>
All races, white, American Indian, all origins, total Hispanic, total non-Hispanic, non-Hispanic white; by never married, married, widowed, divorced	$f = 0.670$ $a = -0.000019$ $b = 5,211$	$f = 0.440$ $a = -0.000019$ $b = 15,633$
Black, non-Hispanic black; by never married, married, widowed, divorced	$f = 0.670$ $a = -0.000213$ $b = 7,486$	$f = 0.440$ $a = -0.000214$ $b = 22,458$
Asian or Pacific Islander; by never married, married, widowed, divorced	$f = 0.670$ $a = -0.000587$ $b = 7,486$	$f = 0.440$ $a = -0.000587$ $b = 22,458$
Mexican, Puerto Rican, Cuban, Other Hispanic; all marital status groups combined, never married, married, widowed, divorced	$f = 0.670$ $a = -0.000238$ $b = 7,486$	$f = 0.440$ $a = -0.000240$ $b = 22,458$
All races, white, American Indian, all origins, total Hispanic, total non-Hispanic, non-Hispanic white; by educational attainment	$f = 0.670$ $a = -0.000011$ $b = 2,369$	$f = 0.440$ $a = -0.000011$ $b = 7,107$
Black, non-Hispanic black; by educational attainment	$f = 0.670$ $a = -0.000106$ $b = 2,680$	$f = 0.440$ $a = -0.000117$ $b = 8,040$
Mexican, Puerto Rican, Cuban, Other Hispanic; by educational attainment	$f = 0.670$ $a = -0.000082$ $b = 1,811$	$f = 0.440$ $a = -0.000109$ $b = 6,673$

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

*The following formulas may be used for live birth-based mortality rates:*

The formulas for the RSE and 95-percent CI's of an infant mortality rate (IMR) are as follows:

$$RSE(IMR) = 100 \sqrt{\frac{I}{D} + \frac{I}{B}}$$

Approximate 95% Confidence Interval: 100 or more infant deaths

Lower:  $IMR - 1.96 * S(IMR)$

Upper:  $IMR + 1.96 * S(IMR)$

Approximate 95% Confidence Interval: 1-99 infant deaths

Lower:  $IMR * L(1-\alpha=.95, D_{adj})$

Upper:  $IMR * U(1-\alpha=.95, D_{adj})$

where

$IMR$  = infant mortality rate (infant deaths per 100,000 live births)

$D$  = total number of infant deaths upon which rate is based

$B$  = total number of live births upon which IMR is based

$$S(IMR) = IMR * \frac{RSE(IMR)}{100} = \text{standard error of infant mortality rate}$$

$L(1-\alpha=.95, D_{adj})$  and  $U(1-\alpha=.95, D_{adj})$  are lower and upper 95% confidence limit factors and are shown in table S

$$D_{adj} = \frac{D * B}{D + B} = \begin{array}{l} \text{adjusted number of infant deaths that takes} \\ \text{into account the RSE of the number} \\ \text{of infant deaths and live births} \end{array}$$

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

## Statistical tests

For testing the equality of two rates,  $R_1$  and  $R_2$ , the  $z$ -test may be used (when both rates are based on 100 deaths or more) or the overlap of 95% CI's of the rates may be used (when either or both of the rates are based on less than 100 deaths).

The  $z$ -test is determined as follows:

$$z = \frac{R_1 - R_2}{\sqrt{R_1^2 \left( \frac{RSE(R_1)}{100} \right)^2 + R_2^2 \left( \frac{RSE(R_2)}{100} \right)^2}}$$

to define a significance test statistic. If  $|z|$  is greater than or equal 1.96, then the difference would be considered statistically significant at the 0.05 level; and if  $|z|$  is less than 1.96, the difference is not statistically significant.

As a hypothetical example, if the three-year average death rate for Mexicans,  $R_1$ , is 36.4 (based on  $D=120$  deaths and  $P=330,000$  population for the three years combined) and the three-year rate for non-Hispanic whites,  $R_2$ , is 13.8 (based on  $D=180$  deaths and  $P=1,300,000$  population for the three years combined), then using the formulas above the RSE's and  $z$ -test are computed as follows:

$$RSE(R_1) = 100 \sqrt{\frac{I}{120} + 0.440 * \left( -.000297 + \frac{20,595}{330,000} \right)} = 18.88\%$$

$$RSE(R_2) = 100 \sqrt{\frac{I}{180}} = 7.45\%$$

and

$$z = \frac{36.4 - 13.8}{\sqrt{36.4^2 \left( \frac{18.88}{100} \right)^2 + 13.8^2 \left( \frac{7.45}{100} \right)^2}} = 3.25$$

Since  $|z|$  is greater than 1.96, the difference between the two rates is statistically significant at the 0.05 level of significance.

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

If either of two rates is based on less than 100 deaths, then one may determine if the 95% CI's overlap as an indication of a statistically significant or non-significant difference. Users of the method of comparing confidence intervals should be aware that this method is a conservative test for statistical significance. That is, the difference between two rates may, in fact, be statistically significant even though confidence intervals for the two rates overlap (79). Thus, caution should be observed when interpreting a non-significant difference between two rates, especially when the lower and upper limits being compared overlap only slightly.

As a hypothetical example, if the three-year average death rate for Cubans,  $R_3$ , is 26.7 (based on  $D=40$  deaths and  $P=150,000$  population for the three years combined) and the three-year rate for non-Hispanic blacks,  $R_4$ , is 61.5 (based on  $D=400$  deaths and  $P=650,000$  population for the three years combined), then the 95% CI's are computed using information from the following formulas and table S:

95% CI for  $R_3$

$$Lower := 26.7 * 0.70266 \left( 1 - 2.576 \sqrt{0.44 * \left( -.000297 + \frac{20,595}{150,000} \right)} \right) = 6.9$$

$$Upper := 26.7 * 1.37991 \left( 1 + 2.576 \sqrt{0.44 * \left( -.000297 + \frac{20,595}{150,000} \right)} \right) = 60.1$$

95% CI for  $R_4$

$$RSE(R_4) = 100 \sqrt{\frac{I}{400}} = 5.00\%$$

$$Lower = 61.5 - (1.96) = 55.5$$

$$Upper = 61.5 + (1.96) = 67.5$$

Since the CI's overlap, the difference between  $R_3$  and  $R_4$  is not statistically significant.

**TECHNICAL APPENDIX**

Table A. Percent agreement between number of deaths from death certificates and from census and Current Population Survey files, by race and Hispanic origin, and ratio of number of deaths 1960 census and the National Longitudinal Mortality Study

Race <sup>1</sup> and Hispanic origin <sup>2</sup>	1960 census		NLMS <sup>3</sup> 1979-1985/1989	
	Percent agreement	Ratio of census to death certificate	Percent agreement	Ratio of CPS <sup>4</sup> to death certificate
White.....	99.8	1.00	99.8	1.00
Black.....	98.2	1.00	98.6	1.00
American Indian <sup>5</sup> .....	79.2	1.12	57.4	1.37
Asian or Pacific Islander.....	---	---	82.5	1.13
Japanese.....	97.0	1.04	---	---
Chinese.....	90.3	1.07	---	---
Filipino.....	72.6	1.28	---	---
Hispanic.....	---	---	89.7	1.07
Mexican.....	---	---	84.9	1.11
Puerto Rican.....	---	---	85.9	1.04
Cuban.....	---	---	80.0	1.07
Other Hispanic.....	---	---	47.6	0.89
Non-Hispanic.....	---	---	99.8	1.00

--- Data not available.

<sup>1</sup> NLMS race data are nine CPS files and for deaths occurring 1979-89.

<sup>2</sup> NLMS Hispanic-origin data are for 12 CPS fields and for deaths occurring 1979-85 for selected States.

<sup>3</sup> National Longitudinal Mortality Study.

<sup>4</sup> Current Population Survey.

<sup>5</sup> Includes Aleuts and Eskimos.

**TECHNICAL APPENDIX**

Table B. Reported age-adjusted death rates and rates adjusted for reporting bias and undercoverage, by race and Hispanic origin: United States, 1999

[Age-adjusted rates per 100,000 U.S. standard population based on year 2000 standard]

Race and origin	1999 age-adjusted rate <sup>1</sup>	1979-89 NLMS ratio <sup>2</sup>	1990 census undercount ratio <sup>3</sup>	Combined ratio <sup>4</sup>	Rates adjusted for reporting bias and estimated census undercount <sup>5</sup>	Race ratio <sup>6</sup> before adjustment	Estimated race ratio <sup>6</sup> after adjustment
White.....	860.7	1.00	0.99	0.99	852.1	1.00	1.00
Black.....	1,147.1	1.00	0.95	0.95	1,089.7	1.33	1.28
American Indian <sup>7</sup> .....	716.1	1.37	0.88	1.21	866.5	0.83	1.02
Asian or Pacific Islander <sup>8</sup> .....	517.5	1.13	0.98	1.11	574.4	0.60	0.67
Hispanic.....	601.0	1.07	0.95	1.02	613.0	0.70	0.72

--- Data not available.

<sup>1</sup> Hoyert DL, Arias E, Smith BS, Murphy SL, Kochanek KD. Deaths: Final data for 1999. National vital statistics reports; vol 49 no 8. Hyattsville, Maryland: National Center for Health Statistics. 2001.

<sup>2</sup> The National Longitudinal Mortality Study (NLMS) race ratios based on weighted data for nine Current Population Survey (CPS) files; NLMS ratios are the ratio of CPS-weighted number of deaths for a race group divided by the death certificated weighted number of deaths for the corresponding race group. The ratio for Hispanic persons was based on 12 CPS files for selected States for 1979-85.

<sup>3</sup> The census undercount ratio is based on the ratio of the 1990 resident census-level population to the resident population adjusted for net census undercount (Hogan H. The 1990 post-enumeration survey: Operations and results. J Am Stat Assoc 88(423):1047-60. 1993).

<sup>4</sup> Product of the NLMS ratio multiplied by the census undercount ratio.

<sup>5</sup> Product of the 1999 age-adjusted rate multiplied by the combined ratio.

<sup>6</sup> Ratio of the rate for a race or origin group to the rate for the white population.

<sup>7</sup> Includes Aleuts and Eskimos.

<sup>8</sup> Includes deaths among Chinese, Filipino, Hawaiian, Japanese, and other Asian or Pacific Islanders.

NOTE: The NLMS ratios, the census undercount ratios, and the age-adjusted rates are subject to variability and/or biases. Therefore, the results based on these ratios should be interpreted with caution.

Table C. Number of States whose Hispanic data was considered of sufficient quality for analysis and publication by NCHS and estimated percent of U.S. Hispanic population residing in reporting States, 1984-1999

Year	Number of States whose Hispanic data was considered of sufficient quality for analysis and publication by NCHS	Estimated percent of U.S. Hispanic population residing in reporting States <sup>1</sup>
1999 .....	50 States and D.C.	100.0
1998 .....	50 States and D.C.	100.0
1997 .....	50 States and D.C.	100.0
1996 .....	49 States and D.C.	99.6
1995 .....	49 States and D.C.	99.6
1994 .....	49 States and D.C.	99.6
1993 .....	49 States and D.C.	99.6
1992 .....	48 States and D.C.	99.6
1991 .....	47 States, New York State (excl. New York City) and D.C.	91
1990 .....	45 States, New York State (excl. New York City) and D.C.	89
1989 .....	44 States and D.C.	97
1988 .....	26 States and D.C.	82
1987 .....	18 States and D.C.	80
1986 .....	18 States and D.C.	80
1985 .....	17 States and D.C.	77
1984 .....	15 States	45

<sup>1</sup> Percents are based on the 1980 Census for 1984-89 and on the 1990 Census for 1990-99.

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Table D. Year in which State began reporting Hispanic data and year in which data reached level of acceptable quality and completeness for analysis by NCHS: Each State

[Prior to 1992, mortality data by Hispanic origin was considered of acceptable completeness if it was at least 90 percent complete on a place-of-occurrence basis. Thereafter, it was considered of acceptable completeness if it was at least 80 percent complete]

States	Year in which State first began reporting deaths by Hispanic origin	Year data reach level of acceptable quality and completeness for analysis by NCHS
Alabama .....	1988	1988
Alaska.....	1989	1989
Arizona .....	1984	1984
Arkansas .....	1984	1985
California.....	1984	1985
Colorado .....	1984	1984

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Table M. Estimated population by 5-year age groups, specified Hispanic origin, race for non-Hispanic population, and sex:  
 United States, July 1, 1999

[Figures include Armed Forces stationed in the United States and exclude those stationed outside the United States. Populations for all origins, Hispanic, non-Hispanic, non-Hispanic white, and non-Hispanic black are postcensal estimates based on the 1990 census, estimated as of July 1, 1999; populations for Mexican, Puerto Rican, Cuban, Central and South American and other and unknown Hispanic are based on the Current Population Survey adjusted to resident population control totals. Due to rounding, population estimates for Hispanic subgroups may not add to Hispanic control totals. The control totals are 1990-based population estimates for the United States for July 1, 1999; see text]

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Table M. Estimated population by 5-year age groups, specified Hispanic origin, race for non-Hispanic population, and sex:  
 United States, July 1, 1999

[Figures include Armed Forces stationed in the United States and exclude those stationed outside the United States. Populations for all origins, Hispanic, non-Hispanic, non-Hispanic white, and non-Hispanic black are postcensal estimates based on the 1990 census, estimated as of July 1, 1999; populations for Mexican, Puerto Rican, Cuban, Central and South American and other and unknown Hispanic are based on the Current Population Survey adjusted to resident population control totals. Due to rounding, population estimates for Hispanic subgroups may not add to Hispanic control totals. The control totals are 1990-based population estimates for the United States for July 1, 1999; see text]

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

Table R. Age-adjusted death rates for selected causes by race and sex, unadjusted and adjusted for estimated net census undercount: United States, 1990

[Based on age-specific death rates per 100,000 population in specified group. Age-adjusted death rates per 100,000 U.S. standard population. Numbers after causes of deaths are numbers of the Ninth Revision, International Classification of Diseases, 1975. Beginning 1987 includes category numbers \*042-\*044. See section "Cause of death"]

Race, sex, and adjustment for net census undercount	All causes	Human immunodeficiency virus infection (*042-*044)	Malignant neoplasms, including neoplasms of lymphatic and hematopoietic tissues (140-208)	Diabetes mellitus (250)	Diseases of heart (390-398,402, 404-429)	Cerebrovascular diseases (430-438)	Homicide and legal intervention (E960-E978)

99	0.81275	1.21746	0.80458	1.22822

NOTE: Table S was generated using the SAS<sup>®</sup> code below. Users can compute other level Confidence Intervals by changing the alpha-value. Table S is a modified version of Table 40 (80).

**VITAL STATISTICS OF THE UNITED STATES: MORTALITY, 1999**  
**TECHNICAL APPENDIX**

```
* Program to compute confidence intervals for expectations of Poisson variables ;
* Specify alpha for alpha*100% Confidence Interval ;

%let alpha = .95;

data CI ;

    alo = (1-&alpha)/2 ;
    ahi = (&alpha+1)/2 ;

do n = 1 to 99;

    L = Gaminv ( alo,n )/n ;
    U = Gaminv ( ahi,n+1)/n ;

output;
end;

proc print data= CI;
    var n  L U ;

run;
```
