TENTH ANNUAL REPORT

WITH

REVISED RATES FOR THE INTERCENSAL YEARS 1901 TO 1909
BASED UPON THE CENSUS OF 1910

WASHINGTON
GOVERNMENT PRINTING OFFICE,
1912

CONTENTS.

	Page.
INTRODUCTION	7–9
Ten-year period 1900 to 1909	7
Annual estimates of population	8
General death rates	9
Scope of this report	9
SUMMARY OF RESULTS	9–20
Deaths, by sex and age	10
Deaths, by color and nativity	12
Death rates in groups of registration areas	12
Comparison with foreign countries	13
Death rates in registration states	14
Urban and rural mortality	18
Death rates of the larger cities	18
CAUSES OF DEATH	21–30
Increase or decrease in death rates from each class of causes	21
Increase or decrease in death rates from principal causes	22
Average and median ages at death from various causes	26
Average death rates (stated as annual rates) for the decade 1900 to 1909, by principal causes	29

SUMMARY AND RATE TABLES.

Table I.—Population of each registration area: 1900 to 1909	32
Table II.—Death rates per 1,000 population in each registration area: 1900 to 1909	68
Table III.—Deaths (exclusive of stillbirths), with death rates per 100,000 population in the registration area, from each cause and class of causes: 1900 to 1909	86
Table IV.—Death rates per 100,000 population in each registration area, from certain causes and classes of causes: 1900 to 1909	92
Table V.—Deaths (exclusive of stillbirths), with death rates per 100,000 population in the registration area and its main subdivisions, from each cause and class of causes: 1900 to 1909	306
Table VI.—Death rates per 100,000 population in cities and rural districts of each registration state, from each cause and class of causes: 1900 to 1909	330
Table VII.—Death rates per 1,000 population, average ages at death, and per cent distribution of deaths at certain age periods, for the registration area, its main subdivisions, the registration states, and cities of 100,000 population and over in 1900, for each of the years 1900 to 1909	380
Table VIII.—Males—Per cent distribution, by important causes, of deaths of males at least 10 years of age engaged in certain specified occupations, classified by age, for the registration area: 1909	388
Table IX.—Females—Per cent distribution, by important causes, of deaths of females at least 10 years of age engaged in certain specified occupations, classified by age, for the registration area: 1909	410
Table X.—Per cent distribution of deaths from each cause and class of causes of death, by age, for the registration area: 1909	416
Table XI.—Per cent distribution of deaths at each age, from each cause and class of causes of death, for the registration area: 1909	420
Table XII.—Standard million—Distribution of the population of the United States, the registration area, its main subdivisions, and the registration states as constituted in 1900 (calendar year), by sex, age periods, color, nativity, and parent nativity, per 1,000,000 persons of all ages as given by the census of 1900	426

GENERAL TABLES.

Table 1.—Deaths (exclusive of stillbirths) in each registration area, by color, general nativity, parent nativity, and month of occurrence: 1909	436
Table 2.—Deaths (exclusive of stillbirths) in each registration area, by age: 1909	472
Table 3.—Deaths (exclusive of stillbirths) in each registration area, from certain causes and classes of causes: 1909	510
Table 4.—Deaths (exclusive of stillbirths) in the registration area, its main subdivisions, and registration states, by age, and by sex, color, general nativity, and parent nativity: 1909	550
Table 5.—Deaths (exclusive of stillbirths) in the registration area, its main subdivisions, and registration states, from each cause and class of causes: 1909	576
Table 6.—Deaths (exclusive of stillbirths) in the registration area, from each cause and class of causes, by sex and age: 1909	588
Table 7.—Deaths (exclusive of stillbirths) in the registration area, total registration states, and each registration state, from each cause and class of causes, by age: 1909	596
Table 8.—Deaths (exclusive of stillbirths) in each city having 100,000 population or over in 1900, from certain causes and classes of causes, by age: 1909	640
Table 9.—Males—Deaths of males aged 10 years and over, engaged in each of 140 groups of occupations, by color and age, for the registration area: 1909	722
Table 10.—Females—Deaths of females aged 10 years and over, engaged in each of 140 groups of occupations, by color and age, for the registration area: 1909	724
Table 11.—Males—Deaths of males aged 10 years and over, engaged in each of 140 groups of occupations, from certain causes, for the registration area: 1909	726
Table 12.—Females—Deaths of females aged 10 years and over, engaged in each of 140 groups of occupations, from certain causes, for the registration area: 1909	768
Table 13.—Deaths (exclusive of stillbirths), by sex, and by color, nativity, and parent nativity, by single years of age at last birthday, for the registration states: 1906 to 1909	780

LETTER OF TRANSMITTAL.

DEPARTMENT OF COMMERCE AND LABOR,
BUREAU OF THE CENSUS,
Washington, D. C., July 26, 1911.

SIR:

I have the honor to transmit the tenth annual report on mortality statistics, embracing returns from the registration area of the United States for the calendar year 1909. Revised death rates for the preceding years of the decade 1900 to 1909 also are presented, based on the growth of population as indicated by the Thirteenth Census.

While deaths are not recorded, or are recorded only very imperfectly, in many parts of the United States, the percentage of total population represented by annual returns of deaths is so large (56.1 per cent) that reasonable inferences may be drawn as to the health of the country as a whole. The death rate for the registration area in 1909 was only 14.4 per 1,000 estimated midyear population, the lowest on record and undoubtedly the lowest that has occurred in the history of the United States. The rate for the preceding year was 14.8 and the annual average for the decade 1900 to 1909 was 15.8. If for the United States as a whole the reduction was the same as that shown for the registration area from 1900 to 1909, then nearly 300,000 fewer deaths occurred in the country than would have occurred had the death rate for 1900 (17.6 per 1,000) prevailed. The tables presented show in detail what causes of death have decreased or increased in prevalence.

The report was prepared under the direction of Dr. Cressy L. Wilbur, chief statistician for vital statistics of this bureau.

Very respectfully,

E Dana Durand

Director.

Hon. CHARLES NAGEL,
Secretary of Commerce and Labor.

MORTALITY STATISTICS

1909

WITH REVISED RATES FOR THE INTERCENSAL YEARS 1901 TO 1909
BASED UPON THE CENSUS OF 1910

MORTALITY STATISTICS.

INTRODUCTION.

The present report is the tenth annual compilation of deaths in the registration area of the United States, and relates primarily to the deaths that occurred in that area during the calendar year 1909. The first report of the series was that for the calendar year 1900, contained in the volume on Mortality Statistics, 1900 to 1904, with summary tables and text relating to the five-year period. Since 1904 the annual volumes have been published separately as soon after the close of the year as the return of the transcripts and the work of compilation permitted, and in addition, beginning with the statistics for 1908, advance bulletins have been published so that the most important data would be available for early use.

Prior to the establishment, under the permanent Bureau of the Census, of this series of annual reports on vital statistics, the compilations of vital statistics related mainly to the years in which the decennial censuses of population were taken. The series of decennial reports commenced with that for the Seventh Census (1850) and terminated with that for the Twelfth Census (1900), the report for which relates to the census year June 1, 1899, to May 31, 1900, and is entirely distinct from the first annual report for the calendar year 1900. These annual reports have enabled the course of mortality to be followed year by year, thus affording much more valuable information than could be found in the statistics for single years presented only at decennial intervals. The early decennial mortality reports were, moreover, based on the data collected by the enumerators of population, a very unsatisfactory method, but beginning with the census year 1879–1880, the registration records obtained by state and city authorities were utilized to an increasing extent.

The "registration area" for deaths, as defined by the Census Bureau, consists of the states or cities that secure returns possessing at least a fair degree of completeness with respect to the total number of deaths. Some other states and cities have a registration system which is too incomplete to justify including them with the registration area. The next table shows the growth of the registration area for deaths.

The registration area has increased until it now embraces considerably more than one-half (56.1 per cent) of the total population of the country. During recent years the growth of the area has been rapid, owing to the active cooperation of sanitary and medical organizations and of the state health authorities with the Bureau of the Census. Further growth is expected, as legislation on this subject is either pending or is to be introduced at the next sessions of the legislatures of certain states.

YEAR.	Population of continental United States.	POPULATION OF REGISTRATION AREA.	
		Number.	Per cent.
Census year 1879–1880	[1] 50,155,783	[1] 8,538,366	17.0
Census year 1889–1890	[1] 62,622,250	[1] 19,659,440	31.4
Census year 1899–1900	[1] 75,994,575	[1] 28,807,269	37.9
Calendar year 1900		[1] 30,765,618	40.5
Calendar year 1901	[2] 77,747,402	[3] 31,370,952	40.3
Calendar year 1902	[2] 79,365,396	[3] 32,029,815	40.4
Calendar year 1903	[2] 80,983,390	[3] 32,701,083	40.4
Calendar year 1904	[2] 82,601,384	[3] 33,345,163	40.4
Calendar year 1905	[2] 84,219,378	[3] 34,052,201	40.4
Calendar year 1906	[2] 85,837,372	[2] 41,983,419	48.9
Calendar year 1907	[2] 87,455,366	[2] 43,016,990	49.2
Calendar year 1908	[2] 89,073,360	[2] 46,789,913	52.5
Calendar year 1909	[2] 90,691,354	[2] 50,870,518	56.1

[1] As of June 1.
[2] Estimated as of July 1.
[3] Enumerated or estimated as of June 1 for states taking an interdecennial census and estimated as of July 1 for the remainder of the registration area.

The registration area for 1909 consisted of 18 registration states, the District of Columbia, which is coextensive with the city of Washington, and 54 cities in nonregistration states. The list of states is as follows, those that have been added during the decade being indicated by stating in parentheses the year in which they were first included, while the states not thus indicated have formed part of the registration area since 1900:

California (1906).	Massachusetts.	Pennsylvania (1906).
Colorado (1906).	Michigan.	Rhode Island.
Connecticut.	New Hampshire.	South Dakota (1906).
Indiana.	New Jersey.	Vermont.
Maine.	New York.	Washington (1908).
Maryland (1906).	Ohio (1909).	Wisconsin (1908).

The present report is of special importance because it completes the first 10 years for which annual returns have been received and permits the data for individual years to be compared with the aggregate mortality of the decade.

TEN-YEAR PERIOD 1900 TO 1909.

In previous reports the quinquennial period 1901 to 1905 has been used as a general basis of comparison by which to measure the results of the more recent individual years. For the purposes of the present report, however, it seemed desirable to present an average for the 10-year period ending with 1909, and accordingly in all the summary tables in which such an average is useful the rates are given for the decade. As the rates thus given are those obtained on the basis of the revised population figures, the average for the

period will remain as a permanent basis of comparison for future years, although it may be practicable in the report for 1910 to group the years into two quinquennial periods, 1901 to 1905 and 1906 to 1910, the five-year period being the one usually taken as a basis in comparative international statistics. The use of the decennial period as a basis of comparison for the present report has a further advantage in that the classification of causes of death remained unchanged throughout the 10 years. For 1910 the second revised International List of Causes of Death went into effect, so that there will be some differences requiring adjustment between the rates for the year 1910 and those for the previous years. Consequently the 10-year period 1900 to 1909 summarizes the results obtained under the first revision of the International Classification, or International List, as it is preferably called, and on this account will be valuable for permanent reference.

ANNUAL ESTIMATES OF POPULATION.

It should be remembered that all methods of estimating population at periods between actual census enumerations, except those based on differences in the number of births and of deaths and on the increase or decrease from migration—methods not generally available in the United States—are more or less arbitrary and may occasion some minor fluctuations of death rates that are only apparent. Such fluctuations are especially likely to occur when the estimates extend over a long period of time, for example, nearly a full decade, and are less likely to occur when regular enumerations of population are made at comparatively short intervals. By means of local enumerations, provided that, even if not complete in all respects, they are conducted according to substantially the same methods in successive years, valuable evidence may be afforded as to whether the increment gained by a given area during the 5-year or 10-year interval between regular Federal or state censuses was gained regularly, either at about the same percentage each year or at about the same absolute number each year, or whether there were sudden changes in the rate or amount of growth. The death rates in the census reports are based on the assumption of equal annual amounts of growth (the arithmetical method). If, for example, the population of a given area grew very rapidly during the first few years of the period, and then experienced a marked decrease in the rate of growth, it is evident that the death rates thus computed for the earlier intercensal years would be too high. For an area in which the chief increase occurred during the last years of a decade, the rates would usually be too low. A table of death rates shows, therefore, only general indications based on the assumption of fairly uniform growth.

The difficulty of a postcensal estimation of population in countries taking only a decennial census increases in a ratio proportionate to the length of time between the estimate and the last preceding enumeration. Consequently, at the time of the publication of the bulletin for 1909 (Census Bulletin 108) it was believed that any attempt at such estimation would fall too wide of the mark to be acceptable as a statistical statement, and death rates were therefore published only for the registration area as a whole and for the few states and cities for which preliminary announcements of the population in 1910 had been received. With the publication of the population returns for 1910 it became possible to substitute for these rates derived from postcensal estimates of population, new rates based on revised estimates derived from a comparison of the census of 1910 with the last preceding state or Federal census. The arithmetical method of estimating population, explained in full in Bulletin 108, page 9 (Method V), was used in determining these rates, which are denominated intercensal (based upon two censuses, one of which is subsequent to the year for which the rate is computed) as distinguished from postcensal (based upon two censuses both of which are prior to the year in question).

The importance of the present revision of the death rates may be appreciated by comparing the rates for the several areas as computed according to the original population estimates for the year 1908 with the rates as subsequently computed according to the revised estimates. In large areas the difference between the two rates is usually comparatively slight, but in small ones it may be greater.

The following table shows the death rates for the registration area and its main subdivisions as computed on intercensal estimates of population derived from the censuses of 1900 and 1910 and as computed on the postcensal estimates derived from the censuses of 1890 and 1900 or from those of 1900 and 1905. It will be seen that for the large group of areas taken together the revised rates are lower than the originally computed rates, because the actual increase in population was greater than had been estimated by the postcensal method.

AREA.	DEATH RATES FROM ALL CAUSES[1] PER 1,000 POPULATION: 1908.		Increase (+) or decrease (−) of revised as compared with provisional rates.
	As computed on intercensal estimates of population.	As computed on provisional postcensal estimates of population.	
The registration area	14.8	15.4	−0.6
All registration cities	15.7	16.2	−0.5
Registration states	14.7	15.3	−0.6
Cities in registration states	15.9	16.5	−0.6
Rural part of registration states	13.3	14.0	−0.7
Registration cities in other states	15.4	15.5	−0.1

[1] Exclusive of stillbirths.

GENERAL DEATH RATES.

The ordinary expression employed for measuring the mortality of a country, state, city, or other unit of area is the death rate, or, as it is sometimes more particularly called, the general or crude death rate. This is merely the ratio of deaths to population, the deaths being those that occurred during a unit of time, preferably the calendar year, and the population being the enumerated or estimated population corresponding to the middle of the unit of time chosen. As a matter of convenience the death rate, at least for all causes combined, is usually expressed as a ratio per 1,000 population. As contrasted with general death rates, specific death rates deal with the number of deaths that occur in a given class of population, as, for example, the ratio of deaths of children under 5 years of age to the population under 5 years of age. Specific rates are far more reliable for purposes of comparing the mortality of different areas or that of the same area at considerable intervals of time, but it is evident that a general idea of the incidence of mortality can not be obtained by a detailed and minute analysis of the constituent specific death rates unless at great expenditure of time. There is a demand for a single expression that will represent the degree of healthfulness, or at least the liability to death, of one locality as compared with that of another. Although crude or general death rates, therefore, are liable to misuse or misinterpretation, they may at least be taken as the first step in comparing sanitary conditions.

SCOPE OF THIS REPORT.

The greater part of this report is devoted to the primary or general tables (numbered 1 to 13, pp. 436 to 794) presenting the mortality statistics in detail for the year 1909 and the summary and rate tables (numbered I to XII, pp. 32 to 434), in which, for the most part, series of consecutive death rates are given for each year of the decade 1900 to 1909. The populations used as the bases of the rates are presented in Table I. Certain tables contain percentages of deaths by occupation, age, and cause (Table VIII, males; Table IX, females), or by ages in relation to cause (Tables X and XI). Table VII shows the percentages of deaths, chiefly at decennial periods of age, and also the average ages at death for certain areas, while Table XII exhibits the distribution of the population of the United States, the registration area, its main subdivisions, and the group of registration states as constituted in 1900, according to the census of 1900, per "standard million." This table will be of service in the study of "corrected rates," based upon the age and sex distribution of population, a subject which will be taken up in subsequent reports. The last general table (Table 13) continues the statement of deaths of males and females in the original group of registration states (namely, those which were included in 1900) by single years of age, for the years 1906 to 1909, so that now, taking the reports for 1908 and 1909 together, the data include 10 consecutive years (1900 to 1909).

The text of this report has been somewhat curtailed in view of the fact that an entirely satisfactory analysis of the data can not be made until the full details of the enumeration of population in 1910 are available. The comparisons of death rates from individual diseases for the registration states, cities of 100,000 population and over, and minor cities, as given in the reports for recent years with special emphasis upon rates of a markedly higher character, have been omitted. All these rates, however, may be found in Table IV, and a special table (p. 30) compares the annual average rates of the more important causes for the 10-year period. No discussion is given of occupational mortality, although several tables on this subject may be found among the summary and general tables. The true incidence of mortality upon occupations can not be known until the occupational data of the census of population are available, hence the study is necessarily deferred until a later report.

SUMMARY OF RESULTS.

The table on the next page shows the population of the registration area for each year from 1900 to 1909, the number of deaths, and the general death rate per 1,000 of population. In comparing the different years, however, it should be borne in mind that the registration area has changed from year to year by the addition of new states and cities. The number of cities outside of registration states which have been added is, however, comparatively small. The states which have been added to the registration area during the decade are, in general, states where the death rates are relatively low, so that these additions would tend to reduce the death rate for the combined area from year to year even in the absence of any actual change in the death rate in any individual state or city. Death rates are generally lower in rural than in urban communities, and the states recently added to the registration area have in most cases a larger proportion of rural population than the states constituting the area 10 years ago. In order to show clearly the effect of the changes in the registration area upon the death rate and to give information regarding changes in death rates upon a strictly comparable basis, the population, deaths, and death rates for the original registration states—that is, the states which composed the area in 1900—are also given for each year in the table. These states are Connecticut, the District of Columbia, Indiana, Maine, Massachusetts, Michigan, New Hampshire, New Jersey, New York, Rhode Island, and Vermont.

YEAR.	REGISTRATION AREA.			ORIGINAL REGISTRATION STATES.		
	Population.	Deaths.		Population.	Deaths.	
		Number.	Rate per 1,000 population.		Number.	Rate per 1,000 population.
Annual average, 1900 to 1909	37,692,567	595,734	15.8	21,670,506	344,237	15.9
1900	30,765,618	539,939	17.6	19,960,742	343,217	17.2
1901	31,370,952	518,207	16.5	20,307,043	332,203	16.4
1902	32,029,315	508,640	15.9	20,648,941	318,636	15.4
1903	32,701,033	524,415	16.0	20,990,841	327,295	15.6
1904	33,345,163	551,354	16.5	21,332,741	349,855	16.4
1905	34,052,201	545,533	16.0	21,699,043	345,863	15.9
1906	41,983,419	658,105	15.7	22,218,713	353,906	15.9
1907	43,016,990	687,034	16.0	22,700,521	366,658	16.2
1908	46,789,913	691,574	14.8	23,182,330	351,163	15.1
1909	50,870,518	732,538	14.4	23,664,144	353,576	14.9

The total number of deaths reported to the Bureau of the Census from the registration area for the period 1900–1909 was 5,957,339, or an average of nearly 600,000 for each year. The number of deaths reported in 1909, 732,538, much exceeds the number reported in 1900, 539,939, but this increase is due to the extension of the registration area, the death rate having decreased from 17.6 per 1,000 population for 1900 to 14.4 for 1909. If the rate for 1909 had been the same as for 1900 the number of deaths returned for the later year would have been 895,321, or 162,783 more than were actually reported. For the original registration states, the returns of which are not affected by changes in the area, the death rate declined a little less markedly during the decade than for the entire registration area. It fell, however, from 17.2 in 1900 to 14.9 in 1909. The largest number of deaths returned for the original registration states was 366,658, in 1907, and the smallest 318,636, in 1902. The death rate for 1909 was lower than for any other year of the decade.

Although the registration area was considerably larger in 1909 than in the preceding year, owing chiefly to the addition of Ohio as a registration state, the total number of deaths returned in 1909 (732,538) exceeded by only 40,964 the number returned in 1908 (691,574). The death rate for the registration area in 1909 was thus appreciably lower than in 1908, 14.4 as compared with 14.8; for the original registration states, however, there was somewhat less difference, the figure for 1909 being 14.9 and that for 1908, 15.1.

Taking all things into consideration, it is probable that the mortality for the year 1909 was the lowest that has ever been reached in the history of the United States. As the returns for the registration area as a whole represent not only states in the North and the West, but also the large cities of the South, it is likely that if complete returns for the entire country were obtained the conclusions afforded by the available returns would be little altered.

DEATHS, BY SEX AND AGE.

The next table shows, for the registration area, the number of deaths of males and females and the distribution of the total number of deaths, by years of age under 5 and by quinquennial periods of age up to 100 years, for each of the 10 years 1900 to 1909, with the corresponding proportions per 1,000 deaths and average for the 10-year period.

During the year 1909 there were 398,597 deaths of males and 333,941 deaths of females. The few deaths reported without distinction of sex were apportioned by estimate in the same ratio as those for which sex was reported. The number of deaths of males per 1,000 decedents of both sexes was 544.1, or somewhat higher than the ratio for the 10-year period, which was 539.5. The excess of the deaths of males is closely related to the excess of male children born and the high mortality of infants under 1 year of age.

Of the total number of deaths that occurred during 1909 (732,538), no less than 196,534, or 26.8 per cent, were of children under 5 years of age, and 140,057, or 19.1 per cent, were of infants under 1 year of age. The proportion of deaths of children under 5 years of age to the total number of deaths that occurred during the year is far greater than that for any other five-year age group, a fact which does not indicate necessarily that the actual mortality or death rate per 1,000 persons of corresponding age living is higher at that period than at certain other periods, especially at the more advanced ages. A consideration of the deaths in the early years of life, however, is of special importance, not only because of the large number of deaths that occur during these years, but also because the number of deaths that are largely or entirely preventable is probably greater proportionally for this period than for any other period of life, and the causes which produce them are now being more and more successfully combated. Great progress has been made in the reduction of infant mortality in England and other countries during recent years, and an organization known as the American Association for Study and Prevention of Infant Mortality has been formed lately in this country for the purpose of coordinating all of the sanitary agencies available with a view to reducing the number of preventable deaths of infants. It is extremely desirable that for such an important purpose reliable statistics of infant mortality should be available for the entire registration area, and as soon as possible for the entire United States, with which the registration area for deaths will ultimately be coextensive. The correct statement of *infantile mortality*, which term, used technically, denotes the number of deaths of infants under 1 year of age per 1,000 living births, depends on the accurate registration of births, which is scarcely to be found in the United States.

[1] Exclusive of stillbirths.

Since the proper statement of the rate of infant mortality is lacking, recourse may be had to the ratio between the number of deaths of infants under 1 year of age and the population under 1 year, although this ratio is unsatisfactory for many reasons, and the population under 1 year is not at present available except as estimated.

A very crude means of judging of the conditions as regards the general mortality among infants and children is to compare the total number of deaths of infants under 1 year and of children under 5 years of age with the total number of deaths registered. Other things being equal—that is to say, with substantially the same age distribution of the population and in the

absence of epidemic diseases prevailing at higher age periods—comparisons between different areas or between different periods of time with reference to the relative proportions of deaths of infants and of children to the total number of deaths should show approximately the relative prevalence of infantile diseases and the importance of reducing the general mortality by efforts directed toward the prevention of infant mortality. Such comparisons may be made for the registration area, its main subdivisions, the registration states, and the cities of 100,000 population and over in 1900, for the years 1900 to 1909, by means of Table VII (p. 380), which shows also the general death rates and the average ages at death. The very different age distribution of decedents that sometimes exists between areas for which the general death rates are substantially identical indicates the unsatisfactory nature of statements of relative "healthfulness" based solely on comparisons of the general rates.

DEATHS, BY COLOR AND NATIVITY.

The following table shows the distribution of deaths in the registration area, by color, nativity, and parent nativity, for the 10 years 1900 to 1909:

COLOR, NATIVITY, AND PARENT NATIVITY.	1900	1901	1902	1903	1904	1905	1906	1907	1908	1909	Annual average: 1900 to 1909

[1] Exclusive of stillbirths.
[2] Includes 917 Chinese, 478 Japanese, 5 Hawaiians, 3 Koreans, 3 Filipinos, 2 East Indians, 1 Tahitian, and 1 Hindoo.
[3] Includes 958 Chinese and 683 Japanese.
[4] Includes 984 Chinese and 609 Japanese.
[5] Includes 997 Chinese and 636 Japanese.

Of the total number of deaths returned for 1909 (732,538), 686,230, or 936.8 per 1,000, were of white persons and 46,308, or 63.2 per 1,000, were of colored. The latter group consists mainly of negroes, the term including all degrees of negro blood. The proportions of deaths of Indians and of Chinese and Japanese were insignificant (2 and 2.2 per 1,000, respectively). In the completeness of the returns for nativity of parents much improvement is shown, namely, a diminution in the proportion of deaths returned with "parentage not stated," a classification which applies only to those offices in which the certificates in use do not provide for the statement of this item.

DEATH RATES IN GROUPS OF REGISTRATION AREAS.

The revised general death rates of the main subdivisions of the registration area are shown in the next table for the years 1900 to 1909.

The rates presented in the table, together with those in all other tables for the registration area or any of its main subdivisions for the 10 years 1900 to 1909 and for the 10-year period as a whole, are based on the revised estimates of population for the intercensal years as shown in Table I, and differ in some instances from the rates presented in previous reports on the basis of provisional estimates.

AREA.	NUMBER OF DEATHS FROM ALL CAUSES [1] PER 1,000 POPULATION.										
	1900	1901	1902	1903	1904	1905	1906	1907	1908	1909	Annual average: 1900 to 1909
The registration area	17.6	16.5	15.9	16.0	16.5	16.0	15.7	16.0	14.8	14.4	15.8
All registration cities	18.6	17.3	16.9	17.0	17.3	16.6	16.9	17.1	15.7	15.4	16.8
Registration states	17.2	16.4	15.4	15.6	16.4	15.9	15.7	15.9	14.7	14.2	15.5
Cities in registration states	18.9	17.8	17.0	17.1	17.9	17.1	17.4	17.5	15.9	15.4	17.0

Registration cities in other states	18.2	16.8	16.7	16.8	16.8	16.2	15.6	16.3	15.4	15.6	16.5

[1] Exclusive of stillbirths.

The rates given in the above table should be regarded chiefly as furnishing a basis for comparisons among certain general groups during each individual year, since the changes that have occurred in the registration area during the decade affect the relations of its principal subdivisions to such an extent that no precise comparisons between one year and another can be made. For example, the proportion of population of the total registration area included in the group of registration cities declined from 69.8 per cent in 1900 to 58.3 per cent in 1909. Moreover, certain cities were changed from one group to another in accordance with the general change in the organization of the registration area; thus, Cincinnati, Cleveland, Columbus, Toledo, and other Ohio cities [1] were included for the years 1900 to 1908 in the group of registration cities in nonregistration states, but for 1909, in consequence of the addition of Ohio to the registration area, they were transferred to the group of cities in registration states.

During the decade there was a general reduction in mortality for all the main subdivisions of the registration area. This is indicated roughly by the rates in the above table, in which changes in the constitution of the registration area are disregarded, and more accurately by the rates for the registration area and its main subdivisions as constituted in 1900. Disregarding changes in the registration area, it will be seen that the mortality in 1900, which would have been considered very moderate a few years ago, was higher in the registration area as a whole and in each main subdivision than that for any subsequent year shown in the table. The death rate in the registration area fell from 17.6 per 1,000 population in 1900 to 14.4 per 1,000 in 1909, a reduction of nearly one-fifth (18.2 per cent); that of the cities in the registration states decreased somewhat more rapidly (18.5 per cent); and those of all registration cities and the registration states, a little less rapidly (17.2 per cent and 17.4 per cent, respectively). The rural part of the registration states and the registration cities in nonregistration states show considerably smaller relative decreases in their death rates (14.5 per cent and 14.3 per cent, respectively).

[1] See Table I for detailed statement.

For the group of registration states as constituted in 1900 the death rate shows a decrease from 17.2 per 1,000 population in 1900 to 14.9 per 1,000 population in 1909, or 13.4 per cent, as contrasted with 17.4 per cent, the decrease shown for the registration states when no allowance is made for changes in its composition. It is evident that for exact measurements it is preferable to deal with individual states or cities or with aggregates made up of the same units of area from year to year. It is exceedingly unfortunate that the growth of the registration area and the extension of better methods of collecting vital statistics (highly advantageous though they are) render it necessary to deal with transitional groups of population—a necessity which would not arise if registration covered the entire United States.

The year 1908 was one of remarkably low mortality in the United States, both for the registration area as a whole (14.8 per 1,000 population) and for each of the main subdivisions. The year 1909 was even more favorable, however, for the registration area and for each of the main subdivisions except the group of registration cities in nonregistration states, for which the rate increased slightly, being 15.4 in 1908 and 15.6 in 1909.

COMPARISON WITH FOREIGN COUNTRIES.

The significance of the death rates shown for the registration area of the United States during the years 1900 to 1909 can best be appreciated by comparison with the rates for foreign countries in the same years as far as the data are available. Such rates are presented in the next table, derived from the international statistics contributed by the various governments and published in the last annual report of the Registrar-General of England and Wales.

The crude death rates of the registration area of the United States compare favorably with those of most European countries. The annual average for the decade (15.8 per 1,000) is precisely the same as that of England and Wales and is lower than the annual average of any other European country except Denmark (14.6), the Netherlands (15.6), Norway (14.4), and Sweden (15.2). The general tendency toward diminished rates in all countries is indicated by the

fact that the mortality for the last year shown in the table is usually lower than the average for the 10-year period; exceptions to this tendency are Bulgaria, Ceylon, Chile, Japan, Ontario, Roumania, and Servia, and these exceptions, in some cases, may be apparent rather than real, being due to improvements in registration.

COUNTRY.	NUMBER OF DEATHS FROM ALL CAUSES [1] PER 1,000 POPULATION.										
	1900	1901	1902	1903	1904	1905	1906	1907	1908	1909	Annual average: 1900 to 1909

[1] Exclusive of stillbirths. [2] Rate based on provisional figures. [3] No figures available. [4] Annual average 1900 to 1908.
[5] Including 77,283 deaths in the earthquake at Messina and Reggio (Dec. 28, 1908); excluding these deaths the death rate was 20.3.

DEATH RATES IN REGISTRATION STATES.

The table on the next page presents the death rates of the individual registration states for the 10 years 1900 to 1909, with the average for the decennial period.

Two summaries are given in this table, one for the changing group of registration states as constituted from year to year, and one for the original group as constituted in the calendar year 1900. The District of Columbia is included as a "registration state" in each total, but the death rates for the District, which is coextensive with the city of Washington, are not shown in comparison with the rates of the states. They may be found in a subsequent table which gives the death rates of the urban and rural population of the registration states and also in the table showing death rates for cities which in 1900 had 100,000 population or over.

There were no additions to the list of registration states during the period 1900 to 1905, so that for the first six years the rates for the two groups are identical. The new group of registration states formed in 1906, in which year California, Colorado, Maryland, Pennsylvania, and South Dakota were added, showed in 1906 a death rate of 15.7 per 1,000 or only two-tenths of 1 per 1,000 less than the rate for the original group (15.9). The difference for the following year was only slightly greater, the rates being 15.9 for the current and 16.2 for the original group. With the inclusion of Washington and Wisconsin in 1908, the difference increased, but only to a total of four-tenths of 1 per 1,000; and the further addition of Ohio in 1909 was attended with the maximum difference in the two series of rates, namely, seven-tenths of 1 per 1,000.

This comparison of the mortality of the new states added to the group of registration states with that of the states originally in the group shows that a part, but only a small part, of the decline in the average mortality for the combined group of all registration states is due to the change in the composition of that group. The extent to which the addition of these new registration states has affected the comparability of the average death rates for the entire registration area (states and cities in nonregistration states) can not be answered precisely. The problem is com-

plicated by the fact that considerable urban population embraced in the new registration states was already included in the registration area, under the heading of "registration cities in other states," prior to the addition of the new states as a whole. Thus Baltimore and certain smaller cities of Maryland were a part of the registration area before the returns for the entire state were obtained for the first time. The additions to the registration states have not materially altered the proportions of rural and urban population for the group of registration states (only from 46.5 per cent in 1900 to 47.9 per cent in 1909), but they have affected much more the proportion of rural population in the registration area as a whole, which rose from 30.2 per cent in 1900 to 41.7 per cent in 1909.

It is likely that the difference between the average mortality of the original registration states and that of those added since 1900, as shown in the table, is due partly to the favorable age distribution of the population of some of the states added. This favorable age distribution is indicated by a very rapid growth in population between 1900 and 1910 (California, 60.1 per cent; Colorado, 48 per cent; South Dakota, 45.4 per cent; and Washington, 120.4 per cent). Such growth is usually due, at least in part, to a large proportion of recent immigration from other states and countries of persons at the most favorable periods of life. This tendency favorable to a low death rate has, however, been counterbalanced to some extent by the addition of the rural population of Maryland and Pennsylvania. In the annual report on Mortality Statistics for 1906 it was estimated that the addition of the new registration states for that year would correspond, on the basis of more favorable age distribution alone, to a reduction of the death rate from 17.2 per 1,000, as observed for the original group of registration states for 1900, to 17 per 1,000, or two-tenths of 1 per 1,000 less.

It is difficult to determine to what extent the rates may have been affected by relatively incomplete registration in some of the newly added registration states. The crude death rates for some of these, as for example, South Dakota, Washington, and Wisconsin, are exceedingly low as compared with the rates in other states and with the rates in foreign countries, as given in the table showing international statistics, excepting only the rates shown for the Australasian states.

REGISTRATION STATE.	NUMBER OF DEATHS FROM ALL CAUSES [1] PER 1,000 POPULATION.										
	1900	1901	1902	1903	1904	1905	1906	1907	1908	1909	Annual average: 1900 to 1909

Total for registration states as constituted in 1900 [2]	17.2	16.4	15.4	15.6	16.4	15.9	15.9	16.2	15.1	14.9	15.9

[1] Exclusive of stillbirths. [2] Includes District of Columbia [3] Nonregistration state. [4] Not shown for less than 10 years.

In sparsely settled states the enforcement of registration laws is very difficult. The burial or removal permit is an essential requirement for the thorough and complete registration of deaths, and in the remote rural districts, with only a few persons, on an average, to the square mile, it may be practically impossible either to provide local registrars or to enforce the provision of law that the certificate of death must be filed with the registrar and a permit issued before interment or other disposition of the body. No undertakers may be available, and the relatives or friends of the decedent may be unfamiliar with the law. Residence at a long distance from the registrar's office may, moreover, prevent compliance with the provisions of law even if known, and if the death is not registered before interment there are usually no means of securing the return. A regular and effective system of state inspection is not feasible, as a rule, because no funds are provided for this purpose; and it is very difficult in many cases to obtain evidence of violation of the law or to enforce the penalty provided therefor. The conditions are entirely different from those that attend the administration of registration laws in the more densely settled states of the East, where, moreover, the people have been accustomed for many years to the registration of vital statistics. It is therefore a matter of surprise that registration laws should be enforced as thoroughly as they have

been in certain states, rather than that the results should seem to show, either for the state as a whole or for certain counties, a condition of registration that is imperfect or below the ordinary standard.

The average density of population of continental United States according to the census of 1910 was 30.9 persons per square mile. The average density in the group of older registration states taken as a whole is very much higher than this. The lowest densities of population of the older registration states were those of Maine, 24.8; Vermont, 39; and New Hampshire, 47.7. The densities of the states added since 1906 were in 1910 as follows: South Dakota, 7.6; Colorado, 7.7; California, 15.2; Washington, 17.1; Wisconsin, 42.2; Ohio, 117; Maryland, 130.3; and Pennsylvania, 171. Only for the first four should there be special difficulty on account of sparsely settled population, and local concentration in cities and villages may overcome this difficulty to some extent in Colorado, California, and Washington, in which states, for 1910, the percentages of the populations living in incorporated places were, respectively, 62.8, 68.2, and 63.6. The corresponding percentage for South Dakota was only 33.2, and this state would seem to present a peculiarly difficult problem so far as obtaining complete returns of deaths is concerned.

In Table II, page 68, and also in Table IV, page 92, attention is called, by means of a dagger (†) following the name of the city or county, to those areas that have shown a remarkably low death rate—under 7 per 1,000 population—for one or more of the years presented. There is no absolute limit below which it can be said that a rate is worthless, as not representing the actual number of deaths that occurred. With very small populations, perhaps amounting to only a few hundreds or thousands, as in some of the counties of California, Colorado, South Dakota, and Washington, it is quite possible that no deaths should occur for a year, or so few that the rate would be extremely low. As a rule, however, rates under 7 per 1,000, especially when they continue for several years and relate to counties with several thousand inhabitants, unless the population is composed almost exclusively of young adults, may safely be taken as indicating deficiency in the registration of deaths. At all events in deriving inferences as to relative healthfulness they should not be compared with ordinary rates based upon a fairly normal age distribution.

No rates as low as 7 per 1,000 occur for any of the cities included in the registration area for the years given in Table II except Owosso, Mich., in 1904 (6.6). Rates below this limit for St. Joseph, Mo., given in previous reports were based upon estimates of population far above the probable truth. No such rates are found for the rural population of any county (exclusive of cities of 8,000 population or over which may be located therein) in the states of Connecticut, Indiana, Maine, Maryland (except Garrett and St. Marys Counties), Massachusetts, Michigan (except Gladwin, Oscoda, and Roscommon Counties), New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Vermont, and Wisconsin (except Douglas, Florence, Price, and Vilas Counties). On the other hand 13 counties in California, 21 counties in Colorado, and 35 counties in South Dakota had rates below this limit for one or more of the four years 1906 to 1909, and Washington had 13 counties in this class for one or both of the years 1908 and 1909. Such a comparison calls attention to rates that require explanation or arouse doubt in the mind of the student of statistics; yet some of the cases may be readily explained on other grounds than that of imperfect registration. Thus for Alpine County, Cal., the death rate for 1909 was zero, no deaths whatever having been returned. But the population of this county consisted of only 327 persons, and it is possible that among so small a number no deaths actually took place. No deaths were returned in 1908 for Costilla County, Colo., which had a population of 5,341. The presumption in this case is different; the law is evidently ineffective for this part of the state. The extremely low rates in the two Maryland counties named above, as well as the comparatively low rates in other counties of rural Maryland, are admittedly due to failure to enforce the state law, but better results may be secured under the recent reorganization of the sanitary service and appointment of a state registrar of vital statistics. The low Michigan rates were for very sparsely settled counties and were all for years prior to 1905.

The next table gives a list of the counties for which, exclusive of any incorporated places of 8,000 population or over that they may contain, the death rates for 1909 were less than 7 per 1,000.

The death rates shown in the table are based on the estimated midyear population for 1909 and the deaths returned by the authorities of the several states. In some instances reports of deaths have been received by the state offices after the transcripts for the year were completed. Such delayed returns would probably affect only to a slight degree the general results, and may properly be omitted in measuring the efficiency of a state registration service.

The table shows, in connection with the death rate for each state as a whole, an additional rate based upon the population and number of deaths outside of counties (or the rural parts of counties) with reported death rates less than 7 per 1,000, for which, at least when taken as a group, the registration may be presumed to be extremely defective. By the exclusion of these counties or parts of counties the death rate for California would be increased from 13.4 to 13.6; that for Colorado, from 14.2 to 14.8; that for Maryland, from 15.5 to 15.8; that for South Dakota, from 8.5 to 10.2; and that for Washington, from 9.8 to 10.2. The rate for Wisconsin would show no change. The rates thus calculated may be regarded as approximations to the actual death rates of the states in question, but are probably still somewhat below the truth. Registration

is doubtless far from complete in many other counties of these states besides those for which the rates happen to fall below the arbitrary test limit of 7 per 1,000. As long as a state registration law fails to be enforced in all parts of a state, more or less doubt will attach to the correctness of the data for any part of the state or for the state as a whole.

STATE AND COUNTY.	Estimated midyear population, 1909.	Deaths (exclusive of stillbirths), 1909.	Death rate per 1,000 population, 1909.

[10] Including part of Colville Indian Reservation.

As an example, reference may be made to the rates for the rural portions of the counties of Maryland, as shown for each of the four years 1906 to 1909 in Table II. It is there seen that while only Garrett and St. Marys Counties have fallen below the rate of 7 per 1,000 population—these counties having been below that limit for each year of the period, and farthest below in the latest years, probably indicating decreasing efficiency of registration—several other counties have shown death rates nearly as low, or at least much lower than would be expected from the character of the population.

Maryland is one of the oldest settled states, with comparatively little immigration in the rural portions and with the usual proportions of children and elderly persons. It is, besides, the only registration state having a considerable colored population—in 1900 amounting to nearly one-fourth (23.6 per cent) of the total population in the rural districts. The colored death rate is usually higher than the white death rate, and the fact that it is more difficult to secure complete registration of the deaths of colored persons than of white persons accounts for a considerable percentage of omissions. Considering the death rates for 1909 in connection with a test of the completeness of registration made by means of an investigation of newspaper notices of deaths in the state, undertaken in cooperation with the state board of health, it would seem likely not only that the returns from Garrett and St. Marys Counties were far below the actual number of deaths, but also that those from Allegany, Frederick, Montgomery, Somerset, Wicomico, and Worcester Counties were deficient—just how deficient can not be estimated until the thorough enforcement of the state law affords a basis of comparison. In Garrett County the work of registration was taken over by the state board of health for the months of February, March, and April, 1910, under the provisions of the Maryland law authorizing such action in case of deficient registration, and a letter from the secretary of the board states that as compared with the corresponding months of 1909 an increase of over 200 per cent was shown in the number of births and deaths registered.[1]

It is unfortunate that it is necessary to discuss defective registration in states of the present accepted registration area, and the attention of state registration officials is earnestly called to the need of a thorough enforcement of the state law in all parts of the state alike, because to permit constant violation of the law in any part of a state casts discredit upon the administration for the state as a whole, and also, to some extent, upon the value of the rates for the registration area. The population represented by the aggregate returns is so large, however, that the omission from the totals of counties or even of entire states

[1] The Maryland law has since been amended (1912), so as to be in closer conformity with the model law.

with defective registration would not appreciably affect the average rates. The death rate for the present group of registration states (1909) is 14.2 per 1,000 population, and the two states showing the maximum departure from this average are South Dakota and Washington. If South Dakota were excluded the rate would be raised by only one-tenth (to 14.3), and if both South Dakota and Washington were excluded the rate would be only two-tenths higher (14.4).

URBAN AND RURAL MORTALITY.

In the following table the death rates of the urban and rural population of the registration states are given for the 10 years 1900 to 1909, together with the average for the decade:

NUMBER OF DEATHS FROM ALL CAUSES [1] PER 1,000 POPULATION.

[1] Exclusive of stillbirths. [2] Nonregistration state. [3] Average not shown for less than 10 years.

By urban population is understood, for the mortality statistics,[1] the population of cities or municipalities (including New England "Towns") that had 8,000 or more inhabitants in 1900, while the population of the remainder of a state is considered as rural. The District of Columbia (city of Washington) is entirely urban, and the percentages of urban population (municipalities of 8,000 population or over) in 1900 were very high for Rhode Island (81.2), Massachusetts (76), New York (68.5), and New Jersey (61.2); while the lowest percentages, for the states included in the registration area, were those of South Dakota (2.6) and Vermont (11.2). It is probable that registration in rural districts is not, on the whole, as complete as in the cities, which would account for some part of the differences found in the rates. For each year the urban death rate is the greater, the average difference for the 10 years for the entire group of registration states being 3.2 per 1,000. For the years 1908 and 1909, which were years of remarkably low mortality, this difference was less than the average. Comparison is made also for the original group of registration states as constituted in 1900, so that the disturbing influence due to the addition of new registration territory, with relatively defective rural registration in certain counties, may be eliminated. For this group the average urban death rate was 17.1 and the average rural rate 14.2. The data for individual states show that in only a very few states, for occasional years, have the urban rates been as low as the rural, save only that in Rhode Island this was the case in a majority of the years.

[1] The population statistics of the Thirteenth Census class as urban places having a population of 2,500 and over.

DEATH RATES OF THE LARGER CITIES.

The next table shows the crude death rates for the cities of 100,000 population and over in 1900 for each of the years 1900 to 1909 and the average for the decade.

The cities are arranged, as in all the tables of this report, in the alphabetical order of the states in which they are situated, thus permitting ready comparison of the rates shown for the cities of the same states. Of the 38 cities of this class in 1900, rates are available for each year of the decennial period for only 36, Allegheny and Pittsburgh having been consolidated as Pittsburgh since 1907 and no satisfactory basis of estimated population being available for St. Joseph. The latter city, for which the population was returned as 52,324 in 1890, 102,979 in 1900, and only 77,403 in 1910, is no longer in the group of cities of at least 100,000 population, and is omitted from tables show-

ing the death rates for cities of this class. On the basis of estimated population formerly employed the death rate of St. Joseph for 1909 would have been only 8.5 per 1,000, but computed upon the actual population of April 15, 1910, as a base, which would give a somewhat lower rate than would the midyear estimate of population for 1909, the rate was 13.7. This is a low rate, but not remarkably so, and probably represents more nearly the actual condition of mortality than any rates presented for St. Joseph for some years past. It does not appear feasible to attempt to estimate the population of the city for the intercensal years.

[1] Exclusive of stillbirths. [2] City as now constituted. [3] Included in Pittsburgh as now constituted. [4] Average not shown for less than 10 years.

It will be recalled that death rates are based on the assumption that the population increases by equal annual amounts, and that in cases where marked changes in the rate of growth of population occur within the period covered by the estimates, minor fluctuations in the death rates may be occasioned that are only apparent. The table shows, therefore, only general indications based on the assumption of a fairly uniform growth.

The consideration that all the death rates shown in this and the following table are merely "crude," "general," "gross," or "uncorrected" rates, as they are variously called, is very important. While useful for certain purposes and necessary for comparisons of the net effect of mortality relative to total population, inferences in regard to the superior healthfulness of one city as compared with another should not be formed on the basis of general death rates alone. The principal reason for this is the fact that the number of deaths in a given community depends very largely upon the age distribution of the population. Other factors are concerned, but age distribution is of the first importance, at least for comparisons not affected by color or race. Hence, until it is known, for example, that the age distribution of the population is substantially the same in two given cities, comparison of the total or crude death rates has little significance and may be actually misleading.

Other qualifications and conditions should be borne in mind before deciding as to the true significance of the rates shown for various cities. The rates of mortality in all large cities are more or less affected by the number of deaths that occur in hospitals, to which nonresidents, sometimes from a very wide

extent of country, are taken for the purpose of treatment or operation. Some cities are health resorts, and are thus subject to very high rates of general mortality from the deaths of persons suffering from tuberculosis or other diseases contracted elsewhere. Large state institutions, especially those for the insane, may unfavorably affect the general death rate. On the other hand, certain classes of institutions, for example, industrial schools for children and prisons, may have death rates lower than the average on account of the favorable age distribution of their inmates and hence tend to lower the rates in the areas in which they are situated. It is impracticable, however, either to eliminate from the report for any area the deaths in institutions and of nonresidents, or to include in such a report the deaths of residents that occurred outside of the place of residence. For certain minor areas reference is made in Tables II and IV to the presence of state institutions for the insane as possibly contributing to the existence of high mortality rates, but for the cities of 100,000 and over no special reference is made to the presence of such institutions because the effect upon the general death rate is usually small.

The presence of a large colored population may be taken as an important factor in a high general mortality, disregarding the question whether this fact is due to a normally higher death rate for colored persons than for white or is merely an index of more unfavorable sanitary conditions than those under which the average person of the white race lives. As estimates of population by color and race are not available for the present report, the comparative death rates of the white and colored population can not be given. Cities in the preceding table with large proportions of colored population are Washington, Louisville, New Orleans, Baltimore, and Memphis, and in each of these cities except Louisville the annual average death rate for the decade exceeded 19, while Fall River and Pittsburgh are the only other cities with a rate exceeding that figure.

The most useful function of such a table of general rates is to measure the improvement in individual cities during the 10-year period. The extremely favorable character of the year 1909 is indicated by the fact that of the 36 cities for which comparisons with the preceding years are available, the death rate for 1909 was lower than that for 1908 in 22 cities, equal in 3, and higher in 11; 31 of these cities showed lower rates for 1909 than the average for the decade, and for 17 cities the rates for 1909 were lower than for any preceding year shown in the table. The latter statement is practically equivalent to saying that the death rates in the large American cities were lower in 1909 than ever before, because throughout the world during the past 30 years there has been a very marked decrease in the general death rates of cities from which registration returns are available. In the United States, as in foreign countries, the general status of urban mortality represents a condition of public health that even a few years ago would have been considered quite unattainable.

Comparison of the movement of the death rates of the large cities of the world may be made by means of the following table taken from the international statistics published in the Annual Summary of the Registrar-General of England and Wales:

CITY.	ANNUAL CRUDE DEATH RATES PER 1,000 PERSONS LIVING.									Decrease per cent between 1881 to 1885 and 1901 to 1905
	1881 to 1885	1886 to 1890	1891 to 1895	1896 to 1900	1901 to 1905	1906	1907	1908	1909	
London	20.9	19.7	19.8	18.5	16.1	15.1	14.6	13.8	14.0	23.0

[1] Average for four years.

CAUSES OF DEATH.

The study of individual causes of death constitutes a very important part of a report on mortality statistics. The exact meaning of the expression "individual cause of death" can only be known by careful examination of the terms included under the titles of the International List of Causes of Death. This statistical list is presented in Table III, in which the number of deaths and the death rates per 100,000 population are given for each of the years 1900 to 1909, together with the annual average for the 10-year period, according to the returns from the entire registration area. In this table will also be found totals for certain groups or classes of diseases, such as "General diseases," "Diseases of the nervous system," etc. The statistics for these classes are of less importance than those for the individual causes included under them, and the tendency among vital statisticians at present is to do away with them as far as possible and direct attention particularly to the more definite individual causes.

It should be noted that many of the terms used in the International List themselves represent in a sense groups of causes of death rather than precise single causes.

There is no question as to the precise medical significance of the term "typhoid fever," for example, and there should be little less exactness in the meaning of the corresponding International title. Unfortunately, however, all deaths from typhoid fever are not reported by physicians by means of this exact term. "Enteric fever" is a recognized synonym, and in England, indeed, is the more usual term. It has been found in the United States in at least one instance that a physician who reported a considerable number of deaths from "enteric fever" supposed that the expression was equivalent to enteritis, which was in fact the cause of death. Other terms of indefinite character, for example, "continued fever," "mountain fever," "typhomalarial fever," as well as paratyphoid fever, which is a distinct disease, are compiled under the International title "Typhoid fever." It follows that the statistical content of the title is somewhat broader and less exact than the precise medical significance.

The same principle applies to all titles of the International List as to typhoid fever, and in many of them the definiteness of the terms included is much less than for typhoid fever, which is a comparatively well marked disease. It would be impracticable to compile separately each term reported by physicians and all statistical classifications necessarily involve much condensation of the terms reported, with some corresponding loss of precision. The exact inclusions of each statistical title may be learned from examination of the Census Manual of the International Classification of Causes of Death (1902) for the years 1900 to 1909, and of the Manual of the International List of Causes of Death (1911) for the decade beginning with 1910. The latter is based on the Second Decennial Revision (Paris, 1909) and a similar publication has been prepared by the Registrar-General of England and Wales. Satisfactory statistics of causes of death depend upon the precise reporting of such causes by physicians by means of definite terms, and it is therefore necessary to provide an authoritative guide or nomenclature of diseases and conditions for their use. A booklet entitled the "Physicians' Pocket Reference to the International List of Causes of Death" has been distributed by the Census Bureau to all the physicians of the United States, and the bureau is cooperating with the American Medical Association's Committee on the Nomenclature and Classification of Diseases with the ultimate purpose of providing a sound basis for the statistics of causes of death. In the meantime, however, all statistics of individual diseases must be viewed with a certain amount of allowance for indefinite reports.

Causes of death include not only diseases, but also various forms of external violence, under which phrase are included accidental causes as well as homicide and suicide. For some purposes the exact nature of the injury in cases of disability or death from violence should be stated. This is especially important for hospital statistics and for the medical statistics of the Army, Navy, and Public Health and Marine-Hospital Service. But for general morbidity and mortality statistics the exact nature of the injury is of little consequence, because the principles of classification are (1) the character of the violence, as accidental, suicidal, homicidal, judicial (legal execution), or in battle; and (2) the means of injury, by which is meant the machine, weapon, vehicle, or instrument which caused the injury. Much uncertainty has resulted in the statistics of deaths from violence by the failure to give complete information, and as a result of efforts to secure greater precision of statement, certain causes of death, for example, the various means of suicide, have shown an apparent increase that was not warranted by the actual facts. A death reported from "gunshot" or "drowning" is compiled under accidental violence and not under suicide unless the fact of suicide is stated upon the certificate. Coroners, especially, should be urged to report more precisely in this respect, as it will not be possible to present reliable statistics until the statements of causes of death from violence have reached a fairly stable level of uniformity and completeness.

INCREASE OR DECREASE IN DEATH RATES FROM EACH CLASS OF CAUSES.

While little stress should be laid upon "classifications" of causes of death, it is of some interest to consider the changes that have occurred in the general classes of causes during the decade 1900 to 1909.

During this period the classes remained unchanged in their constitution, while beginning with 1910 the introduction of the revised International List has caused some differences that will preclude comparison unless they are fully taken into account. In the following table, which relates to the entire registration area, the death rates of the various classes for each of the years 1901 to 1909 are compared with the corresponding rates for the year 1900, which are taken as the bases (100 per cent) for the percentages shown. The comparability of the statistics for the several years in this table and the next is somewhat affected by the change in the constitution of the registration area from year to year. (See p. 7.)

CLASS OF CAUSES OF DEATH (ENTIRE REGISTRATION AREA).	Death rate per 100,000 population, 1900	PERCENTAGE WHICH DEATH RATE IN SPECIFIED YEAR REPRESENTS OF THAT IN 1900.								
		1901	1902	1903	1904	1905	1906	1907	1908	1909
All causes[1]	1,755.0	94.1	90.5	91.4	94.2	91.3	89.3	91.0	84.2	82.1
I. General diseases	478.6	96.9	90.4	93.3	93.7	89.1	86.9	88.1	83.2	79.2
Epidemic diseases	166.2	93.7	82.7	86.3	77.7	69.1	72.0	73.9	68.4	59.1
Other general diseases	312.4	98.7	94.4	97.1	102.2	99.8	94.9	95.6	91.1	89.9
II. Diseases of nervous system	208.8	92.2	88.7	85.4	87.0	86.6	80.2	81.6	72.7	70.3
III. Diseases of circulatory system	147.2	100.1	104.4	108.6	116.6	116.7	114.3	123.8	117.1	120.8
IV. Diseases of respiratory system	256.2	89.7	86.6	84.7	90.1	79.6	76.4	81.0	68.2	69.7
V. Diseases of digestive system	226.2	88.7	84.4	82.8	87.7	89.5	90.8	87.1	84.7	79.9
VI. Diseases of genito-urinary system	105.9	100.8	102.0	109.7	114.5	114.7	108.0	113.0	104.3	105.9
VII. Childbirth	13.3	103.0	97.7	105.3	115.0	112.0	113.5	117.3	118.0	115.0
VIII. Diseases of skin	8.0	90.3	88.8	95.0	90.0	88.8	82.5	80.0	75.0	73.8
IX. Diseases of locomotor system	2.2	118.2	122.7	136.4	136.4	136.4	131.8	131.8	136.4	131.8
X. Malformations	11.5	95.7	93.0	107.0	113.9	117.4	128.7	130.4	128.7	132.2
XI. Diseases of early infancy	76.9	86.0	88.6	89.5	93.6	90.2	92.1	92.6	89.7	85.0
XII. Diseases of old age	50.4	93.3	88.1	77.6	77.0	71.6	66.5	63.1	58.5	52.6
XIII. Violence	96.0	110.6	101.3	113 2	114.5	115.5	122.9	127.3	116.7	113.8
XIV. Ill-defined causes	73.8	76.4	71.3	60.8	56.9	54.3	51.6	45.5	39.2	33.2

[1] Exclusive of stillbirths.

The general death rate from all causes combined showed a fairly constant decline from year to year, the decrease between 1900 and 1909 amounting to nearly one-fifth of the death rate for the year 1900. The percentages for both 1908 (84.2) and 1909 (82.1) are very low, and the relative decrease in those years as compared with 1900 for the various classes of diseases may be observed roughly by the range above or below the percentages for deaths from all causes. Thus for epidemic diseases the percentages which the death rates during 1908 and 1909 formed of the death rate in 1900 (68.4 and 59.1, respectively) were much below the percentages for deaths from all causes during 1908 and 1909. The percentages for diseases of the circulatory system (117.1 and 120.8) were on the other hand considerably above the percentages for deaths from all causes, and the increase in this class of diseases has been fairly constant from year to year, although the percentage for 1907 was the maximum of the series. No great weight should be given to the percentages based on the initial death rates from diseases of the locomotor system, since the total number of deaths from these causes is small at all times.

INCREASE OR DECREASE IN DEATH RATES FROM PRINCIPAL CAUSES.

A comparison for some important individual causes of death, similar to that presented in the preceding table for the general classes, is made in the table on the following page, in which are shown the percentages which the death rates for each year from 1901 to 1909 represent of the death rates in 1900. Those causes for which the number of deaths is too small to afford a satisfactory basis for comparison are not included in the table.

The percentage which the death rate from all causes in any of the years given forms of the corresponding figure for 1900 furnishes a basis with which to compare the variations shown for individual causes. Thus for tuberculosis of the lungs the death rate in 1909 was only 76.3 per cent of that in 1900, a comparison of which with the somewhat higher percentage shown for the general death rate (82.1) indicates a relative decrease in the mortality from tuberculosis of the lungs somewhat greater than the average decrease.

CAUSE OF DEATH (ENTIRE REGISTRATION AREA).	Death rate per 100,000 population, 1900	PERCENTAGE WHICH DEATH RATE IN SPECIFIED YEAR REPRESENTS OF THAT IN 1900.

[1] Exclusive of stillbirths.

In the preceding tables, as well as in Table III upon which they are based, the rates are for the registration area as a whole as constituted for each year of the period 1900 to 1909. Since important changes have taken place in the constitution of that area during this time which would affect to some extent the death rates from all causes and from individual causes, no exact comparisons of the variations in the individual death rates can be made. In order that the necessity of making allowance for changes in the registration area may be avoided, rates are presented in the table on the following page, which relate to the same area throughout, namely, the original group of registration states as constituted for the years 1900 to 1905.

This table presents the data for the largest unchanged area for which figures fairly representative of population embracing both urban and rural elements are available for the past decade, and shows, probably better than the table for the registration area as a whole, the true tendencies of causes of death as indicated by the death rates per 100,000 population. That the general tendency is toward a slightly higher death rate, from all causes combined, in the urban population than in the rural has already been shown, although, as before stated, allowance must be made for the possibility of somewhat more imperfect registration in the rural districts. As a rule, the death rate from each individual disease is slightly higher for the cities, but some exceptions occur in the limited list of causes presented in the table, among which those of chief importance, as represented by the death rates for the 10-year period, are typhoid fever, influenza, apoplexy and paralysis, and heart disease. In the case of tuberculosis of the lungs the annual average death rate for the cities was markedly higher than that for the rural districts, a condition shown also for diseases of the respiratory system, including bronchopneumonia and pneumonia (lobar and unqualified), for diarrhea and enteritis, and for Bright's disease.

[1] Exclusive of stillbirths.

The figures in the above table are particularly trustworthy because they relate to the same territory. The death rate from typhoid fever in 1909 was only 55 per cent of that in 1900. As the percentage for each year of the series was lower than that for the preceding year, it is clear that a constant decrease occurred in the mortality from this disease in the states (chiefly those of New England and the East) that constituted the group of registration states in 1900. The decrease was somewhat greater than the corresponding decrease shown for the registration area as a whole as modified from time to time since 1900. All the epidemic diseases given in the table showed a decrease except scarlet fever. For the latter disease the percentages for the later years were usually above that of 1900, and the fluctuations varied greatly in degree. The death rates from cancer for every year but one were higher than for the year preceding and the rate in 1909 was nearly one-fourth (24.6 per cent) greater than in 1900. The relative increase in the death rate from diabetes (45.5 per cent) was considerably greater than that in the death rate from cancer, but the total number of deaths from this cause was much smaller, and therefore the increase is of less importance numerically.

The comparison of death rates from important causes with the corresponding rates for 1900 is extended to the urban and rural districts of the old group of registration states by means of the percentages in the table on the following page.

On the whole the original registration states of 1900 show a considerably greater diminution of urban than of rural mortality during the decade, although in 1909 the urban death rate (15.6 per 1,000) remained somewhat higher than the rural death rate (13.9 per 1,000). Typhoid fever decreased more in the country than in the city, while the contrary was true for tuberculosis of the lungs. Degenerative diseases of advanced life, among them cancer, apoplexy and paralysis, organic heart disease, cirrhosis of the liver, and Bright's disease, increased in greater degree for 1909 as compared with 1900 in the rural than in the urban districts. Some part of this difference may be due to a progressively more favorable age distribution of urban population, but the considerable amount of difference in some instances would seem to cast some doubt upon the generally accepted belief as to the more unfavorable influence of city life in contributing to degenerative diseases. The general tendency of the percentages shown is of course more important than the differences for single years, and more thorough comparisons will be made as soon as the data for 1910 are available so that averages for consecutive quinquennial periods may be computed.

AVERAGE AND MEDIAN AGES AT DEATH FROM VARIOUS CAUSES.

In this connection it may be of interest to present some data showing the average and median ages at death from all causes and from various diseases and external causes. The average age at death is the result obtained by multiplying the number of persons dying at each age by that age and dividing the sum of the products by the total number of persons who died; and the median age is the age which represents the middle point at which the decedents are equally divided, one-half being below and one-half above this age. The table on the following page shows for each cause of death of the detailed International List the average and median ages at death, by sex, of persons dying in the registration area during 1908 and 1909.

CAUSE OF DEATH.	AVERAGE AGE AT DEATH IN YEARS.						MEDIAN AGE AT DEATH IN YEARS.

[1] Under 1 year.

[2] Under 3 months.

As will be seen in the preceding table, the average age corresponds approximately with the median age for the total of all causes and for many individual causes. Thus, for 1909, the average age at death was 38.8 years, while the median age was only slightly higher (40.7 years). In 1909 the average and median ages of persons dying from general diseases were very nearly the same (36.8 years and 36.2 years, respectively); for persons dying from typhoid fever the average age at death was 29 years and the median age 26.2 years; for those dying from tuberculosis of the lungs the average and median ages were 36.1 years and 33.8 years, respectively; and for those dying from cancer of all forms the average age was 59 years and the median age 60.1 years. When the deaths are distributed with considerable uniformity among the different periods of life, the median and average ages usually correspond very closely. When, however, the deaths occur chiefly at early or late periods of life there may be a very great difference between the two ages; for example, the average age at death of persons dying from acute bronchitis was 15.1, but the median age was less than 1 year, owing to the fact that the great majority of these deaths are of infants less than 1 year of age. Similarly for bronchopneumonia the average age shown is 18.2 years and the median age 1.4 years, a fact which is suggestive of the very marked difference in character between this disease and pneumonia (lobar and unqualified) for which the average age at death in 1909 (37.4 years) and the median age (40 years) closely correspond. The figures for average and median ages given in the table must be used with caution, but considered together they form a very useful clue to the age incidence of the various causes of death and may serve to distinguish diseases which, though closely associated on account of similarity in their medical definition, in reality have very different relations to the public health.

AVERAGE DEATH RATES (STATED AS ANNUAL RATES) FOR THE DECADE 1900 TO 1909, BY PRINCIPAL CAUSES.

The table on page 30 presents for the decade 1900 to 1909 the average death rates per year per 100,000 population from some of the most important causes of death for the registration area and its main subdivisions, as constituted from year to year, for the original registration states individually and cities that had 100,000 population or over in 1900.

In the table only those states are shown for which the registration returns were available for each year of the decade. The annual average rates may serve as a convenient basis of comparison in the study of the rates for the individual years that are presented in Table IV. It should be constantly borne in mind during the examination of such rates that they are not corrected for sex, age, color, or other elements of the distribution of population, and furthermore that certain areas include many more deaths of nonresidents in proportion to the total mortality than do others. It is not practicable as yet to present death rates based solely upon resident population; there is no definite agreement among registration officials as to the exact line of demarcation between deaths of "residents" and "nonresidents," and the tendency is quite marked, in the absence of specific rules, to understate the resident mortality. Nor is it customary at present to prepare tables of death rates for individual causes of death with corrections for peculiarities of population. The latter procedure is a refinement of statistical presentation which will soon become necessary, however, now that the fundamental basis of a uniform list of causes of death has come into general international use, and future reports will devote especial attention to this subject. In the meantime, however, the crude rates presented in the tables of the present report may be used with caution, provided that positive conclusions are avoided until the bases of population are known to be fairly comparable in their constitution.

AVERAGE DEATH RATE PER YEAR PER 100,000 POPULATION FOR CERTAIN CAUSES: 1900 TO 1909.

AREA.	Typhoid fever.	Malarial fever.	Measles.	Scarlet fever.	Whooping cough.	Diphtheria and croup.	Influenza.	Tuberculosis (all forms).	Tuberculosis of lungs.	Cancer.	Diabetes.	Meningitis.	Pneumonia (lobar and unqualified).	Diarrhea and enteritis.

[6] Corrected midyear estimates of population for the years 1905 to 1909, on account of fire in 1908, are: 1905, 37,398; 1906, 38,052; 1907, 38,706; 1908, 32,452; 1909, 32,452. The estimates for 1905, 1906, and 1907 are based on the Federal census of 1900 and the state census of 1905. The figures for 1908 and 1909 are the Federal census figures for 1910.

[7] As of June 1, 1904.

[8] Included in rural.

[9] Including West Bay City.

[1] Exclusive of cities having a population of 8,000 or over in 1900.
[2] Nonregistration.
[3] Formed from part of Larimer County, May 5, 1909.
[4] Not organized.
[5] No estimate; included in Larimer County.
[6] Including Jackson County.
[7] Population by census, June 1, not midyear population, used as basis of rates.

REGISTRATION AREA: 1900 TO 1909—Continued.

[3] Organized as Gates from part of Chippewa in 1901; name changed in 1905.

[4] Not organized.

TABLE II.—DEATH RATES PER 1,000 POPULATION IN EACH REGISTRATION AREA: 1900 TO 1909.

[All death rates are based upon total deaths, including deaths of nonresidents and deaths in hospitals and institutions. Minor areas containing state insane asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

[1] Exclusive of cities having a population of 8,000 or over in 1900.

TABLE II.—DEATH RATES PER 1,000 POPULATION IN EACH REGISTRATION AREA: 1900 TO 1909—Continued.

[All death rates are based upon total deaths, including deaths of nonresidents and deaths in hospitals and institutions. Minor areas containing state insane asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

[1] Exclusive of cities having a population of 8,000 or over in 1900. [2] Nonregistration. [3] Not shown for less than 10 years.

TABLE II.—DEATH RATES PER 1,000 POPULATION IN EACH REGISTRATION AREA: 1900 TO 1909—Continued.

[All death rates are based upon total deaths, including deaths of nonresidents and deaths in hospitals and institutions. Minor areas containing state insane asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

REGISTRATION AREA.	NUMBER OF DEATHS FROM ALL CAUSES (EXCLUSIVE OF STILLBIRTHS) PER 1,000 POPULATION.										
	1900	1901	1902	1903	1904	1905	1906	1907	1908	1909	Annual average: 1900 to 1909

[1] Exclusive of stillbirths.

[2] Not computed separately.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Nonregistration state; cities shown below only those with effective local ordinances.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Not computed separately.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[3] Not computed separately.

[4] Probably included deaths in added territory prior to the date of annexation.

TABLE IV.—DEATH RATES PER 100,000 POPULATION IN EACH REGISTRATION

[All death rates are based upon total deaths, including deaths of nonresidents and deaths in hospitals and institutions. Minor areas containing state insane

REGISTRATION AREA.		NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION.											
		All causes.[1]	Typhoid fever.	Malarial fever.	Small-pox.	Measles.	Scar-let fever.	Whoop-ing cough.	Diph-theria and croup.	Influ-enza.	All other epidemic diseases.	Tuber-culosis of lungs.	Other forms of tubercu-losis.	Cancer.

[1] Exclusive of stillbirths.

[2] Not computed separately.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Menin-gitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Exclusive of cities having a population of 8,000 or over in 1900.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Exclusive of cities having a population of 8,000 or over in 1900.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Exclusive of cities having a population of 8,000 or over in 1900.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Menin-gitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Exclusive of cities having a population of 8,000 or over in 1900.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Exclusive of cities having a population of 8,000 or over in 1900.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Exclusive of cities having a population of 8,000 or over in 1900.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Menin-gitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.

[1] Exclusive of stillbirths.

[2] Exclusive of cities having a population of 8,000 or over in 1900.

AREA, FROM CERTAIN CAUSES AND CLASSES OF CAUSES: 1900 TO 1909—Continued.

asylums are designated by asterisks (*). Areas with very low rates in one or more years, due possibly to incomplete registration, are designated by daggers (†).]

NUMBER OF DEATHS FROM SPECIFIED CAUSES PER 100,000 POPULATION—continued.

Tumor.	Diabetes.	Meningitis.	Other diseases of nervous system.	Diseases of circulatory system.	Pneumonia (lobar and unqualified).	Other diseases of respiratory system.	Diarrhea and enteritis (all ages).	Other diseases of digestive system.	Bright's disease and nephritis.	Diseases of early infancy.	Suicide.	Accident.	Ill-defined causes.	All other causes.	Cause unknown.
